Eckford's
Giant SWEET PEAS

The finest Blooms in the World

**A flower garden without Eckford's Sweet Peas can only be compared to a house without furniture.**

Sweet Peas are requisite to the small, medium or large garden, and if you wish to have colour, effect, prize specimens, and tall plants, then send to Eckford's for your Seeds. The time to buy is NOW. The firm to buy from is ECKFORD'S. No other seed specialist in the world can rival Eckford's for Sweet Peas. Large flower, longer stems, brighter colours, and a profusion of bloom will be the result of growing Eckford's seeds. Remember, Genuine Eckford's Seeds can only be obtained direct from Wem. No Agents are employed.

**ECKFORD'S GREAT £1000 COMPETITION.**

**SECTIONS FOR EXPERTS, NOVICES, AND CHILDREN.**

**£250 for Ladies or Gentlemen keeping one or more Gardeners. £250 for Professional Gardeners. £250 for Amateurs. £125 for Cottagers. £125 for Boys and Girls under 16. Open to all. Send a postcard for full particulars.**

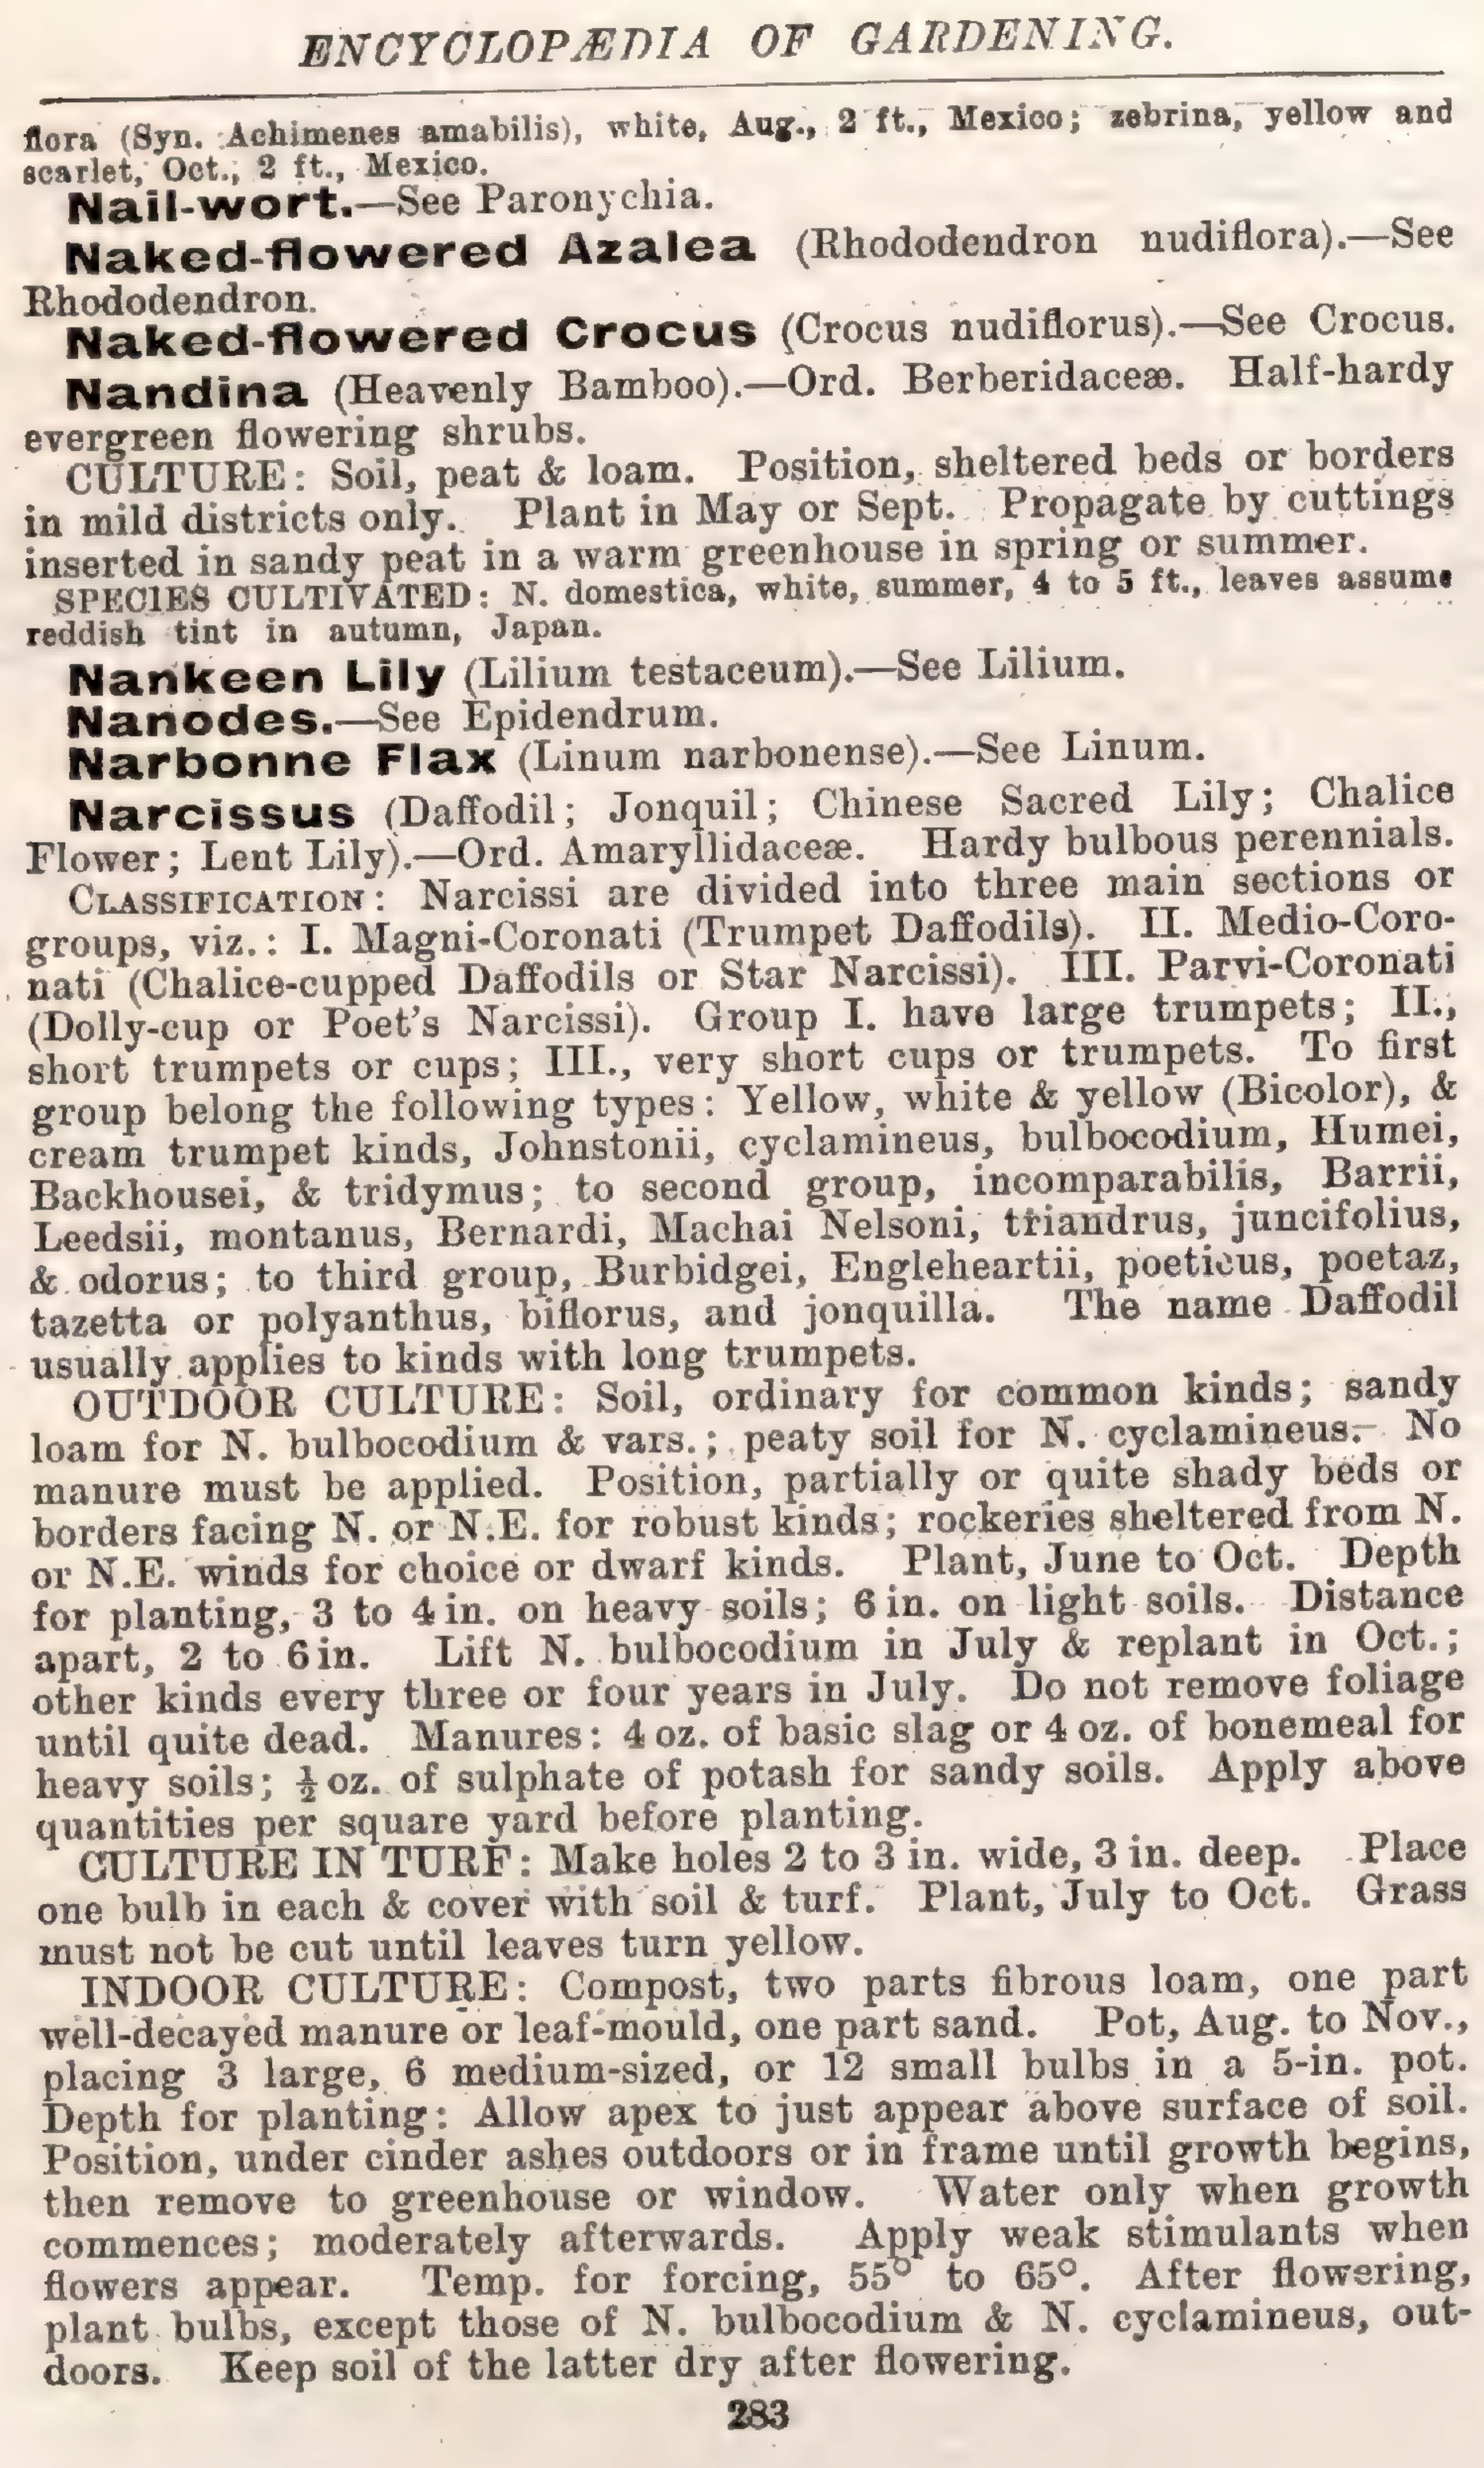
E.C

## SPECIMEN PAGE.



*ENCYCLOPÆDIA OF GARDENING.*

flora (Syn. Achimenes amabilis), white, Aug., 2 ft., Mexico; zebrina, yellow and scarlet, Oct., 2 ft., Mexico.

**Nail-wort.**—See Paronychia.

**Naked-flowered Azalea** (Rhododendron nudiflora).—See Rhododendron.

**Naked-flowered Crocus** (Crocus nudiflorus).—See Crocus.

**Nandina** (Heavenly Bamboo).—Ord. Berberidaceæ. Half-hardy evergreen flowering shrubs.

CULTURE: Soil, peat & loam. Position, sheltered beds or borders in mild districts only. Plant in May or Sept. Propagate by cuttings inserted in sandy peat in a warm greenhouse in spring or summer.

SPECIES CULTIVATED: N. domestica, white, summer, 4 to 5 ft., leaves assume reddish tint in autumn, Japan.

**Nankeen Lily** (Lilium testaceum).—See Lilium.

**Nanodes.**—See Epidendrum.

**Narbonne Flax** (Linum narbonense).—See Linum.

**Narcissus** (Daffodil; Jonquil; Chinese Sacred Lily; Chalice Flower; Lent Lily).—Ord. Amaryllidaceæ. Hardy bulbous perennials.

CLASSIFICATION: Narcissi are divided into three main sections or groups, viz.: I. Magni-Coronati (Trumpet Daffodils). II. Medio-Coronati (Chalice-cupped Daffodils or Star Narcissi). III. Parvi-Coronati (Dolly-cup or Poet's Narcissi). Group I. have large trumpets; II., short trumpets or cups; III., very short cups or trumpets. To first group belong the following types: Yellow, white & yellow (Bicolor), & cream trumpet kinds, Johnstonii, cyclamineus, bulbocodium, Humei, Backhousei, & tridymus; to second group, incomparabilis, Barrii, Leedsii, montanus, Bernardi, Machai Nelsoni, triandrus, juncifolius, & odorus; to third group, Burbidgei, Engleheartii, poeticus, poetaz, tazetta or polyanthus, biflorus, and jonquilla. The name Daffodil usually applies to kinds with long trumpets.

OUTDOOR CULTURE: Soil, ordinary for common kinds; sandy loam for N. bulbocodium & vars.; peaty soil for N. cyclamineus. No manure must be applied. Position, partially or quite shady beds or borders facing N. or N.E. for robust kinds; rockeries sheltered from N. or N.E. winds for choice or dwarf kinds. Plant, June to Oct. Depth for planting, 3 to 4 in. on heavy soils; 6 in. on light soils. Distance apart, 2 to 6 in. Lift N. bulbocodium in July & replant in Oct.; other kinds every three or four years in July. Do not remove foliage until quite dead. Manures: 4 oz. of basic slag or 4 oz. of bonemeal for heavy soils; ½ oz. of sulphate of potash for sandy soils. Apply above quantities per square yard before planting.

CULTURE IN TURF: Make holes 2 to 3 in. wide, 3 in. deep. Place one bulb in each & cover with soil & turf. Plant, July to Oct. Grass must not be cut until leaves turn yellow.

INDOOR CULTURE: Compost, two parts fibrous loam, one part well-decayed manure or leaf-mould, one part sand. Pot, Aug. to Nov., placing 3 large, 6 medium-sized, or 12 small bulbs in a 5-in. pot. Depth for planting: Allow apex to just appear above surface of soil. Position, under cinder ashes outdoors or in frame until growth begins, then remove to greenhouse or window. Water only when growth commences; moderately afterwards. Apply weak stimulants when flowers appear. Temp. for forcing, 55° to 65°. After flowering, plant bulbs, except those of N. bulbocodium & N. cyclamineus, outdoors. Keep soil of the latter dry after flowering.

SUTTON'S CENTENARY PEA.
Per pint, 2s.; quart, 3s. 6d.; post free.

Mr. W. Easthope, Gardener to Miss Pittar, writes: "Centenary as a mid-season Pea is very hard to beat. I had a fine crop, some pods containing 11 or 12 peas of excellent flavour."

SUTTON AND SONS, The King's Seedsmen,
READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.

From an article in "The Field," August 12th, 1911, on The Best Gardening Books:

"I do not know of anything dealing with herbaceous borders more comprehensive than Kelway's Manual."

NOW is the time to plant KELWAY'S DELPHINIUMS—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.

———, Esq., Driffield.

"My employer had one dozen Delphiniums from you last week, which arrived in splendid condition, and have been duly planted, and I hope they will do as well as the other ones he had from you some time ago.

"They have been a perfect picture of beauty here.

"I should esteem it a great favour if you would spare me one of your Manuals of Horticulture, as it is always a real treat to read one of so great and unequalled interest. I consider it the most magnificent of all Horticultural Annuals."

Choice named collectons, 15s., 24s., 34s., 56s. a dozen.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

Mrs. ———,
Ballintubher, Athy.

"The plants arrived safely yesterday morning, for which many thanks, but such a number; they are such strong, healthy plants, too. If you treat everybody as you have treated me, I cannot understand it. You must keep your establishment going for philanthrophy, pure and simple."

FIDLER'S GIANT-FLOWERED SWEET PEAS.—Send at once for our collection (C) of 14 named varieties, all separate, containing in all 1,000 good plump new seeds. Post free, with catalogue, for 1s. FIDLER and SONS, Royal Berkshire Seed Stores, Reading.

THOMSON'S CELEBRATED MANURES.
(For full particulars see page vii.)

CHARLES BLICK'S CARNATIONS, Famous all over the world. NOW IS THE TIME FOR PLANTING AND POTTING. Sample dozen of the finest varieties ever offered. Selfs, Fancies, and Picotees, 10s. per dozen, carr. paid. Also best up-to-date Perpetual-flowering varieties.

Finest hand-fertilised seed of all classes, 1s. 6d. and 2s. 6d. per packet. Send for free Illustrated Catalogue to WARREN NURSERIES, Hayes, Kent.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown, both poisonous and non-poisonous, are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, XL ALL WINTER WASH for Fruit Trees, etc. Don't forget to ask your N. S. or Florist for Richards' small pink list.

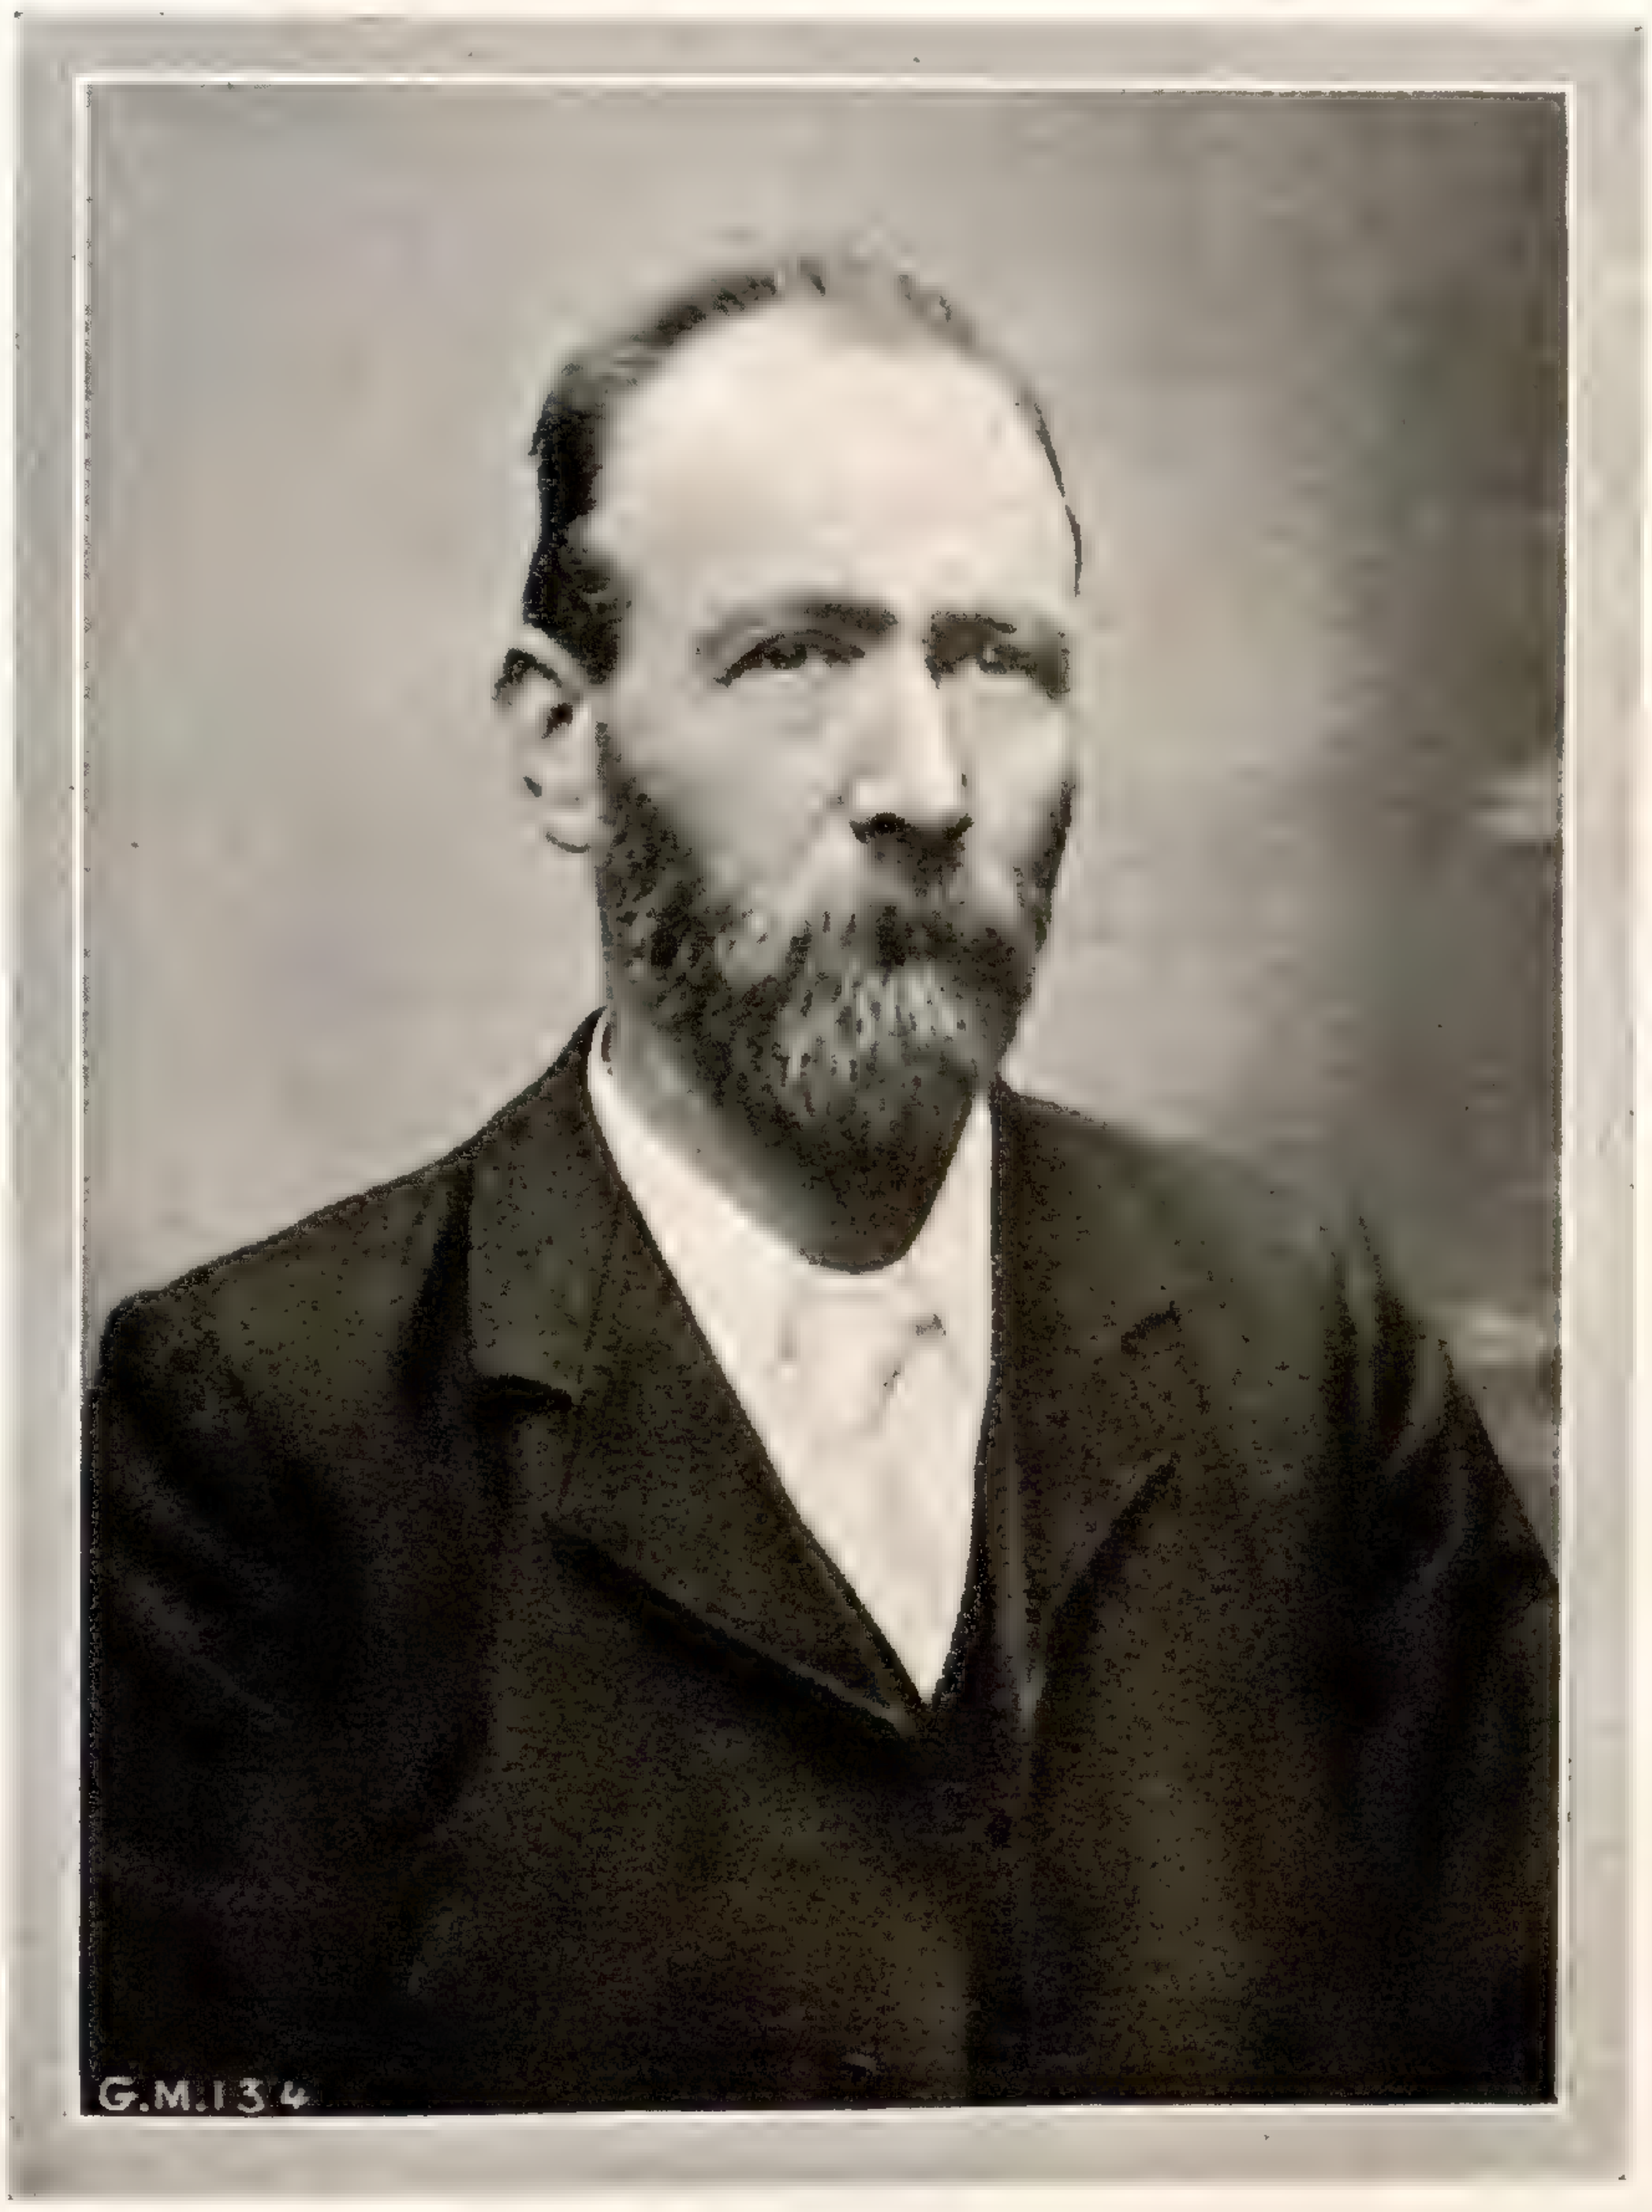
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Diversity in Dahlias.

In accordance with the new policy that was initiated with such eminently satisfactory results two years since, the National Dahlia Society held a conference on the 8th inst., at which papers of much interest to those who are concerned with the dahlia and its cultivation were read and discussed. The advantages of such conferences cannot well be overestimated, for they afford opportunities that do not arise in any other way for those who are interested in any particular flower to meet and discuss points of practice, the relative merits of varieties under various conditions, the best methods of presenting the flowers to public notice, and other matters of more or less importance in connection with their favourites. Such gatherings are invariably interesting and useful, and the one to which reference is now made was by no means the least successful of the large number at which we have had the pleasure of being present. The audience, if hardly so large as could have been wished by those who are desirous of further popularising the dahlia as a garden flower, consisted almost exclusively of those who are specially interested in dahlias, many of them having travelled considerable distances in their desire to be present. The first of the two papers that were read dealt with the cultivation of dahlias in town gardens, a phase of culture that has not for many years received the attention it so well merits. For a long period these flowers were largely grown in town gardens, especially on the eastern side of the Metropolis, and many are the stands of splendidly developed blooms that have come under our notice at the exhibitions of the more important of the amateur floricultural societies that from twenty to thirty years ago flourished on the north-eastern boundaries of the City of London. There are at the present time several amateurs' societies in the Metropolis that are wholly concerned with the cult of the dahlia, but, unfortunately, little is heard of them and their activities outside the area embraced by their operations. Dahlias are so well able to bear the unfavourable conditions that obtain in towns as to thrive where few other flowering plants will succeed, and with their aid the owner of a garden of even modest dimensions can have displays of flowers that are at once bright and attractive. He must, in the course of his practice, differentiate between the production of blooms for exhibition and for garden decoration, and remember that, owing to the actinic value of light being less in towns than in the country, stimulative manures must be sparingly used. The reader of the paper on the cultivation of dahlias dealt chiefly with the production of blooms for competitive purposes; and of a high degree of excellence was the advice he gave, for he recommended the application of a much smaller quantity of manure when the soil is being prepared than is usually considered necessary, and would be advisable in the case of many soils in country gardens. The other paper contributed to the conference was of special interest from the fact that it dealt with a question that immediately concerns all classes of cultivators and has been much discussed during the past two or three years. Within a quite recent period several new types have been brought into prominence, and, as they differ considerably in character from those which have been generally grown in British gardens for two or more decades, cultivators have had some difficulty in determining the position they should be assigned in any comparison that might be made between them and the older types. That there should have been some difference in opinion as to their relative merits is not surprising. The first of the pæony-flowered varieties, with their large and effectively coloured blooms, that were introduced to this country were so robust in growth as to be of little value for decorative effect except in gardens other than those of large size, and the blooms of the Collarette varieties differed so greatly from those of the other types that it was not easy at first to accept them without some question. Some of the leading English raisers have devoted considerable attention to the improvement of the habit of the pæony-flowered varieties, and have already achieved much success in this respect, and obtained many new and beautiful varieties. Cultivators have become accustomed to the blooms of the Collarette varieties, with their frills of short florets round the disk, and now regard them with much favour, especially as they are valuable in the garden. Several of them received awards last season from both the Royal Horticultural Society and the National Dahlia Society, a fact of some importance as showing that these two societies are ready to recognise flowers of merit, however great may be the departure from the existing types. Much satisfaction was expressed at the conference that this should have been done, it being now recognised that to further popularise the dahlia the creation of new and distinct forms must be liberally encouraged. Hitherto, raisers have been rather too conservative in their views in making selections from their seed beds, but happily these views are rapidly



MR. WILLIAM HALL.

undergoing a change that can hardly fail to have an effect of far-reaching importance upon the dahlia as a factor in garden decoration.

---

**Mr. William Hall,** Chief Officer of the Parks Department under the Borough of Sunderland, is not only an excellent manager, but also a creator of parks and gardens, as since his appointment in 1890 he has laid out two new parks for the borough, and laid down six bowling greens and seven tennis courts. Mr. Hall was born at Wark-on-Tyne, and served his apprenticeship under his father, who is still head gardener at Parkend—a position he has held since 1856, probably a record. From home Mr. W. Hall proceeded to the well-known gardens at Eden Hall, Cumberland, and from thence to Holkam Hall, where, as also at Wentworth Woodhouse, he gained considerable experience as a plantsman and as a cultivator of hardy and tender fruits. His first appointment as head gardener was at Deighton Grove, near York, and his second at Kirkley Hall, Northumberland, where he achieved considerable success with phalænopsis. Here he stayed until his appointment to the charge of Sunderland's parks and open spaces. Mr. Hall is a busy man, and admirably manages his extensive charge. He takes great delight in the study of plant physiology, landscape work, and garden design, and between whiles plays bowls, at which game he is a champion.

**New Class for R.H.S. Daffodil Show.**—In connection with the Daffodil Show to be held at the Royal Horticulutral Hall, Westminster, on April 16 and 17, Mr. Chester Jay Hunt, of Montclair, New Jersey, has offered £1 10s., £1, and 10s., as first, second, and third prizes, in a perfectly open class for six varieties, distinct, of Leedsi daffodils, three stems of each, the varieties shown to cost not more than two guineas per hundred.

**Preservation of Colley Hill.**—With reference to the efforts that are being made by the National Trust to preserve Colley Hill, Reigate, Mr. S. H. Hamer, the secretary of that body, informs us that the executors of Mr. George Taylor, the owners of the land, have agreed to an extension of the option of purchase for a short time. About £3,000 is still required, and of this an anonymous donor has promised £1,000 if the remainder of the amount is subscribed by April 15. A shilling fund has recently been started, and has met with much success, 11,000 shillings having been collected in three months. Mr. Hamer points out that to the antiquary, the botanist, the ornithologist, and the entomologist, Colley Hill is of peculiar interest; but if this opportunity is allowed to go by, and the hill is built over, not only will a stretch of the Surrey Hills lose its wildness and beauty, and an old historic trackway (the Pilgrim's Way) be despoiled, but the whole neighbourhood—and, indeed, London—will suffer by the loss of one of its chief attractions. For the information of those who may be interested in the matter we would add that the offices of the National Trust are at 25, Victoria Street, S.W.

**A Fine Specimen Hydrangea.**—From "Amid the Surrey Pines," Mr. W. H. Franks writes: "A good deal has been written about hydrangeas in the rerecent issues of the Gardeners' Magazine, but not too much, because they are beautiful shrubs, and deserving of more attention than they at present receive. Near here (Witley) there is a wonderfully fine specimen, 5ft. high and 24ft. in circumference. It is on the northern side of a cottage, and has no protection whatever, yet it does well, and has had as many as 729 perfect heads of bloom in one season. If some of the pot plants now so popular were retained and planted out, in the southern counties, and given ample room to develop, they would soon become noble examples."

**Cucumber and Tomato Canker.**—The disease of cucumbers and tomatoes caused by Mycospærella citrullina, and commonly known as cucumber and tomato canker, has been included by the Board of Agriculture among the diseases which, in pursuance of the Destructive Insects and Pests Order of 1910, must be reported to the Board by the occupier of any premises on which they appear. Growers who are in doubt as to whether or not the disease is present on their premises should submit specimens of affected plants to the Board for determination. Up to the present the disease has been chiefly confined to tomatoes grown under glass. Occupiers of gardens in which the disease appeared last year are strongly advised not to plant tomatoes in the same soil, unless it has been adequately sterilised, and to spray all their plants during the early part of the season with Bordeaux mixture or a solution of liver of sulphur (one pound to 32 gallons of water).

**Chinese Primula Flowers** of great beauty have been sent us by Messrs. E. Webb and Sons, Wordsley, Stourbridge; the blooms were of excellent size and substance, and some of them exquisitely fringed. A few varieties of great excellence are Rose Queen, the purplish-crimson Eclipse, the white Avalanche, Ruby Queen, of vivid hue; Blue Bell, with very bright blossoms; and Meteor, a delightful salmon-rose flower of great effectiveness.

**Lectures on "Ferns" and "Weeds."**—On Tuesday, March 19, Mr. H. B. May, V.M.H., who has made lifelong study of ferns, and has raised and introduced numbers of fine varieties, will lecture on "Ferns" at the meeting of the Royal Horticultural Society, at 3 p.m. On the same day, following the monthly dinner of the Horticultural Club, Mr. Harold Long will deliver a lecture on "Weeds"; dinner is at six o'clock, at the headquarters of the club, Hotel Windsor, Victoria Street, Westminster.

**An Important Horticultural Exhibition.**—From the schedule now before us we learn that Messrs. Robinson Bros., Lim., of West Bromwich, will hold a horticultural exhibition of an important character in the Botanical Gardens, Edgbaston, Birmingham, on August 28 and 29. The schedule is comprehensive, and the prizes liberal, and in the seventy-five classes ample provision is made for the display of the various classes of border plants, cut flowers, fruits, and vegetables available for exhibition at the end of August. The more important of the classes are those for a collection of border flowers, representing, as nearly as possible, a border of growing plants on a ground space of 20 feet by 8 feet (prizes, £10, £8, £6, and £4); roses, H.P.'s, 48 blooms (£6, £4, £3); table of choice fruit (prizes, £10, £6, £4); grapes, 8 bunches (£10, £6, £4),; and collection of vegetables, 12 distinct kinds (prizes, £20, £15, £10, £5). The cash prizes amount, in the aggregate, to £350, and in addition gold and silver medals will be awarded to honorary exhibits of merit. The competition will be limited to the users of the Carmona Fertilisers, of which, with other "Guaranteed Gardenalities," Messrs. Robinson Bros., Lim., are the manufacturers.

**The Royal Gardeners' Orphan Fund Committee** is indebted to a gentleman, who was unable to be present at the recent annual meeting, for a contribution which will ensure the payment of 5s. per week for one year to one of the unsuccessful candidates on that occasion—an act of thoughtful generosity for which the child's mother is deeply grateful.

**Strelitzia regina.**—From Mr. W. Read, gardener to Major-General Stanmore, Barton Fields, Canterbury, we have received a photograph of a remarkably fine specimen of Strelitzia regina that is under his charge. The development of the handsome leaves is quite exceptional, and the flower spikes, of which there are four, rise well above them. We regret that the photograph is not suitable for reproduction. Mr. Reed states that he is growing the specimen in a warm greenhouse, in which a temperature ranging from 50 to 55 degrees is maintained, and has given it liquid manure two or three times weekly.

**Twenty Thousand Lilacs for the International Exhibition.**—It is said that the nurserymen of the Aalsmeer district of Holland will be well represented at the forthcoming International Horticultural Exhibition, and that part of their exhibit will consist of 20,000 lilacs, which the Aalsmeer growers are adepts at raising and forcing.

**Carnation Conference.**—Under the auspices of the Perpetual-flowering Carnation Society, a conference will be held at the Royal Horticultural Hall, on Thursday, March 21, in conjunction with the society's exhibition. The conference will begin at 3.30 p.m., and Mr. J. S. Brunton will preside. Mr. F. Finch, Balls Park Gardens, Hertford, will lecture on "Cultivation of Perpetual-flowering Carnations for Amateurs"; and Mr. E. F. Hawes, the secretary of the society, will lecture on "Carnations as Bedding Plants." The conference will be open to all who visit the exhibition.

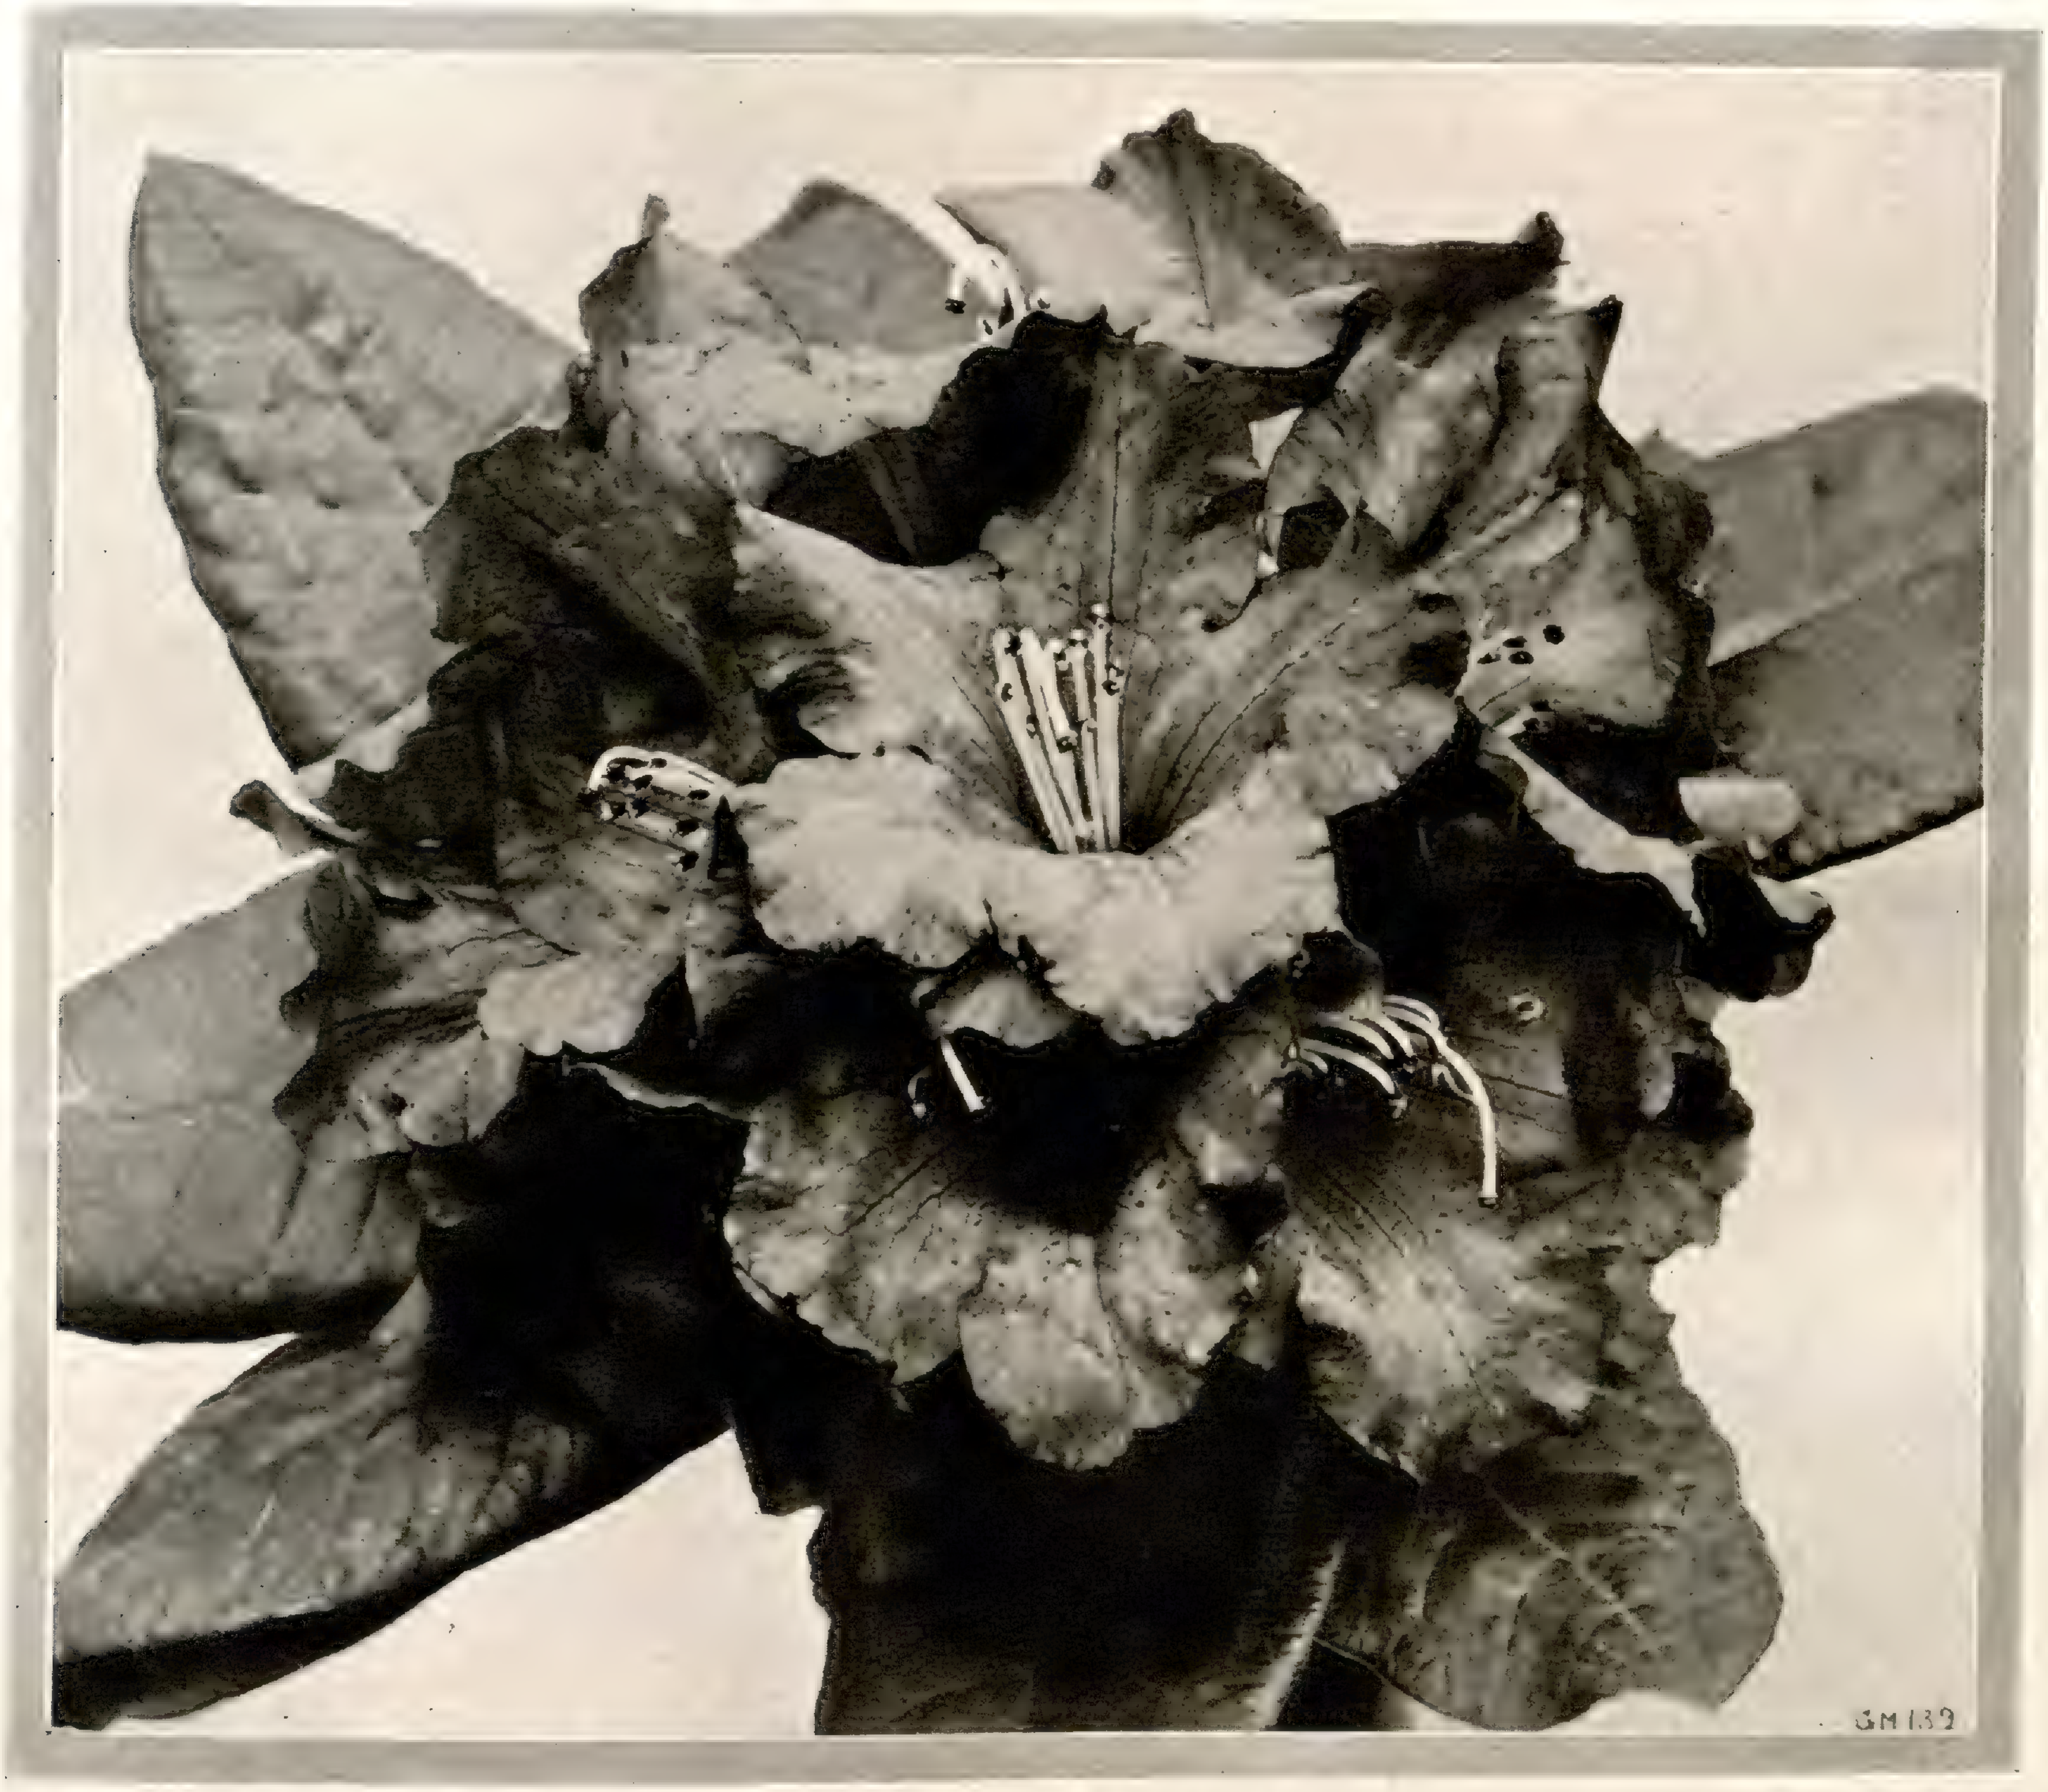
**Official Catalogue of Sweet Pea Names.**—The National Sweet Pea Society has just published its new Official Catalogue of Sweet Pea Names. This list has been brought quite up to date, and it serves to show the enormous number of names recorded for sweet peas. How many of these names are synonyms we do not know, but it would be very greatly to the interest of the sweet pea trade and popularity if the seedsmen and raisers would combine to find out, or place the matter unreservedly in the hands of the N.S.P.S. to settle. The new catalogue consists of thirty-one pages, is interleaved for notes; a copy is being presented free to everyone who newly joins the society this year; and other folks may have it, post free, from the hon. secretary, for the small sum of 7d.

**The Flora of Ireland.**—The other evening Dr. T. Johnson, F.L.S., lectured in the temporary lecture theatre of the Dublin Museum, on the native plants of Ireland. By means of lantern slides and specimens, he described the chief features of the flora, and the effect of the Ice Age on the flora of past ages. The Alpine, Atlantic, American, and other types of plants were dealt with, and sources of present-day additions to the flora mentioned. The flowering plants of Ireland, Dr. Johnson stated, are much the same as those of Great Britain, but smaller in number—about 1,000 out of 1,500. While one-sixth of the flowering plants in Great Britain have been found in the fossil state, the record for Ireland in this respect is almost a blank. It was suggested that there is a large field for investigation in the search for fossil plants of the Arctic type, and in the systematic survey of the extensive peat deposits of Ireland.

**Preservation of Finchampstead Ridges.**—The Finchampstead Ridges, forming part of the Bear Wood Estate, command fine views that extend into the three counties of Berks, Hants, and Surrey, and an effort is now being made by Berkshire residents to preserve this lovely spot for all time to the general public. A meeting has been called for March 8, at Wellington College Hotel, when a scheme will be presented, and the secretary of the National Trust will be present to render assistance.

**Sleep Movements in Plants.**—Professor W. Pfeffer, who has devoted considerable attention to the investigation of sleep movements in plants, has recently published a paper on the mechanical prevention of such movements. The most interesting result recorded in the paper is the discovery that the internal changes, on which sleep movements depend, continue their normal course even when the leaves are fixed so that they cannot execute the normal movements. Thus a plant fixed in the diurnal position will assume the night position if released at the right hour, and in the same way a plant fixed in the night position wakes if freed in the morning. Similar conclusions are drawn from the study of leaves not kept absolutely still, but so as to show very minute sleep movements.

**Extension of Wandsworth Common.**—The Wandsworth Borough Council have decided to contribute £3,000 towards the purchase of the twenty acres of land adjoining the Royal Patriotic Asylum, for the purpose of extending Wandsworth Common, provided the remainder of the sum necessary for the completion of the purchase be contributed by the London County Council, Battersea Borough Council, and the public.



RHODODENDRON CORNUBIA.
A handsome variety, with rich rosy-crimson flowers. A.M., R.H.S., March 5. Messrs. R. Gill and Sons, Falmouth.

**Potato Great Scot.**—In the notice accompanying the illustration of this new round potato, which appeared in our issue for February 27, we, by a slip of the pen, described it as having been introduced by Mr. J. W. Cross, instead of having been distributed by him. This variety, it may be mentioned, was raised by Mr. A. W. McAlister, of Dumfries.

**A Sweet Pea Society for Woking.**—A sweet pea society has been founded at Woking, Surrey, with the title of Woking and District Sweet Pea Society. It is proposed to hold a show early in July and to provide a number of open classes. Mr. L. C. B. Hockin and Mr. W. Hopkins, Westfield Gardens, are co-secretaries of this new venture.

## HORTICULTURAL EDUCATION.

(Concluded from page 192.)

With reference to the lines on which the studies of young gardeners should be conducted, it must be said that there is room for some difference of opinion. Not so long since a scientist, who is recognised as one of the leading authorities on educational matters, stated that much better progress might be made in the study of science with the aid of good books than by attending lectures. There may be something in that view of the case, but the best course is undoubtedly to attend a course of lectures on the subject that is being studied, and to work at the text-book during the intervals between the lectures. By taking this course the study will be less irksome, and the progress more rapid. Generally speaking, it will be wise for the young gardener, even when he enjoys the advantage of attending a course of lectures, not to take more than one subject at a time. If he does this, and devotes his spare time on two or three evenings each week to his studies, he will, at the end of two or three years, be in possession of an elementary knowledge of the sciences that are the most closely associated with garden management.

Those who are not so situated as to be able to attend lectures must be careful in the choice of their books, for if any serious mistake is made in the matter valuable time will be lost, and it may result in the abandonment of the study of the subject. The book must of necessity be sound, but it should also be of a more or less elementary character, for when the beginner commences, as is frequently the case, with an advanced text-book, he makes such slow progress, however strenuous may be his endeavour, that he becomes possessed of a feeling of hopelessness, and gives up the work in despair. The book should be of an elementary character, whatever may be the science with which it deals, for it will give a general view of the whole subject, a point of no small importance, and it will not be overburdened with terms difficult to remember and still more difficult to pronounce. By mastering the elementary work the student will have acquired sufficient knowledge to be of service to him, and if he is disposed to carry his studies further he will be able to do so without meeting with any great difficulties.

Considerable numbers of elementary books on the natural sciences have been published during the past twenty years, and, for the most part, they evince an immense improvement on those of older date. Especially is improvement evident in the elementary works on botany, of which there is a good range on my bookshelves. Among them is one that is especially adapted to the requirements of young gardeners who have to pursue their studies without the aid of lectures or class teaching. It is simple and inexpensive, two points of importance, and complete in itself. Yet it is sufficiently advanced to contain practically all that is necessary the gardener should know relating to the general morphology, the simple structure, and the physiology of plants. With its aid, and the free use of leaves, flowers, and other specimens that can be readily obtained in gardens, it will be possible for the student to become sufficiently acquainted with the various parts of plants, and with the botanical terms relating to them, within a year to be able to recognise and describe each one in scientific language. In like manner he will obtain a sound elementary knowledge of the leaf, root, and other organs. The book referred to is Liversedge's "Elementary Botany," published by Messrs. Blackie and Son at 1s. 6d. When this book has been mastered there are many excellent books of a more advanced character from which to select. Whether the young student carries his botanical studies further or not is a matter to be determined by himself; but it should be remembered that there are other subjects to be studied, and that the object of the writer is not to show how a gardener may become a botanist, but how he may acquire a knowledge of botany sufficient for his everyday requirements, and also to enable him to fully understand the scientific papers on botany that are constantly being published.

To advise on the study of geology by young gardeners is not quite so simple a matter as giving advice on the acquisition of botanical knowledge. It cannot be shown that geology is so closely related to the work of the garden as is botany, and the book has yet to be written which is especially adapted to the needs of the young gardener. There are plenty of good books on geological science, but for reasons that can be readily understood the information they contain is not directly associated with cultural methods. Yet an elementary knowledge of the crust of the earth is so useful that the study of geology as an essential part of the education of the young gardener can be strongly recommended. It not only greatly enlarges the breadth of view in relation to soils, but the study is most fascinating, and forms an admirable foundation on which to commence the study of soils with a view to the application of the information gained to practical purposes. The young gardener will do well to combine the study of elementary geology and physical geography, and he may be advised to select as his text books Sir A. Geikie's "Geology" and "Physical Geography," published by Messrs. Macmillan and Co. in their series of science primers at 1s. each. The first will tell the student what an intelligent man should know of the crust of the earth, and the other will enable him to more clearly understand how the various changes therein have been brought about, of special interest being the chapters on the air, the circulation of water on the land, and the origin and work of brooks and rivers. The lessons the books contain are, as for the most part, taken from the common phenomena of everyday experience, and the facts are so stated as to possess sufficient interest to hold the attention of the student. The most satisfactory progress in the use of these primers will be to study them section by section, and as each one has been studied to turn to the questions at the end of the book, and answer these without referring to the text, until all the answers have been carefully written out. The writing out of the answers will be of much value as a test of knowledge, and be useful as a mental exercise.

Much the same advice may be given with regard to chemistry as that relating to geology. It is not essential to proceed beyond the elementary stage, but it is desirable the gardener should know something about the constituents of air and water, and also be acquainted with the chemistry of the non-metallic elements and the metals, for such knowledge will be found of great practical value. There is no occasion to have a text-book that is costly or difficult to master. Sir H. G. Roscoe's "Chemistry," belonging to the series of science primers already mentioned, will suffice for obtaining a general knowledge of the subject. Those who desire to at once proceed to the study of those fungi and insects injurious to the occupants of the garden will do well to use Mr. T. W. Sanders' "Garden Foes," published at the GARDENERS' MAGAZINE office at 2s. 6d. net, and study it thoroughly.

Not only should the young gardener study the sciences to which reference has been made, but he should give sufficient attention to the practice of writing to enable him to write legibly and clearly. Generally speaking, the writing as taught in English schools is indifferent, and the age at which boys usually leave school renders it impossible to teach them composition. Legible writing and good composition will not enable gardeners to grow plants and crops to a higher degree of perfection, but they will afford them material assistance in obtaining good positions among their fellows. A well-written letter produces a favourable impression at all times, and when a gardener is making an application for a fresh position, the importance of being able to produce an impression that will be favourable to him will be freely acknowledged. The writer would like to say much more upon this point, but the limits of space have been reached. G.

---

**Grape Culture.**—An illustrated guide to the culture and management of vines in greenhouses and in the open air is published at GARDENERS' MAGAZINE Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.). Full particulars are also given as to renovating old vines, and the best varieties to grow.

## ROYAL HORTICULTURAL SOCIETY.

### SCIENTIFIC COMMITTEE.

MARCH 5.

DISEASED TULIPS.—Mr. Massee reported that the tulips referred to him at the last meeting making poor growth and showing brown spots on the foliage and brown flecks in the tissues of the stem had been attacked by the fungus Botrytis cinerea, which had apparently infected the foliage from the air in the first place, not from sclerotia in the soil, as is frequently the case.

DISA SAGITTALIS. — Messrs. Veitch showed this species from S. Africa under the name D. caulescens, to which it is allied. It received a Botanical Certificate in 1890. Messrs. Veitch also showed a malformed Cypripedium Fairrieanum, in which the scape was almost entirely suppressed.

GALLS ON OAK.—Mr. Aldersey sent a branch of oak having roundish swellings of considerable size at intervals along the branches. A fungus, Dichlæna quenina, was probably the cause of these growths, which occur with considerable frequency on young oaks, but rarely upon old ones.

GRAPES KILLED BY FOG.—Some small flowering shoots of grapes were sent to illustrate the damage done by London fogs, which had caused the growths to turn quite brown and shrivel.

NARCISSUS CALATHINUS × MINIMUS. —Mr. Chapman showed a hybrid between these two species having the unusual character, which it shares with N. Triandrus pulchellus, of a corona paler than the perianth pieces, the difference being quite evident. A Certificate of Appreciation was unanimously voted to Mr. Chapman in recognition of his work in raising this hybrid.

MALFORMED NARCISSUS.—Sir F. W. Moore sent a flower of a narcissus somewhat of the incomparabilis form, though not quite agreeing in come characters, having the perianth tube split half-way down between the segments, and an evident difference in colour between the inner and outer pieces. The outer perianth pieces had no corona, but the inner ones had, so that the flower bore a superficial likeness to an iris. The stamens were six, three rising from the top, three from near the base of the tube. The plant produced this type of flower every year. Mr. Bowles remarked that he had seen a similar form in Mr. Polman Mooy's garden, which was also constant. In that case the plant was a bicolor trumpet, and had three pale perianth segments, three strap-shaped strips of corona bent down upon them, three petaloid anthers standing upright. In this case, since the petaloid stamens alternated with the three perianth pieces, the outer perianth pieces were apparently wanting.

PRIMULA KNUTHIANA. — Messrs. J. Veitch showed a primula which had been identified at Kew as P. Knuthiana of Pax, but which was a much finer flower than that figured by Pax in his monograph under that name. It had been raised from seed sent home by Messrs. Veitch's collector, Mr. Purdom, and was much like the form of P. farinosa grown in gardens under the erroneous name of P. frondosa. It was, however, distinct from that plant. The committee expressed a wish to see further seedlings of this plant.

AMYGDALUS × PRÆCOX. — Messrs. Veitch sent flowering branches of Amygdalus × præcox, raised by crossing Amygdalus persica magnifica with A. Davidiana alba. The hybrid had pink flowers like A. persica, but of about the size of A. Davidiana, and retained the early-flowering habit of Davidiana.

DOUBLE HYACINTH. — An uncommon double form of hyacinth, like those figured in old herbals, was sent by Mrs. Rooper. It had been purchased under the name of Italian Hyacinth.

## NEW PLANTS, ETC.

### CORYLOPSIS MULTIFLORA.

This species has long been known to science, and it was described by the late Mr. G. Nicholson in the "Dictionary of Gardening" in 1885, who, however, stated it was not yet introduced to cultivation. It is a Chinese shrub, and promises to be an attractive addition to early-flowering subjects. The flowers appear before the leaves; they are small, yellowish-green, and borne in pendulous catkin-like racemes with considerable freedom. An illustration appeared in our issue of March 9. A.M., R.H.S., March 5. Miss Willmott, V.M.H. (gardener, Mr. C. R. Fielder), Warley Place, Great Warley.

### AZALEA BLUSHING BRIDE.

A beautiful semi-double variety of Azalea indica, and one that seems sure to become popular, owing to the delicate, clear blush-pink colouring of its fine blooms. In habit of growth and freedom of flowering it compares favourably with the finest cultivated forms. A.M., R.H.S., March 5. Messrs. James Veitch and Sons, Chelsea.

### PTERIS PARKERI.

A fine new seedling Pteris with erect, deep green fronds, the pinnæ being quite broad for this family and of stout texture. This should prove very serviceable and popular for decorations and for production for market. A.M., R.H.S., March 5. Mr. J. J. Parker, Rose Nursery, Whetstone.

### RHODODENDRON CORNUBIA.

A very handsome rhododendron of the Himalayan group, bearing fine trusses of large deep rosy-crimson flowers of great beauty and effectiveness. The parentage is given as R. Shilsoni and R. arboreum. A.M., R.H.S., March 5. Messrs. R. Gill and Son, Falmouth.

### ODONTOGLOSSUM JASPER.

An attractive odontoglossum obtained by crossing a spotted variety of O. crispum with O. amabile. The flowers are of good shape, soft pink, freely spotted with bright red-brown. A.M., R.H.S., March 5. J. S. Moss, Esq., Wintershill, Bishop's Waltham (gardener, Mr. Kench).

### DENDROBIUM GOLDEN RAY SUPERBUM.

This is a very fine form of the showy hybrid between D. Othello Colmanæ and D. signatum aureum. The shapely and large flowers are deep yellow, each segment shading to deep purplish-rose at the tip, while the lip is intense purple and yellow, with maroon centre. A.M., R.H.S., March 5. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

### ACIPHYLLA LATIFOLIA.

A stately herbaceous plant, growing from 4ft. to 7ft. high, the stem being about four inches thick at the base; the leaves are leathery, twice pinnatisect, and the small purple flowers are borne in large quantities in compound umbels. This plant is a native of the Auckland and Campbell Islands, and it has been introduced to British gardens by Captain A. A. Dorien Smith. It first flowered in this country at Tresco Abbey, Isle of Scilly.—"Bot. Mag.," t. 8,407.

### RHODODENDRON SPINULIFERUM.

This striking rhododendron was introduced to European collections by Mons. Maurice de Vilmorin, who raised plants from seeds sent him by Ducloux in 1907. The species first flowered under cultivation at Les Barres in 1910. The narrow tubular flowers much resemble those of R. Keysi, but the colour is bright red. Unfortunately this bright-flowered shrub is not fully hardy in this country, but it deserves cool house protection.—"Bot. Mag.," t. 8,408.

### SYMBEGONIA FULVO-VILLOSA.

In this interesting New Guinean plant the segments of the perianth are united in the female flowers, but free in the male flowers. The foliage is begonia-like, and the species is more or less herbaceous; it grows about six inches high, is easily propagated by cuttings, and succeeds in an intermediate house. The female flowers are yellowish, campanulate, and erect.—"Bot. Mag.," t. 8,409.

### PITCAIRNIA TABULÆFORMIS.

In this lowly, stemless, Mexican Bromeliad the white-bordered leaves form a large spreading rosette, from the centre of which rises a cone-like inflorescence, bearing a number of yellow and orange flowers that appear among green and creamy-white bracts.—"Bot. Mag.," t. 8,410.

### PRUNUS SARGENTI.

A beautiful Japanese cherry that has reached Kew by way of the Arnold Arboretum. The species becomes a large tree, is quite hardy, bears bright rose-coloured flowers in great profusion, and is handsome in autumn, when its leaves assume a rich red colour. In the Arnold Arboretum the tree fruits freely, bearing small black cherries in June, but in this country it does not fruit freely.—"Bot. Mag.," t. 8,411.

AZALEA INDICA BLUSHING BRIDE.

This beautiful Indian azalea has large semi-double flowers of a lovely blush-pink shade. A.M., R.H.S., March 5. Messrs. James Veitch and Sons, Chelsea.

**Cyclamen.**—Notable features of the present-day race of cyclamen compared with the old strain, are the wide range of colour that now prevails, the size of the blooms, and the strange shapes that occur among the members of the papilio and fringed sections. The old-time strains were remarkable for the symmetrical shape of the blossoms, a feature that is not to be found at all in the fringed or papilio race, while even the grandiflora race does not, in some cases at least, produce blossoms as symmetrically shaped as of old. The beautiful colours among the varieties of to-day are, however, most striking, some of the salmon-scarlet tints appealing perhaps more to one than any of the others.—W. T.

## VINE BORDERS.

Some forty or fifty years ago vine borders were wholly outside the vinery in many gardens, not always because it was thought they were thus in the best position, but because it was the fashion to grow grapes in conjunction with other subjects, such as pineapples, figs, and mixed plants. Sometimes the vines were turned outside during the winter and protected with hay bands until the time came again to start them into growth. The houses were so constructed that an inside border was an impossibility. After this came a combination of inside and outside borders, but gradually grape growers have some to the conclusion that an inside border is wholly the best where high-class grapes are required.

With the roots in a limited area inside we hear of fewer failures to produce the finest grapes, and, on the whole, a greater immunity from such troubles as shanking in such varieties as Black Hamburgh, a variety more prone to this defect than any other. Some persons still cling to the idea of an outside, or partly outside, border, but it should not be difficult to explain why an inside border is preferable. For instance, the roots are under control, stimulants can be more directly applied, and with greater efficacy, either for the benefit of the foliage, the wood, or the bunches. In an inside border the roots are in a much more equable temperature than when the border is in the open and exposed to repeated weather fluctuations.

At one time the outside borders were protected during the winter with boards, tarpaulins, leaves, and straw, and even some were thatched. Under such a covering the soil was prevented from obtaining the slightest warmth from the sun until the borders were uncovered in May, sometimes earlier. All this protection, entailing much cost and labour, is, happily, dispensed with when the border is wholly inside. Even a combination of inside and outside borders is not equal to one wholly inside. I cannot see why a portion of the roots should be exposed to all external weather variations, and the remainder so efficiently protected. This combination of rooting space is, I know, a favourite method among many successful growers. Personally, I do not now advocate this dual principle, but advise a border wholly inside, with proper safeguards as to drainage and situation.

From the manner in which vine borders are made, it is a fair conclusion to arrive at that there are many good methods. Some borders are four feet deep, with little or no drainage or concrete; the roots are allowed to ramble away at will, and many records of shanked grapes are noted, and many ill-coloured and otherwise unsatisfactory bunches have to be recorded. At the same time the growers see better results from vines differently situated, yet do not grasp the reason of their own failure, nor attempt to reason the matter out for themselves, and so often blame their predecessor for his want of knowledge! In a properly-constructed border, with a suitable elevation, a rooting space of two feet six inches is ample for the production of the finest grapes. It is not the extra bulk of soil that is the principal factor in the growth of the vines and their produce, because so much depends upon how the vines are fed, and how the growth is produced.

In some situations vines will succeed in the ordinary soil without any addition. In such a case, however, there must be natural drainage of a satisfactory character, with a warm subsoil, such as a sandy gravel would provide, certainly not a stiff clay. In making a cheap vine border the local surroundings as to soil have to be taken into consideration, and even if these be naturally favourable the addition of freshly-cut turf, lime rubble, wood ashes, and a small quantity of quarter-inch bones will be an advantage. An elaborate preparation is not a necessity even where local circumstances are not favourable as to soil. The great point is to have a rooting medium of a porous character to enable the water to pass quickly away. Vines enjoy copious supplies of moisture at the roots, but it should pass quickly away after wetting every portion of the border. To remain longer is only to produce stagnation about the roots, and that is all against a healthy condition, inducing shanking of the berries, mildew (if other attributes are favourable to this fungus), a defection in colour, and a general want of that robustness of foliage and growth without which success cannot follow. Firm soil is also an important point in achieving success, as a loose rooting medium does not conduce to firm, short-jointed growth. Maturity of the wood is a great factor in success. The soil should not, however, be made firm when in a wet state—clogging of the water pores would result, and the soil would be in a condition anything but favourable to the free development of the roots, which, it need hardly be said, is essential to the healthy growth of the vines.

It is a mistake to make the border complete at once; far better make it piecemeal, giving the vines the added benefit of new soil yearly until completion. Drainage is an important point in making a new border. A great quantity is not a necessity, and a 6in. depth of broken bricks properly laid, and protected from the admission of fine soil, which is apt to choke the passage of water, will suffice. For this latter purpose nothing is better than freshly-cut turf laid grassy side downwards. There are many other points in this interesting subject I would like to draw the attention of Gardeners' Magazine readers to, but fear I have already trespassed far enough, and the remainder must, perforce, wait a more favourable opportunity.

E. Molyneux.

Swanmore Park.

## RARE SNOWDROPS.

A curious, yet pretty snowdrop is that named Galanthus virescens, or the Green Snowdrop. It is a form of G. nivalis, our common snowdrop, and its history is a little obscure, as all we know of its introduction is that it was grown by Professor Fenzl in the Vienna Botanical Gardens, and that some bulbs were obtained there by the late Max Leichtlin, by whom it was distributed. Both the late Rev. Harpur Crewe and the late Mr. James Allen received it from him, and it was from the latter that I obtained the original bulb which was the beginning of my small clump. It is not a snowdrop which increases rapidly, and in the considerable number of years I have cultivated it, G. virescens has multiplied but little. It is thus a plant which requires some care and consideration if we are to prevent this variety, which would almost appear to be a survival of the original snowdrop, from becoming as extinct as the dodo. Curiously enough, the double green snowdrop —a very singular flower indeed—is quite as slow of increase, and is even more likely to become one of the vanished flowers.

On the face of it, a green-flowered snowdrop cannot be expected to be an attractive flower, yet it is one which grows greatly upon one's affections.

It is, in shape and general appearance, like the ordinary G. nivalis, but the exterior of the outer segments is striped and clouded with green towards the base and over a considerable portion of the remainder, while the interior ones are all green, with the exception of a narrow margin of white. It is a distinct flower, indeed, and we find it more appreciated in our gardens as we grow better acquainted with it. It is later flowering than G. nivalis commonly is.

G. virescens does not reproduce itself true from seeds, as has been proved by several snowdrop lovers who have seeded it, and is increased by means of offsets. It requires no special soil, and it is only necessary to be careful that the bulbs are not destroyed in winter before the blooms appear, or later, after the leaves have died down.

Galanthus Warei, which I once had, but lost during my removal to my present home, seems to be now very scarce, and some bulbs I procured from an Italian source did not give flowers of the character of G. Warei, as I obtained it first through the kindness of Mr. W. B. Boyd, who procured it from Mr. T. S. Ware under the name of G. Scharloki. I have been sorry to be without this snowdrop, although it does not differ much, if anything, from certain seedlings of G. Scharloki, some of which have not the divided spathe of that variety, although it has a good deal of the green exterior markings of the latter. The interior segments in G. Warei have, however, the markings of larger size. Authorities are of opinion that it must have been derived from Scharlok's form of G. nivalis, but no one has been able to clear up the point, which is, however, of little consequence, save to the student of botanical characters. It was never a vigorous plant with me.

S. Arnott.

## CASSIA CORYMBOSA.

Of the many species of cassia introduced into this country, the only one in general cultivation is C. corymbosa, and as a decorative plant it is the best of them all, for it is alike useful as a bedding plant or for furnishing the conservatory during the dull months of autumn. When used as a pot plant, it is much better to root the cuttings in spring and grow them to a single stem. If old plants that have been wintered in a cellar or shed are introduced into a warm house they will soon make side shoots from the dormant buds, and when these have attained a length of three or four inches they should be taken off with a heel attached, and inserted singly in 3in. pots, which have been filled with light sandy soil. If the pots are plunged in a hotbed where a temperature of from 70 to 75 degrees can be maintained, the cuttings will soon root, and when the pots have become filled, the plants should have a shift into pots a couple of sizes larger. After potting return them to the hotbed until established in the new soil, and afterwards they may be hardened off by standing them in a cold frame early in May.

Care, however, will be needed to see they do not suffer from a sudden change of temperature; the lights should be kept closed for a few days, so as to gradually accustom them to their new quarters, and when the weather becomes favourable, which will be about the beginning of June, they may be fully exposed to the open air. By this time the pots will be filled with roots, so that the plants will be ready for their final shift into 32's. When again potted select a sunny position that is sheltered from the winds, and here the pots should be plunged to their rims, where they can remain until housed in the autumn, by which time, if due attention has been paid them, they ought to be from two to three feet high, clothed to the top with bright green foliage, and the upper portion carrying several racemes of clear yellow flowers.

Cassia corymbosa was at one time treated as a stove plant, but lately it has been much employed for bedding, and I have seen it in bloom most profusely until quite late in the autumn. When planted in a sheltered position and the weather has been mild, I have cut fine flowering sprays from the open borders as late as the middle of November. For bedding old plants are preferable, as these bloom much earlier in the season than young ones. In some places in the southern counties, where the soil is warm and the situation sheltered, the plants will withstand the slight frosts experienced, but such positions are by no means general, and only on two or three occasions have I been able to keep the plants through the winter without lifting. Our plan was to lift the plants in the autumn to prepare the beds for spring bedding, and then they were stored away in a dry place where frost could be excluded. If we were desirous of increasing the stock of strong plants the shoots were cut off at the time of lifting and inserted in pots and placed in a gentle heat; here they soon pushed forth young growths which were taken off and rooted in the ordinary way, and by spring these were ready for their final shift, so that at planting out time they were a couple of feet high.

This cassia is very accommodating, and will put up with a lot of rough usage, but on the other hand, if liberally treated it will well repay for the care and trouble bestowed. As a plant for covering the wall of a conservatory or as a pillar plant it is most useful, especially as it retains its foliage and flowers through the winter.

H. C. Prinsep.

## STAPHYLEA COLCHICA.

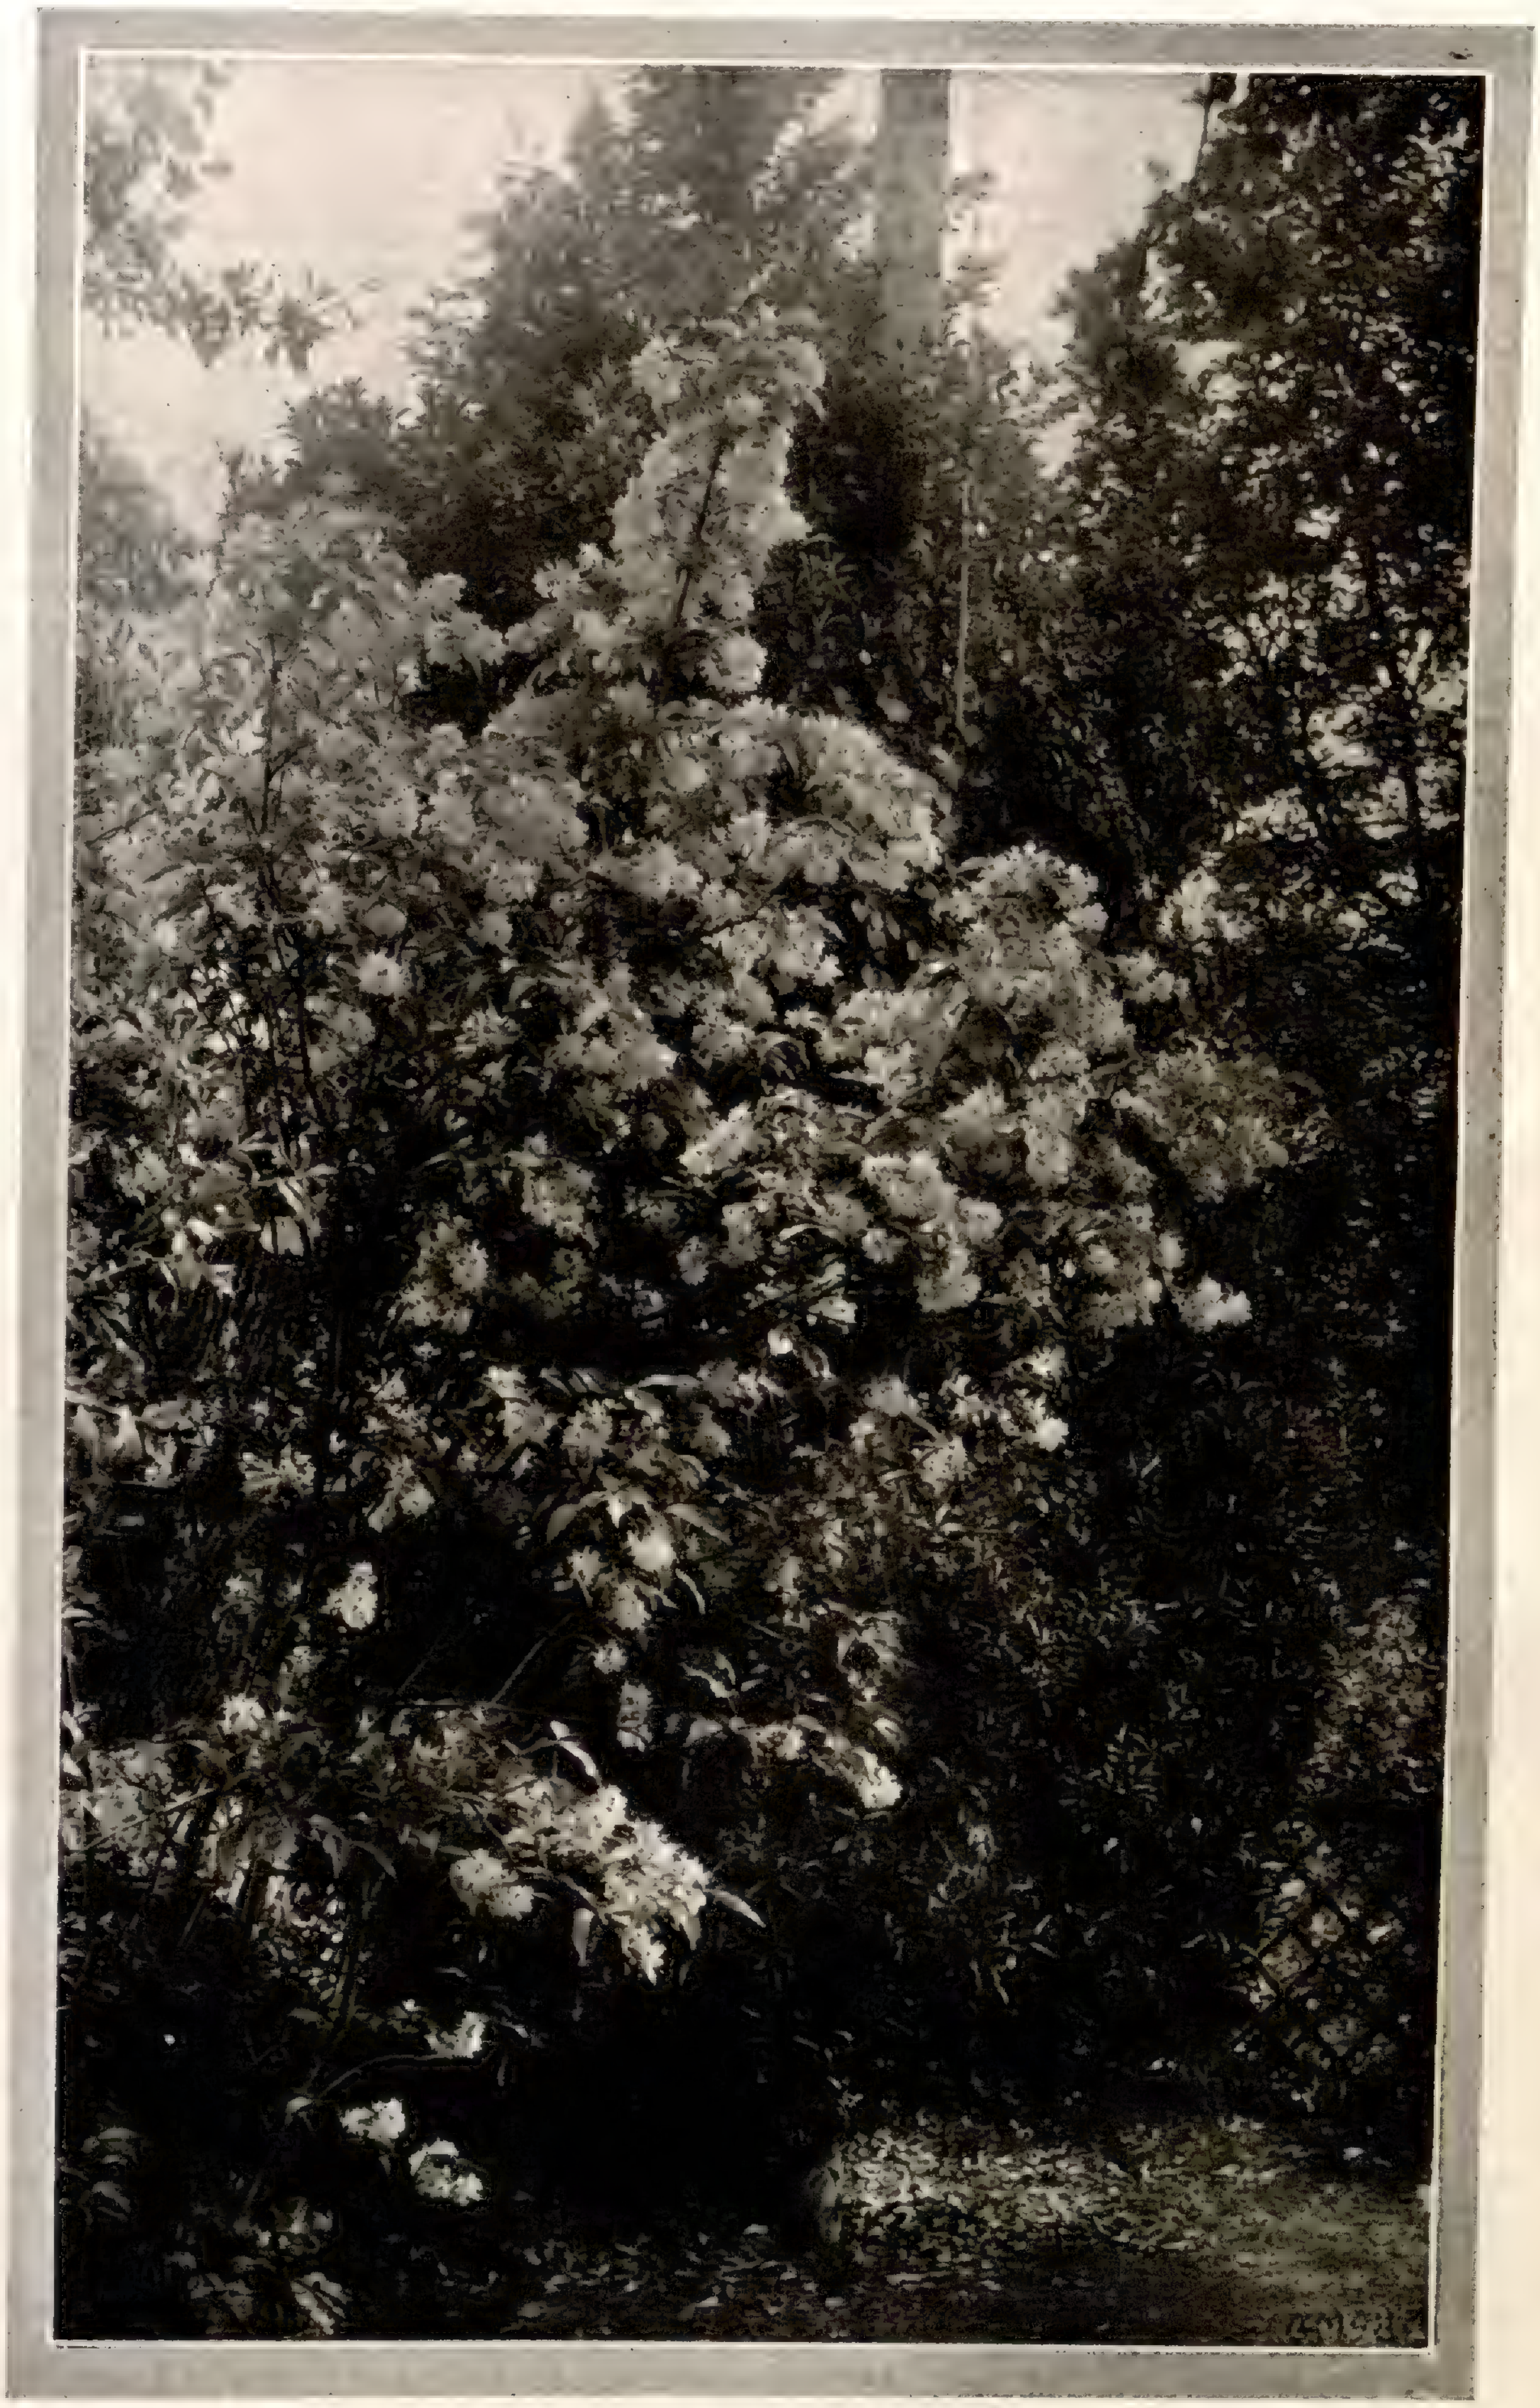
This beautiful flowering shrub is very lovely in the garden during the summer, specimens 20ft. or so in height being covered with large, drooping panicles of pure white flowers with yellow anthers, not unlike orange blossoms, and sweetly scented. About five-and-twenty years ago a correspondent, writing to one of the leading horticultural papers on this shrub, which he evidently knew only as a pot plant, opined that it was probably not free-flowering when grown in the open. In this he was fortunately mistaken. This staphylea is by far the handsomest of the family, the best known of the other members being the North American S. trifolia and the European S. pinnata, know respectively as the Bladder Nut and St. Anthony's Nut Tree. S. colchica is a native of the Caucasus, and thus perfectly hardy, bears pinnate leaves, and thrives in the full sun or in partial shade.

As a forcing subject it is decidedly the best of all deciduous shrubs, as it may be had in bloom, with a modicum of trouble, from Christmas onward, and as the tender green leaves of forced specimens unfold at the same time that the flowers expand the effect is charming. It responds readily to artificial heat, and when placed in a warm house kept moist the flowers open rapidly. Plants may be lifted from the open in the autumn as soon as the leaves fall, potted and forced, but the more preferable plan is to grow plants for forcing entirely in pots. Pot plants carefully treated will improve year by year, and produce a quantity of flower, the panicles being borne on the young wood of the preceding year, and also on the spurs of the old wood. When the plants have passed out of bloom they should be pruned back to a plump bud and encouraged to make strong growth in gentle heat, so that strong buds may be obtained. If the soil is exhausted the plants are taken out of their pots just as they are breaking into growth after being pruned, the soil picked away from the roots, and the plants repotted in fresh soil in the same sized pots, or in one size larger. After forcing they must be kept under glass until all danger of frost is past, for the forced foliage is very tender, and will not bear exposure until hardened off. Through the summer and autumn the plants should be plunged in the open, so that the wood may become thoroughly ripened, and care must be taken that they do not want for water.

Propagation is effected by cuttings of ripened wood eight inches in length inserted in a cold frame in September, by layers, or suckers having a few roots, the last being the most successful method. It may also be raised from seed sown in a sheltered position in the open in September or October. Increase is sometimes effected by grafting on S. pinnata.

When planted out this staphylea is a very rapid grower, a pot plant two feet in height, planted in good soil in the open, attaining a height of 8ft. in five years. The specimen shown in the accompanying illustration was put out from a pot four years before the photograph was taken. In S. pinnata the pendulous, white flower panicles are composed of individual blooms which are considerably smaller in size and lack the spreading petals of the flowers of S. colchica.

Wyndham Fitzherbert.



A FINE EXAMPLE OF STAPHYLEA COLCHICA.
Flowers white, in drooping panicles.

## ILEX INTEGRA.

The number of varieties of Ilex aquifolium and I. platyphylla is so large, and the different kinds are so varied in character, that they usually provide a sufficient amount of variation for the person whose sole object is decorative effect; those people, however, who are interested in more than the purely ornamental aspect of a particular plant, and make an effort to furnish their gardens with rare and out-of-the-way subjects, may, with a little trouble and expense, collect together an extremely interesting set of hollies (Ilex species), which are quite as decorative in appearance as many of the well-known forms of the common holly.

Of this number the Chinese and Japanese I. integra is one of the least known, although it is not of recent introduction. Growing in Japan and China to a height of from 30ft. to 40ft., it is said to be a favourite subject for garden decoration. Here it is of pyramidal outline, with dark green ovate leaves up to 4in. in length. The leaves differ from those of most hollies by being spineless; in fact, it is only now and then that a leaf can be found with a broken margin, and then its serration is very slight. White flowers appear in May, which are followed, on female plants, by bright red fruits, which may be about the size of those of the common holly, or considerably larger. As is the case with I. aquifolium, a yellow-fruited variety has been recorded. This has been called leucoclada; it does not, however, appear to be in cultivation. I. integra thrives under much the same conditions as the other hollies.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, writen for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

# A DISEASE OF SWEET PEAS, ETC.

(Concluded from page 207.)

### Symptoms of the Disease in Orchids.

I have only observed the disease on cultivated species of cypripedium, of which abundant material was sent to Kew, and it was stated to be present on most of the plants occupying a large house. The roots are attacked first, then the bases of the leaves, which gradually become brown and finally assume the condition of a soft rot, when the whole plant falls over. The snow-white Milowia fruit was produced in abundance when the decayed portions were placed under favourable conditions for its growth. It was in all probability the spores of this condition of the fungus that spread the disease from one plant to another in the house, the minute spores being dispersed by wind, syringing, etc.

### Preventive Measures.

It is practically impossible to cure a plant that is once infected, as the mycelium is located in the living tissues of the root, and no substance is known that will check or kill such mycelium, without at the same time killing or materially injuring the host-plant. Hence the only means of checking the onslaught of the fungus is by the adoption of preventive measures. The majority of cases of disease are obviously due to infected land. No evidence of the presence of spores on peas or other seeds is forthcoming, and would not be expected to occur, when it is remembered that the fungus, as a parasite, confines itself to the root and collar of the stem. Infection of the soil may be brought about by various means. When a diseased crop is grown, the roots in most instances become thoroughly decayed, and too friable to remove even if an attempt was made to do so. It is on such decayed roots that the Torula or resting-spore stage of the fungus grows, consequently the soil becomes infected, and even if a crop of some kind is afterwards grown that the fungus cannot attack, it finds host-plants in the various kinds of weeds growing along with the crop. In addition, when it is remembered that the fungus can pass through its complete course of development as a pure saprophyte, feeding on the humus present in the soil, it will be readily understood that, when land is once infected, the fungus is quite capable of holding its ground, and of quickly extending its area of devastation, unless prompt measures are taken. The infection of a new area is in the majority of instances due to the use of manure, on which material the fungus flourishes and reproduces itself at a very rapid rate.

Commercial formalin (= 40 per cent. formaldehyde) has proved to be the most effective fungicide for sterilising infected soil. In the United States, where Thielavia proves very destructive in causing a root-rot of tobacco seedlings, the soil of the seed-beds is thoroughly soaked with a solution of formalin in water, in the proportion of one pint of formalin to twelve gallons of water. One gallon of the mixture should be allowed for each square foot of the surface. After the watering is completed the soil should be covered for two or three days with coarse sacking or canvas, to keep in the fumes. The watering should be done after all digging has been done and when the seed beds are in a condition ready for sowing, and a week or ten days should intervene between the soaking of the soil and the sowing of seed, to allow for the complete escape of the formalin fumes and for the drying of the soil.

When green manure is dug into land intended for seed beds it should previously be thoroughly watered with formalin as advised above.

Professor Benincasa has quite recently conducted a series of experiments as to the best means of checking root-rot of tobacco in seed beds. Having proved that infected soil is the usual source of injury, and that heating such soil to a temperature of 90 deg. C. does not completely eradicate the disease, comparative tests were made by using ordinary garden soil, pure sand, and volcanic ash or pumice for seed beds. The plants grown in garden soil were badly infected, seed beds of sand proved very efficient in controlling the disease, volcanic ash gave the best results of all, both in arresting the disease, and in the rapid and vigorous growth of the seedlings. This result is partly due to the absence of humus, which favours the continuous growth of the fungus in soil containing organic matter, and also to the physical conditions of such soil.

The author suggests the use of coal ashes, volcanic scoria, or naturally or artificially powdered volcanic rocks, as suitable for the formation of seed beds.

---

# FANCY PERPETUAL FLOWERING CARNATIONS.

From the princess down to the factory girl all womankind, more or less, are the slaves of fashion. This is not restricted solely to the adornment of their person. Fashions in flowers are almost as changeable as fashions in hats or hatpins. Yet it is the beautiful which survives or reappears.

It was considered proper until quite recently to admire only flowers of self colours, particularly so in such florists' flowers as roses, carnations, chrysanthemums, etc. But fashions change, and so to-day a carnation can be beautiful which possesses more than one colour, and this, of course, is as it should be.

For as long as carnations have been popular with the people, so long have fancy varieties of certain markings been held in the highest esteem. The old Painted Lady class in border carnation is represented in perpetual varieties, in later years, by that fine old variety Prosperity, which is, perhaps, best described as a white overlaid pink, and no one who has seen a perfect flower of this old favourite can deny its beauty. Since the days of Prosperity we have had lots of varieties which have aspired to the position it once held. Purity and clearness of colour, however, which the majority lack, are quite as important to a fancy as to a self. To-day we have a worthy representative of this beautiful class of carnation flower in Mrs. Tatton. This is one of those varieties which has never received the attention it deserves, and is not found in quite half the catalogues. Yet it is one of the best varieties yet raised in Great Britain. Its superiority over any other variety with similar markings, such as Lucille, Conquest, Apple Blossom, etc., will be quickly recognised by anyone who has grown them all under the same conditions as I have.

Then we have in all classes of carnations those lovely fancy varieties, white, marked pink or red. Old Alice Tyers, in the borders, long maintained its popularity, and Mrs. Bradt, in the perpetual section, was popular for years in America, being supplanted by Mrs. M. A. Patten, which was very popular with the florists in its day. Jessica and Bay State, one white, flaked pink, the other white, flaked red, had a brief reign, but both lacked freedom. This season we have Wivelsfield Wonder, a white, flaked pink, which is a seedling from Mrs. Bradt, and has been voted the best in this scheme of colouring. Benora, a white, flaked red, is coming from America, and promises well.

Now we are obtaining quite a number of yellow ground or fancy yellow varieties in the perpetual flowering carnation section. Canary Bird, yellow, flaked pink, of American origin, is perhaps the best of these; while there is also Orpheus, yellow, pencilled carmine and white. This season brings with it Sunstar, yellow, with pale pink and white markings, which promises to be popular.

When we think of fancy carnations we group with them heliotropes, but surely Mikado should be grouped as a self colour. However, we will deal with this new and delightful group here.

Mikado was the forerunner, and mainly through its good qualities this new colour has become popular with practically all associated with the flower. We now have heliotrope selfs and fancies. Of the latter Salome and La Mode are the principals, and their extent of beauty is purely a matter of taste. But even the florists use this class of flower, so that there can be no doubt as to their future. Geisha is an aspirant which has undoubtedly gained greater popularity in a short time than any similar variety, and this is well deserved. The flowers have excellent form, and are of a delightfully light shade. It has, like all heliotropes, an underlying colour, which is more prominent in the young flowers. The new Fairmount is undoubtedly the most serious rival Mikado has, it being superior in almost every respect. The colour is more solid, and has a perfect French grey finish. The flowers are larger, and the habit of growth more robust. So we see the selection in this new class of colour in perpetuals is being rapidly extended.

The purple carnation does not appeal to all, yet it undoubtedly has its place, and, mixed with other colours, such as white or yellow, gives an unique effect, while under artificial light they are superior to crimsons, assuming a gloriously rich claret shade. Vinca and Royal Purple are the best representatives of this class. The latter variety is generally considered the best. The colour is more free from magenta, and the habit of growth much freer.

There are other fancy varieties, such as Mrs. T. M. Crook, Helen M. Gould, Imperial, etc., which are distinct from all others, and have their respective charms which appeal to many.

Marmion and Lady Audley Neeld rival each other for superiority, and are generally grouped as perpetual flowering Malmaisons. The massiveness of their flowers and the decisiveness of the marking give an unique effect. The general description is white, overlaid cherry-red. However, this, or, indeed, any description, cannot convey to the reader the colour and effect of a fancy flower. Marmion undoubtedly produces the finer flowers, and Lady Audley Neeld has a better habit of growth.

From the foregoing it will be seen how in quite a few years the number of fancy varieties has increased, and still others, such as the new Mandarin and Elektra, which are practically terra-cotta fancies, promise to add to this already large list, which would not exist if there was not a market for them.

The effect at a distance is the supreme test of a fancy variety—whether that effect is muggy or clear and attractive. Too many are only examined closely, the distant effect being ignored, which renders them useless for decorative work, but some varieties look more beautiful at a distance or under artificial light.

Montagu C. Allwood.

## OUTDOOR PEACHES.

Some regard the peach as the king of fruits, and, though other fruits may equal it, most will admit that none beats it when it is at its best. To obtain it in this condition, however, entails more labour and attention than the growing of any other hardy fruit, except, of course, the closely-allied nectarine; but some may say that its superiority to a well-ripened gage plum is not sufficiently marked—if, indeed, it exists at all—to repay the extra attention required. The lengthened period of protection from frost which is necessary owing to the earliness of its flowering, the incessant struggle with aphis, the disbudding of the shoots, and the thinning of the fruits, with the annual taking down of the whole tree from the wall, and replacing it, to say nothing of the renewal of the soil and necessary surface feeding, constitute a formidable list of operations, some of which scarcely exist, or only in a very modified degree, with most other hardy fruits.

### Winter Pruning.

Let us begin with the operation which is either the beginning or the end of the year's routine, according to the system adopted, that of the winter pruning, as it is usually called. Some defer this till the blossom buds are getting almost ready to burst in March, keeping the trees unnailed and tied away from the wall, so that they shall not be hastened into flowering by the radiation of the sun's heat. It is doubtful if the gain by this method outweighs the advantages of doing the work in September, or as soon after as the fruit is gathered. For one thing, there is less work to do at the latter season, but the principal recommendation of autumn pruning is that by cutting out the old wood at that season the young wood has the maximum benefit from the autumn sunshine, while the wounds heal up more quickly then than at any other time, and so the risk of gumming is lessened.

The retarding of flowering by tying the tree away from the wall is probably less than a week at best, and as preparations have to be made for protecting the blossom in any case, there does not seem to be much gain. Of course, no one should nail up peaches with shreds, for not only is there the trouble of detaching the branches from the wall at some time between September and March, but the shreds harbour insect pests.

### Pests.

Aphis is the great trouble in peach growing, masses of curled leaves past all hope of cure being only too familiar to all. The delay of syringing until it is seen that the leaves are beginning to curl is perhaps the prime mistake of the amateur, and even of the professional gardener sometimes. If the blossom is carefully examined aphis will be found among it, and, as soon as ever the blossom has been fertilised, even before it is obviously set, the tree should be syringed, there being still nothing more harmless and more effective than the old-fashioned mixture of soft soap and quassia chips. Peach foliage is very sensitive, and, it may be added, rather erratic or fickle, and petroleum and soft soap emulsion, however well made, will sometimes cause injury. If the tree is sprayed twice in the first week or ten days after flowering, and then once a fortnight until midsummer, the occasional evening syringing with clear water, which peach trees should always receive, will probably keep them clean for the rest of the summer, though the tree must always be kept under careful observation. Some recommend giving peaches the first spraying before the blossoms open, and then, after the foliage begins to expand, syringe with plain water every evening, in addition to the periodical spraying with insecticide.

### Disbudding.

The work of disbudding the shoots and thinning the fruits should not be done all at one time, but spread over two or three weeks, or even longer, especially in the case of the former, as no shock is then given to the tree, and the energy set free by the removal of useless shoots is gradually transferred to those which are to form next year's fruiting wood, while better opportunity is given to select the best shoots for the purpose.

A preliminary thinning of the fruits should be made as soon as they are becoming visible, taking off all the badly placed ones and some of those which are thickly placed together, and leaving the major part of the thinning till it can be seen which are going to take the lead, though even then it should not be all done, as there are various possibilities of injury to the young fruits, besides the probable loss of some during the stoning process.

### Watering and Feeding.

If the old soil over the roots within three or four feet of the stem was removed during the previous autumn or winter, and some fresh rich soil, with plenty of bone-meal in it, put in its place, the trees will scarcely need any help during the stoning period, assuming the soil has a sufficiency of lime, or has been well dressed with basic slag, mortar rubble, etc. If the season is a dry one, the trees should have a good soaking occasionally with plain water, as the peach is a wilding in growth, and has the fondness of the willow for water so long as it is not stagnant.

When the stoning period is drawing to an end, and the fruits are seen to be increasing in size, it is time to begin feeding, always remembering to soak the soil thoroughly wth clear water first. A dressing of rich guano is one of the best things to apply, six or eight ounces to the square yard being used and well watered in. If one of the highly concentrated artificial fertilisers is used, a quarter of a pound to the square yard would be as much as it would be safe to apply, and this should be given in two doses, with an interval of a fortnight between them. Feeding and watering should alike cease when the fruits begin to show signs of ripening, for not only may the manure impair the flavour, but a wet soil, by excluding air from the roots, and in other ways, may produce the same effect. A fairly dry soil at the time of ripening appears to be necessary if the finest flavour is to be obtained.

### Gathering the Fruit.

This is a little art in itself. Some put a net under the tree to catch the falling fruits, but few should fall if they are properly looked after. When the earliest fruits are getting ripe each should be gently tried by touching it with the fingers at the back so that if it leaves the branch it may lightly drop into the open palm. This should be done alternate days in very hot weather, or every three days at the most. Fruits are sometimes pushed off the branch by their own swelling, but more often by earwigs, woodlice, ants, etc., eating the fruit just against the stalk. This is especially the case when a wall needs pointing, ants sometimes beginning to eat the fruit when it is the size of a wood nut. Holes in an old wall should be stopped up with cement, a job which can be done by any handy man without that damage to all surrounding objects which often results from the employment of a builder's man.

People sometimes speak of peaches and other stone fruits as being of such superior quality when eaten direct from the tree, but this is at least open to question. If peaches are laid carefully on a dish as picked, in a single layer, and kept for a day, or even for two or three days, when they are not dead ripe at the time of picking, the flavour is decidedly improved, the ripening process, which is a preliminary to decay, continuing after the fruits have left the tree. **Alger Petts.**

## BORDER AURICULAS.

There are three well-marked groups of auriculas—namely, show, alpine, and border varieties—and to those who do not possess the necessary appliances for the cultivation of the first two, the latter will be most useful. The auriculas which are listed under the heading of border varieties are highly appreciated for the fragrance and bright colouring of their blossoms. Beautiful effects are obtained in the spring by massing them in beds, either in separate colours or mixed.

Raising a batch of plants from seeds is an interesting proceeding, and at the same time a very simple one. Like all the other members of the Primula family, the seeds of auriculas germinate best when sown as soon as they are ripe; but when seeds have to be purchased, the most suitable time for sowing them is during the second half of March or early in April. Pots or pans should be filled with a mixture of two-thirds loam, one-third leaf soil, and a small quantity of sand. Sow the seeds thinly, and cover them lightly with the soil, affording them a gentle watering, and placing them in a frame to germinate. To prevent a too rapid evaporation, a piece of glass must be placed over the receptacles, and this should be shaded with paper. Immediately germination is noticed, remove the glass and paper, and shade the frame lightly. The seedlings appear very irregularly, and often slowly, therefore it is advisable to retain the seed pans for some time after the first comers have been transplanted. Seed boxes are used for the purpose of transplanting, and the young plants nursed along for a time in the frame.

When the seedlings attain fair size, they are best transferred to open nursery beds, where they will be allowed to bloom. The idea of flowering the plants in nursery beds for the first time is that it allows the cultivator to weed out all the undesirables, and to make a selection of those considered the finest varieties. The folowing season the selected ones should be planted in their frame shelter until early in spring.

When a good strain has been selected, and the plants become large, propagation may be effected by division, and a good time to divide is in the spring, when flowering is over, and the plants are lifted from the beds to make room for other subjects. A fairly shaded and moist situation should be selected for their summer quarters, and the divided portions put out about nine inches apart. When a good strain has been selected, it is a good plan to save seeds and sow them as soon as they are ripe. Usually the seeds ripen in July, and consequently the young plants raised from them are small for wintering in open beds, therefore it is advisable to provide them with frame shelter until early in spring.

For town gardens the border auriculas are amongst the most useful of plants. Fogs and soot seem to have no effect on them; in fact, they thrive in the smoke-laden atmosphere.

Gnaton Gardens. **E. C. Pooley.**

## JAPANESE ANEMONES.

The varieties of Anemone japonica have been so greatly increased within the past ten or twelve years that they form a group of considerable importance among the hardy herbaceous plants, and one of much value for contributing to the charm and interest of the flower garden during the latter part of the summer season. They are equally attractive arranged in lawn groups and in bold masses in the mixed border, the latter being the best place for them when the garden is of limited dimensions. They are especially desirable in the flower garden of the country house, as they are usually at their best when the owners turn from the gaieties of town life to the quiet pleasures that the country is so well able to afford, and usually entertain their friends. The Japanese anemones are also most useful for the supply of cut bloom at a season when really choice flowers are none too plentiful.

The typical Japanese anemone (A. japonica) possesses much beauty, although hardly equal in richness of colour to some of the newer rose-coloured forms. It has the advantage of being vigorous in growth and free in blooming; the colour of the flowers may be best described as pale rose. The pure white variety, known as A. japonica alba, is so highly meritorious that it should be grown wherever the charms of the Japanese anemones are fully appreciated. It has a bold habit, and produces its large salver-shaped pure white flowers with remarkable freedom. The recently introduced Lady Ardilaun also has pure white single flowers, and can be strongly recommended. Whirlwind, now generally known, has large semi-double white flowers, and is useful both for its effectiveness in the garden and the adaptability of the flowers to various floral arrangement in a cut state.

The most beautiful of the varieties with flowers other than white are the type which has been already mentioned. Elegantissima, semi-double, light pink; Mont Rose, dwarf in growth, and bearing large semi-double rose-pink flowers; Prince Heinrich, a distinct variety, with semi-double crimson flowers; and Queen Charlotte, a beautiful variety, the flowers large, semi-double, and of a soft pink hue.

All the Japanese anemones here mentioned are equally suitable for the formation of lawn groups and for association with other hardy perennials in the mixed border. When grown in beds it is an advantage to associate with them one of the lilies that bloom early in the summer to prolong the attractiveness of the group. Lilium Hansoni, one of the finest of the free-growing lilies, is especially suitable for associating with these anemones, for it carries its flowers well above the foliage of the anemones, and when they have lost their beauty the stems can be cut back to a level with the foliage of the latter. Moderate-sized groups present in the borders the most attractive appearance.

These anemones will thrive in any good garden soil to which a liberal addition of manure has been made. Late in the autumn is perhaps the best time to plant, but if pot plants are obtained they can be planted now with the full assurance of success. The chief point in the cultivation of these flowers is to allow them to remain undisturbed for as long a period as they continue to make a strong growth and bloom freely.

A FINELY-FLOWERED GROUP OF ANEMONE JAPONICA ALBA.

## SPRING IN THE SHADY GARDEN.

As though to compensate for a lack of summer splendour there are innumerable ways in which spring is to be made beautiful in the shady portions of the garden, and one especially noteworthy fact is the ease with which plants can be lifted from the open ground, and placed in shadowed beds and borders when about to bloom. This applies to almost all bulbous plants; if we take up hyacinths, tulips, narcissi, daffodils, scillas of most species, anemones, chionodoxa, and crocuses, with a sufficient depth of unbroken soil on the same spade, and drop them into specially prepared holes, they will not suffer the slightest check, even if the buds are colouring. Wallflowers that are not veterans may be moved from place to place in the same manner, and a belt of the bright gold, or a group of the vivid red, will quite transform a cold, dreary-looking border into a gay one.

A simple expedient for having a fine spring show in shade is to cultivate numbers of bulbous and other spring plants in oblong, round, or square tubs or boxes; these can be planted precisely as though they were beds, and kept sunk in sunny ground all winter, mulched over with three or four inches of dry stable manure. When the plants are attractive by reason of foliage, and within some weeks of flowering, the receptacles should be disinterred and sunk in the garden of shade. When a leaf-mould and loam mulch, or one of cocoanut-fibre refuse, is laid over the soil, there will be nothing to reveal the fact that the plants have not come to maturity there. Dwarf brown wallflowers, carpeted by Scilla siberica, double red tulips with an undergrowth of myosotis, or Eastern Queen wallflower, above mauve arabis, prove very successful. The tubs need not be ornamented, as they are sunk, but if the wood is painted inside and out it will last much longer. By having an extra supply of these tubs, and growing plants in half of them for a summer display, sinking these in the place of the spring ones as soon as the early flowering plants fade, a lovely constant adornment for a usually bare part of the garden is gained. Pinks and snapdragons make an excellent combination; not only will the flowers quickly succeed the early favourites, but the antirrhinums will continue until winter, while the foliage of the pinks remains decorative. For positions of special importance, such as sunless front gardens, autumn tubs might well be prepared also; dwarf Michaelmas daisies and chrysanthemums, montbretias, pansies, and Sedum spectabile are most suitable subjects.

Masses of white foxgloves are among the fairest things that a shady border can contain in the earliest summer, or latest spring, but few gardeners realise the stately charm of a lawn or front garden bed of these flowers. An edge of gold or mauve pansies or violas can be recommended. Then all the forms of Campanula latifolia flourish without sun, giving blue or white columns of bloom, while the tufted evergreen foliage is of value throughout the entire year. Alternate white campanulas and coloured foxgloves look well, but for an earlier display white columbines should be chosen.

A large bed of aquilegias, from prize mixed seed, proves one of extreme interest and beauty early in the year; it can safely be carpeted, or broadly edged, with mixed pansies or violas, as all the lines harmonise, a fact that should be remembered by those who are choosing seeds for sowing under glass. Crimson bedding pansies are most meritorious in shade, because they provide the rich warm colour that is always lacking. Then the whole family of the primrose, including polyanthuses, oxlips, and the lovely long-stemmed cowslips, can be congregated in shaded soil; even the delicate double white and other primroses will flourish if planted in interstices of low rockwork.

One of the prettiest spring displays in a suburban front garden is a centre rockery mound covered only with yellow primroses and blue, white, and pink forms of Scilla nutans; this is an instance of how the simplest ordinary blossoms attain importance when represented in sufficient quantity by themselves.

A small grass plot can be turned into a fair spring display, even if shadowed, by outlining it, except where an entrance is left, by a two-feet wide stretch of rockery, and introducing spring-blooming bulbous and perennial subjects into this; for colour in summer a variety of begonias and dwarf asters can be introduced, without the perpetual early plants receiving an injury.

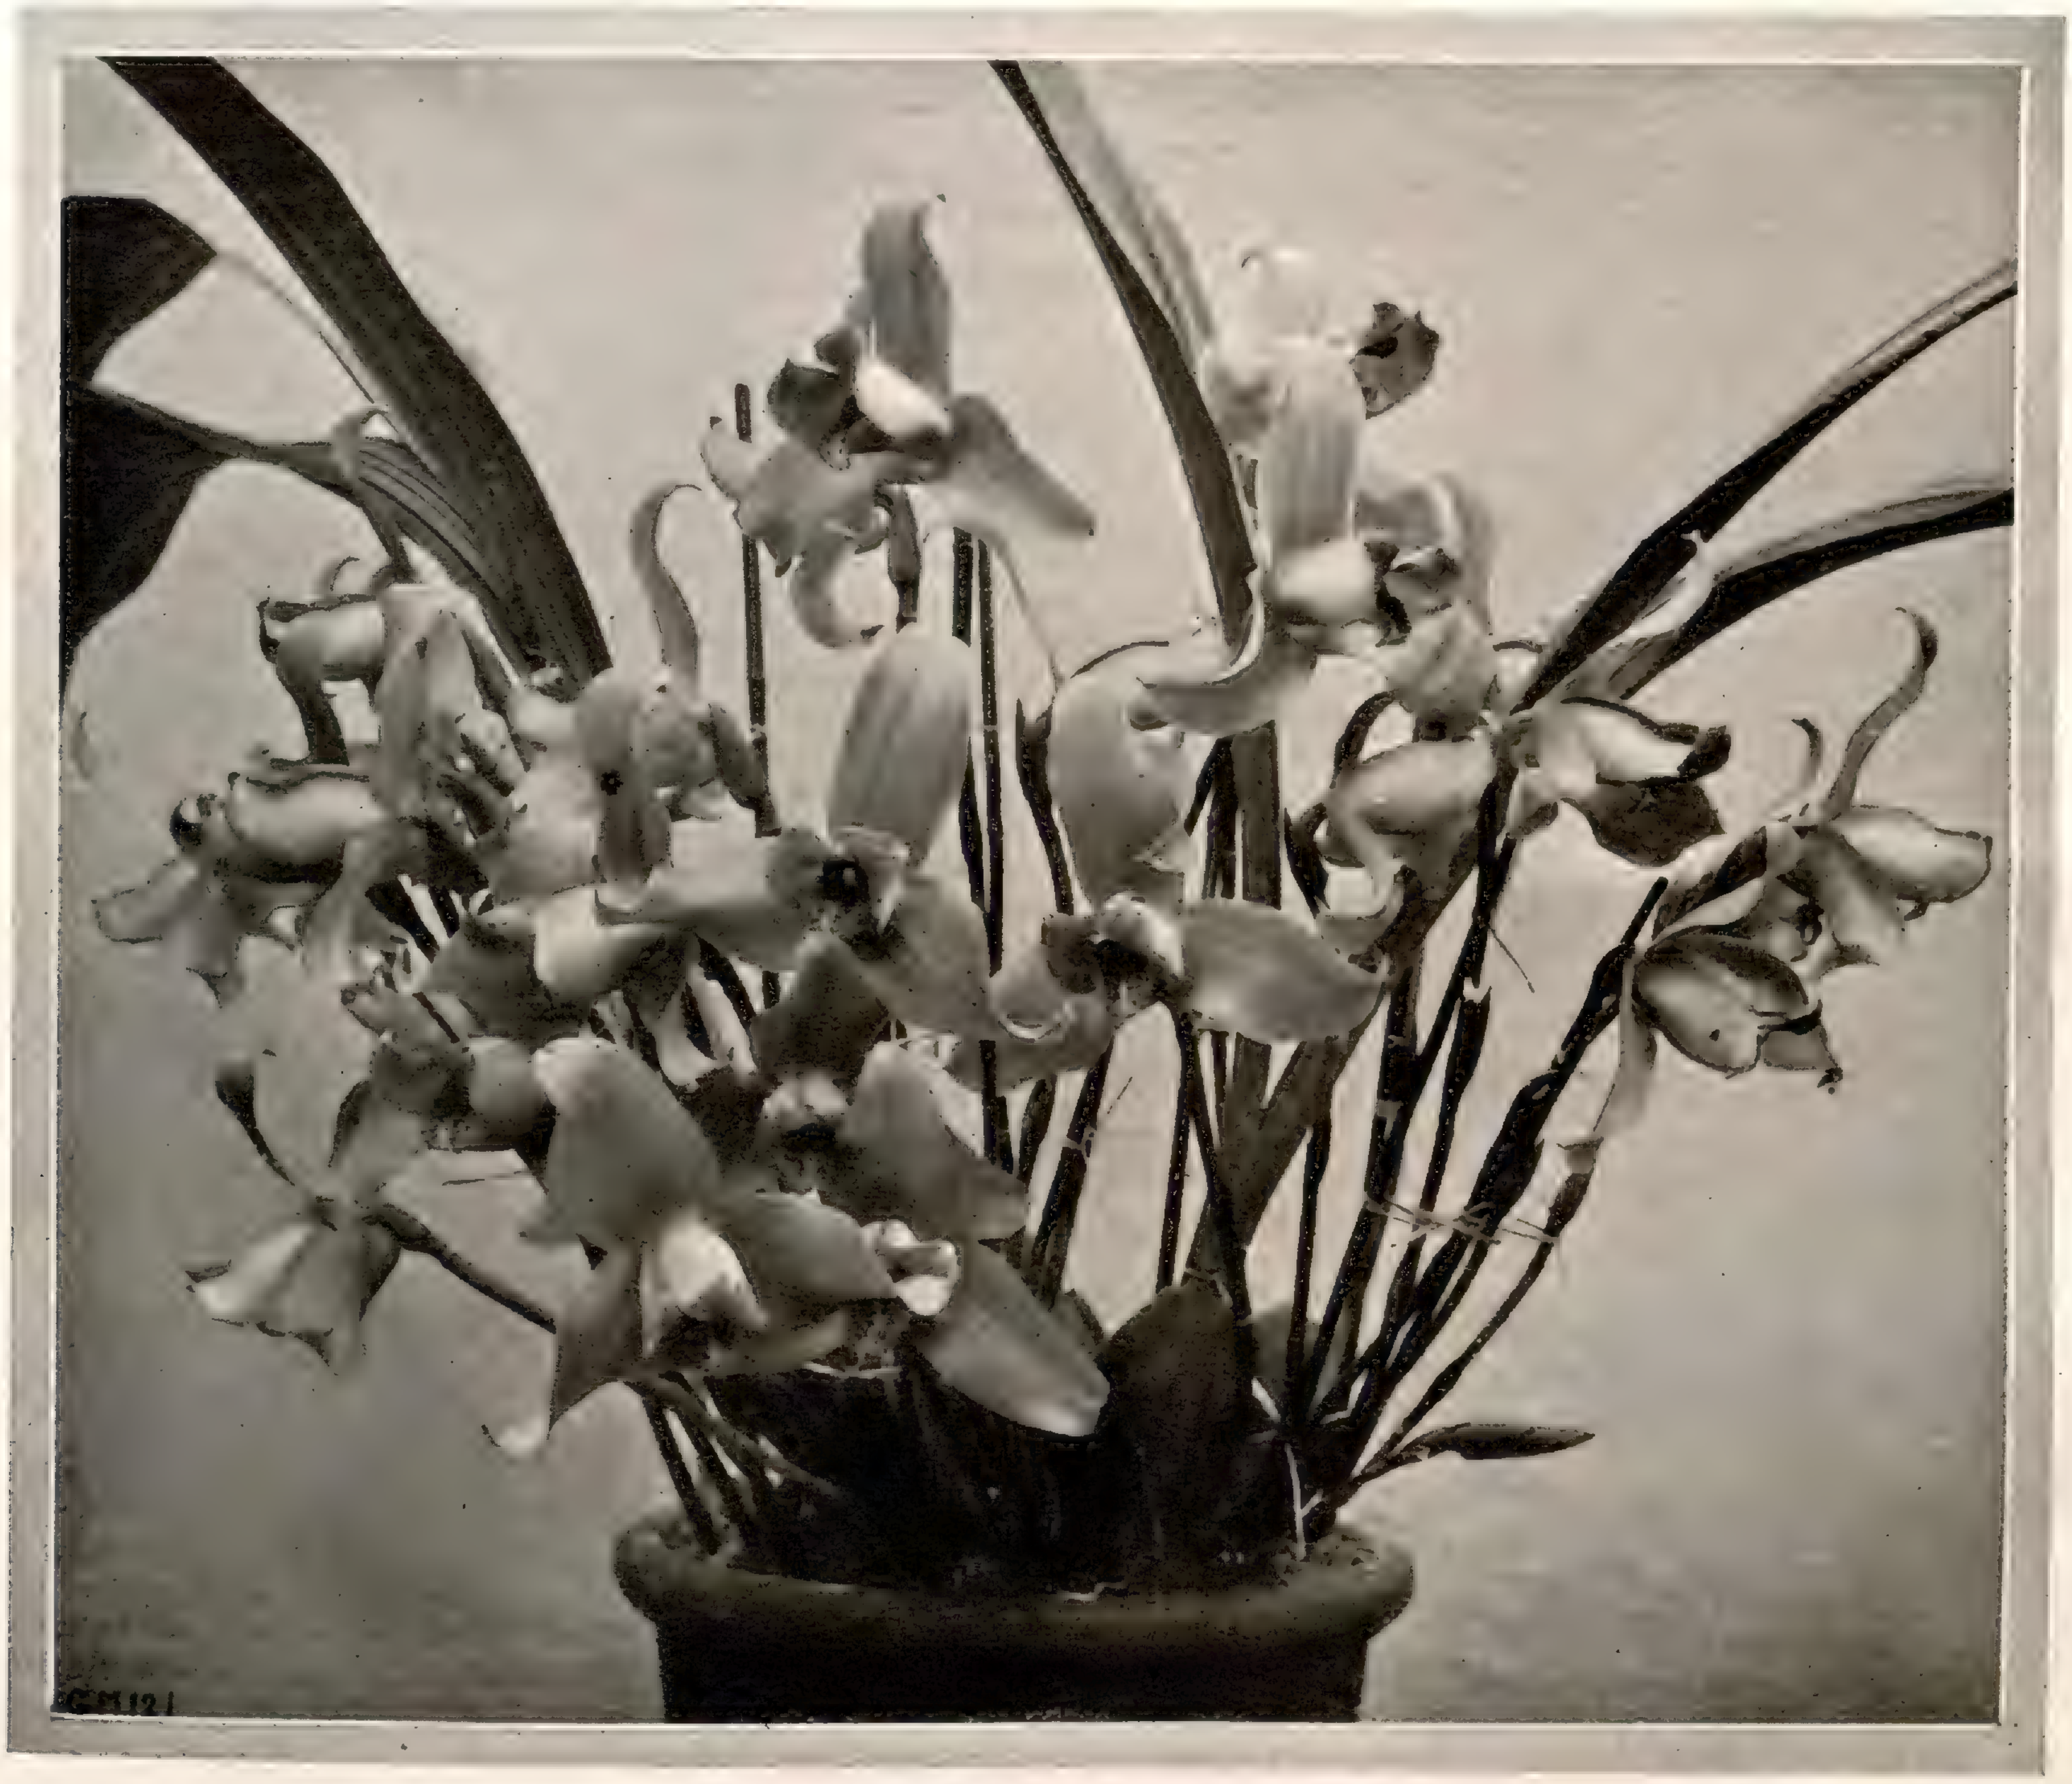
M. H.

## LYCASTE BALLIÆ.

Nearly nine years ago the writer, discussing L. Balliæ, stated, "Not only is it beautiful, but it is easily managed in an intermediate house, or the warm end of a greenhouse, and as it does not take up a great deal of space when its leaves fall, it is just the sort of plant for an amateur's limited collection." These remarks have been amply justified in recent years, and further evidence of the attractiveness and freedom of this hybrid lycaste was seen at a recent meeting of the Royal Horticultural Society, when Mr. Thorne, gardener to Mrs. Joicey, Sunningdale Park, Sunningdale, exhibited the specimen figured in the present issue. This fine example of skilful management carried thirty flowers, and was greatly admired by the many visitors interested in orchids who were present at the meeting.

Lycaste Balliæ is the result of crossing L. macrophylla with L. Skinneri, and as the cross has been made on several occasions, and as L. Skinneri shows so much variation, it follows that L. Balliæ varies somewhat in colour. This variation has led to the use of several names, such as L. Charlesworthi, L. Cappei, L. Mary Gratrix, and L. schœnbrunnensis. Generally the petals of L. Balliæ are reddish-rose, spotted with deep red; the sepals soft reddish-rose, and lip cream coloured, marked with blood-red.

C.



LYCASTE BALLIÆ.
A fine hybrid between L. macrophylla and L. Skinneri, with rose-red flowers. This specimen carried 30 flowers, and was exhibited by Mr. Thorne, gardener to Mrs. Joicey, Sunningdale Park, Sunningdale.

# When and How to Spray Fruit Trees and Reasons Why.

Year by year the spraying of fruit trees gets to be a more general operation, and it is not too much to say that in the future it will become part of the cultural routine, just the same as pruning and other work. That this is coming is indicated by the fact that the people who already take the most trouble over spraying and spend the most money on it are the commercial growers who are dependent on their fruit for a livelihood. They, in short, realise the necessity of the operation, as they are far too shrewd to spend time and money on it if there was no return; and when commercial growers lead the way, amateurs, farmers, and others who grow as a side line are sure to follow, though many of the latter may be slow to make a start.

I am afraid there are a good many people who spray fruit trees in a rule of thumb kind of way, because someone has told them that it is a good thing, but without having any clear ideas of their own as to why they do it or what they expect to get as the result. This sort of thing is wrong; it is like shooting without aiming, and to spray intelligently and successfully one should have some knowledge of the diseases and the life histories of the insect foes that the spraying is intended to check or eradicate. How can this knowledge be obtained? Partly from books, and fortunately there is plenty of cheap and reliable literature in the market that the practical grower can make use of, and the knowledge can partly be secured by observation. We talk about nature study in schools, but, bless me, we want more nature study out of schools and amongst adults. The ignorance that still prevails amongst practical growers in respect of insect life is appalling, and the habit of including all the common pests under the comprehensive and meaningless heading of "blight" is far too common. If you know the tactics of your enemy you are half way on the road towards defeating him; but there are many people who still look upon "blight" as being inevitable, and if they fight it at all they do so blindly, but without taking any trouble to find out what it really is, where it comes from, and how it multiplies.

What, then, are the objects of spraying? First, to cleanse; to keep the stems and branches of trees free from lichen growths and other harbours of insect life. Is this cleanliness necessary? Look into an old West Country orchard and see the branches of the trees simply fringed with lichen. Note the sickly nature of the growth, take stock of the fruit that is produced, and you have the answer to the question. Secondly, we spray with an object of preventing the development of insects from an egg to a living and feeding stage, and if a means could only be found for doing this quite effectually, a good deal of time and money might be saved. Thirdly, spraying is done to kill insects while they are actually engaged in their work of destruction, and this has to be done when preventive measures fail. Lastly, all the enemies of the fruit grower are not animate, but they take the form of fungoid diseases of a destructive nature, and these not infrequently present greater difficulties in eradication than living insects.

Quite a host of people are engaged in feeding practical growers with material for spraying. First, there is the scientist, who makes a study of insects and diseases, and suggests remedies; secondly, there are the manufacturing chemists who have flooded the market with insecticides and fungicides to save the grower trouble and make business for themselves; and thirdly there is the appliance maker, and to his credit it must be said of him that he has turned out spraying machines of a reliable character, from the big motor-driven plant to the knapsack which the operator carries on his back. But, in spite of these opposing forces, Nature protects her own, and, as insects and diseases continue to multiply, growers have to arm and protect their interests.

We talk of winter spraying and summer spraying, the former being done when trees are dormant, and the latter when they are in growth; but it would be rather more correct to speak of the former as spring spraying because it is mostly done in March, before growth commences, and its effects are naturally preventive and somewhat speculative, as it is carried out in anticipation of trouble.

## The Objects of Spring Spraying.

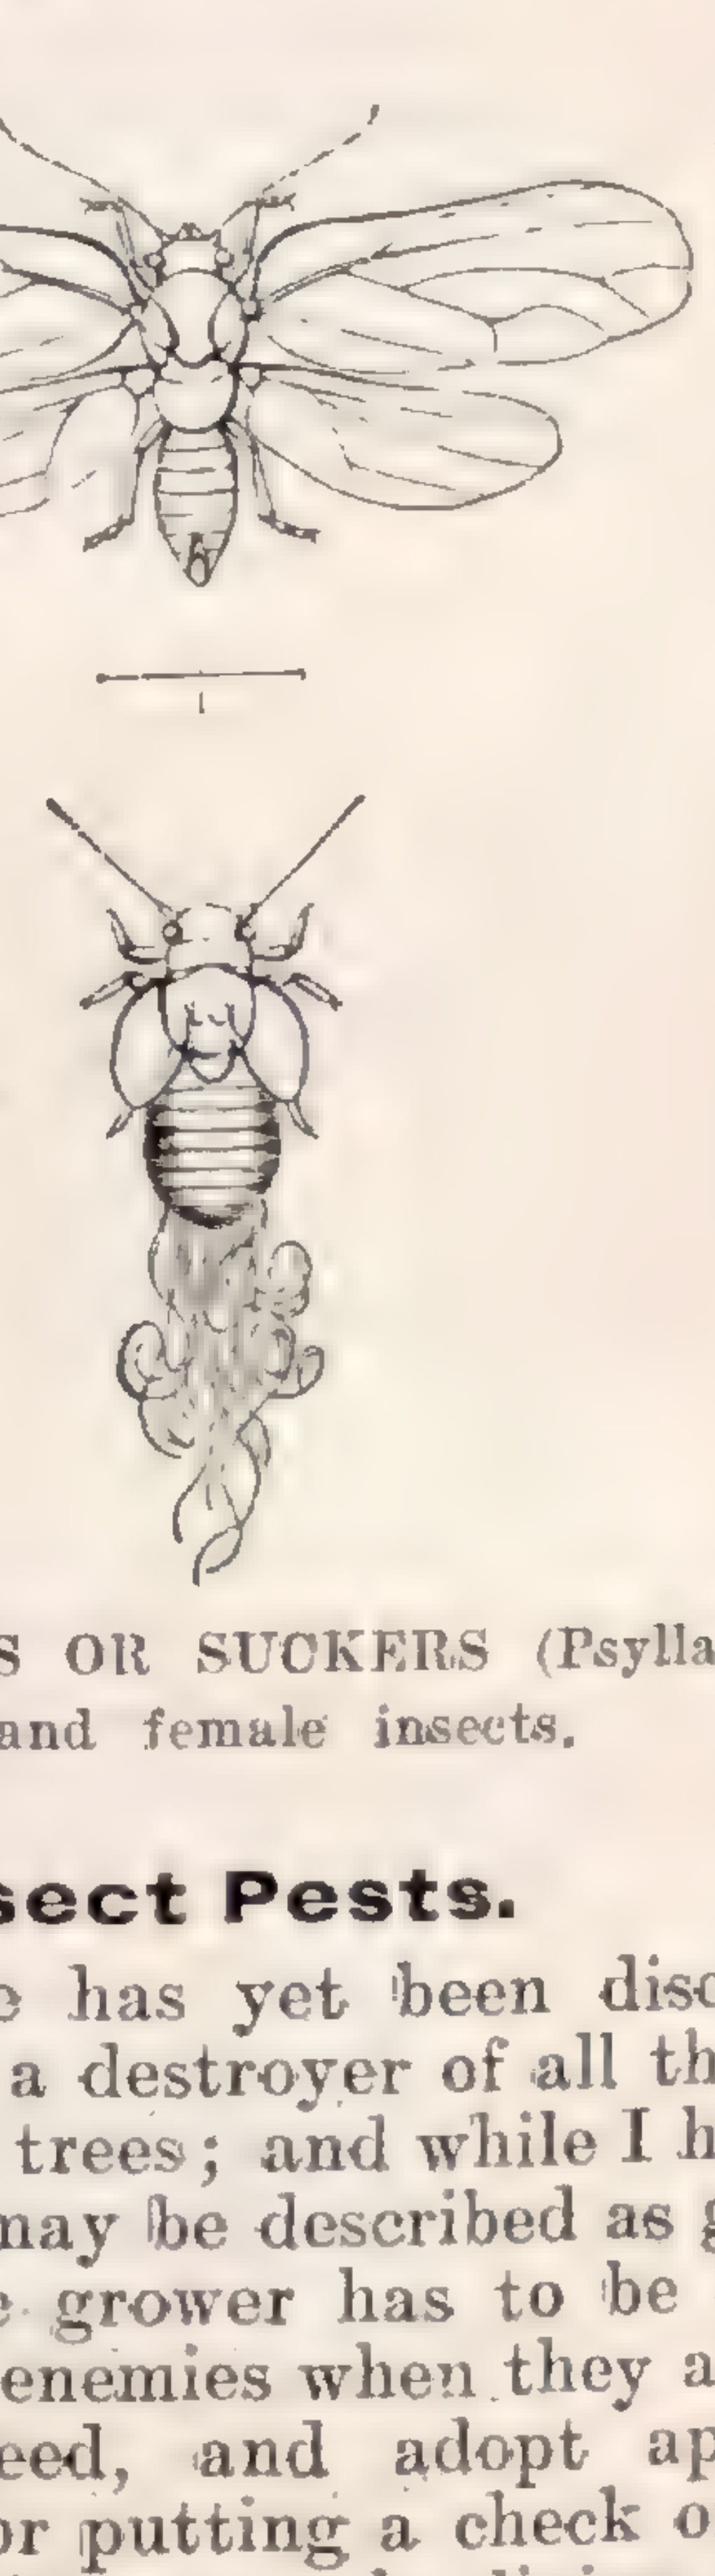
If the only object of March spraying was to cleanse trees, there would be no difficulty about it, for ever since caustic soda and the spraying machine took the place of lime and the old whitewash brush, there have been winter washes galore put on the market; and while they are all successes as cleansers, it is doubtful how much further they go, for most of us have seen trees spotlessly clean, and with shining bark, but victims nevertheless of caterpillars and other insect pests. Nevertheless, progress has been made in the matter of spring spraying, even at the expense of spraying to no purpose; a good many things have been found out, though there are still discoveries to be made, and we can spray this month with the assurance that we are not only cleaning trees, but doing something to prevent insect and fungoid troubles later on. Still, in the matter of spring spraying it is necessary to exercise faith.

## Spring Spraying with Lime.

After all, the use of lime on fruit trees is only a case of history repeating itself. Long before sprayers and insecticides were introduced, farmers used to paint the stems of their orchard trees ghostly white with lime wash, and from the tops of ladders they used to dust lime amongst the branches to kill lichen growths. And now we have come back to it again, first as a cleanser, and secondly, because though lime does not claim to destroy the eggs of insect pests, notably apple sucker, which is one of the worst of the tribe, it is claimed for it that any rate a coating of warm lime on the twigs and branches seals in the eggs of the above pests and a great proportion of them are prevented from hatching. Further, it has the same effect in preventing the development of fungus spores of the apple scab and the brown rot. There are a few rules, however, that should be observed in respect of lime spraying. First, it should be left as late as is consistent with safety, or the end of this month when the buds are swelling, but before they expand. Only the best white lime should be used, at the rate of one bushel to 25 gallons of water. Place the lumps of lime in a tub with enough water to cover them, and as the lime is slaked add the remainder of the water, stirring the mixture up to a cream. Thorough straining is very essential, or a lot of time will be lost through the clogging of the nozzle, and the lime wash should be applied while it is warm to all parts of the tree, and particularly the ends of the shoots. A still day is desirable for spraying, and the eyes and hands should be protected, the former with goggles and the latter by greasing.

## Lime and Sulphur Spray.

The addition of sulphur with lime is recommended in order to add to its efficiency as a fungicide to prevent scab, and this at a lower strength may also be used as a summer spray, but for the moment we have only to do with March spraying. The lime and sulphur wash is more difficult to prepare than when lime alone is used, but proprietary mixtures can be obtained if desired. The home-made preparation which is known as the Californian wash consists of 6lbs. quicklime and 3lbs. flowers of sulphur to 10 gallons of water. The lime and sulphur should "be put in a tub with enough water to cover them. When the lime is slaked and still hot, add more water, boil for forty-five minutes and make up the quantity to 10 gallons."



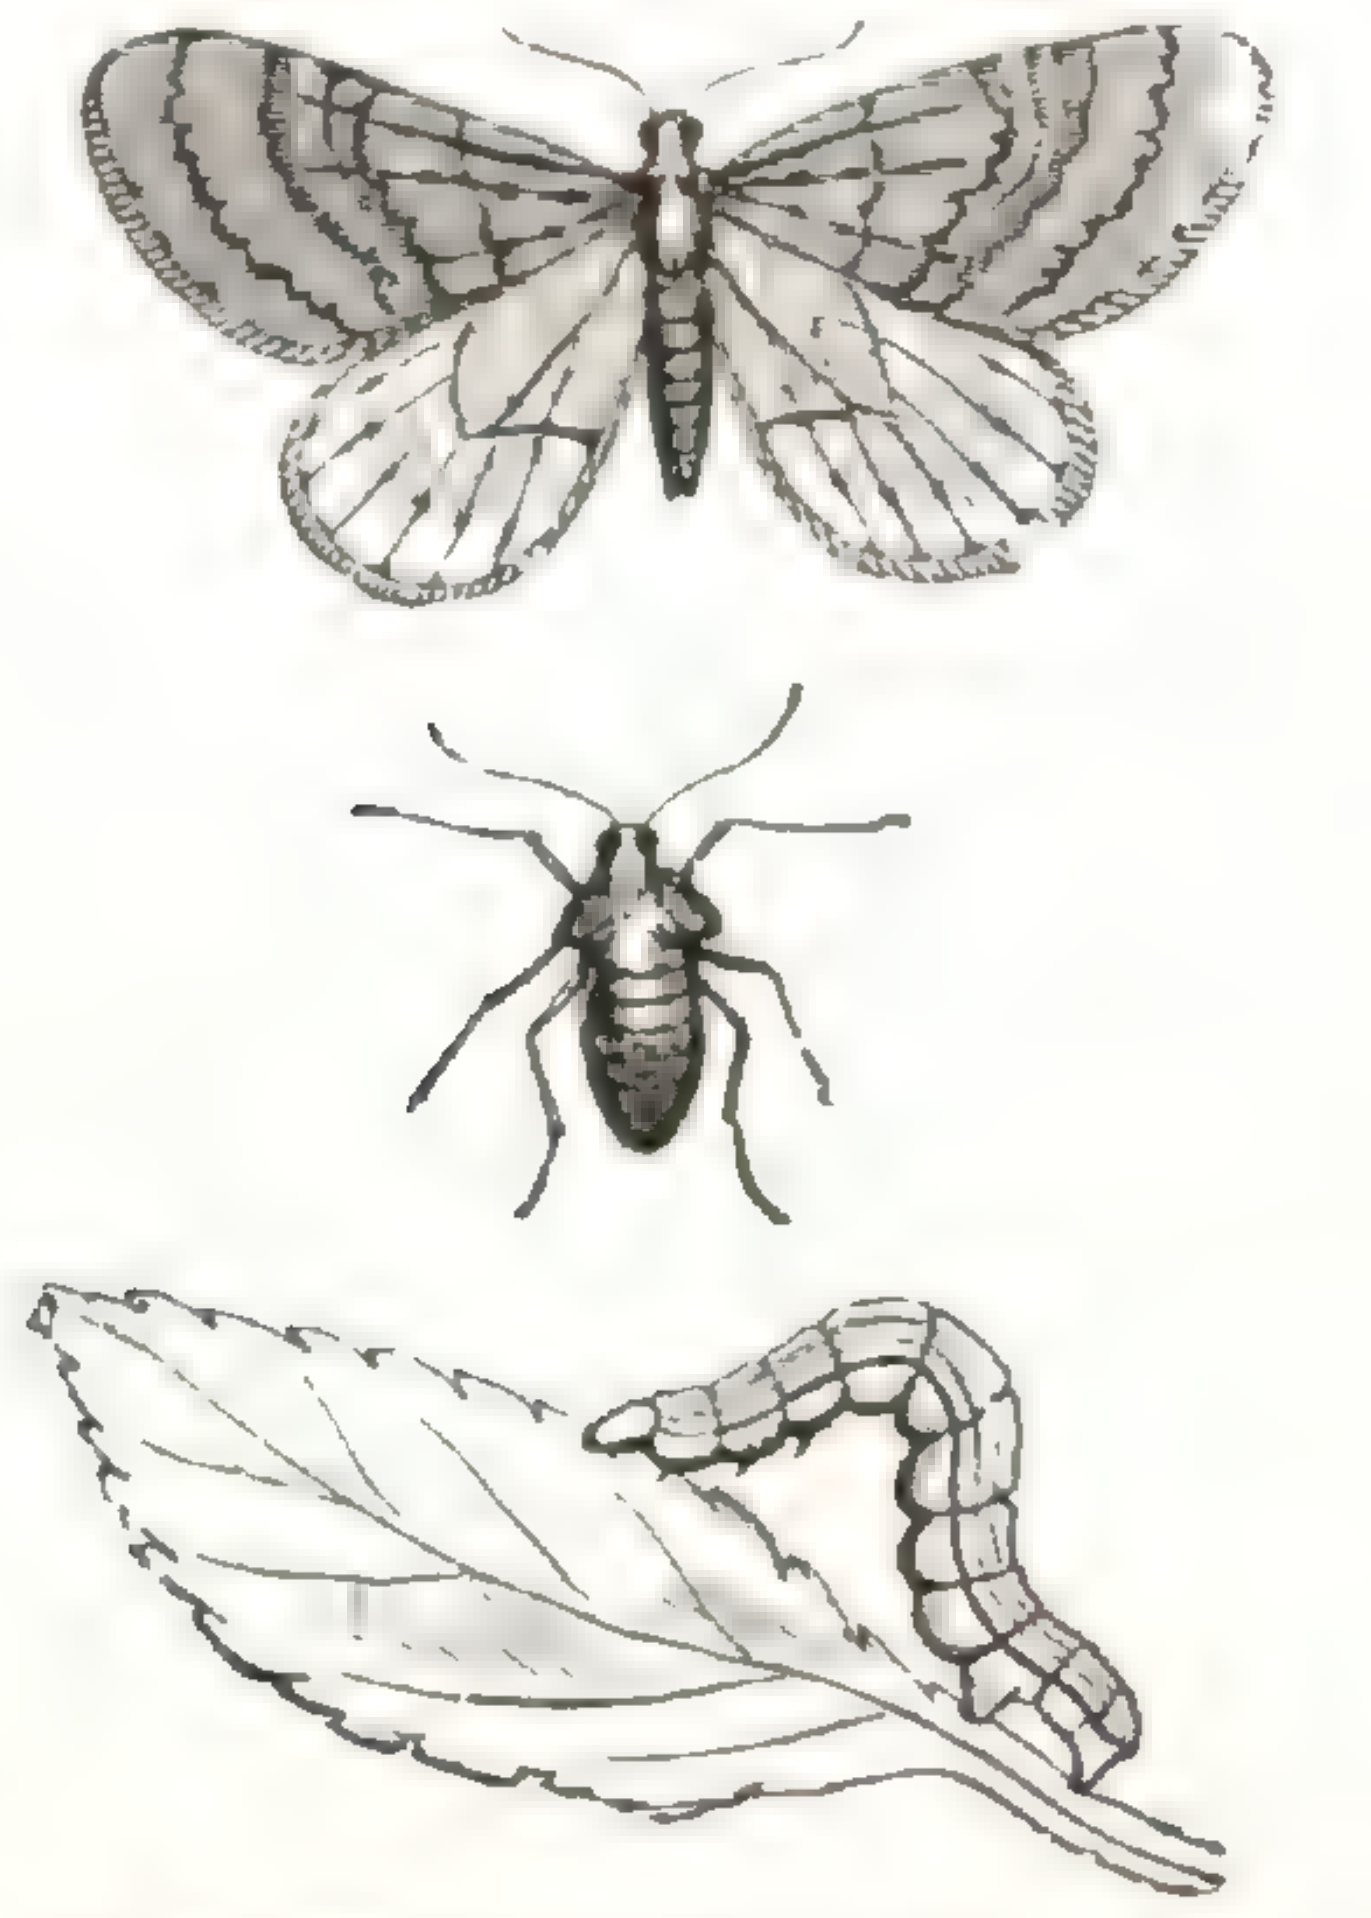
APPLE CHERMES OR SUCKERS (Psylla mali). Male and female insects.

## Insect Pests.

No insecticide has yet been discovered that will act as a destroyer of all the pests that affect fruit trees; and while I have referred to what may be described as general preventives, the grower has to be on the look-out for his enemies when they actually commence to feed, and adopt approved methods then for putting a check on their depredations. Amongst the living foes of fruit crops there are some which only appear occasionally and locally, but others which are widespread are the most injurious, and the majority of these are described below.

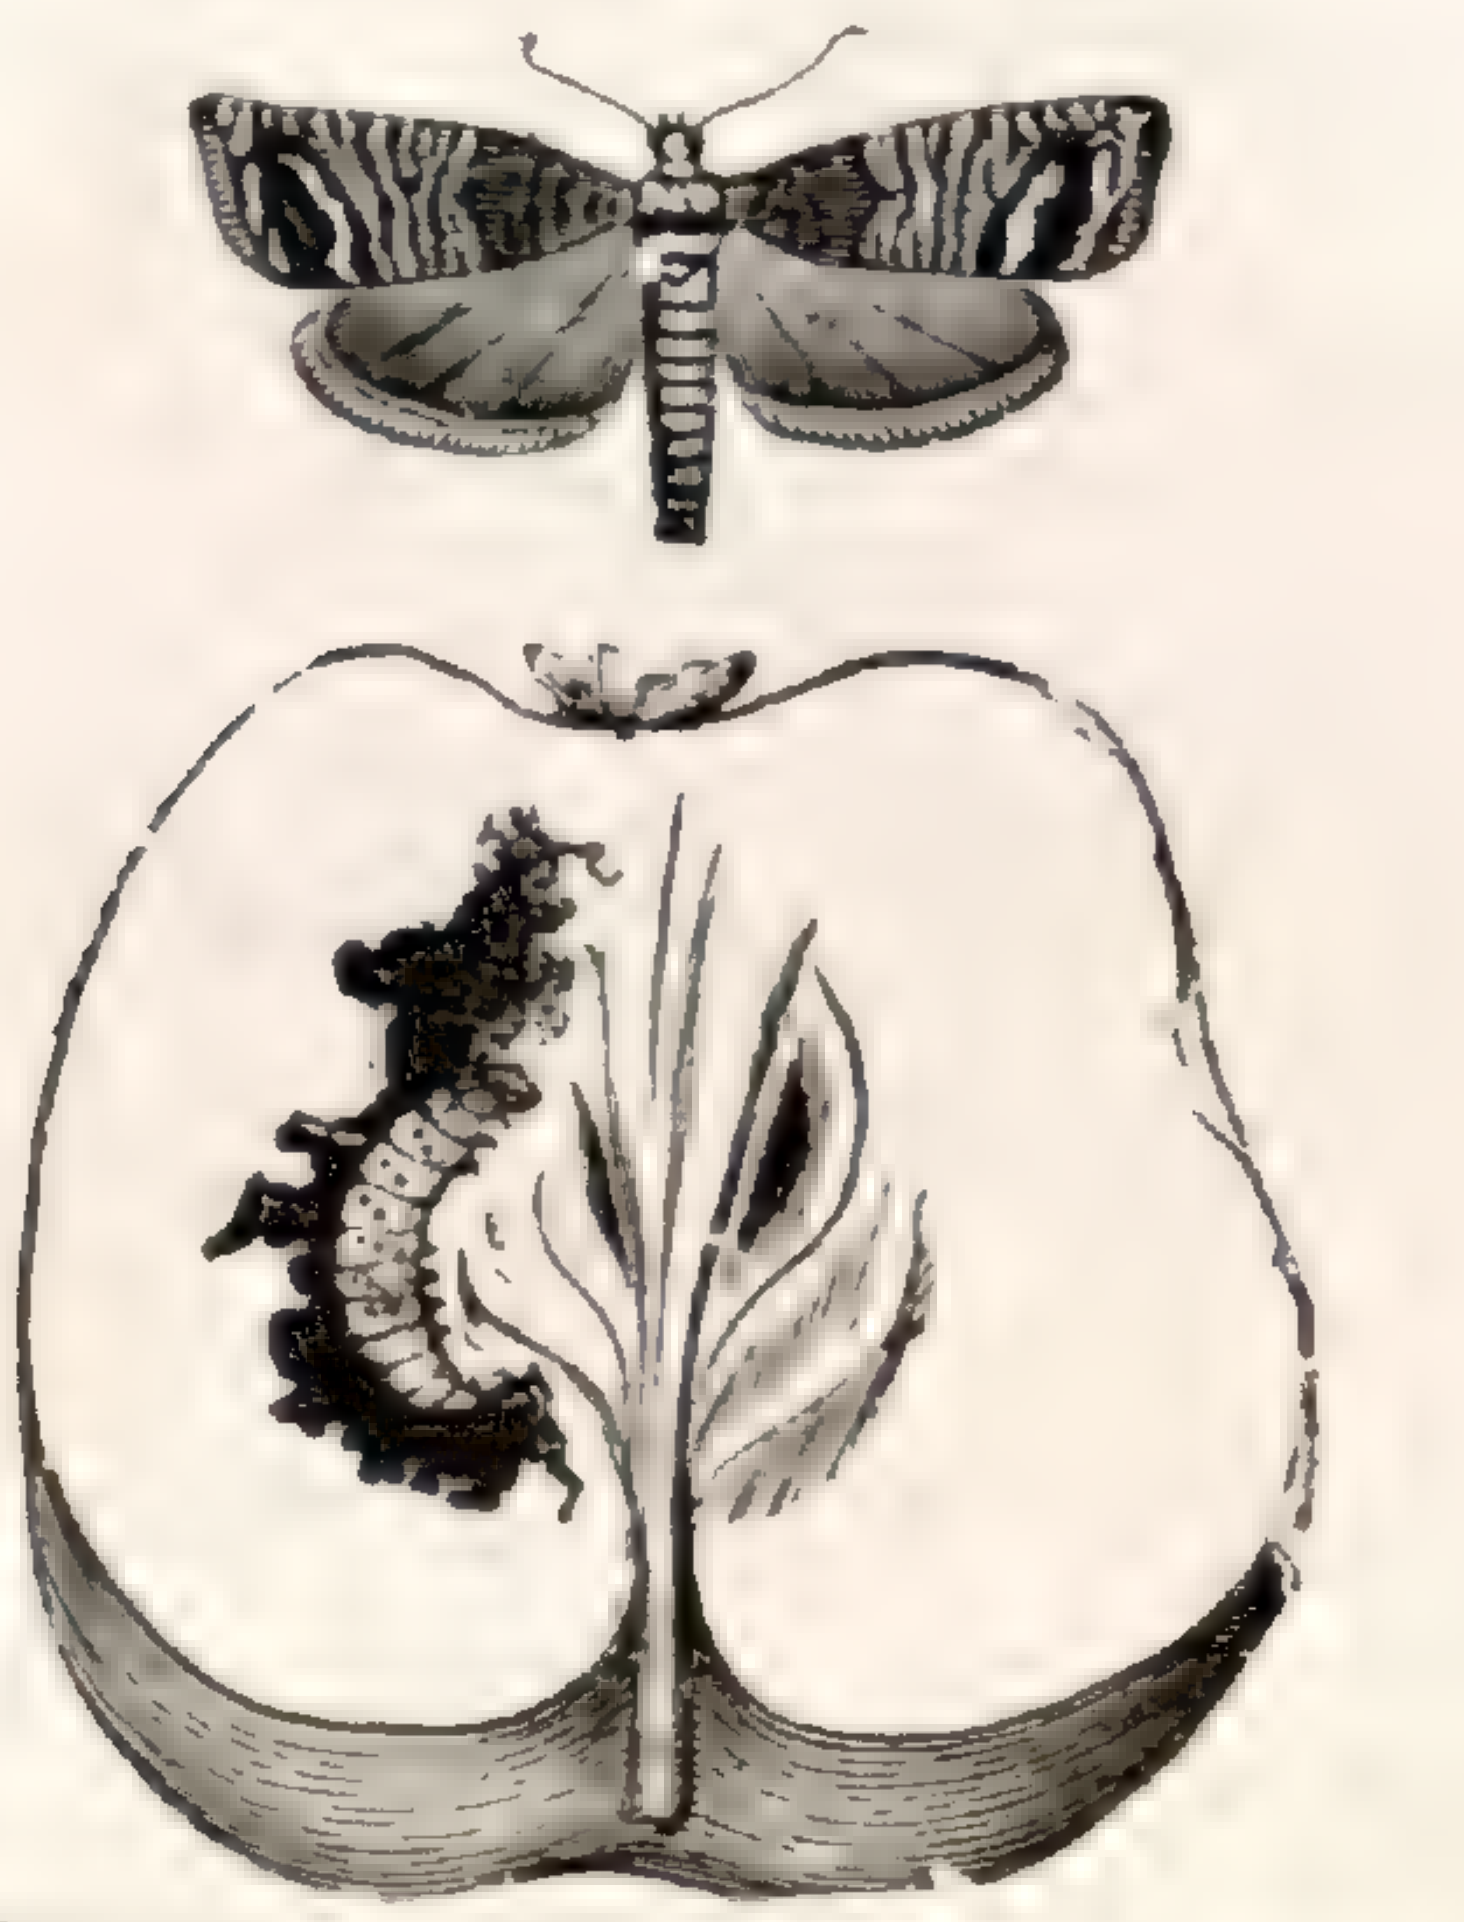
Apple Sucker.—Masses of sticky honeydew in the trusses of blossom always indicate the presence of this aphis-like pest, and it is questionable whether the apple crop has a worse enemy. The suckers (Psylla mali) hatch out in April from the eggs that are laid on the young shoots, and after they have done their evil work the blossoms turn brown, and the flower stems wither and fall off. March is the best time to spray for Psylla with the lime wash, which seals the eggs to the shoots and prevents the development of the insects. In May and June the pests may be seen in a winged state, and they commence their egg-laying in the autumn. Prevention is doubtless the last course to pursue with this pest, and when established in the flower trusses the only spray that can be used with safety is a nicotine solution.

American Blight.—The woolly aphis is too well known to need description, and though it does not appear to injure an old tree it is fatal to a young one, as it stunts growth, causes ugly swellings to appear on the shoots, and is the forerunner of canker. The trouble with American blight is to reach the insects by means of a sprayer, as it secretes itself in holes and crevices, and when warm weather comes the hateful cotton wool-like substance appears on the trees. There is no single season for fighting American blight, which should be attacked at all times. Spring spraying does something to prevent it, but when the pest appears in the summer there is nothing better than touching the patches of blight with a small brush dipped in methylated spirit.



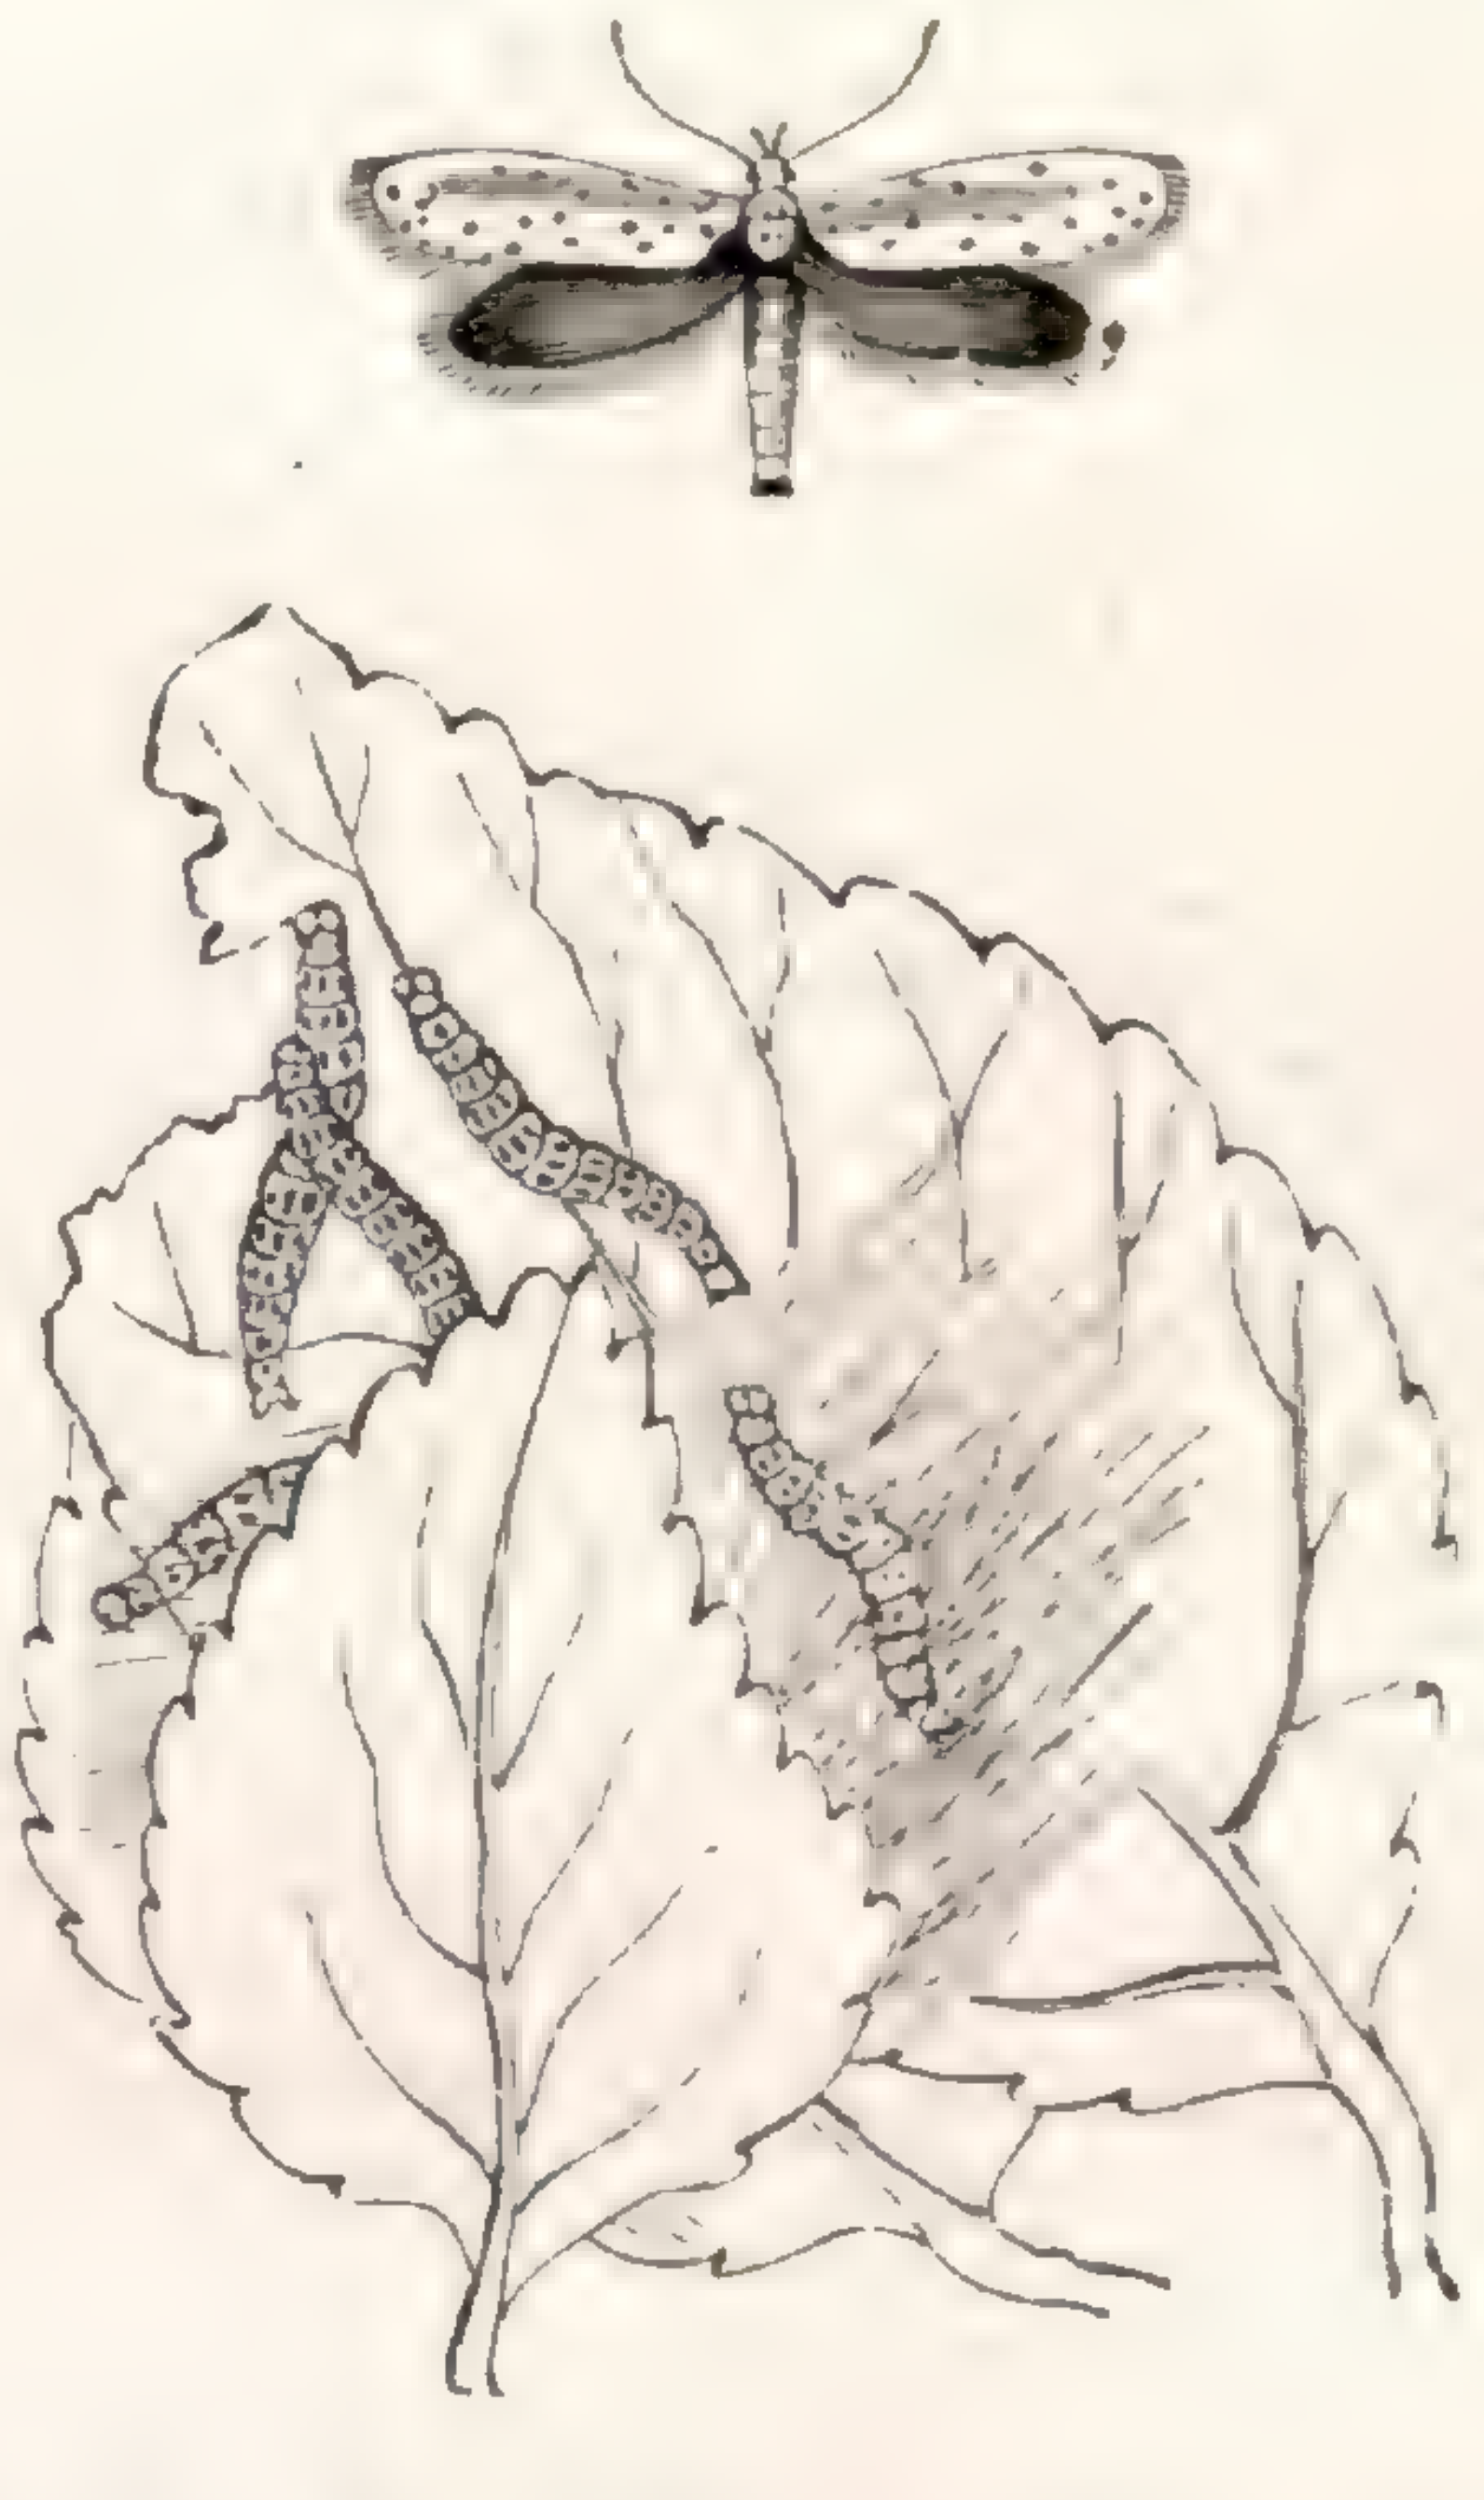
WINTER MOTH (Cheimatobia brumata).
Caterpillar, Winged Male, and Wingless Female.

Winter Moth Caterpillar.—Of all the pests that bite there is none so bad as this one. It is not particular as regards food, for it attacks apples, pears, and stone fruit, and in the Forest of Dean I have seen stretches of oak trees entirely defoliated by it. The damage done to the foliage of fruit trees by this pest is often serious. The first means of dealing with it is a preventive one, and consists of grease-banding trees early in October to catch the female moths as they ascend the trunks to lay eggs in the branches. Perhaps grease-banding is more general in that famous fruit-growing district in the Evesham Vale than anywhere, and every year thousands of moths are caught by this process. The young caterpillars begin to feed when they are hatched out soon after the trees break, and the best way of dealing with them then is to poison their food and so destroy them. Prepared arsenate of lead, used according to the directions supplied by insecticide manufacturers, is the handiest stuff to use, and the spraying should be done before the flowers open, as the caterpillars are only commencing to feed then, but another spraying may be necessary after the fruits have set. Before they reach maturity winter moth caterpillars may be destroyed by spraying with weak paraffin emulsion and also by several proprietary fruit tree washes.



THE CODLIN MOTH (Carpocapsa pomonella).
Moth and Caterpillar.

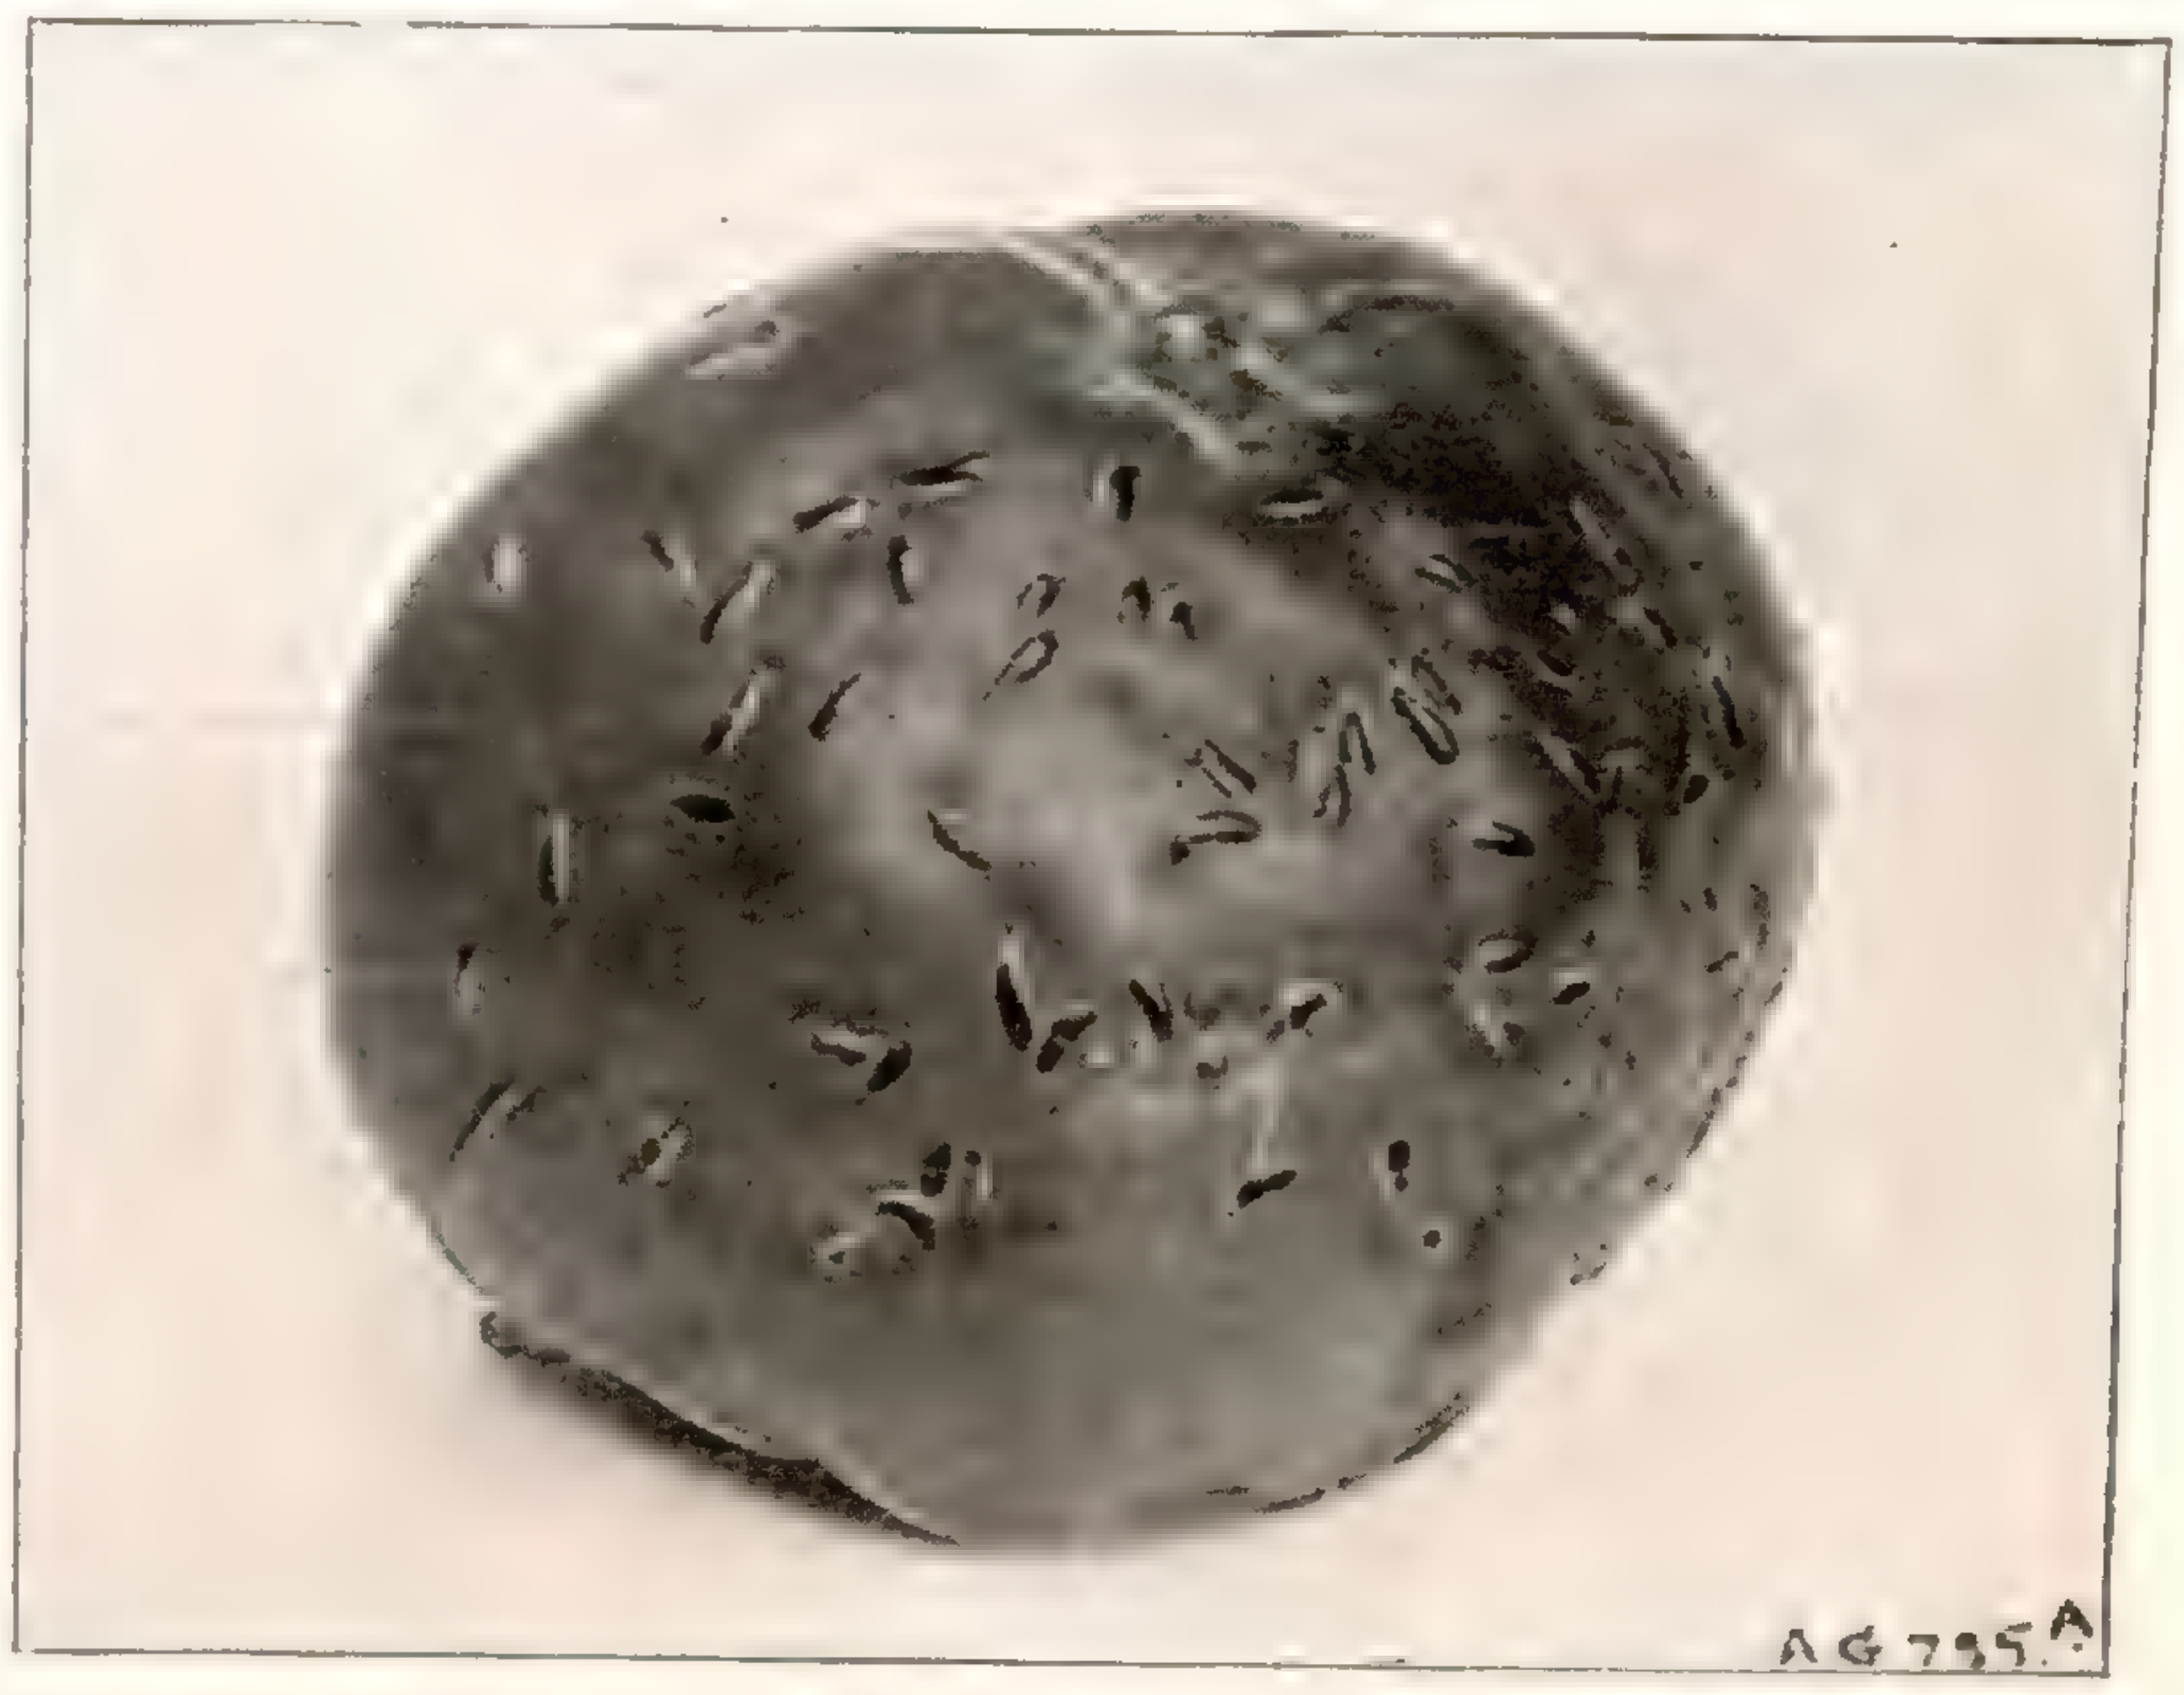
Codlin Moth Caterpillar. — Most people are acquainted with those apples which fall prematurely ripe from the trees, and bored with the tell-tale holes that are the work of the caterpillar mentioned above. For this pest I believe a March spraying with lime or a caustic solution is good as a preventive, as the number of hiding-places of the enemy are reduced; but after all precautions have been taken, in some seasons the hateful maggots commence their work of boring the apples at the eyes, and they then eat their way to the core in the interior. When this happens, there is nothing like poison, and nothing so good as an arsenate of lead wash applied with a sprayer. The spraying should not be delayed until the calyx of the small fruit has closed in, but it should be done immediately the flower has set. The poisonous liquid then lodges in the eye of the fruit, and is fatal to the grubs located there. There is one further remedy, i.e., destroy grub-bored apples, which frequently have the maggots in them when they fall; and if growers would form a coalition to do this, the codlin moth population would be considerably reduced.



ONE OF THE TENT CATERPILLARS.
SMALL APPLE ERMINE MOTH (Hyponomeuta malivorella), Moth and Caterpillars.

Tent Caterpillars.—These are the larvæ of the Lackey and Ermine moths, which feed inside their web-like tents at the ends of shoots. The eggs of these moths may often be found when pruning in bands and patches on young shoots, protected by a coating of gum. A coating of lime-wash will often prevent the eggs from hatching, and last season I effectually put an end to both Lackey and Ermine caterpillar when they commenced feeding by syringing forcibly with McDougall's fruit tree wash.

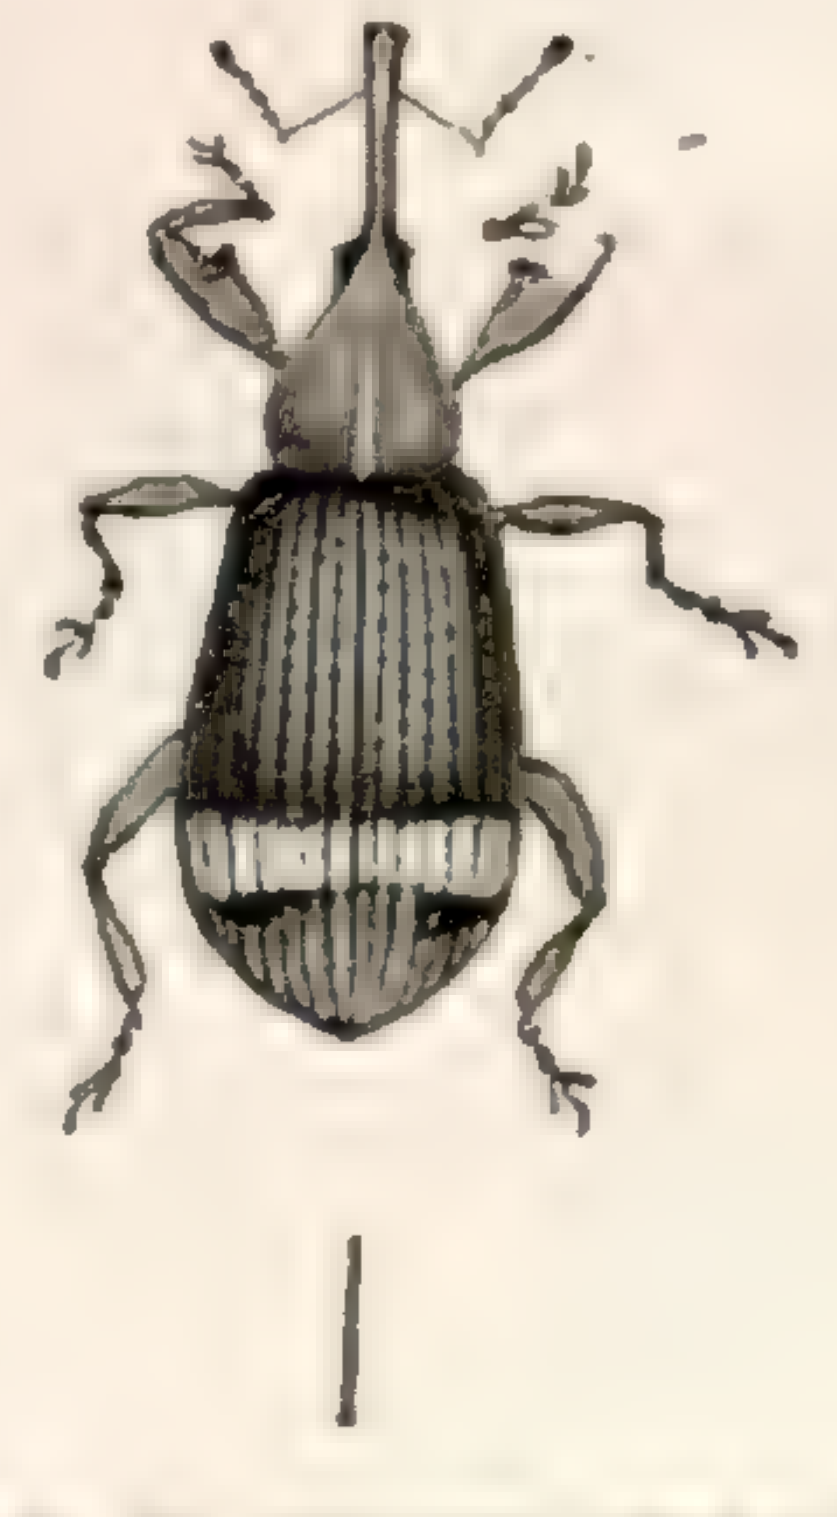
Mussel Scale.—Young apple trees may quickly suffer in health if the bark is allowed to become covered with mussel scale, and it is often found under and near the bands where standard trees are tied to the stakes. March is the best time to deal with it, either by means of lime spraying or one of the proprietary caustic solutions that are sold for winter spraying.



MUSSEL SCALE (Lepidosaphes ulmi) ON APPLE.

Apple Blossom Weevil.—Every year this pest takes its toll of the apple crop, and if the flowers the petals of which turn brown and fail to expand are examined, the white grub of the weevil will be found inside. We have yet to find a real remedy for this pest; but lime spraying in March undoubtedly does some good, first by sealing up many of the harbouring places of the pest, and secondly, by retarding somewhat the opening of the buds.

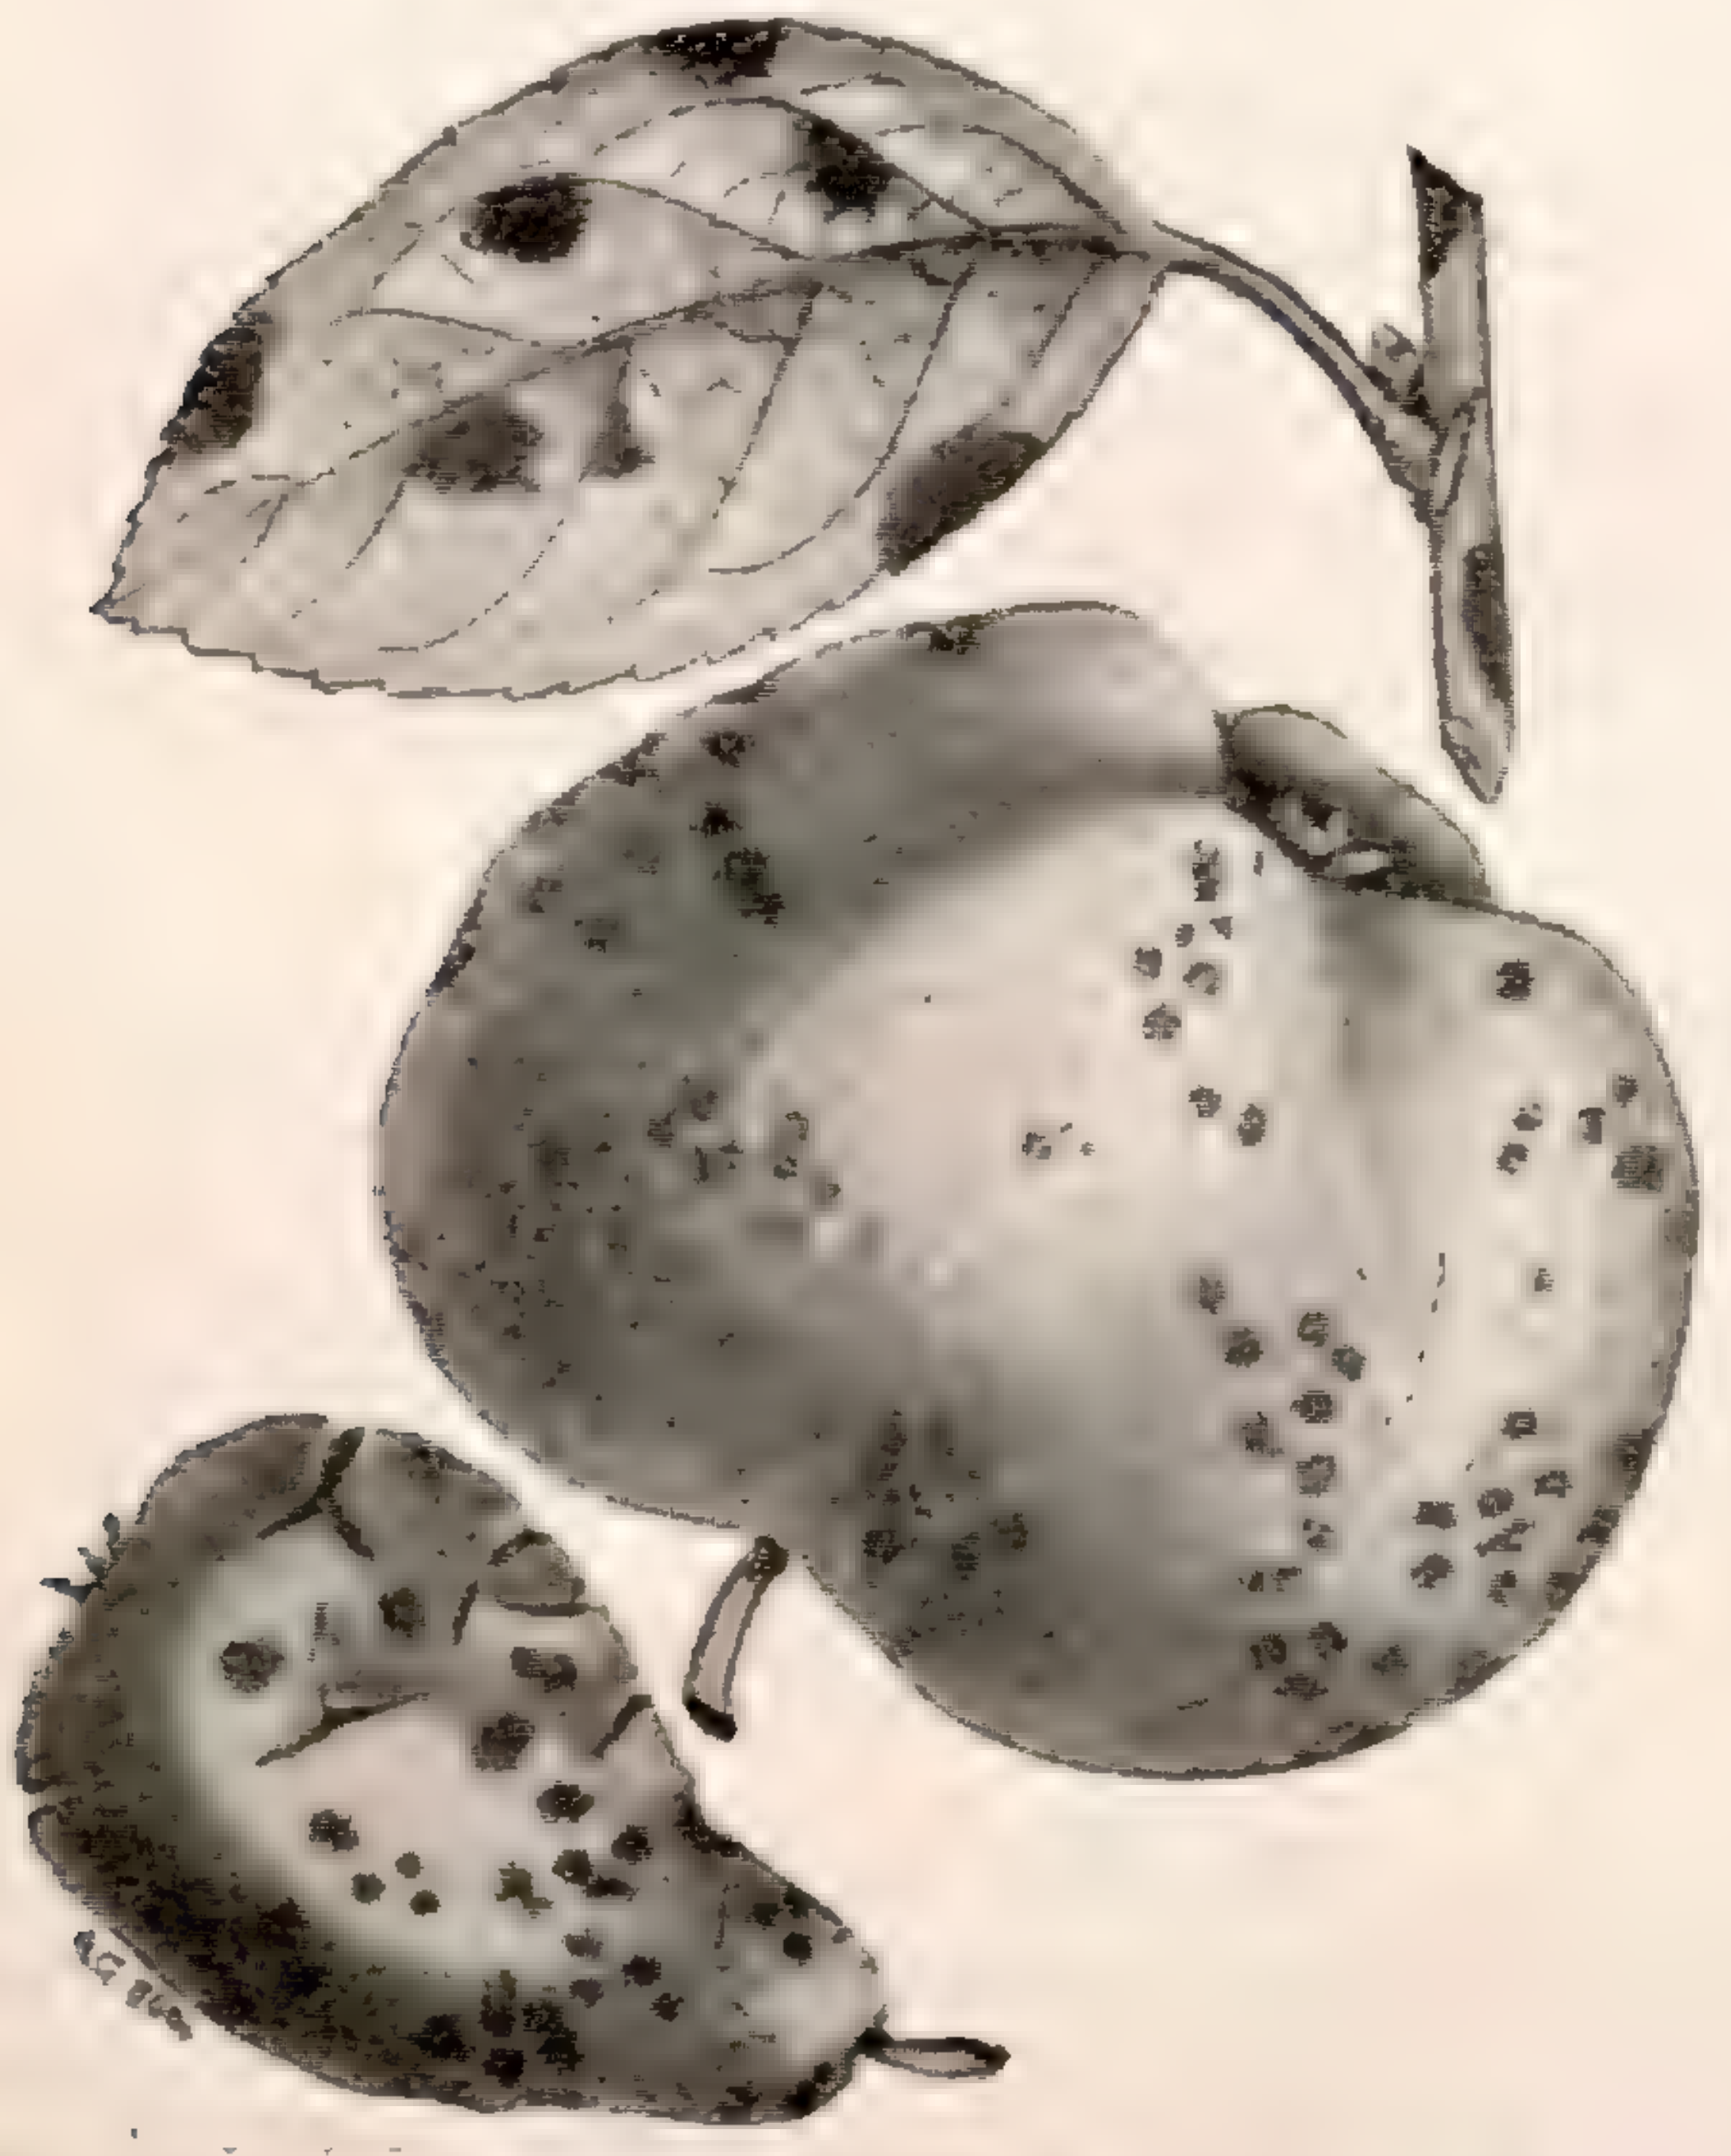
Aphis. — Noted for their marvellous powers of multiplication, the different members of this family, such as the apple aphis, plum aphis, and cherry aphis, are common enemies of the fruit grower. In dealing with aphis there should be one rule, i.e., deal promptly, because a score yesterday may mean a thousand to-morrow. In the case of aphis on fruit trees, lime spraying in March is beneficial, as it stops some of the species from hatching, and afterwards nicotine wash, the well-known soft soap and quassia, not to mention a number of proprietary washes, will destroy aphis, but the spraying should not be neglected until the trees are sticky masses of honeydew and filth.



APPLE BLOSSOM WEEVIL
(Anthonomus pomorum).
(Much magnified.)

## Fruit Diseases and Fungicides.

In addition to being a fighter of insect foes, the fruit grower in these days has to be something of a doctor as well, for fruit trees are liable to diseases and ailments which either affect them constitutionally or reduce the commercial value of the crops. These diseases are a varied quantity, and while some may be prevented or checked, in the case of others no effective remedies are as yet forthcoming, and scientists are in the same position in respect of them as medical men are in reference to several of the diseases to which human flesh is heir. Further, there is a similarity between the two, and just as a healthy man is more proof against an epidemic than a sickly one, so does a dirty and weakly fruit tree fall a readier prey to disease sooner than a vigorous one. The obvious lesson from this is—keep fruit trees clean and in sound health by good cultivation, use preventive measures so far as possible to ward off diseases, and if remedies are necessary, apply them promptly before much damage is done. Spring spraying is not a cure for diseases, but in some cases a means of prevention, and several instances of this are described below.



APPLE AND PEAR SCAB DISEASE.
As illustrated by the Board of Agriculture; the spots on the apple and leaf are caused by Fusicladium dendriticum, and those on the pear by F. pirinum.

### Apple Canker.

The real cause of canker is unknown, and it appears under many different circumstances, some varieties, like Lord Suffield and Ribston Pippin, are more liable to it than others, and frequently it does its worst in injuring trees where the conditions of subsoil are unfavourable to apples. When canker gets all round a branch there is no hope for it, and the limb may as well be severed, but in the case of wounds, particularly on young trees, the fungus may be checked by cutting the cankered part away to clean wood and painting with Stockholm tar. This is an old remedy, and a better one, to my mind, is to secure a small bottle of Lysol from a chemist, dilute it to one part of Lysol to three parts of water, and apply it to the cankered parts with a stiff paint brush. A few years ago I treated a number of young standard trees with this remedy that were cankered at the point of working, and the results were so satisfactory that I have every confidence in recommending it.

### Apple and Pear Scab.

Most of us are painfully acquainted with the apple scab (Fusicladium dendriticum) and its relative Fusicladium pirinum, which attacks pears, and is perhaps the worst trouble of the two, because whereas the former is responsible for corky scabs on the fruit, the latter makes pears crack, and prevents their development. In the bright sunny summer of last year both apples and pears came very clean, and there was little scab, which leads one to the conclusion that climatic conditions are largely responsible for it, but in any average season it is a common cause of trouble. Spraying in the spring for scab must be viewed in the light of a preventive measure, and lime-sulphur wash is recommended. Two years ago I had evidence of the value of ordinary limewash, applied warm, being good for scab, and this was in connection with some Wellington apples, which were always so scabby as to be unmarketable, but the season following the spraying the fruit was wonderfully clean and free from scab. Lime-sulphur wash may also be applied in the summer, and some prefer it to Bordeaux mixture. A recipe for making a self-boiled lime-sulphur spray was given in the "Journal" of the Royal Horticultural Society, March, 1909, and is as follows: Flowers of sulphur, 10lb.; quicklime, 15lb.; water, 50 gallons. The lime is placed in a wooden vessel, and a few gallons of boiling water poured over it. The sulphur is then added with a few more gallons of hot water. The mixture should be covered with a cloth, and the solution boiled by the heat of the slaking lime for twenty minutes. When boiling has ceased the remainder of the water to make 50 gallons is added, and in straining care should be taken that all the sulphur is worked through. Bordeaux mixture is also recommended for scab, and the Board of Agriculture formula is a half-strength solution formed of 6lb. copper sulphate and 3lb. quicklime to 100 gallons of water. Spraying should be commenced as soon as the fungus appears on the foliage, and be continued, if necessary, at intervals until the apples are the size of a nut. Still another preventive remedy is to spray trees on which scab has been prevalent, just before the buds commence to swell, with a solution of sulphate of copper, at the rate of 1lb. of sulphate to 75 gallons of water.

### Apple Mildew.

The development of trees is sometimes checked in the spring and early summer by the powdery mould of the above mildew, and for this the same remedies as suggested for the scab are applicable. If it is only a case of a few shoots being affected by the mildew, and this is by no means infrequent, the best plan is to cut off the twigs and burn them.

### Brown Rot.

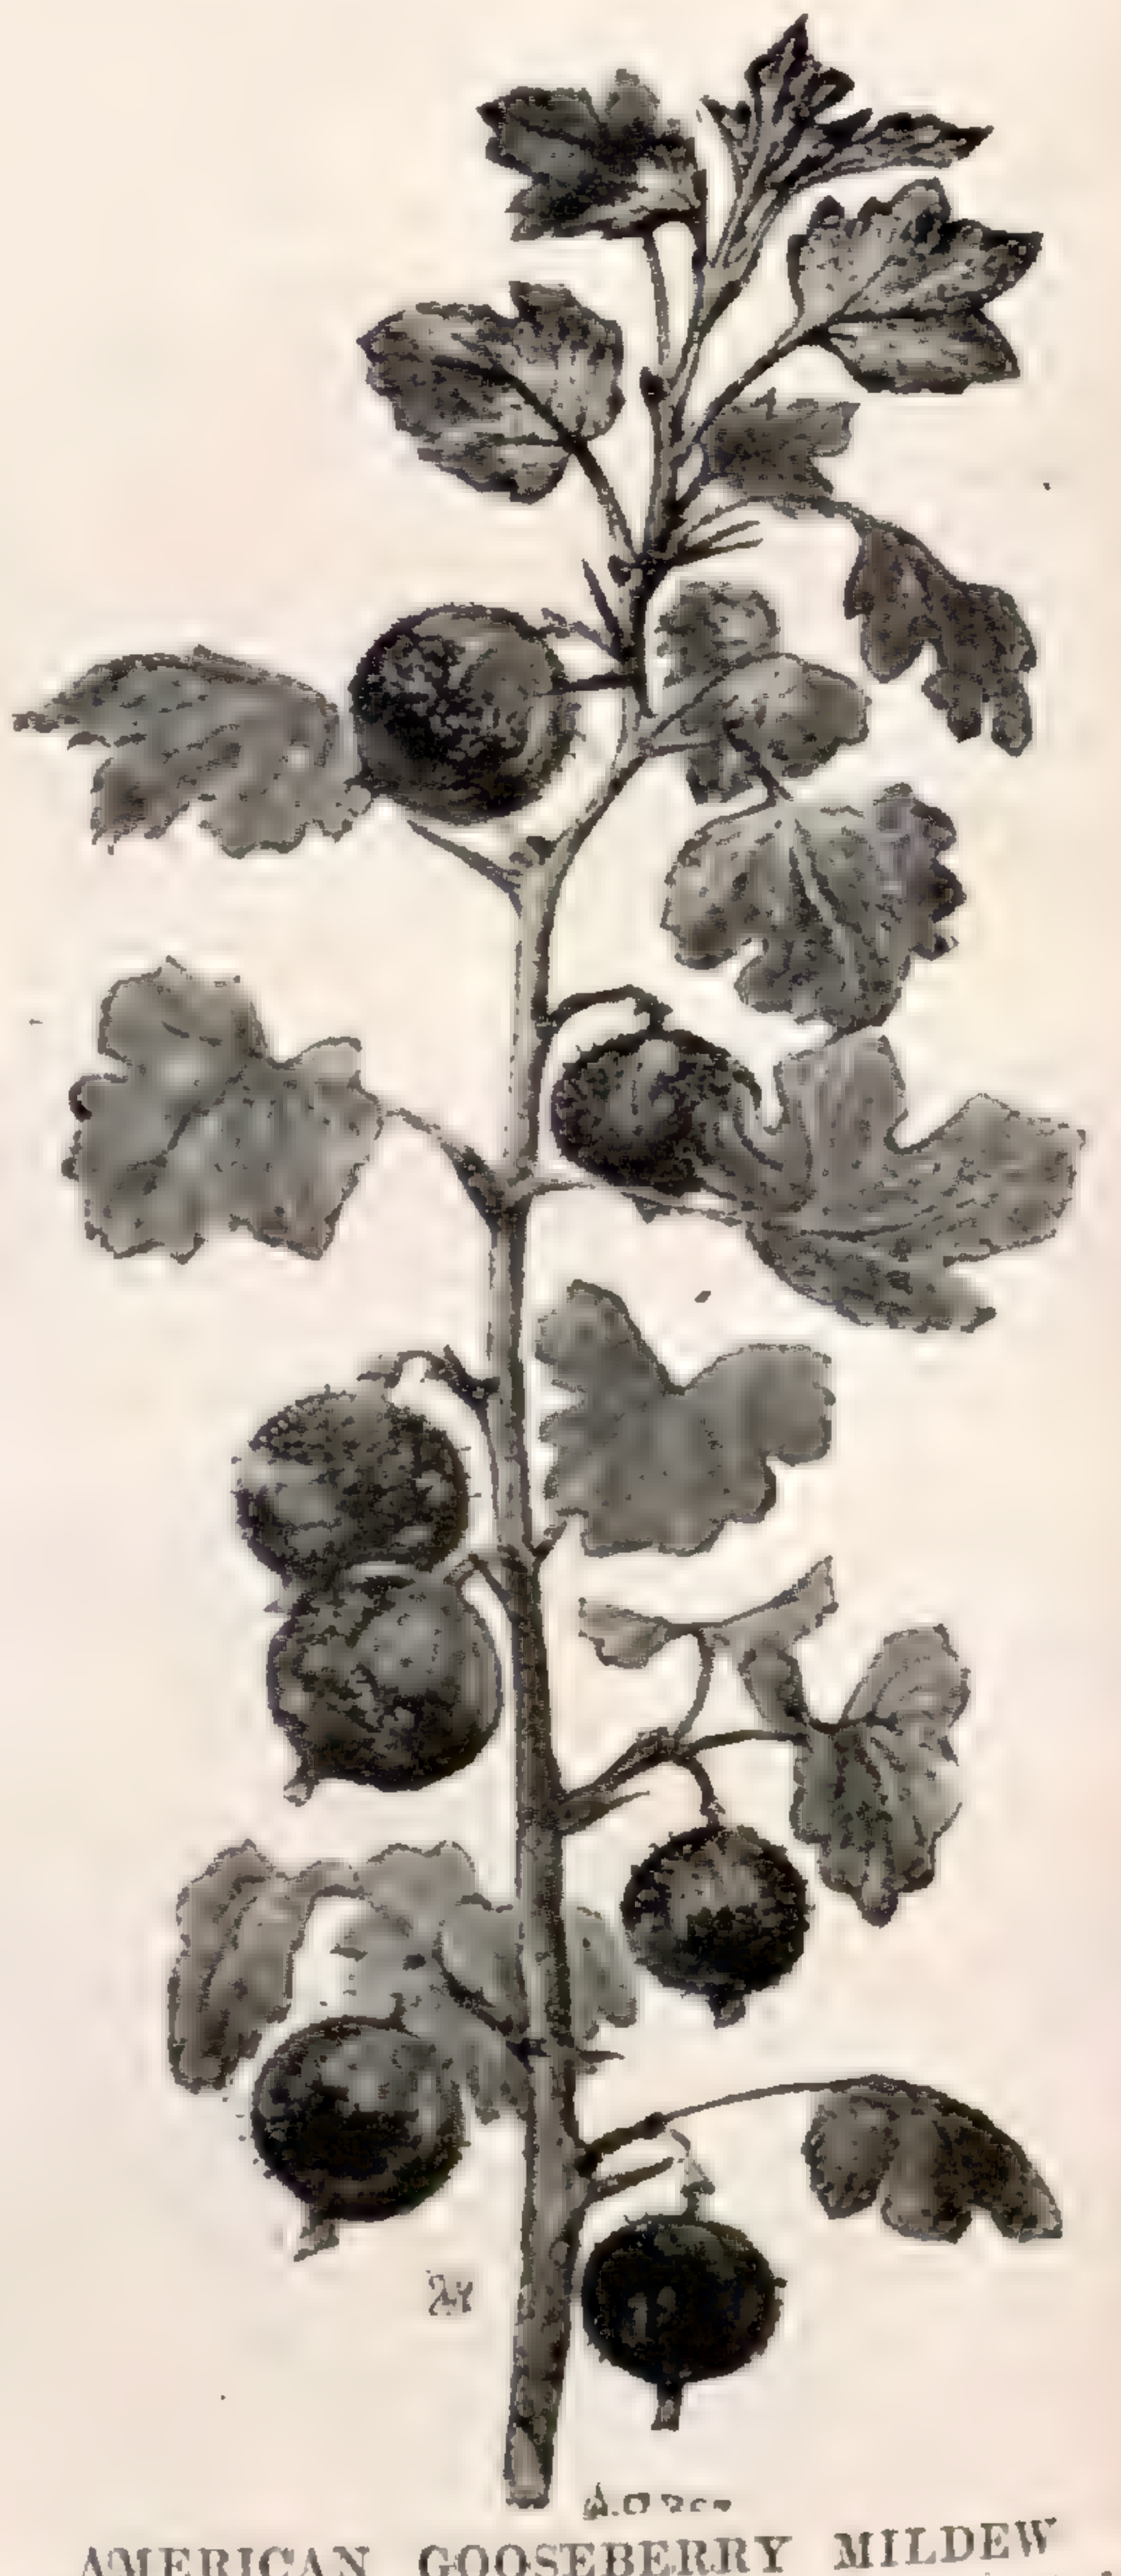
This fungus (Sclerotinia fructigena) not only affects apples and pears, but stone fruits as well, and it appears on the foliage before attacking the fruit. The effect of the disease is that the fruits become hard and remain on the trees in a mummified state, even to the next season. These specimens are holders of the fungus germs, and should be picked off and burnt, but in other respects the remedies for brown rot are the same as for apple scab.

### Peach Leaf Curl.

This disease (Exoascus deformans), also known as the "leaf blister," is the bane of all gardeners who grow peaches and nectarines out of doors, and it is so well known that no description of it is necessary. There is no doubt whatever that climatic conditions have a great influence on leaf curl, and when these are particularly favourable for the disease it is doubtful whether there is any known remedy that will effectually prevent or check it. Cold, damp weather in the spring, with biting winds or quick changes of atmosphere, are very favourable for the disease, which gives much less trouble if the conditions are genial at the critical period. Last spring leaf blister was very prevalent, and dozens of trees have not recovered from the effects of it. Lime and sulphur sprays and Bordeaux mixture are both effective as preventives if applied when the buds first show signs of swelling, but before the leaf buds expand, and the latter solution is then used at the strength of 10lb. copper sulphate, 5lb. of lime, and 50 gallons of water, the copper sulphate being dissolved in one wooden vessel, and the lime slaked in another before they are brought together. In America the self-boiled lime and sulphur wash is also used as a check to the disease when the trees are in leaf, without injury to the latter.

### American Gooseberry Mildew.

This notable disease, which is costing the country so much money in attempts to eradicate it, has been illustrated and described so many times that most people must be acquainted with its symptoms, and if one is unfortunate enough to have bushes affected with the mildew the best thing to do is to obey the law by reporting the case to the Board of Agriculture or a local inspector, and instructions will be given as to the compulsory pruning and spraying of the bushes. American Gooseberry Mildew caused a great scare when it was first "discovered" several years ago, and the time appears to have arrived when growers might reasonably ask whether it is such a serious thing as it was at first declared to be, and also what effect the compulsory measures have had in eradicating the disease.



AMERICAN GOOSEBERRY MILDEW
(Sphærotheca mors-uvæ). Diseased leaves and fruits as illustrated by the Irish Board of Agriculture.

### Silver Leaf.

It is unfortunate that no effective remedy has been discovered for this disease (Stereum purpureum), which is causing wholesale loss of plum trees, and the variety that is worst affected is the fine old Victoria, though others of a soft-wooded nature are liable to infection. In some cases, when a few branches are affected, the disease may be checked by cutting these off, but badly affected trees should be burnt, and when silver leaf once appears the attack generally ends in the death of the victim. Speaking of plum trees, I am reminded that a good many trees die annually through being attacked by the shot-borer (Xyleborus dispar), and growers are often at a loss to know what is wrong. In cases of bad attacks there is no remedy, but the trouble may be prevented either by lime spraying the stems and lower branches two or three times annually, or smearing with some greasy mixture that will make the bark distasteful to the beetles.

In conclusion, it may be added that there are numerous insects and some diseases besides those mentioned in this article which fruit growers have to wage war against, but the worst and most destructive have been dealt with, with the exception of the Black Currant Gall Mite, and the Pear-Gnat midge, for both of which a really reliable remedy is very much wanted. Taken collectively they are a formidable host, these enemies of the fruit-grower, and the trouble is that while one anxious man tries his best to eradicate common foes by spraying, and so forth, his neighbour is just as careless about it, and breeds the very pests that the other is trying to destroy. In consequence of this the keen fighter of fruit pests, both insects and diseases, is hampered by the apathy of his neighbour, and no permanent victory can ever be possible as long as there is no spirit of either coalition or co-operation existing amongst people who grow fruit, and whose interests are identical.

G. H. H.

## LIBONIA FLORIBUNDI.

This grand old autumn-flowering plant was, some years ago, a general favourite, and found a very prominent place in our conservatories during the autumn and early winter months. The scarlet and yellow flowers have a warm, bright appearance at a season when such flowers are needed, but scarce.

Autumn-rooted plants require very careful treatment from now onwards, else they will lose the bottom leaves, and leave the stems bare. The temperature must be kept even, the potting carefully done, and the foliage freed from insects, especially red spider. Spring-rooted plants may not grow quite as large, but they will be beautiful compact specimens, and most useful for filling vases, as well as for the warm greenhouse and conservatory stage.

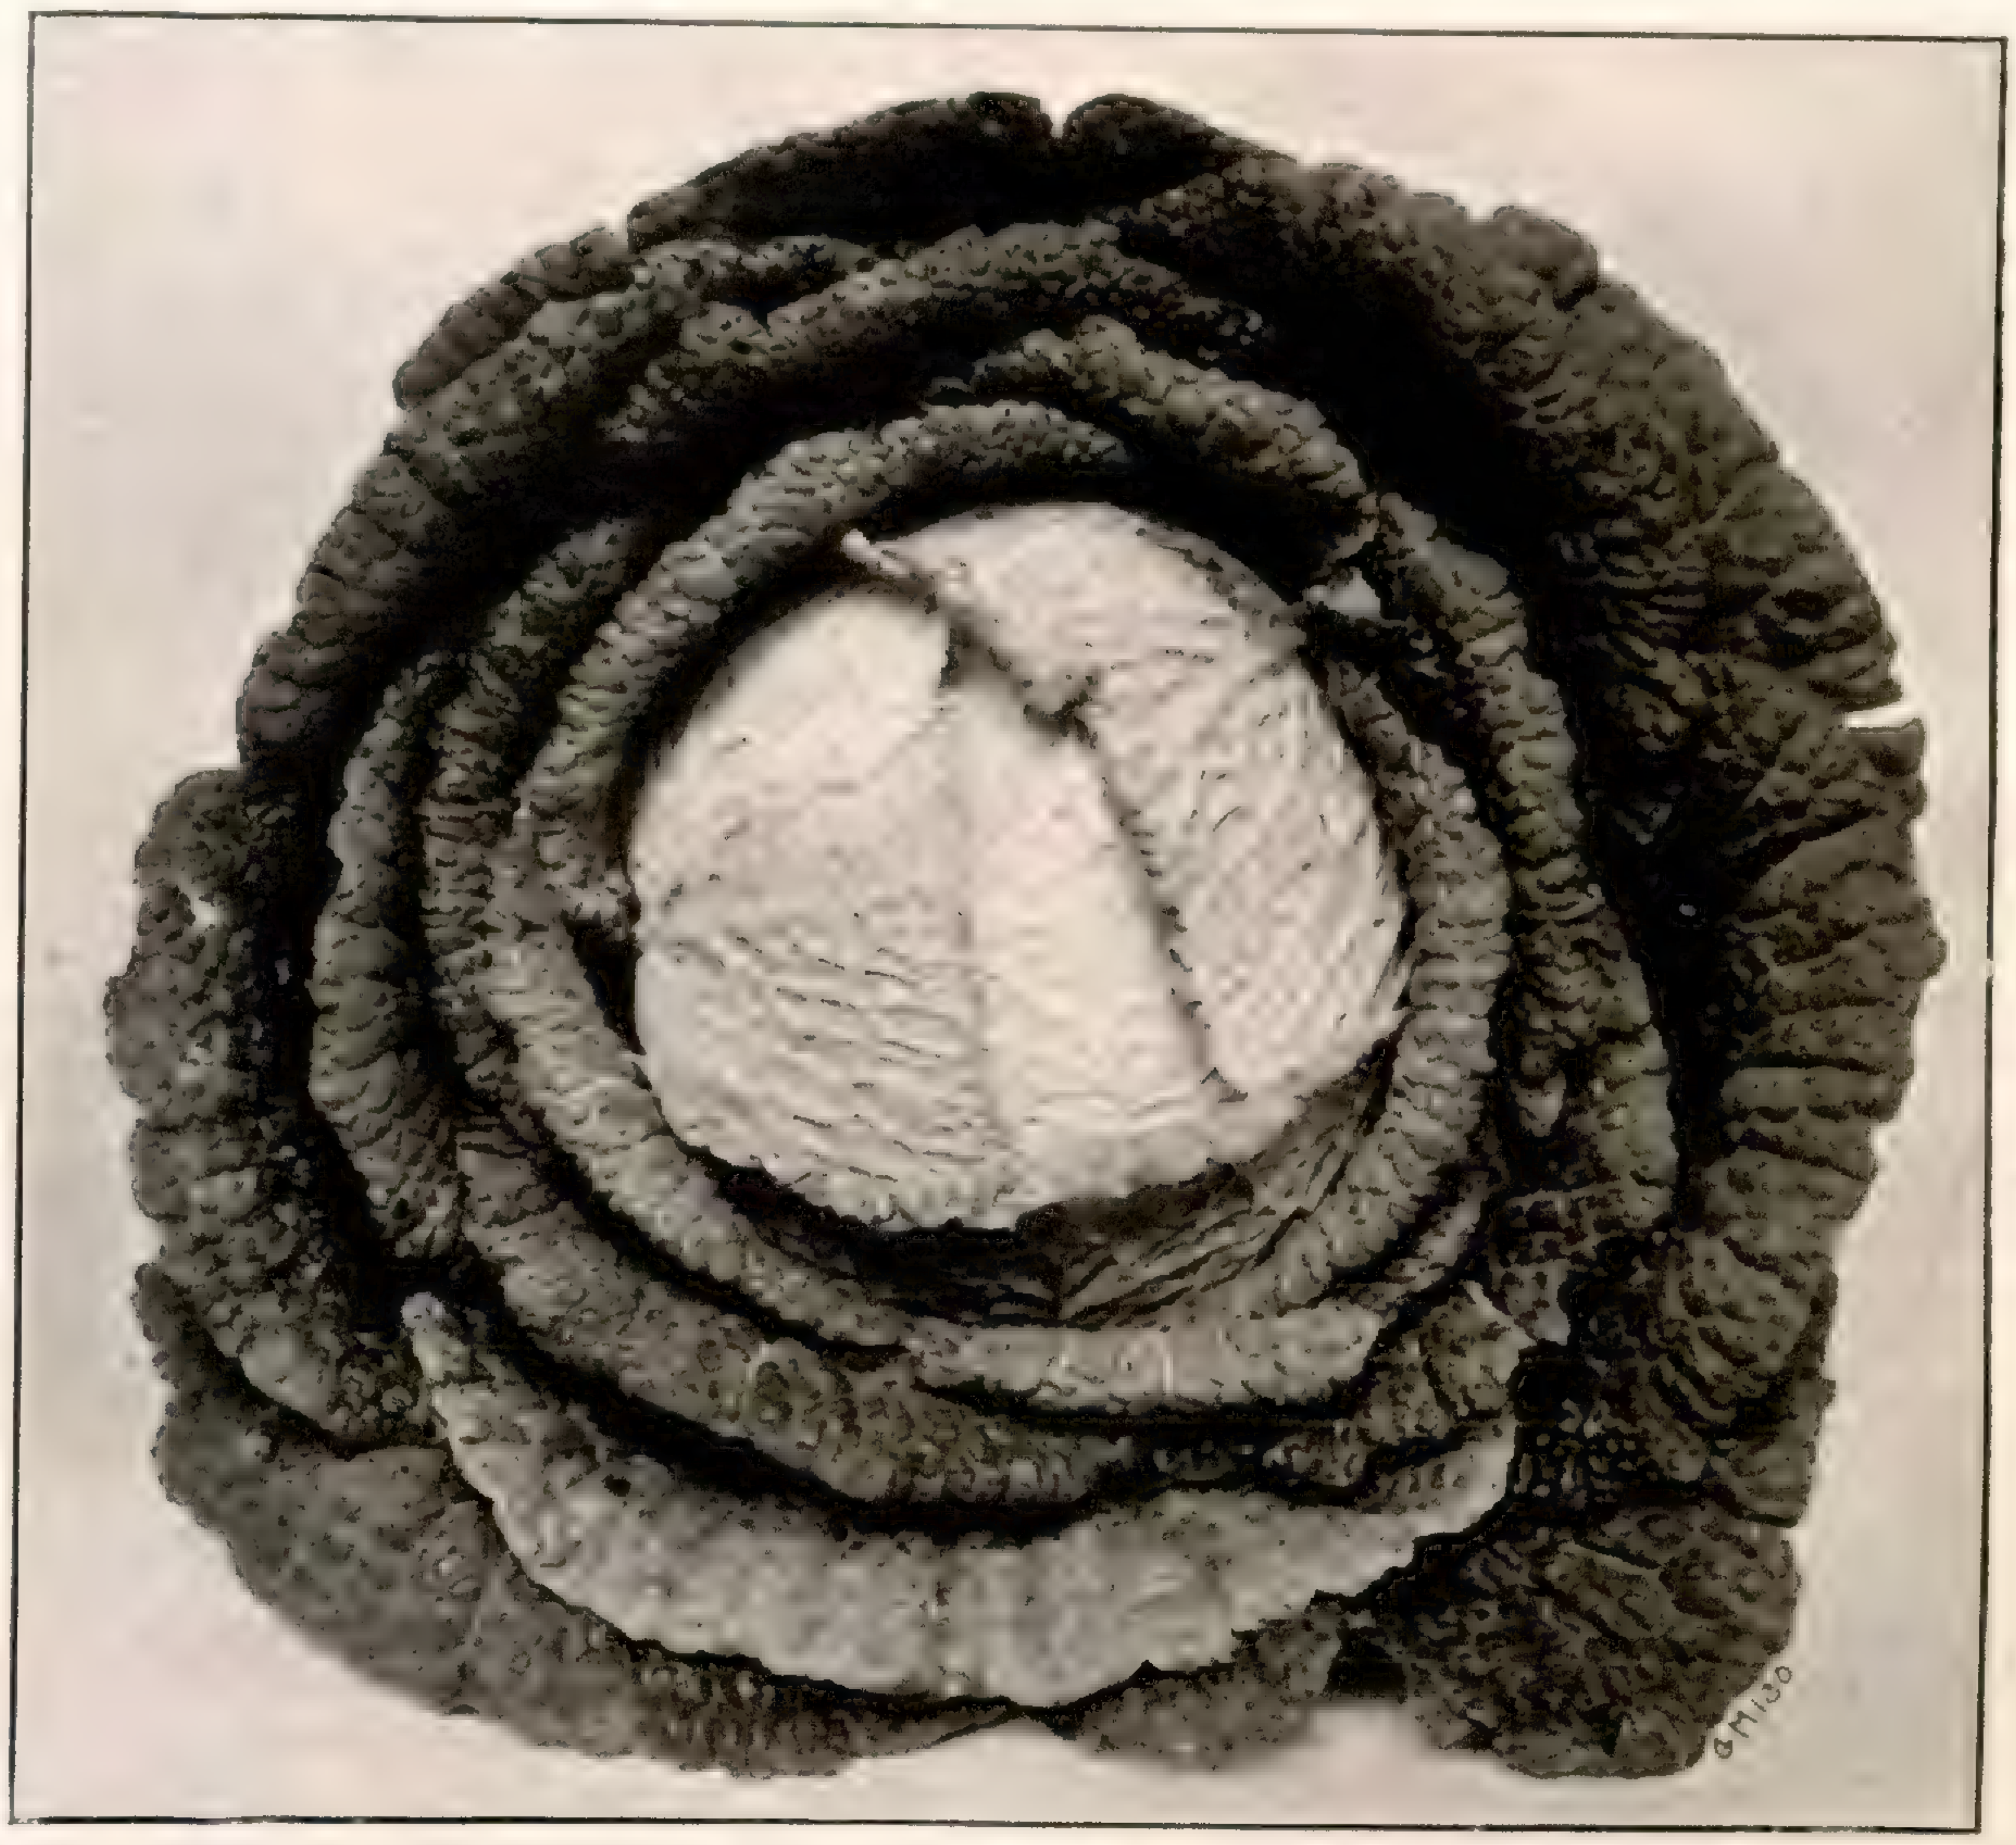
Inexperienced cultivators should insert cuttings in a light compost under a handlight, or in a propagating frame. Directly they have rooted pot them singly in small 60's, and use a mixture of fibrous loam and peat in equal quantities, adding freely some sweet leaf-soil and coarse sand. At each of the subsequent repottings a similar compost may be used, but in a rougher condition. The leading shoot should be pinched when it is five inches high, then side shoots will grow freely, and lay the foundation of bushy plants. From June 10 to the first or second week in September keep the plants in a frame.

G. B.

## SAVOYS.

The crinkly-leaved cabbages so popularly known as savoys are among the most serviceable of winter greenstuffs, and they are extensively cultivated both in private and market gardens. One mistake frequently made is that of sowing the seeds too early and planting the seedlings on very rich land. The result of such practice is that the savoy heads become excessively large, and if sharp frosts follow wet weather there is wholesale bursting, and so a large amount of useful material is wasted. Good soil is essential, but savoys should not be planted on excessively rich land.

Instead of sowing savoy seeds in March, as is so frequently done, it is far better to wait until the first week in April, and then sow in the same manner as for cabbages, sprouting broccoli, kales, etc. Another sowing towards the end of April is also desirable where a fairly large supply has to be maintained. Planting should take place as soon as the seedlings are fit to transplant, and a site that has been occupied by peas will be an admirable one. Whatever crops the savoys have to follow should be merely cleared off, the land being cleaned at the same time; but no digging should be done, as firm soil is quite half the battle in securing hardy plants and good, useful heads. It may be necessary to use an iron bar to bore the holes with for the reception of the plants, and if this is the case it is all so much to the good. Water the plants, and make them firm in the holes, and then little beyond surface hoeing will be needed to ensure a moderate and continuous growth.



DWARF GREEN CURLED SAVOY.

Good varieties are Dwarf Green Curled, Perfection, the small Tom Thumb, Early Dwarf Ulm, and Drumhead, the latter a very large variety, and on that account grown extensively for market where size is important.

## GAZANIAS IN THE GARDEN.

These richly-coloured flowers are not grown in the flower garden as extensively as they were 25 or 30 years ago. I do not know of any other flower that can replace Gazania rigens as regards the colour. The rich, orange-coloured petals, with the black eye or centre, combine to make a flower of great distinction. It has always been a great favourite of mine, and I have grown it extensively and in various positions.

To secure the very best effect, the cultivator should avoid the use of a very rich soil, as a too luxuriant plant does not flower freely. Furthermore, when grown in large masses, or forming broad edgings to beds, the general effect is much more pleasing than that obtained from thin planting.

Cuttings may be rooted in autumn and in spring. The autumn-struck plants are the most satisfactory as regards freedom of flowering. Spring-struck plants flower more sparsely unless the roots are restricted considerably. Some old mortar rubble should be mixed with the compost in which the plants are grown, both in pots, boxes, and borders. After they are well established a rather dry condition of the soil induces freer flowering, but, of course, the plants must not be allowed to suffer in this way, and when dry spells of weather come watering can be nicely regulated. For planting on dry banks, hot, sunny borders, and for furnishing baskets, boxes, and vases, gazanias are very suitable. There are several very beautiful varieties, but I think splendens, with its rich orange, black and white flowers, is the best for the garden.

Geo. Garner.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CALANTHES are among our most useful winter-flowering orchids. They will now have started into growth, and the earlier flowering sorts will need repotting. On no account should the plants ever be allowed to remain a second year in the same compost; for, however good it may now appear, it will become in a most unsuitable condition long before the plants have finished their season's growth. When the new growths are a few inches high, and about to push forth new roots, is the best time to repot. Turn the plants carefully out of their pots, and shake away the exhausted soil, cutting back the old roots to about an inch in length; these root stumps will assist in keeping the pseudo-bulbs in position, until the plants are established in the new compost. Previous to repotting, carefully examine and clean each pseudo-bulb. Large or small pots may be employed according to the requirements of the plants, and the uses they are to be put to when in bloom. The strongest bulbs should be potted up separately in five inch and six-inch pots. The pots should be clean, and about half-filled with clean crocks covered with sphagnum moss. The compost should consist of peat and fibrous loam in equal parts, from which all the fine particles have been taken; add some sphagnum moss and dried cow manure. Press the compost moderately firm around the base of the pseudo-bulbs, and fill to within three-quarters of an inch of the rim of the pot, thus leaving sufficient space for watering and top-dressing. Warm the compost before use. After potting stand the plants in a light position in a house where the temperature ranges from 65 to 70 degrees by night, with a rise of 10 to 20 degrees by day, and give a light shading during the hottest part of the day. No water should be given until the roots are seen to be pushing into the new compost, but a moist, warm, genial atmosphere is necessary during the whole of the time the plants are making their growth. When each plant becomes firmly established in its new compost, and is nicely rooted, an abundance of water may be afforded, with an occasional watering with weak liquid manure. The calanthes now in bloom, such as C. Regnieri, C. Sanderiana, and others, will also require repotting after the spikes are cut and growth recommences

PROPAGATION. — These deciduous calanthes may be easily propagated by taking off the old back-bulbs and the tops of the new ones, and placing them close together in shallow pans upon a layer of sphagnum moss in a warm, moist position, in the hottest house; they will soon push forth growth, and may be potted up and treated as previously advised. — J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

MYRSIPHYLLUMS. — Trails of these twining plants are much in request for table and other floral decorations all the year round. Last year's plants, if shaken out and repotted now into 7in. pots and grown in heat, will quickly throw up their stout basal shoots, when they may be placed in the position they are to occupy against a wall or partition in a warm house for supplying trails for early cutting. To form a succession to these, seeds should be sown, and when the seedlings are two or three inches in height put two or three together in thumb pots; given good cultivation these will soon be ready for 48's, in which size pot they may remain for one season. When grown in pots the trails are more compact than when grown in a bed or border; therefore are better adapted for the use to which they are generally put. Fine green twine should be used for the trails to entwine themselves upon, as then, when cut, there is no need to withdraw the string before use. As the trails are cut, place a new string in position to receive other growths, which are generally abundant. The two best to grow are M. asparagoides and M. myrtifolia. When well established give frequent applications of liquid manure

TABLE PLANTS.—The most promising of the young crotons, dracænas, pandanus, Panax Victoria, Abutilon Sawitzi, and the like, that are required for table and other decorations in the dwelling, should be selected at an early date, and given special treatment, to ensure symmetrical specimens, in 48-sized pots as soon as possible. These should not be crowded among the general collection of stove subjects.

PALMS.—In most gardens these indispensable plants are much used in the dwelling-house, and often they receive somewhat rough treatment. Now is a good time to overhaul the stock, repotting those that require a shift and top-dressing others. For the most robust growers use a compost of three parts sand loam to one of leaf-soil, adding a little decayed manure, sharp sand, and sifted mortar rubble. Pot firmly, and leave plenty of room for applying copious waterings. The less robust varieties should be potted in a rather lighter soil, adding plenty of finely broken crocks and charcoal to keep it open. A few small plants should be purchased at this season to replace worn-out or overgrown specimens.—H. T. Martin, Warren Wood Gardens.

## THE FLOWER GARDEN.

ROSES.—It is now time to commence the pruning and training of climbing roses, and in doing this it is well to remove any dead growths first by cutting them right out from the base. The remaining shoots will need careful thinning, as nothing is gained by training them thickly, but the older branches that are showing signs of weakness should be cut away, and young growths trained in their places. Endeavour to arrange the growths so as to cover the amount of space at disposal evenly, and when dealing with very strong shoots it is advisable to shorten them back to about one-third their length. If it is desirable to retain the branches full length of any particular variety, they can be induced to break into growth and flower all along their stems by bending them over and fastening them to pegs in the ground, afterwards securing them in their permanent places. Tea roses that have been protected during the winter should now have their protecting material removed, but it is well to defer pruning them until a little later. Hybrid perpetuals can be dealt with at once, and it is well to cut back newly planted roses to within about three buds of the base.

GLADIOLI AND MONTBRETIAS.—The present is a good time to plant these, and whether they are grown in the mixed flower borders or in beds by themselves, thorough cultivation of the soil is necessary if they are to be a success. They look well in the mixed border planted in groups of one colour. Cover them with four inches of soil, and have a little leaf-soil placed around the corms when the natural soil is stiff and heavy. Among the montbretias Prometheus is an especially handsome variety, and Lady Hamilton, George Davison, Germania, Westwick, and Lord Nelson are some of the best.

SPRING FLOWERS.—The recent mild weather has brought on the spring flowers rapidly, and various subjects are already quite gay. Stir the surface soil in flower beds with the Dutch hoe, and keep everything smart and tidy. Snowdrops and aconites have been rather short-lived this year, but the lovely chionodoxas and the crocuses are very bright. Anemone palsatilla is flowering gaily, and Erica carnea is a mass of bloom, while Daphne Blagyana is already flowering profusely, and forms an object of especial beauty in the rock garden.

TUBEROUS BEGONIAS.—It is now time to start these into growth, and a good plan is to place the tubers in boxes half-filled with leaf-soil in a fairly warm house until growth is active, when they can be put separately into small pots, using a light open compost. When they are first started little moisture is required except that provided by the syringe. When they have become established in the pots remove them to a cool house or frame where they can gradually be hardened off.

ANNUALS.—To produce sturdy plants most kinds should be sown now in boxes of fine soil or in a cold frame. When they are large enough prick them out to obtain strong plants for planting in the flowering quarters. The kinds recently enumerated in the Gardeners' Magazine are all recommended for garden adornment. The middle of April is soon enough to sow in the open ground.—J. Gardner, Batsford Park Gardens.

## FRUITS UNDER GLASS.

MELONS.—When the leading growths of the earliest plants have attained a length of three feet, the points should be pinched out to induce the development of fruiting shoots; stop the laterals which show fruit at the second leaf beyond the fruit, and all unfruitful laterals should be pinched back to two or three leaves. We do not allow any laterals to grow below the trellis; these are rubbed off as soon as they appear, but every care is taken of the leaves, from the soil upwards, to accelerate the swelling of the stem in proportion to the quantity of leaves and laterals it has to sustain upon the trellis. We adopt the system of pollinating the flowers as soon as open. The atmosphere of the house is kept fairly dry during the flowering period, air being admitted on all favourable occasions; syringing is withheld for four or five days, or even a week, and each flower is pollinated during that period. This method does not, of course, allow all the fruits to be "set" at the same time, but we have never found that it materially affects the swelling of the young fruits if strong healthy plants are maintained. In fact, we find under this system that the ripening of the fruits is prolonged, which is of the utmost importance where a constant supply of melons is required.

PINE-APPLES.—Endeavour to shift the plants that require it as soon as possible into their fruiting pots, using a compost as recommended in a previous calendar. The soil must be thoroughly warmed before being used, and rammed firmly around the sides of the pot, and well up around the collars of the plants; the compost should be in a fairly moist condition when used, as this will obviate the necessity of watering for several days. After potting, plunge the pots up to their rims in the fermenting material, close the ventilators, and syringe the plants early in the afternoon to induce the roots to push into the new soil. Maintain an atmospheric temperature of 80 to 85 degrees, and admit air when the weather permits. With the lengthening of the days and more sunshine, it will be necessary to examine fruiting plants two or three times a week, and those requiring water should be given a sufficient quantity of tepid water to thoroughly soak the soil; applications of liquid manure or some chemical fertiliser should be given once a week.

SECOND EARLY VINES.—Any vines that have been tied down to ensure an even break should be returned to the trellis. When this is accomplished, commence to disbud directly it can be ascertained which are the best growths to select. Nothing is gained by allowing the shoots to remain crowded before proceeding with this operation. Increase the night temperature to 65 degrees, with a temperature of 70 to 75 degrees in the day time, allowing a rise of 10 degrees with sun-heat. Administer water to the borders if necessary, and create a moist, humid atmosphere by damping down the paths and walls several times a day, spray the rods lightly, and close the house early in the afternoon to nurse the sun heat as much as possible. Do not allow the hot-water pipes to become overheated at any time, or this will probably cause the foliage to become infested with red spider.—Henry R. Farmer, Cardiff Castle Gardens.

THE HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.

THE TWENTY-FIRST SHOW
of the above Society will be held in the CITY HALL, VICTORIA SQUARE, HULL, on WEDNESDAY and THURSDAY, 20th and 21st NOVEMBER next.
Schedules Free.
JAMES DIXON,
County Buildings, Hull, Hon. Secretary.

THE PERPETUAL-FLOWERING CARNATION SOCIETY.
GREAT SPRING EXHIBITION, THURSDAY and FRIDAY, March 21st and 22nd, 1912, HORTICULTURAL HALL, VINCENT SQUARE. Nine Silver-gilt and Silver Challenge Cups offered for Competition. Special Classes for Amateurs. Also Conference on Carnations (First Day of Show), March 21st., at 3.30 p.m. Admission 1s. For schedules, etc., apply E. F. HAWES, Ulysses, Fortune Green, London, N.W.

WOLVERHAMPTON.

GREAT FLORAL FETE, July 9th, 10th, 11th, 1912.

£900 IN PRIZES.

Schedules on application to the Secretary (post free), R. F. AMPHLETT, 80, Darlington St., Wolverhampton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## National Dahlia Society.

This society held a conference at Carr's Restaurant, Strand, W.C., on Friday, March 8. Owing to the inclement weather, the attendance was not so large as at the 1911 conference, but many of the prominent growers and raisers were present.

The President, Mr. George Gordon, V.M.H., opened the proceedings, and in doing so expressed the pleasure he felt in meeting so representative a gathering of those who were specially interested in the dahlia and its cultivation. He felt, and he had no doubt that those present shared in his feelings, that the National Dahlia Society had acted wisely in adopting the policy of holding a conference annually. Such gatherings could hardly fail to greatly stimulate the interest in dahlias, and to be of much value to those who are engaged in their cultivation. To the veterans of the cult an interchange of views on various matters connected with the flowers was beneficial, but to beginners it was an immense advantage to have an opportunity of obtaining from experts advice on cultural methods, selection of varieties, etc. He said he had a long-founded regard for the show flower, but felt that it was the duty of the society to encourage every section of the flower, and so enlist the sympathy and support of as large a number of dahlia-lovers as possible. He then called upon Mr. George Davidson to address the meeting on

### THE CULTIVATION OF DAHLIAS IN A TOWN GARDEN.

Mr. Davidson said: The amateur with the small garden in the suburbs is at a great disadvantage in cultivating his flowers, compared with his fellow in the country, or farther from town, where there is the advantage of more space and air. If exhibiting be his aim, then his difficulties increase, and with such flowers as the rose and sweet pea it is practically impossible for him to be able to compete on anything like equal terms with those more fortunately situated.

Not so, however, with the dahlia, for with the possible exception of the carnation, there is no flower more suited for growing in the suburbs, either for exhibition or the decoration of the garden.

Of course he has to face difficulties, but provided he is keen there are very few, if any, that cannot be got over with a little ingenuity and work. Soil, aspect, trees, etc., he has very little choice but to take as he finds them.

The first presents no real difficulty, as I think dahlias can be grown well on practically any soil, provided it is properly prepared. I have grown exhibition blooms on sandy soil, soil with a subsoil of brick-bats, sardine tins, etc., and now on a wet stiff clay. Aspect, of course, cannot be altered, but unless the garden is entirely shaded dahlias of one section or the other can be successfully grown.

Trees I find the greatest disadvantage. If the suburban gardener is fortunate enough to have a plot without any, or only a few small ones, then all is plain sailing. However, the majority of modern gardens are, as a rule, parts of some old estate, and his small space is as often as not occupied with one or two old trees of the forest kinds. If he requires a larger garden he will almost invariably find it attached to an older dwelling and contain a number of fully-matured and well-developed fruit trees, which, whether fruitful or the contrary, are generally highly prized by the landlord. I have always found it extremely difficult to obtain his permission to remove these obstacles to successful cultivation of flowers. If the garden is comparatively free from trees probably a neighbour makes up for it by taking a fiendish delight in growing as many of the strongest varieties as he can close to your fence, so that you get the full advantage of the roots. On one side of my garden I have to contend with a row of willows, which on the wet soil flourish amazingly. I very soon decided that the pompon dahlia was most likely to succeed here, so after cutting away as many of the large branches hanging over my garden as I could (which, by the way, must be done with a certain amount of tact to prevent unpleasantness), I proceeded with the help of a pickaxe, and a navvy, to get out as many of the roots as I possibly could, the whole piece of ground being thoroughly broken up to a depth of two feet or more. In this ground I planted my dahlias, with partial success. I managed to get plenty of exhibition bunches from those placed farthest from the trees, but those nearest the stems came with bad centres, or showed eyes, in spite of continual watering and feeding. The trees were taking practically all the moisture, while under the plants the ground was quite dry.

The next year I tried a slightly different plan. After digging the ground thoroughly, which in the meantime had become full of fibrous roots, I inserted in the soil nearly up to the rim a six-inch pot, against each plant; this was placed close to the stick before planting, so as not to damage the roots. These pots were filled two or three times in the evening, and about three times a week, with water, in addition to the ordinary watering. This was quite successful, and it was a rare thing to have blooms with bad centres, at any rate during September and early October.

I place nearest the trees those pompons which naturally produce rather large blooms, and therefore there is not the same difficulty in getting them small enough for the shows as when grown in naturally good soil. On the other hand, feeding is sometimes required to keep them up to the necessary size.

A number of amateurs experience difficulty in getting some varieties sufficiently small for the early exhibitions. This can be obviated by growing plants from old tubers, which will give an earlier and large display of bloom of the right size.

The small amateur very often makes a big mistake when growing for exhibition by having too many varieties and too few plants of each. Find out what does best with you, as what will do well in one garden may not in another, and plant three or four plants of each. Personally, I consider if one cannot get a good bunch of six blooms from four plants that variety should be discarded, as however pretty it may be, if it is a shy bloomer, or only gives an occasional good flower, there is no room for it in a small garden.

In my garden I can generally depend on the following varieties to give me good exhibition bunches: Adelaide, Phœbe, Cyril, Little Bugler, Nerissa, Queen of Whites, Daisy, and Montague Wootton.

Now, though it is possible to obtain good blooms of both the pompon and single dahlias when grown under trees, provided they are not so large as to exclude too much light and air, I have never succeeded in getting show and cactus varieties to do well in this position. The blooms can be had large enough, but invariably lack substance and depth. It is therefore necessary to have a piece of ground as free as possible from the influence of roots.

The great objection to growing the cactus dahlias is the large amount of room they take up. Though they certainly require more ground than the other varieties, they can be grown, at any rate for exhibition, in a much smaller space than is generally advocated by those with more ground at their disposal.

I use a plot 12ft. wide from walk to fence; this is divided up into 5ft. beds, with 1½ft. between them. Eight plants are put in a bed, in two rows. Of course, at this space there is a great deal more work and inconvenience than when grown at a more orthodox distance, but this is better than not growing them at all.

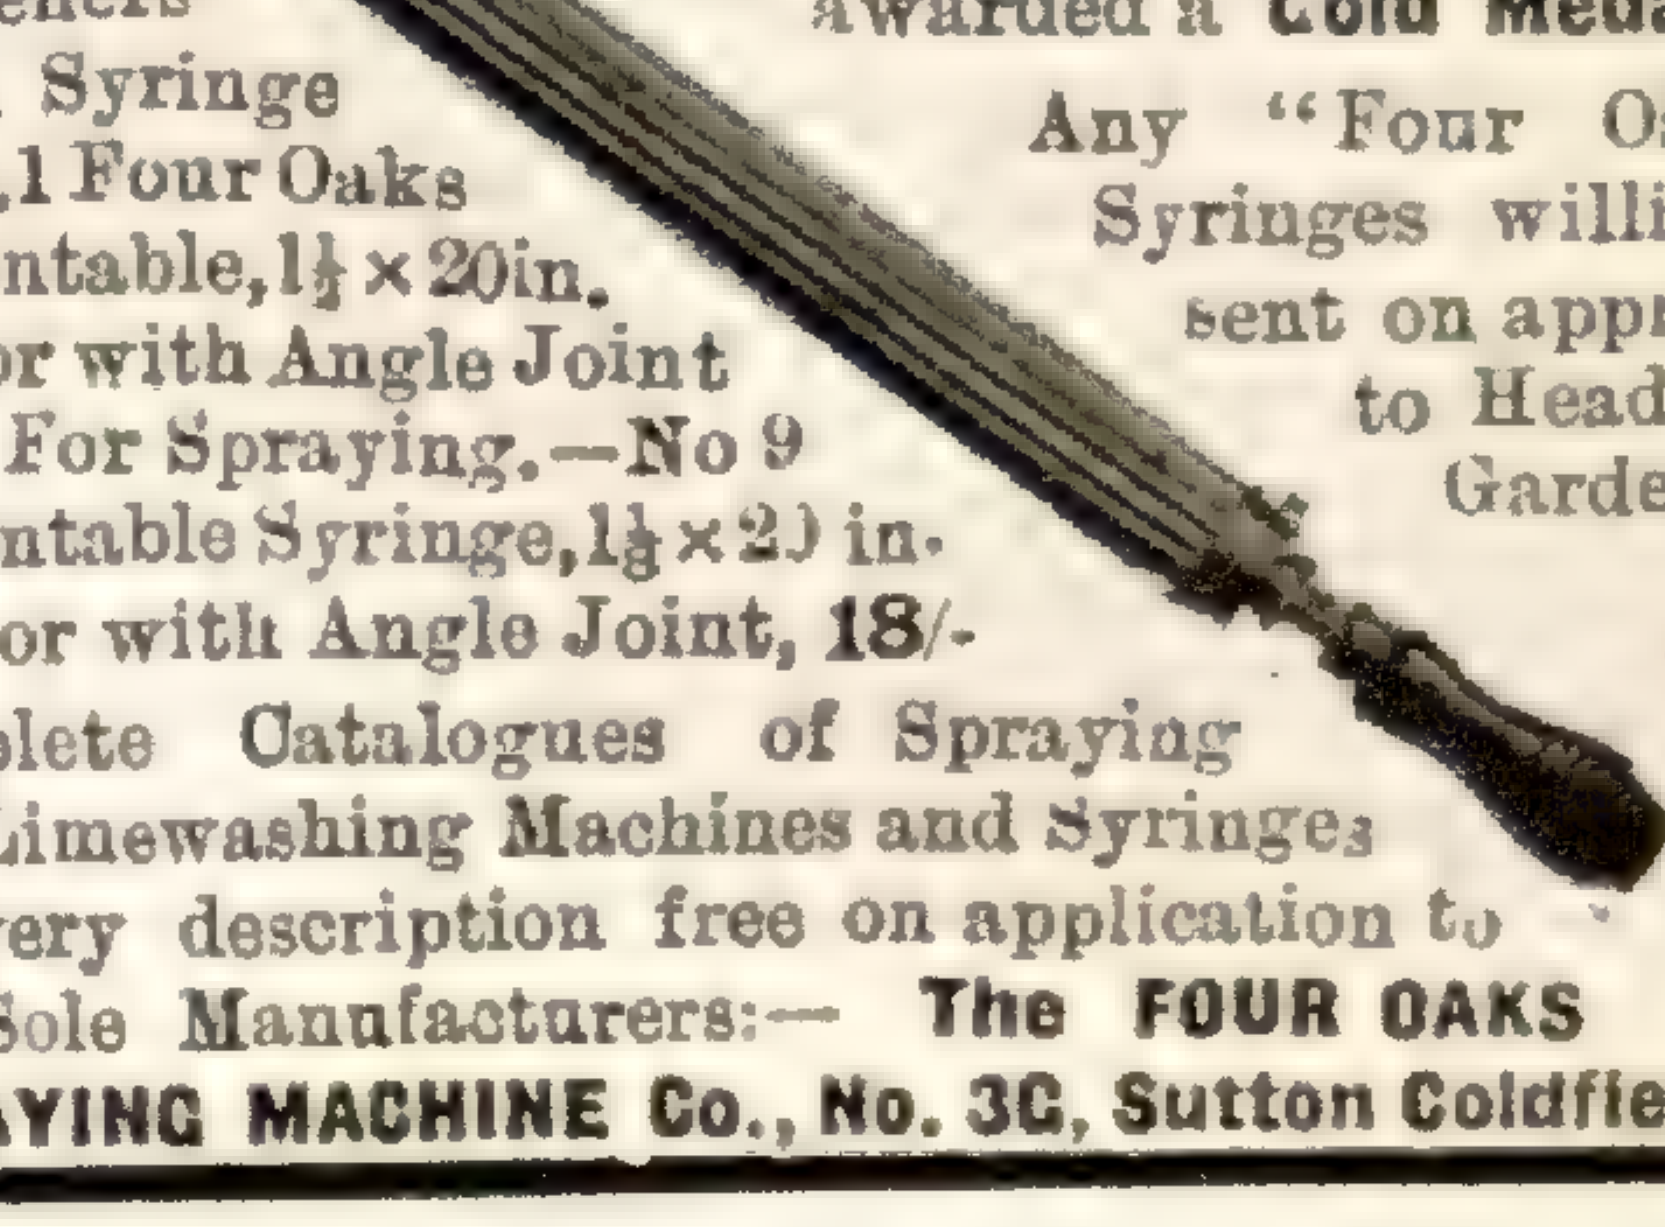
The greatest trouble is to prevent the blooms getting damaged by being blown about by the wind, and thus coming in contact with neighbouring plants. This can be prevented by tying the stems of the bloom to bamboo canes, placed at intervals around each plant. One advantage of close planting is that blooms may be more readily protected from the vagaries of the weather by judicious tying. Thinning out the laterals will have also to be more severely done so as to allow the plants to have all the air possible.

From a decorative point of view close planting cannot be recommended, as the plants will make too much growth and the blooms would not be seen. I consider that the gardener with a limited amount of space will find it more satisfactory to grow the singles and pompons, as they not only take up less room, but give a far more plentiful supply of blooms than the majority of cactus dahlias seen on the show board.

It will be found that dahlias, more especially the cactus sorts, grow considerably taller in the suburban garden than in the country; taller stakes should therefore be used, or there will be danger of their being broken down by the autumn gales.

I have also noticed that they are generally later in blooming. If a bud does not appear about the beginning of July, I invariably pinch out the centre of the plant, and when necessary give a few light doses of nitrate of soda, which will cause the side shoots to start away vigorously, and plenty of bloom should be had by show time.

I have not attempted to go into cultural details in this paper, as the proceedings are exactly the same whether the garden is large or small, and full particulars have already been given from time to time. However, watering, and probably feeding, will have to be indulged in more freely. Very often, even after a couple of days' rain, I give my plants a good soaking, as it must not be forgotten that trees and other plants take much



→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No. 1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅓ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3G, Sutton Coldfield.

moisture, and while growing as they are rather close together, and staked out, they act as a kind of umbrella, and probably very little of the rain actually reaches the roots. This, in my opinion, is more often than not the cause of single blooms and bad centres.

Dust and soot, especially if your garden is near a railway, will soon ruin your light-coloured blooms if they are not protected by some means. I use shades of transparent water-proof paper, fixed on wire frames, and as they fold up flat when not in use they take up very little room in the winter.

That dahlias can be grown successfully for exhibition in the suburban garden is shown by the number of competitors who enter at the National Dahlia Society's shows, and as they are very often prize-winners, it is at once apparent that they have nothing to fear from those more fortunately situated.

### DISCUSSION

Mr. Davidson, in answer to one member, said he did not use any other than natural manures, in liquid form, after the flowers were set.

Mr. Lee asked how much pruning should be given in a town garden, and the lecturer said it must be severe for exhibition blooms, and he considered the plants should be not less than 2½ft. to 3ft. apart, more if possible. Mr. S. Mortimer said 4ft. apart was the usual distance to plant for exhibition flowers.

### DECORATIVE, PÆONY-FLOWERED, AND COLLARETTE DAHLIAS.

This was the subject dealt with ably by Mr. J. B. Riding, and we hope to publish his paper in full in an early issue.

After describing the various groups mentioned above, and speaking highly of their usefulness, a brisk discussion followed.

Mr. Joseph Cheal opened the discussion, and said he confessed to some conservatism with regard to pæony-flowered and collarette dahlias, but he quite understood that both groups were fine for garden decoration, especially at a little distance from the eye or house. Disbudding should not be practised, as this would mean weak stems and huge flowers. Of the collarette varieties he liked the rounded forms best. It would be a good thing if old dahlia lovers would cast aside all prejudices and predelictions and remember that there is a place for all and every section of dahlias, and that each finds some admirers and each has distinct uses.

Mr. J. T. West said he could not find much decorative value in the giant decorative sorts. He had done some work among pæony-flowered dahlias, and humorously told of his original experience with the earliest Dutch-raised sorts, from which he obtained some very fair seedlings, including Liberty. Disbudding should not be practised in this section, as it would spell ruin to the section. He said he only obtained two good varieties out of 1,200 seedlings, and he found that it was easier to raise good cactus varieties than good pæony-flowered varieties. Dahlias for garden decoration should, he considered, only be judged when shown without wires or dressing.

Mr. Stephen Jones said the giant, like Gustave Douzon, was one of the finest decorative dahlias if it was looked after a little, and if a man would not look after his plants he should be content to grow groundsel. The collarette dahlias were of great decorative value also if given moderate attention.

Mr. Wyatt said that the more sections of dahlias there were the more people would be pleased; therefore it was folly to condemn any section. There was, he considered, room for considerable improvement in the colouring of pæony-flowered dahlias.

Mr. Emberson said all his flowers of Bertha von Suttner and South Pole pæony varieties came double in 1911, and he wondered whether anyone else had a similar experience. Mr. West said the dry season had a good deal to do with the doubling. Mr. C. H. Curtis spoke of the high value of large decorative and pæony-flowered dahlias, when cut, for large floral effects in halls and churches, etc.

### CONCLUSION.

Mr. J. Wyatt very pleasantly proposed a vote of thanks to Messrs. Davidson and Riding for reading such useful and up-to-date papers; this was seconded by Mr. J. T. West, who thought the conference would be the means of increasing the amateur membership of the society. The vote was heartily accorded, and a similarly hearty vote to the president concluded the proceedings rather before 8.30, so that those from some distance could get home at a reasonable hour.

---

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 5th inst. Mr. Massie, the president, was in the chair, and there was an attendance of 100 members.

Dr. John H. Wilson, lecturer on agriculture in St. Andrew's University, gave an address on "Fruit-growing in Australia." The lecturer was a member of the Agricultural Commission which was invited by the Commonwealth Government to report on the rural economy of Australia. Using slides made from photographs taken on the way, Dr. Wilson showed that fruit-growing was carried on vigorously in all the States of the Commonwealth. In the higher ground of southern Queensland the apple, peach, etc., were successfully grown, while in warmer regions the banana and pineapple were deservedly in favour. The orange succeeded well in all the States with the exception of Tasmania. Probably the orange was the most profitable fruit crop in New South Wales, although apples, pears, and stone fruits were also extensively grown. In Victoria the irrigated areas were largely under fruit, but orcharding was likewise a very important industry in regions dependent on surface water collected in dams. Special reference was made to examples of the latter system at Doncaster, near Melbourne, where lemons, apples, pears, apricots, plums, and cherries were grown with marked success.

In Tasmania the apple occupied more than two-thirds of the orchard areas. The production of that fruit was being rapidly increased there, more especially on the banks of the Tamar, in the northern part of the island. Following the example set by Victoria at Mildura, on the Murray, the South Australian Government was reclaiming large portions of land for fruit-growing further down the river, the water being raised by powerful pumps and distributed in concrete channels. In Western Australia, in the elevated country lying between Perth and Albany, apple-growing was being greatly extended, the soil and climate being very suitable for the industry. The rapid advance of apple-growing in Tasmania and Western Australia is mainly due to the good prospects which the London market offered for the fresh fruit, which arrived at a time when supplies from home and elsewhere were exhausted.

Exclusive of vineyards, the area under fruits in the Commonwealth was one hundred and eighty-five thousand acres. Dr. Wilson pointed out that the growers everywhere received much help from experts employed by the respective States. In this connection he mentioned that recently the Commonwealth Government had instructed the noted vegetable pathologist of Victoria, Mr. D. McAlpine, to devote his whole time for four years to the problem of checking the ailment of the apple called "bitter pit." The cost of the investigation during that time would not be less than £8,000. Great attention was paid to the testing of suitable varieties in experimental orchards. These were often connected with the State farms or the agricultural colleges. Systematic instruction in orchard work was given in the colleges and other institutions. In certain States provision for cold storage was made by Government.

On the motion of Mr. Comfort, Dr. Wilson was accorded a very hearty vote of thanks for his interesting address.

The exhibits were: Apples, Dr. Robertson and William Robinson, from Mr. Charles Webster, Gordon Castle Gardens, Fochabers; new perpetual-flowering carnations, including White Wonder, Una Wallace, Lady Northcliffe, British Triumph, Regina, Scarlet Glow, and the latest American introduction, Gloriosa, from Messrs. Todd and Co., Edinburgh; cyclamens from Mr. John Black, Inverard Gardens, Edinburgh; collection of tulips from Mr. James Bruce, Springfield Nursery, Davidson's Mains; decorative chrysanthemum J. G. Day, from Mr. Alex. Porter, Davidson's Mains; Dawe's Champion Early rhubarb (forced and unforced), from Mr. James Scarlett, Sweethope, Musselburgh.

The apples Dr. Robertson and William Robinson, exhibited by Mr. Webster, received each a Certificate of Merit; Mr. Black was awarded a cultural certificate for his cyclamens, and the exhibit of carnations by Messrs. Todd and Co. was very highly commended.

Mr. William Cuthbertson, J.P., will deliver a lecture at the meeting on April 2 entitled "Sweet Peas up to Date," with lantern illustrations in natural colours.

---

## United Horticultural Benefit and Provident Society.

The annual meeting of this society was held at the Royal Horticultural Hall, Westminster, on Monday evening, March 11. Mr. C. H. Curtis presided, and the attendance of members was an unusually large one for such an occasion.

Quite early in the proceedings the Chairman moved a resolution conveying to Leopold de Rothschild, Esq., the society's patron, the heartiest congratulations of the officers and members upon his providential escape from death by assassination a week previously; this, needless to say, was carried unanimously.

### REPORT OF THE COMMITTEE FOR 1911.

The following is the substance of the report presented:

The net benefit membership is 1,358, unfortunately less by eight than it was a year ago; and instead of having enrolled seventy new members as in the year 1910, only fifty have been added. Doubtless the exceptional circumstances in which all friendly societies were placed last year, owing to the legislation of the Government, account for this, and the committee is in no way alarmed or despondent, but hopes that the old progressive condition will have been regained, when the members and potential members have become accustomed to the new conditions that have arisen as the result of the passing into law of the National Insurance Act. Forty-five members have lapsed, twenty-five from the higher scale and twenty-one from the lower; twenty members have gone abroad, six have died, and two have passed the age of seventy years.

Among the deceased members, the committee has to name, with sorrow, G. Attrill, A. J. Brown, Charles Foster, and G. Thompson. Mr. James George, who was one of the founders of this society, and for many years one of its trustees, died in March last year, when the previous annual report was in the press.

The total amount paid out to the nominees of deceased members was £248 12s. 4d. In regard to the lapsed members, though their numbers are considerable, the percentage is certainly not higher than in any similar society. These lapsed members, however, do not forfeit their deposit balance; indeed, one member, who lapsed thirty-eight years ago, applied for, and promptly received, the amount of 13s. 4d. owing to him.

The total amount of sick pay to benefit members during the year was £507 12s., being £53 8s. 6d. less than in the previous year, and over £63 less than in 1909. The chronic sick pay amounted to £102 6s., being nearly one-fifth of the total sick-pay account.

Seven hundred and eighty-eight members are paying on the higher scale, and five hundred and seventy-two on the lower. Twenty-eight members have taken advantage of Rule xviii., par. 3, which enables those who have reached the age of sixty to withdraw "twice the amount credited to their account as interest in the previous year." By such withdrawals they are furnished with a ready means for the payment of their subscriptions, which is a great boon. One member withdrew £6 12s. 8d. under this rule; and another member who had reached the age of seventy years, by virtue of par. 4 of the same rule, withdrew £42 8s. 9d. from his balance account.

The repeated suggestions to the effect that members who are recovering from an illness should take advantage of the provisions of the convalescent fund, have been better acted upon in 1911 than in some previous years. The amount of assistance from this fund was £10, being 18s. more than the subscriptions. N. N. Sherwood, Esq., founder of this fund, contributed five guineas as usual.

Acting upon the advice contained in the quinquennial actuarial report, published last year, the committee discussed at several of its earlier monthly meetings the question of making a uniform allowance of 5s. to those of its necessitous members who are over seventy years of age. At the July meeting a proposition on this matter was passed to take effect as from January 1, 1912. Subscriptions to the benevolent fund amounted to £220 17s., and the payments therefrom to £90 11s. 6d.

The strictest economy, consistent with the proper working of the society, has been observed. The total management charges amounted to £222 7s. 6d., as against £222 9s. 7d. in 1910; and £195 11s. 10d. in 1909.

During the year the sum of £2,700 has been invested by the trustees, who have purchased the following: £500 L.C.C. 3 per cent. for £429 8s. 6d.; £700 L.C.C. 3 per cent. for £591 12s.; £400 Newport Corporation 3 per cent. for £334 1s.; £300 L.C.C. 3½ per cent. for £298 18s. 6d.; and £800 Middlesex County 3½ per cent. for £772 2s., the total sum being £2,426 2s.

Two members of committee were deputed to watch carefully the proceedings in Parliament in connection with the new Act of State Insurance—the National Health Act. The committee discussed the problems that were raised in regard to this enactment at each of its monthly meetings, and nothing was left undone to safeguard the interest of the members of this society. Efforts were made to interview the Chancellor of the Exchequer, and eventually a conference was agreed to between a deputation from your committee and a representative of the Chancellor. Your committee has also endeavoured to obtain an audience of the Commissioners who have been appointed to administer the Act, but has been unsuccessful. The Commissioners, however, have furnished information as to the interpretation of the clauses and provisions of the Act. In a measure such as this, of a character at once so far-reaching, complex, and novel, its application and bearing upon our particular society, and the relation of our society to it, has provided a problem that has had to be considered discreetly, with caution, and without haste. Special meetings have been held to discuss the Act, and the result has been that the committee looks forward most hopefully to the prospect of this society becoming approved; within the meaning of the Act. The members have been invited, by circular letter, to state their position and opinion in reference to the Act. In conclusion, the committee relies upon the full confidence and support of all the members in the serious work with which it is now confronted, and in which it is engaged. It may be necessary also to exercise the virtue of patience; but the outlook of this society, under the new law, appears promising.

In short, the society provides for sickness, makes provision for chronic illness, renders aid to the distressed, credits each member with a due proportion of the surplus funds, helps the convalescent and cares for the feeble and aged. Every member should act as a missionary of the society and continually preach the gospel of thrift and self-help with intent to secure new members. The financial stability of the society is beyond question, as it has now £41,500 invested.

In conclusion, the committee begs once more to acknowledge the kindness of those who, as honorary or life members, or in other ways, assist the society and help to extend its usefulness and sphere of influence.

The Chairman moved the adoption of the report and financial statement, and took opportunity to review the year's work. He paid special attention to the subject of the National Health Act, and pointed out that 90 per cent. of the members would come under the Act and the rest be exempt from it. He said that, in the event of the majority of members agreeing to approval under the Act, there would be two sections of the society, one as now, and one under the provisions of the Act. He outlined in brief the scheme the committee had in mind, and suggested that in future a member "under the Act" would, on payment of 10d. per week, instead of 9d., obtain the full benefits obtainable under the Act, plus a sum of 4s. per week and other benefits the society was now able to provide. He suggested that there would be a sliding scale of contributions and benefits on the ordinary or voluntary side, so that a member on the "insured" side might elect to pay what he felt he could afford, plus what he would be compelled to contribute under the Act, and, remembering the excellent health record of gardeners, and the satisfactory progress of the society in the past, he said the committee hoped to make the society a most attractive one for young gardeners. The Chairman pointed out that the society need not associate or amalgamate with another society or societies until three years after the enforcement of the Act, and also emphasised the point that the committee would do nothing to commit the members until everyone had had an opportunity of considering the scheme now in progress of formation.

Mr. Burge formally seconded the motion. Mr. Summers said he understood all employed in the manual work of gardening, no matter what their income, would have to contribute to the state scheme. He stated that there was a proposal on foot in the Lea Valley to form a society among those employed in the nurseries and market gardens of the district, for the purpose of administering the Act; a meeting was held recently, at which he was present; he gave the lecturer (sent by the Insurance Commissioners) a copy of the U.H.B.P.S. report. This report evidently came as a surprise to the lecturer, who knew nothing of the society, but who appeared to be so favourably impressed by the working of it that he suggested the Lea Valley gardeners should meet and consider the advisability of joining up with the U.H.B.P.S. instead of forming a separate society. Mr. Summers' statement created great interest. He said a communication would, he believed, come from the Lea Valley men, and he expressed a hope that the Chairman of the "United" would be able to come down, with other members of the committee, and endeavour to draw into the society many hundreds of new members.

Mr. Edwards, Mr. Hill, Mr. Gumbrell, Mr. Frogbrook, Mr. Winter, Mr. Wilson, and others spoke on this matter. Mr. Frogbrook held somewhat pessimistic views, and, feeling he was not in accord with the committee, he was resigning his seat thereon; he made certain statements relative to the future of the society, based on statements made to him by the member of Parliament for the Leyton division. The Chairman asked for references to any part of the Act, or memoranda, on which these statements could be founded, and requested Mr. Frogbrook to be kind enough to furnish the committee with them. The motion was then put and carried.

Messrs. A. C. Hill, T. Winter, and E. F. Hawes were re-elected members of committee. Mr. Creswell fills the vacancy caused by Mr. Frogbrook's retirement; and Mr. Campbell, Roehampton, was elected to the seat Mr. Woods vacates under the age limit. Votes of thanks were accorded the trustees, Messrs. Hudson, Scott, and Curtis, and to the treasurer, Mr. W. P. Thomson. Mr. W. Collins was congratulated on the completion of 25 years' service, and re-elected secretary. The Press was thanked for services so kindly rendered, and a vote of thanks to the chairman brought the meeting to a close about 10 p.m. Besides those mentioned, Messrs. Hawes, J. Wheeler, W. Wesker, and Shelton took part in the animated but pleasantly conducted proceedings.

Eckford's
Giant Sweet Peas

SWEET PEA PERFECTION.

When growing Sweet Peas, grow only the best. To obtain the very best, send direct to ECKFORD for your Seeds; but remember they are only genuine when obtained direct from Wem. Eckford's are the largest retailers of Sweet Peas in the world, and do not supply the trade.

**HENRY ECKFORD, F.R.H.S.,**
**(Dept. 221) WEM, SHROPSHIRE.**

## ANSWERS TO CORRESPONDENTS.

MAYUS PUMILIO.—C. F. M., Chertsey: I have some seeds of a New Zealand plant named Mayus pumilio, but as I know nothing of such a subject, can you please enlighten me and suggest the best method of dealing with the seeds and subsequent plants?—Mayus pumilio belongs to the natural order Scrophulariaceæ, which contains the mimulus, foxgloves, pentstemons, veronicas, and other popular garden plants, but it is not a specially attractive member of that order. It is interesting and distinct, growing vigorously and spreading freely by means of underground stems; it is of lowly growth, rarely exceeding a height of four inches, and its violet and white flowers, borne on slender stems, hardly rise above the spoon-shaped foliage. Should be grown in the rock garden in light soil and a sunny position. Sow seeds at once in light soil and place in a frame or cool greenhouse, prick off the seedlings into boxes as soon as they are large enough. Some of the seedlings may be planted out later in the year, but a stock should be grown in pots in a cold frame until next spring when they may be planted out in the rock garden.

DECAYED BULBS.—The question addressed to you by "A. B., Essex," regarding the behaviour of his bulbs (p. 188) and your comments thereon, remind me, says "Pedestrian," of a sad experience I once had, not only with bulbs, but with seedlings and cuttings of various kinds, some 15 or 20 years ago. Thinking that, perhaps, "A. B.'s" failures may be traceable to something of the same nature, I am induced to state the facts in order that he and others may avoid even such misfortune. At the period mentioned alterations on a rather large scale were in progress in a part of the pleasure grounds, when a band of silver sand, fairly fine, yet gritty, was struck, and, to the eye, appeared at least equal to what we had been buying to mix with composts for propagating and other purposes. A large quantity of this was stored and used for various mixtures with the most disastrous results to the plants. Seedlings developed their cotyledens and then disappeared, cuttings would not make roots, and the roots of bulbs refused to permeate any compost to which this sand had been added. Everything and everybody was under suspicion, as, so far as we could judge, the conditions were the same as in former years. It was getting well into spring when it dawned upon me that the sand we had been using was the only item in the mixture that varied from previous years, and that it might be the source of our misfortune. I had a sample analysed, and learned that it contained an excessive amount of iron. I say excessive because I do not now remember the quantity, but I think it was about 12 per cent. In any case we discarded this sand, and returned to that from the old source, with the usual good results.

SPRAYING FRUIT TREES.—H. R. S., Seaton: I feel sure that if you could once again draw attention to the value of spraying fruit trees, stating why and how it should be done, such information would greatly interest many readers. Your "Wasted Orchards of England," published many years ago, did a great deal of good, but there is need for another good rousing up, at least in Devonshire.—As we are dealing with the matter of spraying for insect and fungus pests on fruit trees in the present issue, we need only refer you to the article and illustrations.

### NAMES OF PLANTS.

W. H. C., Bury St. Edmunds.—1, Acacia armata; 2, Boronia megastigma.

F. I., Axminster.—1, Saxifraga apiculata; 2, S. oppositifolia; 3, S. Burseriana.

A. L. J., Ware.—1, Cydonia Manlei; 2, Muscari conicum; 3, Adiantum reniforma.

S. P., Wells.—1, Acalypha Macafeeana; 2, Phyllanthus (Reidia) glaucescens; 3, Darlingtonia californica; 4, Cantua buxifolia.

F. F., Todmorden.—1, Begonia manicata; 2, B. fuchsioides; 3, Haageana; 4, B. Rex.

M. T. B., Oswestry.—1, Gleichenia dicarpa longipinnata; 2, Primula Kewensis; 3, Odontoglossum gloriosum; 4, a very poor Cattleya Trianæ; 5, Plumbago rosea.

L. R. P., Ware.—1, Cypripedium aureum; 2, a poor form of Dendrobium nobile; 3, Kleinia (or Cacalia) articulata; 4, not recognised; 5, Sphagnum cymbifolium.

**Prudential Assurance Company, Lim.**—The directors state in their report for the year ended December 31 last that in the ordinary branch the number of policies issued during the year was 60,012, assuring the sum of £5,396,721, and producing a new annual premium income of £325,699. The premiums received were £4,812,268, being an increase of £6,147 over the year 1910. The claims of the year amounted to £3,423,273. The number of deaths was 8,471. The number of endowment assurances matured was 20,862, the premium income of which was £119,586. The number of policies in force at the end of the year was 901,693. In the industrial branch the premiums received were £7,631,408, being an increase of £205,091. The claims of the year amounted to £2,976,058, including £277,083 bonus additions. The number of claims and surrenders, including 4,488 endowment assurances matured, was 373,641. The number of free policies granted to those policy-holders of five years' standing and upwards who desired to discontinue their payments, was 140,617, the number in force being 1,705,885. The number of free policies which became claims was 43,668. The total number of policies in force in this branch at the end of the year was 19,041,748: their average duration exceeds twelve years. The assets of the company, in both branches, as shown in the balance-sheet, after deducting the amount written off securities, are £81,239,682, being an increase of £3,710,456 over those of 1910.

## GARDENING ENGAGEMENTS.

Mr. J. Chapman, of Ferry Hill, Chatteris, Cambridgeshire, has been appointed gardener to R. C. Harding, Esq., Bank Grove, Richmond Road, Kingston-on-Thames.

Robinsons' Guaranteed Gardenalities

You never go wrong when you rely on Robinsons' Guaranteed Gardenalities, for each and every one has a universal reputation.
They fulfil their purpose and achieve their ends. Take for instance

THE "CARMONA" FERTILIZERS.

Here you have the finest soil food and fertilizer which science can offer. It makes the most barren ground rich in nutrition, and plants prosper and thrive when they draw their sustenance from such a source.

Fertilization is essential—you must practise this principle, or otherwise failure attends your efforts. Get "Carmona" Fertilizers, and you are on the right side. Special attention is directed to the "Carmona" Sweet Pea Fertilizer.

"Carmona" Fertilizers are sold in quantities to suit all needs. Note bulks and prices.
1 cwt., 20s.; ½ cwt., 12s. 6d.; 28lbs., 7s. 6d.; 14lbs., 4s. 6d.; 7lbs., 2s. 6d.
1s. and 6d. tins.
Of all Seedsmen and Agents, or write direct.

CLIFT'S FLUID INSECTICIDE.

Messrs. Robinson Bros., Ltd., most strongly advise every gardener to write for a copy of the very convincing reports upon the extensive laboratory and outdoor experiments, conducted by an eminent expert, in relation to the efficacy of Clift's Fluid Insecticide. The facts and figures contained therein will at once demonstrate the absolute superiority of this standard insecticide. The prices are:—
40 galls., per gall. 4s. 6d.; 20 galls., per gall. 5s.; 10 galls., per gall. 5s. 3d.; 5 gallons, per gall. 5s. 6d.; 1 gall., 6s.; ½ gall., 3s. 6d.; 1 pint, 1s.

FREE ENTRY FOR ROBINSONS' £350 SHOW.

This will be the gardening event of the year. To be held on August 28th and 29th next, at the Botanical Gardens, Edgbaston, Birmingham. All cash prizes and many Championship Medals. Every buyer of "Carmona" Fertilizers has free entry. Each packet contains an entry "fee" coupon.
Show Schedules now ready, and sent on application.

ARE YOU WORRIED WITH WEEDS?

Then get "Eradiweed," the guaranteed cent. per cent. weed killer. It will free your gardens from weeds.
"Velvas" Lawn Sand—the finest procurable, and gives utmost satisfaction.

LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA St. S.W.

# MODERN GLASSHOUSES

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

*February, 1911.*

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls.

VOL. LV.—No. 3,047. SATURDAY, MARCH 23, 1912.

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Symbiosis.

The term symbiosis has been applied to those very peculiar associations which have been found to exist both in the animal kingdom and that of plants, in which a sort of friendly alliance has been entered into for mutual benefit, thus differentiating such associations from parasitical ones, in which the benefit is entirely one-sided. In the plant world the association is usually on a microscopic scale, with bacteria, which of late years we have learned do an immense amount of good by their association, tenanting the roots of the host plants, and assisting them by producing nitrogenous nutriment by which the plants benefit, while, on the other hand, the bacteria themselves find a congenial habitat and nutriment for their needs in the roots they occupy. A knowledge of this fact has enabled the orchidist particularly to raise plants from seed which hitherto had often been a matter of great difficulty. Our scientists, however, by careful examination of the soils in which orchids thrive, discovered that special species of micro-organisms, or bacteria, people the soil in such cases, different species accompanying, symbiotically, different species of orchids. The next results obtained by carefully conducted experiments with special cultures of these bacteria were, that orchid seeds sown on sterilised material either failed entirely to germinate, or did so so feebly as to perish soon afterwards, while, if sown on material provided by these cultures with the proper kind of bacteria, germination was vigorous, as was also subsequent growth. This, of course, proved conclusively the beneficial symbiotic action of the bacteria concerned, and also cleared up the mystery that orchid seeds, which resisted ordinary sowing, often appeared in quantities around the parent plants, where, of course, the necessary bacteria occupied the soil. It is, however, perhaps in the relations between insects and insects, and particularly with ants and termites (the white, so-called, ants), that the most astonishing interrelations exist. We are all familiar with the common species of ants, which are often unwelcomely plentiful in our gardens, and most of us know that a sort of symbiosis exists between them and the aphis, or green-fly, which exudes a sweet and honey-like liquid, that the ants greedily devour, and obtain by gently stroking the aphis with their antennæ. The symbiosis, however, which we have in mind goes much farther than this, the "guest" insects, as they are termed, inhabiting the nests of the ants and termites, and being fed by them for the sake of sweet juices which they exude. The most remarkable feature here is the enormous number and the varied character of the insects concerned, it having been estimated that something like 3,000 different species of such guests exist, and occupy the nests of the great number of ants and termites known all over the world. All these "guests" belong to insect orders, most of the members of which lead independent lives, but some, and as we have seen not a few, have, in some inscrutable way, come into association with their "hosts," who, instead of destroying them as intruders, have permitted them to remain, and, in most cases, provide them with food, profiting in return by the juices aforesaid. These insects, thus treated, have by a process of evolution become so modified in character that it is often a matter of great difficulty for even the expert entomologist to determine to what outside order or genus they really belong, and from which they originated, and, in point of fact, the great number of species we have mentioned are practically new species of known genera, but, and often, quite extraordinarily different from any of the independent living ones. Beetles of numerous species appear to predominate, and many of these, as of the other kinds of insects, have so responded to the requirements of their "hosts" that they have developed brightly-coloured brushes and other appendages, whence the saccharine juices exude for the benefit of the hosts, while their jaws have become also fittingly shaped for receiving their food from the ants and termites in return. They have also varied in other ways; quite un-ant like species have actually become so like the ants themselves as to deceive all but experts. Among the tropical wandering ants, which periodically traverse the country on devastating expeditions, in the course of which nothing living escapes them, some actually convey their guests with them, some on foot, and others are carried by means of special arrangements which have been evolved to meet the case and facilitate their transport. Some of the "guest" insects are treated as menials by the ants, instead of providers of appreciated juices, and in that case assist in what we may term the domestic offices of the ant colony. In any case, however, we have here a multitude of most remarkable cases of true symbiosis, in the sense of amicable and mutually beneficial association between diverse forms of insect life, the study of which undoubtedly place the ants and termites on a very high mental plane, if we may use such a term in connection with mere insects.

MR. H. GOUDE.

---

**Mr. H. Goude,** whose portrait we have the pleasure of giving in this issue, is busily engaged in disseminating a knowledge of horticulture in the county of Norfolk; and, judging from the results obtained, he affords a conclusive proof of the enormous advantage to a teacher of gardening of a thorough acquaintance with the practical details of the art. In the course of his training in gardening Mr. Goude had opportunities for becoming well acquainted with the practical work in both nurseries and private gardens, and it is evident that these opportunities were taken full advantage of; for, on the completion of the preparatory stages of his gardening career, he became manager of a market nursery at Worthing, and two or three years later he received an important appointment as head gardener in Bedfordshire. Eleven years ago Mr. Goude went to Norfolk to take up an appointment as gardener and steward, and during the period he occupied the position he achieved much success, and was a formidable competitor at the Norwich shows and some other of the principal exhibitions in the county. Mr. Goude's present position gives him abundant opportunity for preaching what he used to practise, for during the lecturing season he regularly lectures five nights each week; and, as evidence of his ability in imparting knowledge, it may be mentioned that the lectures are well attended. During the daytime demonstrations are given for gardeners and small holders. Lectures and demonstrations do not, however, exhaust Mr. Goude's activities in the cause of horticultural education. School gardens are dotted all over the county, and these have to be periodically visited, and teachers' classes are held every Saturday for those who are about to take up the subject of gardening. While taking the keenest interest in the whole of the important duties associated with his position, Mr. Goude would appear to be especially interested in school gardening, this being greatly stimulated by the endeavour of the boys to understand the instructions given them in connection with gardening.

**The Irish Cup for the International Exhibition.** — At the monthly meeting of the Royal Horticultural Society of Ireland the Irish Cup that has been purchased for presentation by the society to the Royal International Horticultural Exhibition was placed on the table, and was much admired. In the course of the meeting Sir Frederick Moore, the hon. secretary of the fund raised for the purchase of the cup, gave some particulars of the amount raised. He stated that the response was so generous that it had been resolved to present a second cup, which would be offered for alpine plants, and to give the cash balance in aid of the Belfast rose show, which will be held on July 19 by the Ulster Rose and Floral Society in conjunction with the National Rose Society.

**Scottish Forestry.**—It will be a matter for much regret, writes our Aberdeen correspondent, if Scottish forestry is to be made the subject of jealousies between rival institutions. Apparently this would seem to be the case, if we are to judge from the agitation started in the Edinburgh Press against Aberdeen University being selected by the Scottish Forestry Commission as the seat of the first chair of forestry in Scotland. Evidently it has come to the ears of the Edinburgh authorities that it is the intention of the Commission to recommend Aberdeen as the demonstration area, but, if so, it is information which no one else seems to possess, as the long-deferred report of the Commission has not yet been issued. Be that as it may, if such decision has been made, it is a wise one. No one wishes for one moment to minimise the great services rendered by Edinburgh University to the cause of forestry. But it is to the future, not the past, we must look. Looking to the future we must, says one of our leading forestry authorities in the North, take the country as a whole, and see where the greatest areas of woodlands are; and not only that, but where the bulk of afforestable land is situated. This is undoubtedly in the north. It must be borne in mind that, in all probability, the demonstration area—which is acknowledged on all hands to be one of the first essentials, and the establishment of which, we may presume, is among the recommendations of the Commission—would be the working centre of forestry extension, and would not be merely used as an object lesson for forestry students. The great bulk of the work will be on the waste ground suitable for the establishment of economic forests; and, this being for the most part in the northern half of Scotland, it is reasonable to suppose the demonstration area should be there also.

**Conference on Horticultural Education.**—By permission of the Principal, a conference on horticultural education will be held, under the auspices of the North of England Horticultural Society, at Armstrong College, Newcastle, on Saturday, May 4, commencing at 3 p.m. Earl Grey, president of the N.E.H.S., will preside, and the main object of the conference will be to consider: (a) Work already being done; (b) How horticulture can actually be taught in the classroom, and the subjects suitable; (c) How horticulture is to be taught in the new Farm Institutes; (d) How can classes for young gardeners in isolated places be formed, especially when they are few in number. Should capable head gardeners be subsidised to teach horticulture to such lads? (e) How far is it possible for such an art as horticulture—"a matter of practical skill guided by rules"—to be taught at all except in a garden?

**British Pteridological Society.**—We have received No. 11 of the "British Fern Gazette," the organ of the society, and, as usual, this contains much of interest to those who appreciate the charms of our native ferns. Of special interest is "The Narrative of a Resuscitated Collection," in which Mr. W. B. Cranfield describes in a highly interesting manner how in the summer of 1908 he transferred the large collection of British ferns formed by the late Mr. James Moly from the latter's residence at Charmouth, Dorset, to his garden at Enfield.

**Preservation of Finchampstead Ridges.**—The committee appointed at a recent meeting at Wellington College for the purpose of carrying through the scheme for the preservation to the public of the view from the summit of Finchampstead Ridges, have decided to approach the trustees of the Bear Wood Estate for the purpose of obtaining some additional land in the area. It is understood that the vendor is so far favourable to the project as to have intimated his intention to contribute to the scheme.

**Contact Insecticides.**—The substances which kill insect pests through coming into contact with the outer surface of the insect body have been investigated at the Michigan Agricultural College for the purpose of determining exactly how such substances kill. It is commonly supposed that they act by plugging up the breathing pores, thus causing death by suffocation; but it was found extremely difficult to kill many insects in a reasonable time merely by depriving them of air, and it is concluded that the certain and fairly rapid death caused by such materials as kerosene and gasolene cannot be due to the stoppage of the tracheæ alone. It was also found that air saturated with the vapour of various insecticides was nearly as effective as the liquids themselves. Further tests showed that in the use of many insecticides, such as kerosene, gasolene, creolin, and pyrethrum, vapour penetrated the tissues and caused death long before the liquid or powder itself had time to penetrate the chitin, or to cause suffocation by the plugging of the tracheæ. The evidence obtained seemed to show that the vapours, after absorption in the insect body, become mainly effective through the tendency of their presence to prevent absorption of oxygen by the tissues.

"**The Hardy Plant Year Book,**" of which we have received a copy within the past few days, is of interest as the first of the annual publications of the National Hardy Plant Society, and of value for the information it contains on the cultivation and exhibition of the plants with which the society is immediately concerned. The contents include the annual report, the rules and bye-laws, a full report of the conference held at Shrewsbury in August last, articles on a visit to Friar Park Gardens, seasonal borders of hardy flowers, autumn flowers in the rock garden, and insects injurious to hardy plants. There are descriptive lists of the new plants of the past year and garden varieties of flowers which received recognition. The first of these is unsatisfactory, inasmuch as it conveys the impression that there is but one gardening paper in which new plants are illustrated and described.

**National Diploma in Horticulture.**—To enable the North of England Horticultural Society to effectively consider this scheme and co-operate with the Science and Education Committee of the Royal International Horticultural Exhibition, in May next, the council have appointed the following Special Committee: Major J. W. Dent, Ribston Hall, Wetherby; R. Farrer, Esq., Ingleborough; Professor M. E. Sadler, LL.D., Vice-Chancellor, The University, Leeds; Professor J. H. Priestley, B.Sc., F.L.S.; Professor R. S. Seton, B.Sc.; Professor F. E. Weiss, D.Sc., Dean, The University, Manchester; Mr. A. J. Allsop, Mr. P. Clapham, Mr. W. H. Dobson, Mr. J. Donoghue, Mr. W. B. Little, and Mr. G. Taylor.

**Tobacco Culture in Canada.**—Canada raises a good deal of the tobacco which is consumed in the country. The industry is of recent origin, and its progress has been greatly forwarded by the work of the Tobacco Division of the Government Experimental Farms, which has helped the growers in selecting and testing the right kinds to grow, and also by practical demonstrations of the best processes of curing the leaf. The improvement of the quality may be imagined when it is stated that some 15 years ago samples of the tobacco then grown by the Quebec farmer for his own use, upon being submitted to several of the leading tobacco manufacturers in the United Kingdom, was pronounced to be of a quality quite unfit for their purposes; that, in their opinion, a use for it might be found for fumigation purposes, as an insecticide for greenhouses; and that its commercial value was about 1d. a pound. Tobacco is at present raised almost entirely in Quebec and Ontario. The total crop last year was 20,000,000 lbs., two-thirds of the whole crop being raised in the latter province. The yield averages 1,500 lbs. per acre in normal years, and if well cured commands from 6d. to 7½d. per lb. for "binders," and from 4d. to 4½d. for pipe tobacco. Tobacco is one of the most paying crops. It is generally grown in areas of 1 to 4 acres especially in the fruit growing districts of Ontario and Quebec, where it forms a useful adjunct to fruit growing.

**The Southampton Horticultural Society,** which celebrates its jubilee this year, has lately issued its prize schedule for the several shows arranged to be held. First and foremost is the rose show, to be held jointly by the National Rose Society and this Society on June 26. The prizes are numerous, and arranged to suit all classes of growers. This also applies to the prize list for the Jubilee Show, to be held on July 16 and 17, comprising 36 classes for carnations, 12 for sweet peas, and over 60 for miscellaneous plants, cut flowers, fruit, and vegetables, in addition to provision for cottagers and juveniles. The autumn show schedule includes the usual classes for chrysanthemums and fruit.

**A Co-operative Kitchen Garden.**—In the development of the St. George's Hill estate, near Weybridge, for building purposes, it is intended to proceed on wholly new lines in making provision for the supply of the prospective residents with fruits and vegetables. The houses to be built will chiefly be of large size, ranging in cost from £2,000 to £10,000 each; and it is desired to avoid breaking up the areas of woodland for the purpose of providing space for kitchen gardens in connection with the residences. It is therefore proposed to establish a large kitchen garden, fully equipped with plant and fruit houses, and an extensive orchard. The garden will be in telephonic communication with the houses on the estate, and the produce will be supplied at market prices.

**Garden Plots for Scholars.**—Many of the schools in the populous parts of London have plants in pots and window boxes, and thus have enabled the scholars to obtain some knowledge of gardening, but an addition to this training an experiment of much interest is about to be made at Canning Town. The vicar of the parish has secured a piece of land that has been laying idle during the past twelve years to be chiefly used as allotments for the working men of the neighbourhood. Part of this land will be devoted to the provision of gardens for children, and about sixty scholars attending the schools in the neighbourhood will be provided with plots. The land is now being prepared, and the children are anticipating with much interest the time when they will have gardens of their own.

**Antidote for Rhus Poison.**—We cull the following from our American contemporary, "The Weekly Florists' Review": E. O. Orpet, of Lake Forest, Ill., speaking of ivy poisoning, says that last summer, when Rhus toxicodendron was just budding forth with blood-red shoots, four men were employed to root it up, for unless given something to climb upon, it becomes a pestiferous ground weed. These men were seemingly immune until hot weather, but when perspiration was free all were badly affected. The face swells to such an extent that the sufferer can scarcely see, and other portions of the body are also affected. Our physician recommended as a remedy tincture of Sanguinaria canadensis, applied with a soft cloth. Each man was cured in four days by the use of this simple remedy. The bloodroot grows plentifully here with the rhus in similar situations, and a pint of the tincture is ample to effect a cure of a serious case. Physicians also recommend the fluid extract of Grindelia robusta for cases of poison from Rhus toxicodendron and R. venenata, the latter being the most injurious of the two species.

## ROYAL HORTICULTURAL SOCIETY.

In spite of unpleasant weather and the dislocation of train services owing to the coal strike, there was a first-rate exhibition at the Royal Horticultural Hall, Westminster, on Tuesday, March 19. Daffodils and early spring flowers were in great force, and flowering shrubs were especially good. Orchids again proved a great attraction, and carnations were much in evidence. The attendance was again very large.

### FLORAL COMMITTEE.

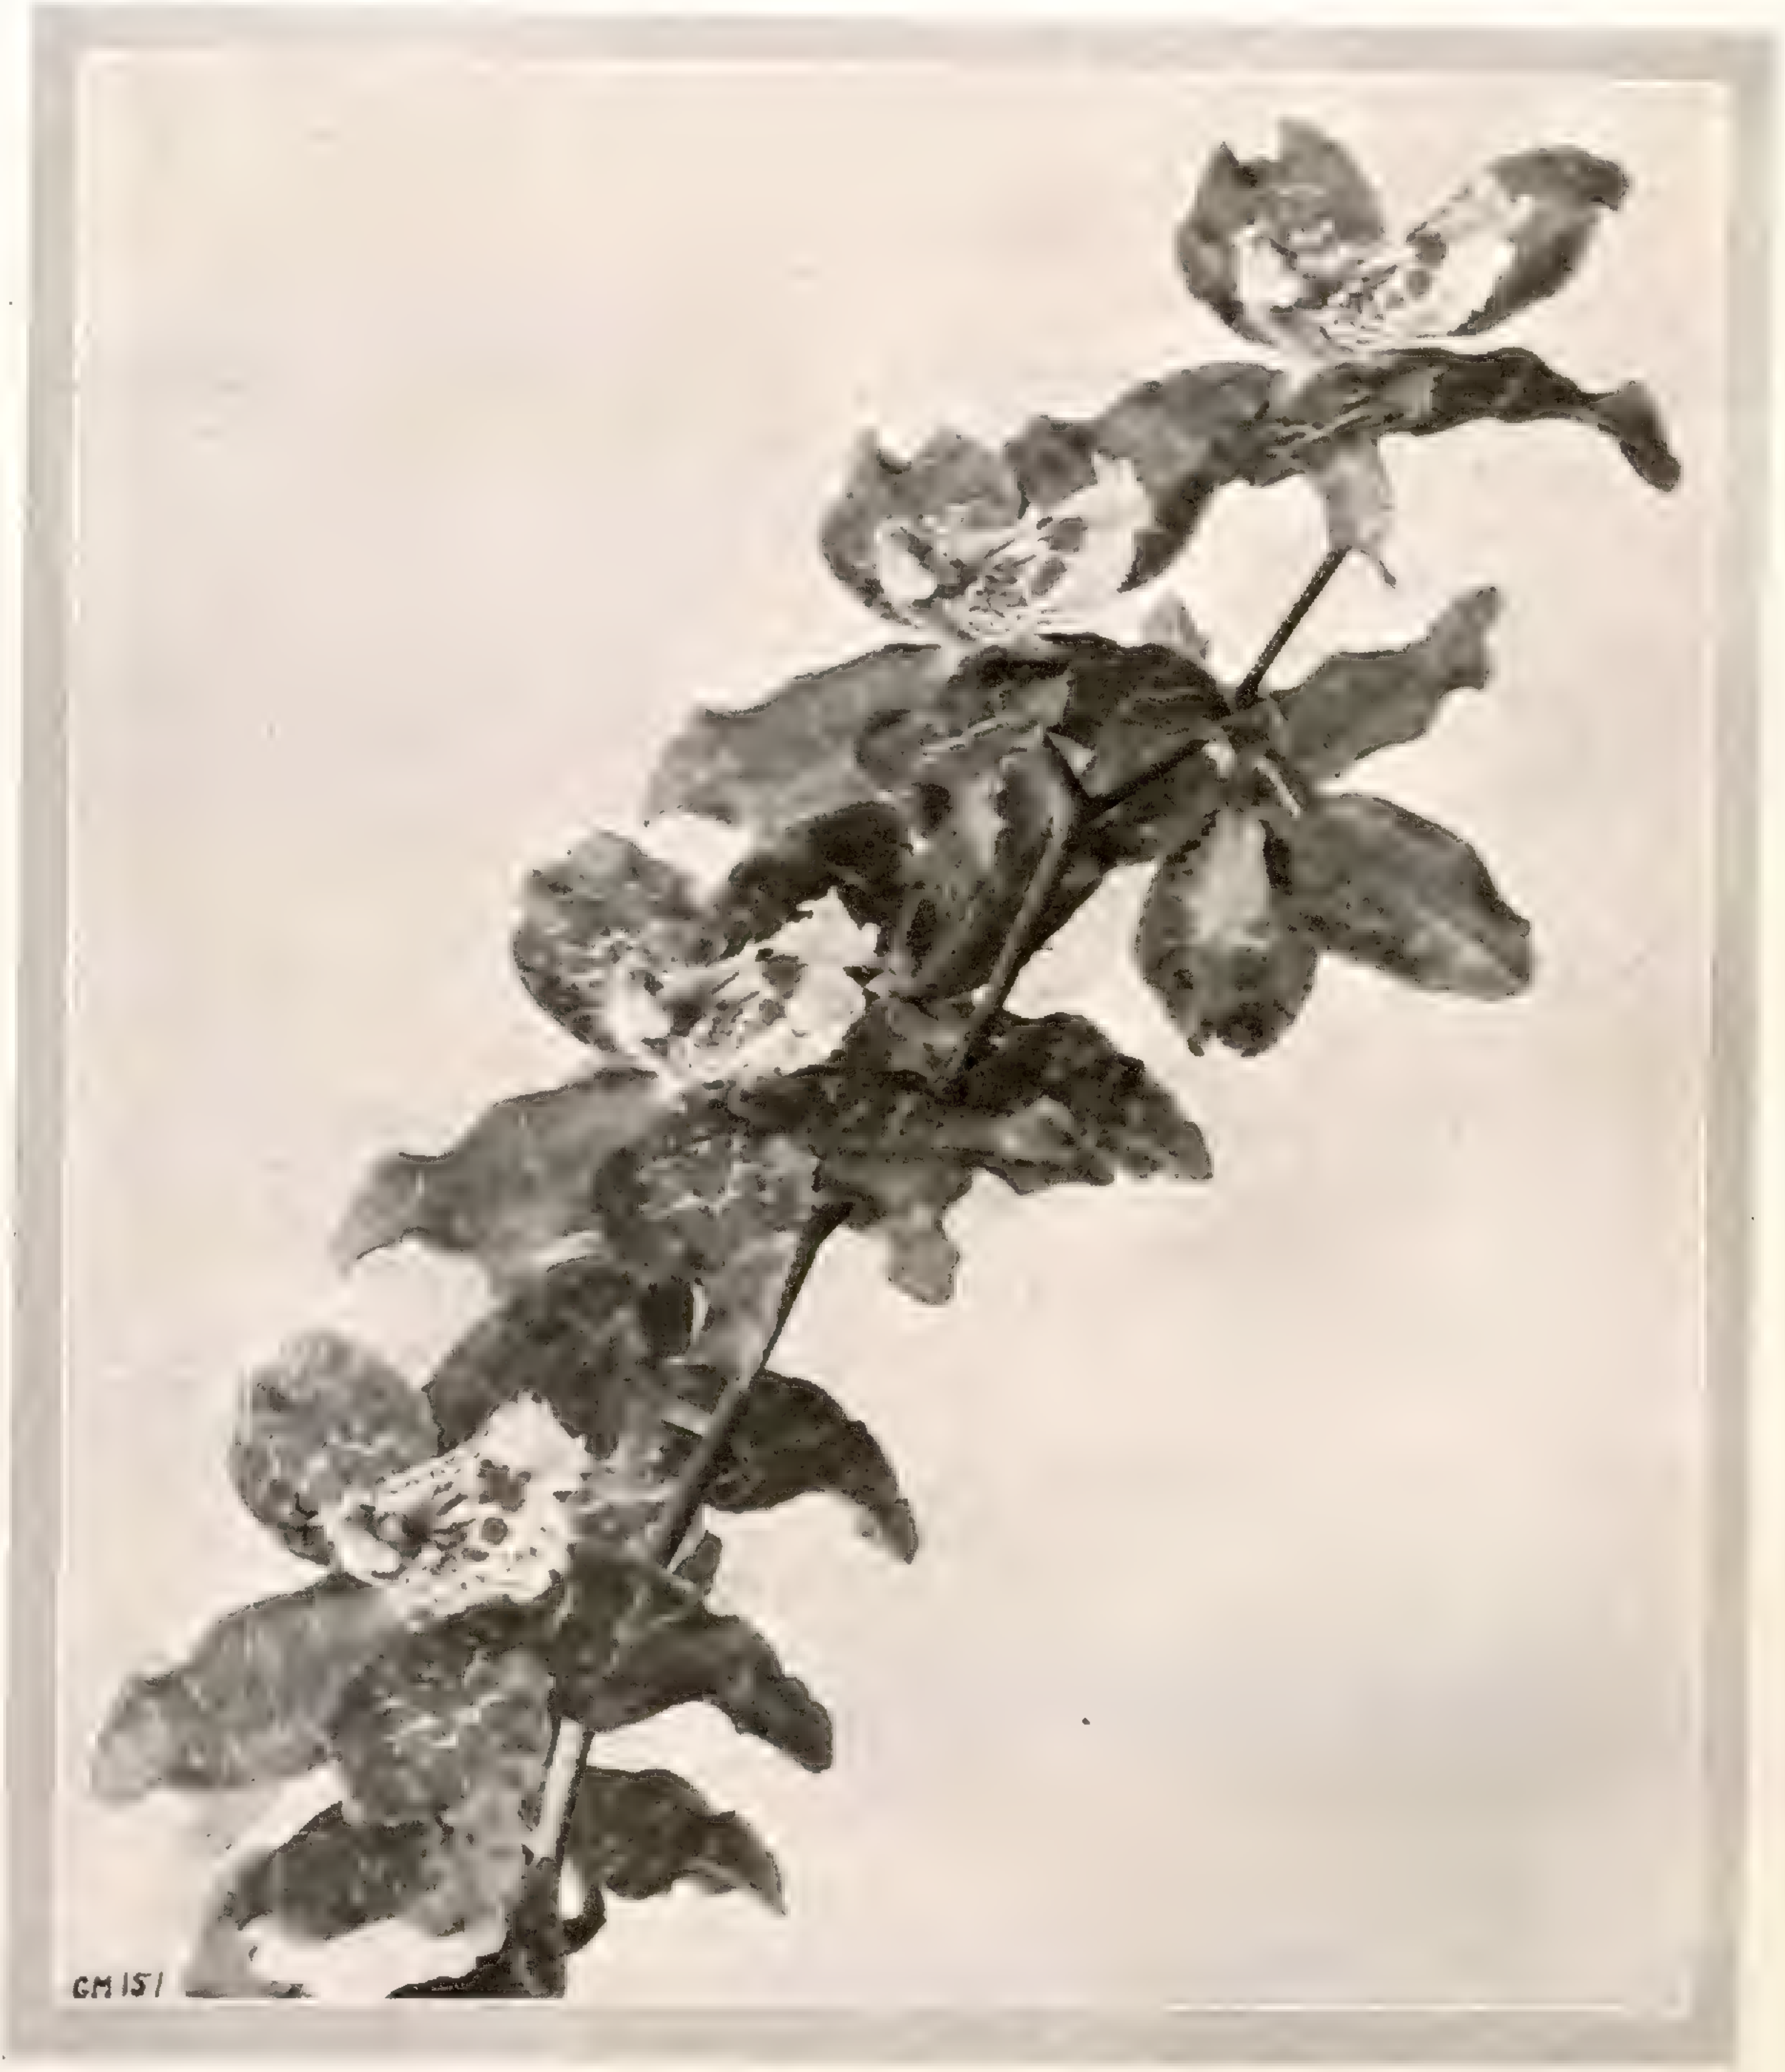
Rose Queen, a finely-shaped, fragrant H.T. variety, with rich silvery-rose colouring, gained an A.M., as shown by Mr. W. E. Wallace, Eaton Bray, Dunstable. Mr. G. Prince, Longworth, exhibited roses, and made a very pretty show of the lovely Fortune's Yellow. The roses from Messrs. G. Mount and Sons, Canterbury, consisted almost entirely of the varieties Lady Hillingdon and Mrs. G. Shawyer, both being shown in fine condition.

Greenhouse plants in great variety from Messrs. J. Veitch and Sons, Chelsea, comprised gorgeous amaryllis, a splendid strain of Primula obconica, Azalea amœna Hexa, greenhouse rhododendrons, and Amphicome Emodi. In another group the firm had a splendid lot of lilacs in pots, Indian azaleas, the new double Prunus Pissardi Moseri fl.-pl. (A.M.), a lovely flowering shrub; and Primula Knuthiana (A.M.), with rosy lilac flowers. The same firm had also a splendid bank of cyclamens.

Mr. H. Burnett, Guernsey, was, as usual, an exhibitor of very fine perpetual carnations, and staged grand bunches of Mrs. Tatton, Mrs. H. Burnett, R. F. Felton, Mandarin, Marmion, Carola, and Mrs. C. F. Raphael. Messrs. W. Wells and Co., Merstham, had Scarlet Glow and White Wonder carnations in good form in their exhibit. Messrs. Allwood Brothers, Haywards Heath, disposed good blooms of carnations in attractive fancy vases and bowls, thus demonstrating once more the decorative value of the flowers. Messrs. Young and Co., Hatherley, presented fine vases of Cheltonian, Mikado, Lady Neeld, Winsor, Enchantress, Rose Enchantress, Britannia, and Afterglow perpetual carnations. An interesting exhibit from Messrs. Stuart Low and Co., Enfield, included camellias, cyclamen, acacias, and a selection of perpetual carnations.

A few fine hippeastrums (amaryllis) were staged by Mr. Dye, gardener to Lord Rothschild, Tring Park, and two of these—Rose du Barri, deep salmon rose, and Musigny, deep crimson—each gained an A.M. The green-flowered shrub, Corylopsis Veitchi (A.M.), was exhibited by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. Mr. Goldston, gardener to Lady Mary Holland, Easton Place, London, S.W., submitted a few well-grown amaryllis, chiefly orange and white varieties.

Flowering shrubs from Mr. L. R. Russell, Richmond, made a brave show, the mollis azaleas, lilacs, forsythias, laburnums, etc., being margined by Primula obconica and Francisea floribunda—the latter a fine plant. Messrs. R. and G. Cuthbert, Southgate, showed Ghent and mollis azaleas, lilacs,



ODONTOGLOSSUM QUEEN OF GATTON.
Flowers yellow, heavily marked with brown. A.M., R.H.S., March 19, Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

magnolias, etc. Messrs. W. Cutbush and Son, Highgate, filled a long table with lilacs, magnolias, Pyrus malus Scheideckeri, Prunus triloba, Spiræa confusa, Rhododendron Pink Pearl, and an exhibit of fine flowers of all the best varieties of perpetual carnations, the new Mr. J. Mackinnon being especially good.

Across the top of the hall Messrs. J. Hill and Son, Edmonton, exhibited a grand lot of ferns, staging splendid examples of Nephrolepis Fosteri, N. todeaoides, Platycerium Hilli, Cheilanthes elegans, Osmunda palustris, the graceful Adiantum Williamsi, Lastrea erythrosa, Blechnum brasiliense, and other good things. Fragrant gardenias, bright clematis, and graceful ferns were extensively displayed by Messrs. H. B. May and Sons, Edmonton. Messrs. Jarman and Co., Chard, set up a pretty group of star cinerarias in a great variety of colouring. Messrs. W. Artindale and Son, Sheffield, exhibited cut flowers of their very fine strain of Primula obconica.

A blaze of colour was provided by Messrs. H. Cannell and Sons, Swanley, who presented large bunches of very fine varieties of zonal pelargoniums, their Sirdar, Duke of Bedford, Carmania, Mars, and Saxonia being especially brilliant. Messrs. H. J. Jones, Lim., Ryecroft, Lewisham, showed zonal pelargoniums, and staged very fine flowering varieties as Chas. H. Curtis, A. Lovett, Ellen Countess of Radnor, Cymric, Jas. Wraight, F. Gulliver, Arabic, and Mrs. H. Wood, all splendid sorts with large trusses of big blooms. Mr. Hawthorn, gardener to Messrs Charrington, Byfleet, put up a nice little group of cyclamens.

Mr. Maurice Prichard, Christchurch, had Primula helvetica alba, Anemone pulsatilla, and Primula cashmeriana in very fine firm. Messrs. J. Cheal and Sons, Crawley, arranged a small rock garden filled with primulas, lithospermums, heaths, etc., with flowering shrubs at the back. Messrs. Bakers, Wolverhampton, had in a collection of early flowers some delightful groups of Primula frondosa, Cypripedium spectabile, Iris reticulata, and blue and white hepaticas.

Messrs. Thompson and Charman, Bushey, Messrs. G. and A. Clark, Dover, and Messrs. T. S. Ware, Lim., Feltham, staged rock garden exhibits, the latter making a fine effect with trilliums, scillas, primulas, etc. Mr. Clarence Elliott, Stevenage, made a feature of Viola gracilis and Saxifraga apiculata on a small rock garden. From the Burton Hardy Plant Nursery, Christchurch; Mr. Jas. Box, Lindfield; Messrs. Whitelegge and Page, Chislehurst; Messrs. G. and A. Clark, Dover; and Messrs. J. Peed and Son, Norwood, S.E., came exhibits of alpine and early hardy flowers.

Mr. G. Reuthe, Keston, showed Narcissus cyclamineus, a fine selection of saxifragas, irises, Rhododendron argenteum, Pieris japonica, etc.

Messrs. R. Gill and Sons, Falmouth, displayed a large collection of Himalayan rhododendrons, including the new R. cornubia, R. arboreum, R. barbatum, R. Shilsoni, R. Henry Shilson, R. cinnamomium, R. albescens, and other fine things. Abies Douglasi Fletcheriana, a pygma form of a popular tree, was exhibited by Messrs. Fletcher Brothers, of Ottershaw, and gained an A.M.; it is a very distinct and striking plant.

Mr. Van der Elst, Tottenham Nurseries, Dedemsvart, Holland, exhibited a very pretty pink form of Anemone pulsatilla, named Mrs. Van der Elst, and, seeing how popular hardy plants are at present, it was not easy to understand how this failed to gain an award; at Amsterdam a week previously it met with official approval.

### ORCHID COMMITTEE.

Mr. W. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, brought up the splendid Odontoglossum Queen of Gatton (triumphans and percultum), A.M., with yellow flowers heavily marked with brown, and with a white and red purple lip; a fine O. Rolfeæ also came from the Gatton collection. A beautiful specimen of Sophronitis grandiflora, carrying 100 flowers, was exhibited by Mr. Alexander, grower to Lieut.-Colonel Sir G. Holford, Westonbirt, Tetbury, Gloucester, who also exhibited Cattleya Dirce Westonbirt variety (A.M.).

Messrs. Charlesworth and Co., Hayward's Heath, had delightful plants of Odontoglossum Gladys, O. ardentissumum, O. armairvillierense, O. Phædra, O. Craveniana, O. amabile, the striking Neomoorea irrorata, and the graceful Angræcum citratum. Messrs. J. and A. McBean, Cooksbridge, displayed some fine forms of Odontoglossum crispum, O. Phœbe, O. nebulosum, Cattleya Schroderæ, and the lovely little yellow Lælio-cattleya Euripedes. De Barri Crawshay, Esq., Sevenoaks, showed several seedling odontoglossums and a fine Cymbidium insigne.

The orchids from Messrs. S. Low and Co., Enfield, included Odontoglossum Rolfæ, Oncidium concolor, Brasso-cattleya Langleyensis, Cattleya Schroderæ, and other good things. Messrs. Sander and Son, St. Albans, were quite large exhibitors of orchids, and their fine exhibit contained Dendrobium Wardianum, Phaius Norman, Cymbidium Gottianum, Renanthera Imschootiana, a number of beautiful odontoglossums and odontiodas, Cattleya intermedia nivea, etc.

A large number of odontoglossums and odontiodes were arranged by Mr. Day, gardener to H. J. Goodson, Esq., Putney, and among the former O. Cobbiæ, O. ardentissimum Dayanum, O. amabile, and O. Wilckeanum were conspicious; Phaius Norman was well represented, and so was Cattleya Trianæ. Mr. H. T. Pitt, Stamford Hill, exhibited Cymbidium Lady Colman, Rosslyn var., as well as the original hybrid. Mr. E. V. Low, Hayward's Heath, showed Cpyripedium aureum Surprise, with seven fine flowers. Mr. R. C. Thwaites, Streatham, submitted Eulophia Saundersi and Odontioda Sanderæ.

S. Gratrix, Esq., Manchester, exhibited a grand plant of a very beautiful odontoglossum named O. crispum Samuel Gratrix; it carried a fine spike of rounded flowers marked heavily with bright and light brown; a First Class Certificate was awarded. A little group of orchids from Mr. Coningsby, gardener to G. H. Smith, Esq., Killoran, Finchley, contained good specimens of Cymbidium eburneo-Lowianum, C. insigne, and Lycaste Skinneri. Messrs. Hassall and Co., Southgate, presented the good old Angræcum sesquipedale, Brasso-cattleya Maroni, and Cattleya amethystoglossa.

### DAFFODIL COMMITTEE.

This body had a number of groups to consider, and several fine novelties were placed before it, three Awards of Merit being granted.

Some exquisitely beautiful new daffodils, exhibited by Mr. Alex. Wilson, Shorel, Bridgwater, attracted the attention of all daffodil lovers. Among those named Bernardino, Hypatia, Midas, the new White Whelp; Robespierre (A.M.), a grand incomparabilis; Rubalite (A.M.), a big poetaz; Gyr Falcon, a giant Leedsi, with soft cream colour; Pilgrim, Inglescombe (double), and Buttercup. In addition there were a number of beautiful seedlings as yet unnamed.

Messrs. W. Cutbush and Son, Highgate, presented a long table full of daffodils in pots, the chief varieties being Mrs. Langtry, Barri conspicuus, Empress, Glory of Leiden, Horsfieldi, Emperor, James Walker, Sir Watkin, King Alfred, and Sulphur Phœnix, Messrs. R. and G. Cuthbert, Southgate, exhibited tulips in pots, chiefly Darwin varieties; Mr. Farncombe Saunders, Corydon, White Queen, Pride of Haarlem, Psyche, Clio, and Le Tulip Noir were the varieties most in evidence.

A beautiful selection of varieties of daffodils from Mr. Christopher Bourne, Simpson, Bletchley, attracted a great deal of attention; Victoria, Norma, Weardale Perfection, the lovely Evangeline, Gloria Mundi, Whitewell, and the grand new Helios (A.M.), a fine and shapely incomparabilis variety that subsequently passed into the possession of Mr. Walter T. Ware, Inglescombe, Bath. The bold King Alfred daffodil was finely displayed by Messrs. James Carter and Co., Raynes Park, this firm exhibiting large drifts of it on a bold piece of rock garden, backed by conifers, and with a pool of water in the centre. There were about seven hundred blooms of this splendid daffodil, so the fine effect produced can well be imagined.

Messrs. Barr and Sons, Covent Garden, filled a large space with a fine collection of cut daffodils, and among newer sorts they displayed Alice Knights, Plenipo (double), Doubloon (double), Cleopatra, Sir Galahad, Mrs. G. H. Barr, Michael, Michael Angelo, Bernardino, Bedouin, Adelaide, Lord Kitchener, Furnace, and Homespun. An exhibit of tulips set up in tall bamboo stands and associated with sprays of Asparagus Sprengeri, came from Messrs. S. Bide and Sons, Farnham; the varieties were Vuurbaak, Lucretia, and Pink Beauty, and these were shown in fine form.

Tulips and daffodils grown in fibre, in fancy pots, by Messrs. R. H. Bath, Lim., Wisbech, were capital. Prince of Austria, Coleur Cordinal, Spaedonk, Keizerkroon, and Rose Luisante among tulips, and J. B. M. Camm, Aspasia, Emperor, and Princess May among narcissi were excellent. Mr. J. Martin, Truro, showed a few daffodils, and the Rev. G. H. Engleheart, Denton, Salisbury, showed some splendid new seedlings, including one unnamed trumpet variety of creamy-buff colouring with faint pink tinge.

Messrs. Robert Sydenham, Tenby Street, Birmingham, exhibited Lilium speciosum, lily of the valley, tulips, spiræas, and hyacinths, all grown in bowls in fibre; and staged a few good daffodils, such as Flambeau, King Alfred, Argent, Mrs. Brett, Elvira, Millie Price, and C. J. Backhouse.

### FRUIT AND VEGETABLE COMMITTEE.

Lily White seakale, Harbinger cabbages, with Early Paris, Stanstead Park, and All-the-Year-Round lettuces, cucumbers, corn salad, radishes, chicory, dandelion, beet, endive, Mercury or Good King Henry, tarragon, and celeriac—all salading subjects—were shown by Messrs. Sutton and Sons, Reading, and made a very interesting exhibit. Carter's Forcing lettuce, a capital cabbage variety, was well shown by Messrs. J. Carter and Co., Raynes Park.

Apples were well shown by Mr. W. Heath, gardener to Sir Daniel Gooch, Hylands Park, Chelmsford, the varieties Annie Elizabeth, Royal Jubilee, and Newton Wonder being especially well preserved. Mr. F. E. Wienholdt, Rhodes Farms, Inyanga, South Africa, exhibited dishes of good specimens of Cleopatra, King of the Pippins, Blenheim Pippin, Munro's Favourite, and Syke House Russet apples.

The awards will be found on page 247.

---

**Heliotrope Madame de Bussy.**—This is a very fine heliotrope either for bedding or for pot culture, the flower clusters being massive, the individual blooms very large, and in colour bluish violet with a white centre. What is more, the blossoms are deliciously scented, a feature which is wanting in some of the newer kinds.—K.

**Cucumbers.**—If the seedlings have made good progress in pots, and a hotbed has previously been prepared, they will now be ready for their permanent stations. A good compost for the early batches consists of three parts turfy loam, one part flaky leaf-soil, and some mortar rubble to keep it open. Place a thin layer over the entire bed, then place hillocks or mounds at three feet apart to receive the plants. Plant, and stake to the first wire, at which height the plants should be stopped, train thinly, and do not overcrop. Promote a moist and genial atmosphere, watering the plants very carefully until well established. A temperature at night of 65 degrees, rising to 80 by day in sunny weather, will suit cucumbers well. Encourage growth by timely light top-dressing of warm soil whenever the roots appear.

## FANCY CARNATIONS.

Fancy carnations have, as the result of the activities of the raisers, undergone so remarkable a development within the past ten years that they now form a group of considerable importance, and enjoy a high degree of popularity among those who appreciate in even a moderate degree the charms of the carnation in its many attributes of beauty. There is no occasion, in referring to the section wherein the fancy varieties have a place, to institute comparisons between them and the selfs with a view to determine their relative merits. Both classes possess merits of a high order, and both should be fully utilised in beautifying the flower garden and in furnishing supplies of blooms in a cut state for indoor decorations. In the opinion of the writer they are especially useful for pot culture and for planting in borders where the flowers will be immediately under the eye of the cultivator, and thus enable him to enjoy to the full the exquisite colouring and distinctive markings that so strongly appeal to the artistic perceptions of flower-lovers, and especially of those who take an interest in carnations.

FIRST PRIZE COLLECTION OF UNDRESSED FANCY CARNATIONS.
Shown by Messrs. A. R. Brown, Lim., King's Norton, at the Midland Carnation Society's exhibition in 1911.

The success that has been achieved by raisers in the improvement of the section has enabled them to introduce during the past few years a large number of new varieties of great merit, and as the result the list of really first-class flowers has became so lengthy as to perplex those who have no opportunities for seeing varieties until they are widely distributed in gardens. To assist such cultivators—and, indeed, all who may be desirous of revising the list of varieties grown for the purpose of substituting some of the more recent introductions for older flowers—the following selection has been prepared. This has purposely been made short that cultivators with limited space at their disposal should not be perplexed by a multiplicity of names, but there are many others that could be recommended to those who have room for a larger number of varieties.

Alice B. Stewart.—A distinct and beautiful flower, richly marked with rose on an apricot ground.

Celestial.—A handsome yellow-ground flower, marked with maroon and red.

Delicia.—A beautiful white-ground flower of large size, with pink and red markings.

Donald McDonald.—A large and attractive flower of superb form, now being introduced by Mr. C. Blick; the ground rich yellow, deeply suffused with bright red.

Douce Davie.—An effective flower, with yellow ground, and suffusion of rose at the margin of the petals, the latter marked with deep rose.

Father O'Flynn.—A remarkably fine variety, the ground bright yellow, attractively marked with light scarlet.

Forester.—A handsome yellow-ground flower of large size, raised by Mr. J. Douglas; the markings are crimson and red.

Hidalgo.—A superb yellow-ground flower that has been in cultivation some years, and continues to hold a high position; the blooms are of fine form, and the petals marked with maroon and red.

John Ridd.—A remarkably fine variety that is being introduced by Mr. J. Douglas this season, the blooms are of fine form and the petals have rose-red markings on a bright yellow ground.

Leslie.—Another of Mr. C. Blick's fine novelties; the flowers are large and the broad buff-coloured petals are margined and suffused with bright rose.

Liberté.—A fine variety, the blooms large, and of fine form, the ground clear yellow, overlaid with crimson marking. This variety was conspicuous in the collection with which Messrs. A. R. Brown and Co. obtained premier honours for six varieties undressed, at the Midland Counties Carnation Society Show last year, and illustrated herewith.

Linkman.—A remarkably attractive variety; the flowers are large in size and of superb form, with bright scarlet markings on a yellow ground.

Lord Steyne.—A distinct and handsome flower of large size, heavily marked with crimson on a rich yellow ground.

Mrs. F. Gardiner.—A charming flower of high quality, with apricot-coloured ground and bright rose markings.

Mrs. J. L. Gibson.—A distinct and attractive flower, with lilac-rose markings on a buff-coloured ground.

Mrs. Penton.—A new variety of quite exceptional merit, the flowers of fine form, the ground buff, with rich rose markings.

Pasquin.—A bold and handsome flower of full size and fine form, the ground yellow, the margin and markings of the petals rose-lavender.

Rhea.—A charming variety of recent introduction, the flowers of excellent form and full size, the ground colour yellow, suffused with rose-scarlet.

Sweet Briar.—A remarkably pleasing variety of high quality, the flowers of full size, with lavender and rose markings on a white ground. Carnation Grower.

---

**Sweet-scented Flowers.**—That little unassuming heath-like greenhouse shrub, Boronia megastigma, with its sober tinted brownish flowers, would attract but little attention were it not for the delicious fragrance that they possess. So pronounced is it that a single specimen will make its presence manifest throughout a good sized structure. What is more, although of so penetrating a nature, the perfume is not at all overpowering. Another greenhouse shrub remarkable for the fragrance of its blossoms is Daphne indica or odora. This flowers as a rule from December onwards to the spring, whereas the Boronia is generally a little later in blooming.—T.

## BORDER CARNATIONS.

These popular garden flowers still maintain the high position they have occupied for so many years, and in spite of many rivals continue great favourites. The rapid development which has taken place among them says much for the high esteem in which they are held by the flower-loving public. The beautiful flowers, many of which are sweetly scented, are highly appreciated for room decoration, for, when afforded careful attention, they last for some considerable time in a cut state. Although not so continuously in flowering as begonias or geraniums, the carnations provide an excellent variety for bedding purposes, and when massed in separate colours beautiful effects are obtained. There are few plants that surpass these for town gardens, for they will thrive in the most smoke-laden atmosphere, while for seaside cultivation they are well suited.

CARNATION JOHN RIDD.

A distinct and handsome fancy variety, raised by Mr. James Douglas, Great Bookham. The blooms are of large size, and are freely marked with rose-red on a yellow ground.

### Soil Preparation.

Many failures with carnations are attributed to the soil, yet almost any soil may be made fit, if thoughtfully prepared. There are more drawbacks in localities than in soils, for the latter can be altered and improved, but the locality cannot. Thorough drainage is a most important point, for there is nothing a carnation dislikes so much as a moisture-retaining soil, and many failures are due to sourness. In selecting a piece of ground for planting avoid, if possible, sheltered and confined borders, choosing in preference an open position, where the plants will be fully exposed to all the elements.

When the question of where to plant has been decided the ground should be well dressed and deeply dug, and left lying in a rough state until it is required for planting. If of a heavy nature, it is more beneficial to dress with stable manure, while for light soils cow manure is the best; but whichever is used it must be thoroughly decayed. A dressing of some approved soil disinfectant will prove of great assistance if dug in with the manure, as it destroys many underground enemies. Shortly before planting a dressing of wood ashes and soot, and, if obtainable, a liberal quantity of fresh sea sand, will be beneficial. Retentive soils should be dressed more freely with wood ashes and sand than those of a light nature. This dressing must be thoroughly incorporated with the soil, and the top of the ground left in a more even and fine condition than it was in the earlier digging.

### Raising Seedlings.

There are two methods of raising plants, one by seed sowing and the other by layering. Seedlings are readily raised, and they bloom freely in the year following the sowing of the seed. It is an extremely interesting proceeding to raise a batch of seedlings, but the cultivator must not expect to get many flowers as fine as those of named varieties, and there will also be a small percentage of singles. From the middle to the end of March is a suitable time to sow the seeds, using pans or boxes which have been previously filled with light soil, placing them in a warm house with a temperature of about 60 degrees, where the seeds will quickly germinate. As soon as the seedlings are large enough to handle, transplant into boxes filled with well-decayed manure and sand in equal parts. When established in the boxes, cold frame treatment should be afforded, keeping the stock fairly close until the plants become accustomed to the change of temperature, after which time they must be gradually hardened off until full exposure is safe. Under this treatment splendid plants are obtained for putting out into their flowering quarters for the following season.

### Planting.

In many districts it is quite safe to plant out the majority of the varieties which have been propagated by layering, in the early autumn, but the cultivator has to take into consideration those which are less robust than others. The yellow varieties, and all those having flowers with yellow predominating, are inclined to be rather delicate, and these are much safer when potted and wintered in frames. When for any reason the planting cannot be done in the autumn there should be no hesitation in planting at this season, for, provided the work is properly done, the results will be in every way satisfactory.

The end of March and early in April is the most suitable time for spring planting, providing the ground is in good working condition. Assuming that the soil has been prepared beforehand, it is made firm by treading and raked level. If planted in rows, the distance between each row should be about twenty inches, allowing eighteen inches from plant to plant. The soil must be made firm about the roots, and these should be deep enough to prevent the plant from swaying about with the winds. When bedded out for summer effect it is advisable to plant a little closer. For this, about fifteen inches space between the plants will be found sufficient. If the weather remains dry after planting is finished, a good watering should be afforded.

Regarding the planting of the seedlings these are put into their permanent quarters as soon as they are large enough, which is generally about the end of July. The space recommended for the layered plants will suffice for seedlings.

### Summer Management.

Constant attention is required throughout the growing season, to keep the plants in a healthy condition. It is very beneficial to frequently stir the surface of the soil with a hoe, and an occasional dusting with soot is of great assistance. This latter operation should be carried out in the early morning when the dew is on the foliage.

Carnations have many enemies, and precautions must be taken to prevent any damage being done by the various pests which atack them. The soot dressings will usually keep sparrows off, but where there is any danger of rabbits or hares doing damage, it will be necessary to enclose the beds with wire netting. The carnation maggot is very troublesome in many districts during the early summer, and if not destroyed causes much damage. It is necessary to carefully examine the plants occasionally to exterminate this pest.

As growth advances and the flower spikes are produced, support must be afforded. Galvanised wires will be found most suitable for this purpose, and inconspicuous; but the top end must be turned round to prevent any hurt occurring when picking the flowers. If large flowers are required for exhibition purposes, the buds must be thinned, leaving about three to develop on each spike, and in some instances it is necessary to reduce the numbers to one. Mulching with decayed manure is beneficial, where the soil is light, during hot, dry weather, and the plants will need water occasionally.

### Varieties.

Bridegroom, pink; Cecilia, yellow, large flowers; Delicia, white ground, marked pink and crimson; Donald MacDonald, yellow ground, edged and marked crimson; Daffodil, good yellow; Duchess of Wellington, deep lavender; George Macquay, white; Gloriosa, apricot ground, marked scarlet; Herbert J. Cutbush, scarlet; King Arthur, crimson; Lady Linlithgow, rose; Lieut. Shackleton, yellow ground, splashed pink; Mrs. Macrae, dark scarlet; Mrs. G. A. Reynolds, apricot; Miss Willmott, pink; Mrs. Henwood, white.

PICOTEE F. W. GOODFELLOW.

A beautiful yellow-ground variety, raised by Mr. C. Blick, Hayes, Kent. The flowers are of large size, and the petals have a heavy rose edge.

Yellow-ground fancies are, as a class, dealt with in another article, but the newer yellow-ground picotees are so beautiful that they merit attention, and a good baker's dozen of varieties consists of: Childe Harold, fine wire edge; Dalkeith, heavy crimson edge; Exquisite, light scarlet-edge; Gretchen, deep yellow, light purple edge; Her Majesty, heavy purple edge; John Ruskin, light rose edge; Lady Douglas Galton, purple wire edge; Lady Gascoigne, rich rose edge; Lady Golightly, heavy crimson edge; Lucy Glitters, medium rose edge; Mrs. Walter Heriot, very fine, rose edge; Onward, medium rose edge; and Peregrine, clear yellow, rose margin.

The following will be found suitable for producing an excellent supply of flowers for cutting: Carabas, Mrs. Nicholson, and Raby Castle, pinks; Trojan, Countess, and White Swan, whites; Islinglass, scarlet; Daffodil, yellow; Uriah Pike, dark crimson; Mephisto, crimson; Benbow, buff; Crimson Clove and Gloire de Nancy are two well-known favourites, and should be grown for the fragrance of their blossoms.

Gnaton Gardens. E. C. Pooley.

## PERPETUAL CARNATIONS OUT OF DOORS.

The adaptability of the perpetual carnation for growing and flowering in the open air is now being more generally recognised, and there is no small probability that this class will supersede the border varieties, especially when we have raised a few different shades of colour in the selfs and also in the fancies. To introduce this wider range of colour in the perpetual carnation the cross-fertilisation necessary might be effected with varieties which we already have in the perpetual section, so as to retain the perpetual habit now obtained, and not by using pollen from border varieties, or the ultimate object might be defeated.

When one considers the short flowering period which the border carnation gives, it is surprising that the perpetual varieties were not tested earlier, and also that even now the plants are not more utilised for outdoor flowering. This may be due to the idea that the perpetual varieties are not hardy enough. That they are as hardy as and more so than many of the border carnations I have repeatedly proved, and the test has been in the worst kind of soil and atmosphere one could grow them in during winter, and in which about only half a dozen varieties of the border carnations would survive.

The preparation of plants for open air culture is a simple matter. Stock for the purpose may be propagated early in autumn, grown cool during the winter months, and planted out about the end of March, weather permitting, in the quarters where they are to flower. When the young plants are rooted, and have grown sufficiently, they should be pinched or stopped once. I prefer stopping the plants once only, and allowing all other growths to grow away unchecked. If the young plants can be grown in five-inch pots before being planted out, the greater production of bloom will be obtained, but should time and space not permit of this, then they may be planted out from three-inch pots. A little later propagation will suffice for the smaller sized pots, but the plants should be well established, yet not be checked by being kept too long in the pots before being transferred to the flowering quarters. Any surplus young stock could be planted out, and a good supply of flowers will be provided by plants which have flowered in pots, and have to give place to younger batches of plants in the houses.

Choose a border which does not require any fresh manure at digging time, and, if lime is not present in the soil, some should be worked in when the ground is prepared. Where it is desired to gather flowers over as long a period as possible it is a good plan to grow the plants where the blooms can be covered at night with tiffany stretched over wires; this protection may not be necessary in all localities, yet at the same time it is worth the extra trouble, as it keeps the blooms untarnished during heavy dews and rains.

Perpetual carnations growing in the open give better stock for propagating than can be obtained from pot plants. They require little attention beyond keeping them staked, stirring the soil between them frequently, and watering in very dry weather, with an occasional weak stimulant when the soil is moist.

Specially good varieties for flowering out of doors are Britannia, Mrs. Burnett, Mrs. T. W. Lawson, Enchantress, Winona, Beacon, Winsor, and Lady Bountiful; in fact, most kinds will respond to this treatment, though those which form good plants, after stopping the lead once before planting out, are most satisfactory. T. H. Slade.

## THE NEWER HYBRID BRIAR ROSES.

For the garden the hybrid briar roses will, in the near future, play an important part, as, since the introduction of the variety Soliel d'Or by Pernet Ducher in 1900, we have had many additions to the class, mainly through that source.

This group includes some of the oldest and most beautiful roses in the garden. For instance, Austrian Copper and Austrian Yellow, both grown in England by Gerard in 1596, are even now great favourites, as both blossom profusely, the former a bright reddish-copper, and the latter deep yellow. These were followed by Harrisoni (Harrison, 1830), a very pretty yellow, of dwarf habit, and Persian Yellow (Willcock, 1837), with large double flowers of a deep golden colour. Soliel d'Or (Pernet Ducher, 1900) is the result of crossing Persian Yellow with Antoine Ducher; it is perfectly hardy and free flowering, giving large flat blossoms of a distinctly pleasing colour — orange-yellow to reddish-gold, shaded with nasturtium-red.

From this variety we have obtained the following novelties, all of which are destined to become popular owing to their freedom of flower and brilliancy of colour, especially when grown as a hedge or screen where they can ramble at will. They require little pruning beyond the removal of small and worn-out shoots. A yearly renovation of the soil about their roots will encourage the growth, and add to the number of flowers.

The year 1910 was especially productive of varieties, giving us no less than three of the five coming from P. Ducher—Beauté de Lyon, coral-red, slightly shaded with yellow, the flowers full and globular. Viscountess Enfield, quite one of the most attractive, coppery old rose, shaded with yellow, the inner petals tinted with carmine, with occasional stripings of yellow in the centre. Rayon d'Or, quite unique in colour among roses, the long and pointed buds coppery-yellow, striped with claret-red, and as the blooms expand they show a flush of rose, which gradually dies away to bronze, and later to a rich yellow; this rose should be valuable in pots for early flowering, as under cool treatment the colour is most interesting. Soliel d'Angers (Ch. Detriche, sen.), deep ochre-red, edged vermilion; the foliage of this variety is sweetly scented. Juliet (W. Paul and Son, 1910) is a most remarkable rose in colour, and said to be derived from Soliel d'Or and Captain Hayward. The outside of the petals is old gold, the interior a rich rosy-red, changing to deep rose as the flowers expand; the blooms are of full size, most shapely, have an extraordinary lasting power, and delightful fragrance.

The hybrid briars are not nearly so subject to mildew as H.T.'s or other sections; in fact, some of the varieties are quite immune. E. Molyneux.

Swanmore Park.

## MAGNESIA.

Your correspondent, Mr. Alger Petts, raises a question on p. 141 as to the value of magnesia salts for horticultural purposes, and suggests that experiments should be conducted on plots of ground yielding the same produce with some of the magnesium compounds, and also with common salt and lime, to prove their value. This would certainly be a means of testing the relative values of the salts employed on the small portions of soils and crops grown upon them, but the results would be no guarantee that they would be the same on another plot. Very often an experiment carried out on one formation of soil is taken as a criterion for all future courses of treatment, no matter what the composition is.

All soils formed from the magnesium limestone are rich in magnesia, and no application of it could be of any service to plant life upon it. Again, practically all soils that have been under cultivation for a lengthened period have had applications of lime and kainit at one time or other, and as these contain magnesium salts the supply of this indispensable plant food is being unconsciously maintained in the soil. Farmyard and other organic manures contain a certain percentage of magnesium salts, and by their application to the soil the store of these salts is augmented, if not to the extent of the quantity extracted by the previous crop, yet sufficiently to enable growth to develop.

Soils naturally deficient in magnesia, even when long cultivated, and dressed with magnesium lime, are likely to benefit from periodic applications of magnesium salts, and this I have seen exemplified during last year. The soil was a heavy loam, rich in potash, but deficient in lime, phosphates, and magnesia. In Staffordshire an extent of country is being broken up for the first time and brought into cultivation, and, although the natural herbage is of the most useless plants, the crops obtained after the use of lime, kainit, and phosphates are wonderful. Most of this land is heavy clay, with a few sandy bands running through it, and, so far as can be judged from its neglected appearance, has never in its history received any aid to its fertility. This year a portion is being treated with a crude magnesium salt, and this is fully expected to foster the production of an even greater crop than the heavy yields of the last few years. It is on maiden land of this kind, and on an extensive scale, that experimental work is of value, showing the natural resources of the soil with the aid of fertilisers of a definite character, and not on small plots in a garden which may vary considerably in their chemical composition; a fact often overlooked.

Some years ago, when in charge of a kitchen garden of a good many acres in extent, I found very heavy clay in one part, almost pure sand in another, and all the variations of soil between these, within the walls, and yet we secured excellent crops all through. Naturally lime and magnesia were abundant, but potash and phosphates were deficient. Still, without any artificial help in these materials, we had peas go to the top of 7ft. stakes and down to the ground again on some of the quarters. The heavy manurings which had been given to this garden during the several hundred years it had been in cultivation no doubt contributed to the supply of both organic and inorganic plant food constituents available, and also their fairly even distribution. The physical properties of some portions being of a less retentive nature than the clays, the deficiencies of potash and phosphates were most marked upon them. Considerable experimental work was carried out in these gardens, and the results, in some instances, were quite the opposite of what was expected when commencing the experiments.

On soils almost side by side, and under identically the same treatment, excellent and very indifferent crops were obtained. It is because of this experience that I see the possibility of mistaken impressions regarding experiments with some of the magnesium compounds, common salt and lime. If the lime used in experiments of this kind contains magnesia, which will be the case with 90 per cent. of the limes in the country, then it is useless employing magnesium salts alone, and drawing a comparison. Magnesium salts should be mixed with non-magnesium lime, or lime containing very little magnesia, and then applied to all fruit crops, especially stone fruits, and also to all leguminous crops in the kitchen garden. Common salt can be tried at the same time, but its effect will not be manifest. There would be very little benefit from lime and magnesia dressing to land intended for the growth of cabbage, celery, asparagus, and all green vegetables, but salt, being one of the chief constituents required by them, would influence their growth in a marked degree if added to the soil in which they were being cultivated. Experiments with magnesium salts should therefore be confined to crops requiring large supplies, and the salts always be in either a mixture or in combination with lime. Hibernia.

## PERPETUAL SPINACH.

A green vegetable that continues to yield useful material for the table during the hottest and driest of seasons, and is at the same time a capital subject in wet weather, and so hardy that the severest winter has not the slightest effect upon it, is one that deserves more than passing notice. Such a vegetable is the Spinach Beet, or Perpetual Spinach, and there is no doubt it will be grown this year in many gardens where it has never been cultivated previously.

In gardens where there is ample provision for the cultivation of the choicer vegetables, possibly Perpetual Spinach may not be regarded with favour for the employer's table; but even if this is so, there are others to be considered in such establishments, and a good breadth of Perpetual Spinach is a great standby, and can be drawn upon for the servants' hall, the gardeners' home, and the bothy. But a person must be very fastidious who cannot appreciate a dish of well-cooked Perpetual Spinach.

Deep rich soil is essential to the highest success, but here again the Perpetual Spinach is most adaptable, and can hardly be sown in the wrong place. In rich soil the beet-like roots grow to a large size, and the leaf development is correspondingly large and continuous. Perpetual Spinach is, botanically, a variety of Beta Cicla; it is of garden origin, and a hardy perennial; hence a sowing in March and another about mid-summer will suffice to keep up a good supply. Sow in drills a foot or fifteen inches apart, and thin out the seedlings to nine inches apart at the earliest possible moment. General attention includes frequent hoeings, weeding, regular picking of the useful leaves, and a few good soakings of weak liquid manure in a dry season, though, if the soil be deep and rich, these latter will not be necessary even if desirable. C.

## PERPETUAL CARNATIONS FOR PRIVATE GARDENS.

It is astonishing how rapidly the perpetual carnations are increasing in popularity; but their delicious perfume, diversity of colour, and durability when cut, are characteristics that fully justify the favour with which they are regarded.

There are so many varieties at the command of the cultivator that in districts where all the varieties do not succeed, it is easy to replace those which fail with others that will thrive. One of the most pleasing varieties is, in my opinion, that lovely pink flower, Mrs. Burnett. I always feel sorry when I see a poor batch, for the simple reason I have not been able to grow it here, although, in other cases, I obtain my revenge. Pink Delight is another beautiful flower, but, like White Perfection, is not easy to propagate or to grow to a high degree of perfection. With me it does not make a good plant. I am now building my hopes on Lady Northcliffe, one of the latest introductions. R. F. Felton produces finely developed blooms, is attractive in colour, and the plant has evidently a good constitution, and not subject to disease. May Day, Regina, and Rex are excellent varieties, and quite worthy of a place in select collections. Lady Allington and Rival are of great merit, and will hold their places for some time to come. Rose Doré is a rare grower, but not free flowering in winter; the two older varieties, which I consider have not yet been surpassed in their respective colours—namely, blush pink and scarlet—are Enchantress and Britannia. The latter should always be grown under glass. The newer Scarlet Glow is a promising variety, the flowers of good form, and the colour very bright. White Enchantress is a good variety in its colour group.

All the above varieties are grown here, but none of them can be compared in size with Carola. In my previous notes I have always spoken in favour of this variety. I have a house of it now, simply grand. It is a wonderful carnation, very free, with magnificent blooms, as large as a Malmaison. In many parts this variety appears to suffer much from rust; it did here at first, but with the usual care it soon became clean, and since then not a spot has been seen. This year our stock will be increased from five to seven hundred plants.

One or two of our leading horticulturists have recently brought out a remedy, or cure, for rust. In my opinion the preparation is good, but the directions for use are not in accordance with my practice. Instead of using the preparation twice a week, as advised, I use it twice a day. On no account must a syringe be used. It must be the finest spray possible, one similar to what the florist uses, which only leaves a moisture like the morning dew on the foliage. If this spray is continued the rust will disappear, as it cannot thrive under such treatment. Anyone who doubts the efficiency of this treatment need not "Wait and see," but "Come and see." The above variety must be grown under glass throughout the season, and once the plants are free from the disease there will be no further trouble, and the grower repaid a thousandfold.

Mrs. Raphael is one of the largest of the perpetual carnations, more like a Malmaison, but thrives well. Here it is a most vigorous and healthy grower, and the flowers are of a charming cherry-red colour, with a delightful fragrance. These beautiful flowers are becoming more and more indispensable for decorations, and they can be grown with but little artificial warmth, for even now, in the middle of March, it is quite safe to dispense with fire heat, which cannot be said about other flowers suitable for decoration at this time of the year.

A. Grubb.

Porters' Park Gardens.

CARNATION SCARLET GLOW.

One of the finest of the perpetual varieties with scarlet flowers. The blooms illustrated were shown by Mr. H. Burnett at a recent R.H.S. meeting.

## CALLIANDRA TWEEDIEI.

One cannot well imagine many more beautiful plants than this Brazilian evergreen shrub, when it has been well grown and is in full flower. Here we have a low bush, with miniature, mimosa-like leaves, of a delicate green colour—an ornamental plant even out of flower. But when, as now is the case, the frail-looking branchlets bear globose heads of bright red flowers, the value of the shrub is greatly increased. The individual beauty of the flowers lies in their bunches of long stamen-filaments which contrast so sharply with the pale green leaves. At first sight the flowers are so suggestive of those of the Australian Bottle Brush (Metrosideros speciosus), only these flower-heads are stalked, and are not so dense, that one might almost describe the calliandra as a pigmy, bushy Sensitive plant trying to look like a metrosideros.

At maturity the calliandra is said to become 6ft. high, which is over large for the average stove house, but there is no difficulty in keeping the plants at less than half that height. The species under notice will thrive in a compost of medium loam and leaf-mould, with the addition of a sprinkling of silver sand. If it is available of first-class quality, peat may be used instead of leaf-mould, but poor quality peat is always an unsatisfactory rooting medium.

Being a native of Brazil stove house treatment is necessary for the calliandra, but while in flower the plants could be placed in an intermediate temperature without any fear of injury, provided that they are not over-watered. Cuttings of young shoots which are becoming firm in texture will usually root if firmly inserted in light sandy soil, and placed under a bell-glass where a moderate amount of bottom heat is available.

Cecil Aubrey.

## OLEARIA STELLULATA.

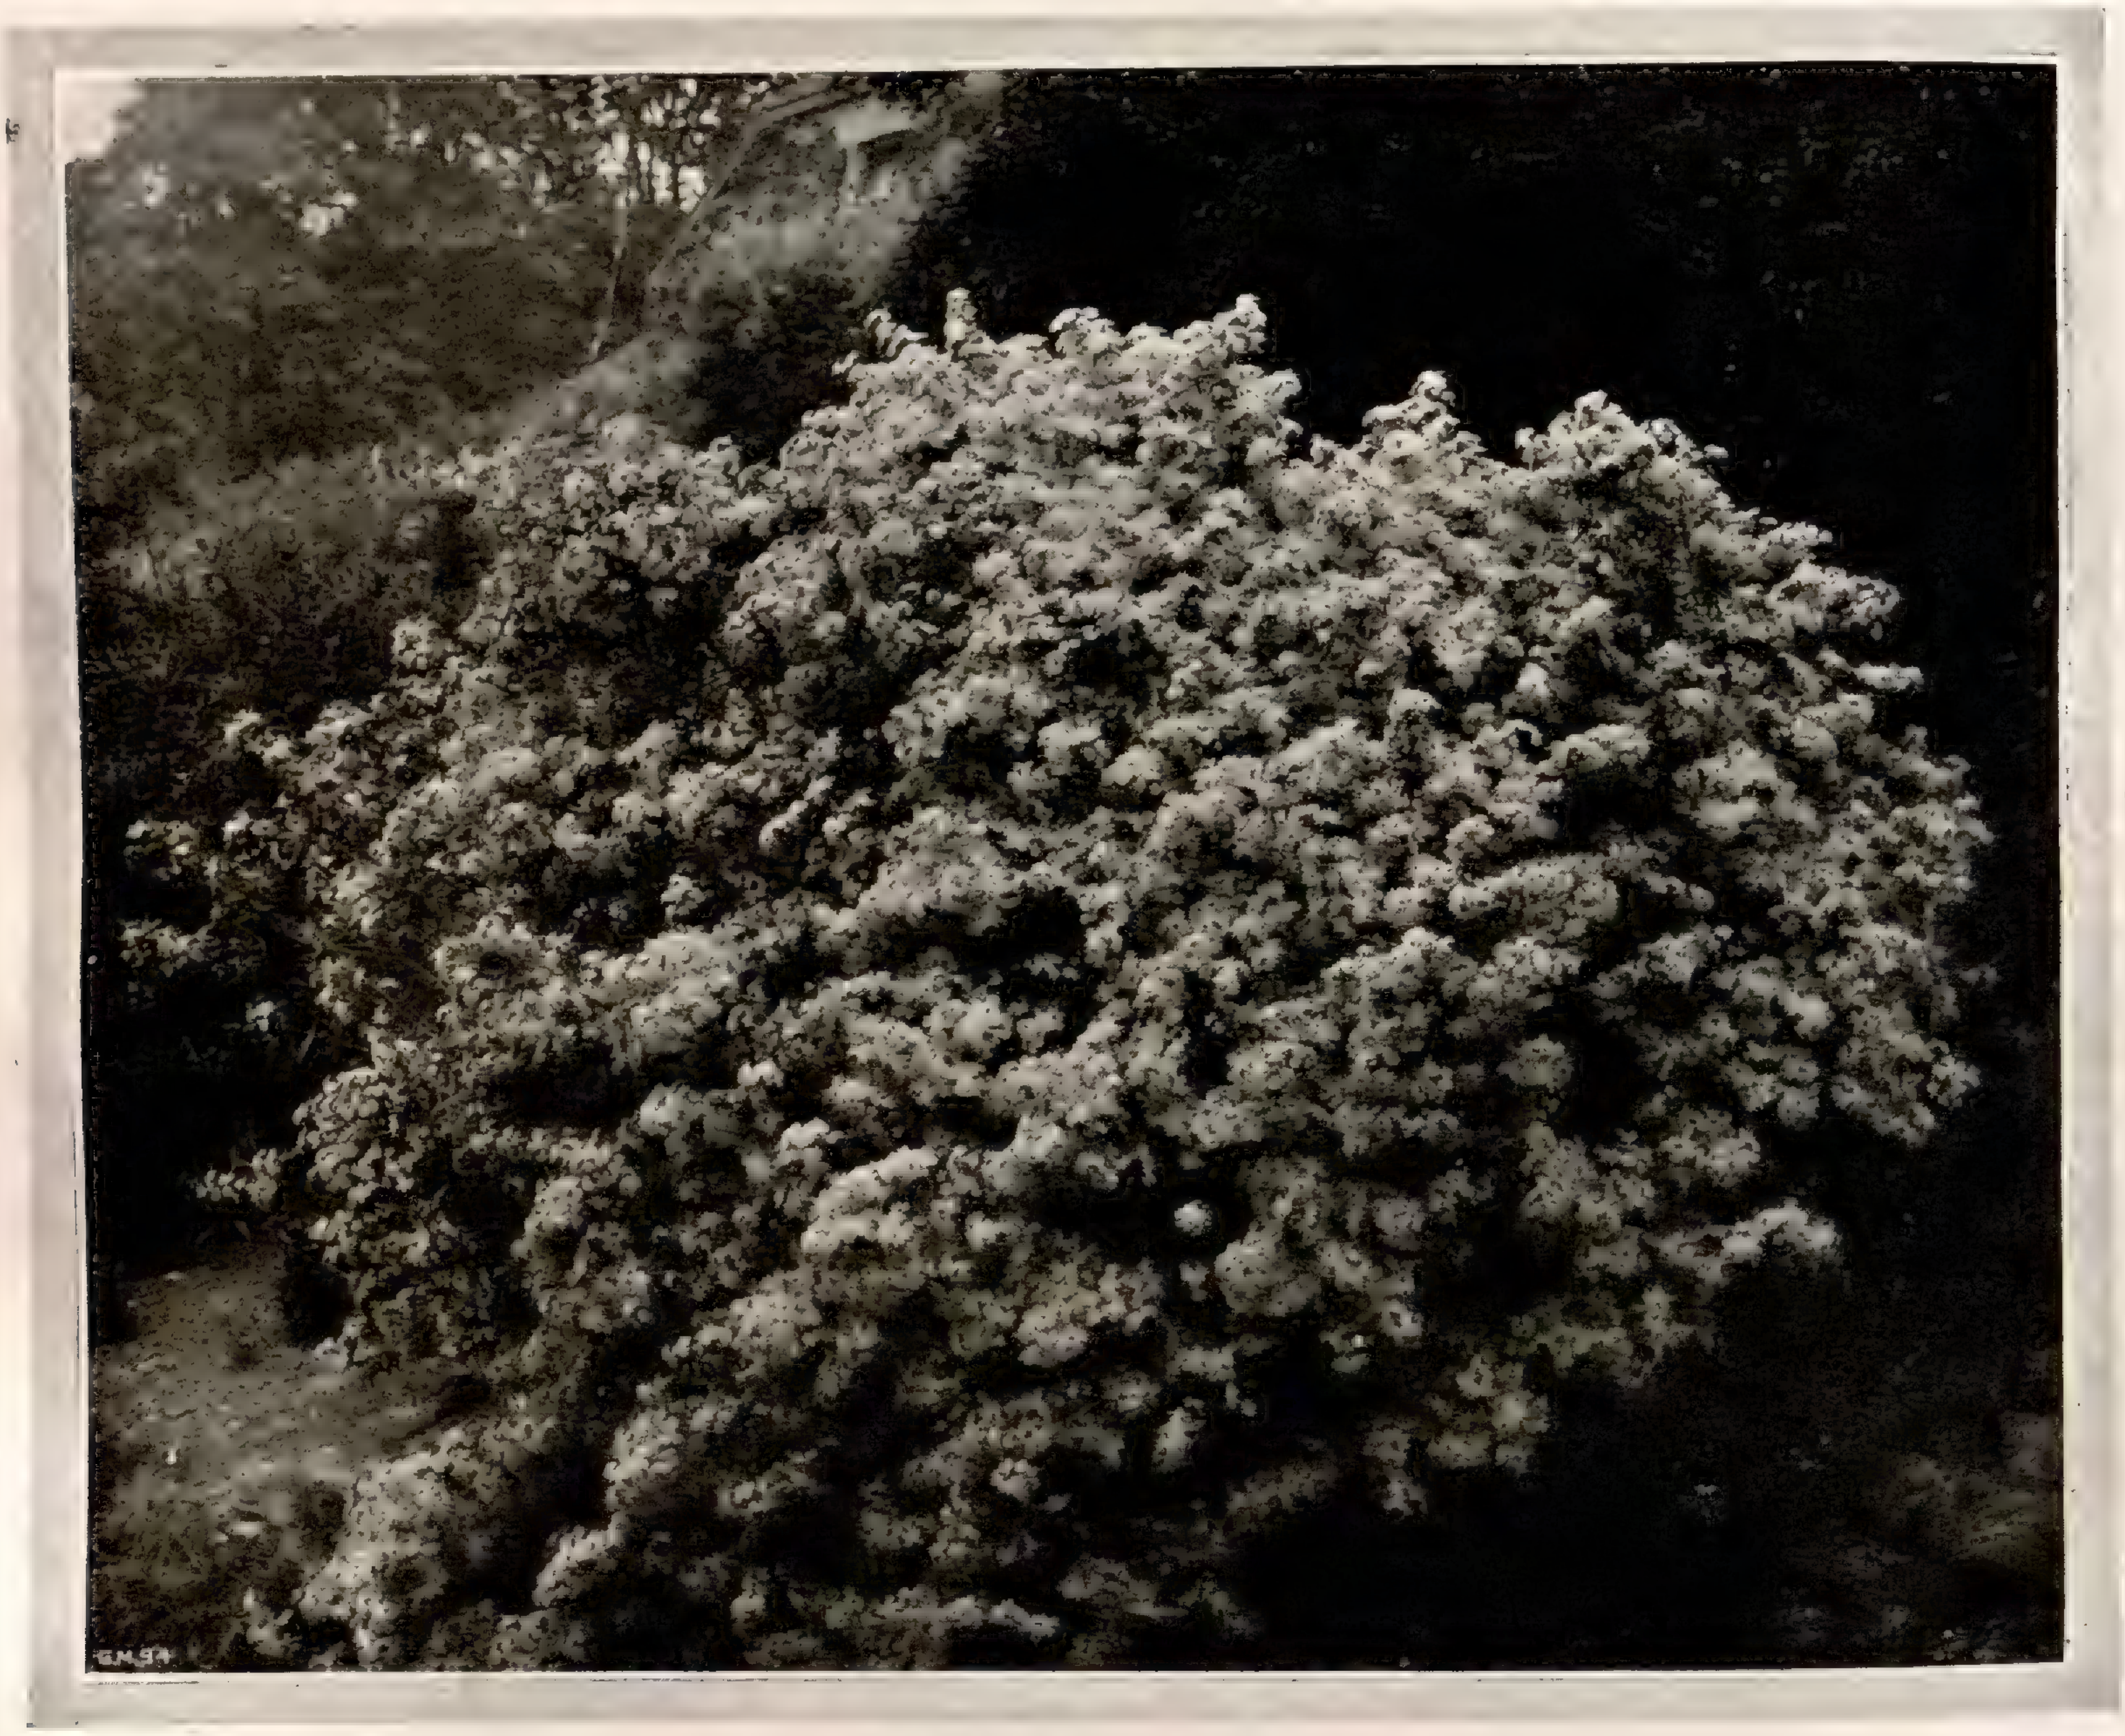
In gardening works this shrub is generally held to be synonymous with O. Gunniana, but the latter is quite distinct, and its white daisy-like flowers are smaller, of greater substance, and more cupped than in O. stellulata. O. Gunniana is possibly now not in cultivation.

O. Stellulata was one of the first species to be introduced into England. It is a native of Tasmania and New South Wales. In the south-west it attains large proportions, the shrub represented in the accompanying illustration being 7ft. in height. It is an early bloomer, being at its best in May, while its first blossoms generally expand early in April. In colder parts of the country it flowers about a month later. The leaves vary in length from half an inch to two inches, and are narrow, deep green on the upperside and whitish beneath. The flowers are borne in leafy panicles, which are long and very graceful in form. Each flower is small, daisy-like, pure white, with about a dozen ray-florets. Although this species rarely presents the unbroken sheet of white that O. Haasti does, its larger and more starry flowers are freely produced on the branching shoots, and the plant, having a graceful habit, makes a charming picture, especially in large specimens several feet in height.

It is fairly hardy, even in Scotland, if planted against a south wall, and protected during frost, but is more tender than O. Haasti. It succeeds best in a sunny position, and is not particular as regards soil, since it may be seen flourishing both in heavy, retentive loam, inclining to clay, and in light, shaley soil. Large specimens, 6ft. or more in height, make charming pictures when white with countless blossoms, and, although this species cannot excel O. Haasti in the number of its flowers, it possesses a far more graceful habit, which renders it more ornamental as a garden shrub. The bloms last in beauty a considerable time, and a well-flowered plant is in general appearance quite distinct from the numerous hard-wooded subjects, such as ericas, chorizemas, pimeleas, eriostemons, and others, all of which require much the same treatment.

Cuttings of this olearia root quickly, and the plants flower freely in quite a small state. Being readily increased and quite happy in a cold greenhouse, pot plants should always be held in reserve to take the place of any which may have been killed by the winter frosts, while they prove exceedingly useful in the early spring, when the flowers may be hastened by gentle heat. The genus was formerly known as eurybia.

WYNDHAM FITZHERBERT.



OLEARIA STELLULATA.
A beautiful hardy evergreen shrub with white flowers.

---

**Cyperus alternifolius.** — Since palms and ferns have been so extensively grown for decorative purposes, this member of the Sedge family has not been met with so frequently as was at one time the case. It is a very pretty plant, with the leaves disposed like the ribs of an umbrella on the top of a clean green stem. It stands well in the dwelling-house if kept supplied with water. There is a variegated variety which needs to be potted in rather poor soil to keep its colour well.—S. W.

## HERBACEOUS BORDERS.

Herbaceous borders are popular nowadays, the trend of fashion having set largely in its favour; and it may be said that the spirit of favouritism which has been extended toward them has much to recommend it from the garden-lover's point of view.

Though usually spoken of as herbaceous borders, the truer designative "Perennial Borders" might well be accorded to them, thus giving, as it were, a titular permission for the inclusion of various shrubs, bushes, etc., which certainly cannot be regarded as herbaceous subjects. But whether herbaceous or perennial borders be spoken of matters but little; the main idea in the creation of such borders is that they should be well-arranged with a suitable collection of decorative subjects, that will give blossom and beauty for as long a season as possible.

The idea has been given to a waiting world of a series of vivid colour effects in the borders. Bold massed groups of one particular colour, alternating, or combining, with other groups of particular hue, equally bold, and equally bright, into forming, as it were, a "kaleodoscopic rainbow of colour." The colours may gradually shade from one to the other, or may be set in vivid contrast against each other. It matters but little as long as you obtain a repetition of colours throughout the season. And is this the sole end of the herbaceous border, that sweet inheritance from old-world English gardens? Or shall we advocate the merits of the true herbaceous border for each of the summer months?

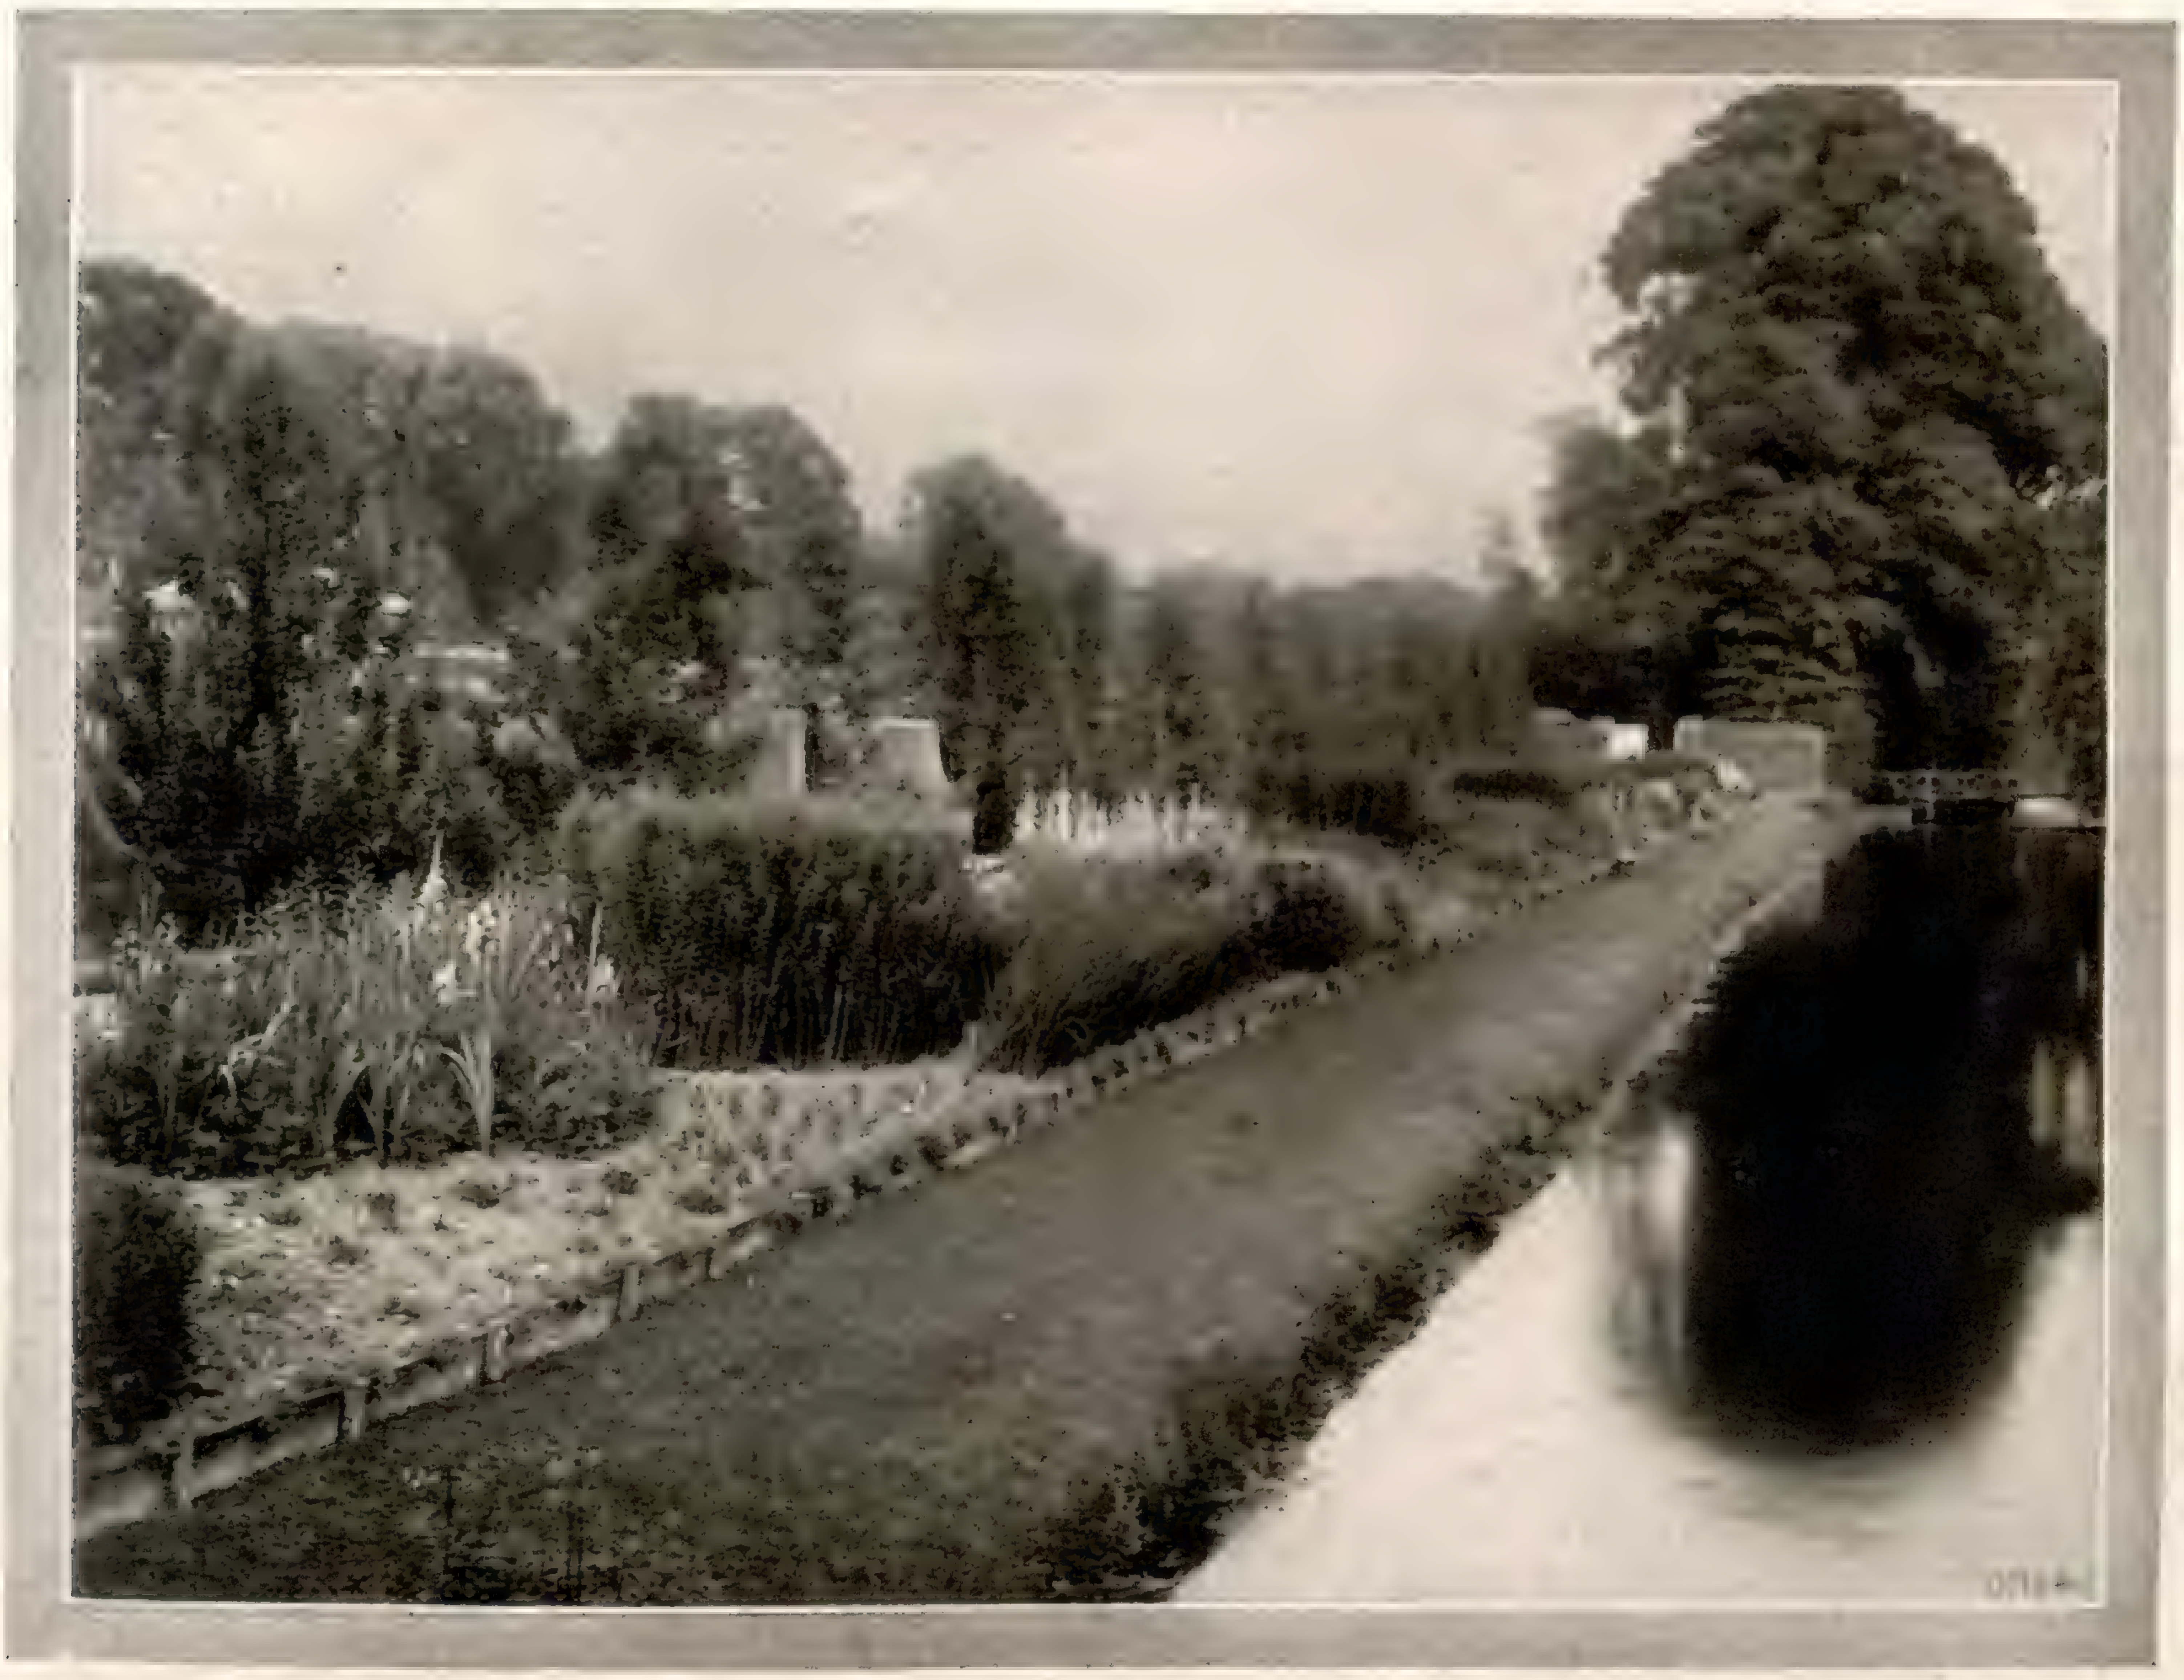
Neither will fill the requirements of the true herbaceous border; neither the "rainbow brilliancy" nor the monthly scheme; but rather the full idea must be to render the beauties of the flowering perennials in the most picturesque manner from spring until autumn. The collection need not comprise a host of rarities, one can obtain beauty from what are ofttimes termed "common subjects"; yet carefulness in selection and planting have a telling effect when the herbaceous border is "in being."

I do not wish to give any especial list of subjects to be utilised, for many readers will have their own ideas about their own favourites, and would be able to formulate as good a selection as I; and yet I must enter a plea for diversity in foliage, flowers, and the heights of various subjects used. Flatness in a planting scheme is fatal; therefore let there be distinct diversity in the manner noted. Let it be understood that I do not wish to discredit those pleasing schemes which describe themselves as the White Border, the Blue Border, etc., etc., for provided the utmost discretion is used in planting the best subjects possible of the colours named, there is no good reason why the White Border or the Blue Border, or, indeed, any other pleasing colouring should not become popular. A garden scene showing blossoms of one particular "colour study," set in a wealth of green foliage, will prove a veritable fount of delight to many a garden lover. There is a restfulness in it; a peace which acts as a calm to weary nerves; a picture which does not jar either upon the eye or mind; a Garden of Rest!

To produce the best effect in the herbaceous borders one must make both the borders and the intervening path as broad as possible; the greater beauty is apparent in the spacious borders, with bold free groupings. Or, if the border be a single one at the end of a lawn, or in a similar position, let it be arranged so that there is a good view of it obtainable from across the lawn, for the distance lends enchantment and provides an effective picture.

With reference to the introduction of shrubs, etc., let me advise care in grouping these. A few dainty masses of Japanese maples, deutzias, shrubby spiræas, roses, azaleas, syringas, philadelphus, pyrus, etc., etc., will enhance the beauty of a broad border, and effectually break up any idea of flatness, either in summer or in the winter time when most of the other subjects are cut to the ground. But do not plant shrubs heavily; just interpose here and there light-growing specimens or groups in the general scheme, and you will get an added beauty.

Usually a good gravelled path is set between two borders, though one may sometimes note a grass pathway in a few gardens. Both have their merits, and are deserving of no caustic criticism, though both need a certain amount of care and attention. To my mind, however, a rough stone pathway, with interstices among the flat stones for varied lowly subjects to rove through, gives a delightful finish to old-fashioned herbaceous borders in an old-world garden. The grey-bronze stones, deep with age and the effects of weather, through which creep tiny linarias, sedums, thymes, erinus, and many other charming subjects, make an ideal pathway, firm and dry, and possessing a beauty of their own.



HERBACEOUS BORDER AT WILTON HOUSE, SALISBURY, THE SEAT OF THE EARL OF PEMBROKE.

The edging of the herbaceous border also requires a little study. It may be a grass verge; it is sometimes ornamental tiles; possibly dwarf box may form the edging. But after all, what is prettier than a rockwork edging overrun with dianthus, arabis, alyssums, aubrietias, violas, saxifrages, cerastiums, sedums, iberis, and many others of the rock plants.

It gives a charming, informal, interesting edging, a delightful setting or frame to the border, a setting that cannot possibly suffer by repetition.

In closing, may I urge the importance of good work in the herbaceous borders. Deep trenching and thorough manuring are necessary at the formation, and as time goes on the soil must be kept well worked between the plants, and the plants themselves kept in health by transplanting and division when necessary. With well-worked soil and a fair amount of manure, the herbaceous borders should be a garden of floral beauty, a picture of luxurious growth and glorious blossom.

P. S. HAYWARD.

---

**Ficus Parcelli.**—Among the several members of the fig family that are grown for the beauty of their foliage is Ficus Parcelli, whose leaves, though they are wanting in the leathery nature of those of Ficus elastica, are mottled and marbled in so many ways with white on a dark green ground as to be very attractive. It needs ordinary stove treatment. The genus Ficus is fairly prolific in variegated forms, as in addition to F. Parcelli there is a variegated variety of F. elastica, while the creeping kinds, F. radicans and F. repens, both have variegated sports.—T.

## DAHLIAS.

The dahlia appears to owe its name to Andre Dahl, a Swedish botanist, and a pupil of Linnæus. In Germany, however, the flower was known to some extent as the Georgina, this name having been originally proposed as a substitute for dahlia, so as to prevent confusion with Dalea, an insignificant leguminous plant. For many years the flower was only single and semi-double, but the German florists at length obtained very double blooms, and a multitude of different varieties of all colours (except blue) and shapes were afterwards raised in this country. Subsequently, when popular interest in the flower was flagging, the cactus dahlia was introduced, and quickly attracted interest. Meanwhile, German horticulturists turned their attention to a section which we know as the pompon. At present, the Dutch pæony-flowered dahlias are being grown to a large extent, and it is thought that this section is to be the next rage in dahlia culture.

It would appear that the late autumns experienced during recent years have been extremely unfavourable to the dahlia grower. I was very much impressed, however, by the excellent display of dahlias which were on view in Sefton Park, Liverpool, during the past autumn. This display seemed to attract more than ordinary attention, as the border in which the dahlias were planted presented an absolute blaze of colour, such as it would have been almost impossible to secure with any other class of plant of like stature. Some kinds, such as the cactus dahlias, have undoubtedly a very important value from a decorative point of view; like chrysanthemums, they are capable of retaining their freshness for some considerable time when placed in water. Few cottage gardens throughout the south of the country are complete without a collection of dahlias. The dahlia classes at the various country flower shows attract hosts of exhibitors from amongst the cottagers, and so keen is the interest displayed that I have known of many who have cheerfully paid fancy prices for novelties of recent introduction.

### The Cactus Section.

The cactus dahlia is undoubtedly a flower of extreme beauty, graceful in form, and probably of a wider scope of colouring than is to be encountered in any other form of flower in the whole realm of horticulture. The following varieties are among the best, and the list is compiled from a selection given by one of the most noted dahlia growers of to-day: Caradoc, Clincher, C. E. Wilkins, Dorothy, Dr. Gray, Faunus, Fairy, Glory of Wilts, Great Western, Kathleen Bryant, Nelson, and Ruby Grinstead. In the modern type of cactus dahlia the edges roll back in the opposite direction from that in which they were formed, making the floret appear much narrower than it really is. All the different varieties of cactus dahlias owe their elegance and grace of form to the varied curves and flutings, and the curious twists and irregularities of the florets. The best varieties have their buds formed in the shape of a filbert, pointed at the end, and it will be noticed that the florets unfold from a straight position, instead of being curved inwards.

### Exhibition Dahlias.

It is difficult to formulate a list of show points to which all dahlias should conform, since the very diversity of form in this flower is the principal factor upon which its popularity is founded. However, it may be stated in general that a good cactus dahlia should be of large size, with a closed centre, and no suspicion of green. The florets must be long and narrow—the narrower the better; and it will be more in their favour if they are curved inwards to a slight extent; every floret must, of course, be regularly and evenly placed, without confusion. The ordinary or double show dahlia, of which some surprisingly good specimens are shown in country shows, should have the following points: The flower must be round and perfectly symmetrical, the florets regularly and evenly placed, and their edges rounded and shell-shaped, not in any way mouse-eared or pointed. The latter, by the way, should taper gradually to a smaller size towards the centre of the flower, not suddenly. Pompon dahlias must have the same points as regards shape and form, but should be of smaller size, no more than two inches across. Broad, rounded florets of good substance are essential in the single dahlias; they must also lie flat, without being crumpled or twisted; also the edges should be slightly reflexed. Single dahlias should have a clear and decided colour. Pæony-flowered dahlias seem to score best when the shape, form, and colour are as grotesque as they can possibly be; in fact, the very ugliness (from a florist's point of view) of this section seems to have brought them into popular fancy.

### Propagation.

Plants in pots may be purchased from nurserymen during spring, and these should not be planted out until May if they are to be grown in the open ground. Where plants have been obtained and grown through one season, however, the roots should be carefully lifted when cut down by frost, and stored in a cellar or outhouse when fairly dry; it is advisable to bury them in ashes or sand so as to prevent mildew. They may be brought to light in March, and placed in a warm house of some sort, when, as soon as the eyes commence to grow, the central stem can be divided in such a way as to leave a growth and some of the tubers on each section of it. These make very good plants for the late summer or autumn if planted out in May, but for exhibition culture cuttings taken the same season are best. The roots should be started in heat, and the cuttings will root readily in March. To avoid deterioration, it is advisable to take the cuttings quite close to the root, where the stem is solid; if they are taken higher up where the stem is hollow, deterioration will certainly ensue.

### Staking and General Management.

The young plants should be potted into six-inch pots in good compost, and stood in cold frames until about the first week in June. Then they may be transferred to their permanent quarters, staking immediately with a good stout 6ft. stake, and supplying the plant with plenty of water in the absence of rain, so as to enable it to establish itself quickly. Delay at this stage generally means late flowering and consequent disappointment. As soon as fresh growth is made, four additional stakes should be placed around the central one, about 12 or 15 inches away from it, and with their tops leaning outwards. The side shoots should be tied to these stakes as soon as they are sufficiently developed. When grown for exhibition purposes it is most essential that the plants should have a number of their shoots reduced and their buds removed; a cluster of buds is generally produced in the points of the principal stems, and these should be disbudded to the best and generally the leading bud; the growth-buds that are produced in the axils of the leaves immediately below the flower buds should be pinched out at the same time.

As soon as flowering commences a soaking of liquid manure or guano may be given with advantage. Old blooms, as the florets fade, must be removed at once, and no useless spindly growth should be allowed to develop in the centre of the plant.

J. C. NEWSHAM.

## NARCISSUS SEEDLINGS.

At a recent meeting of the Royal Horticultural Society's Scientific Committee Mr. Worsley made some remarks upon the growth of narcissi in gardens. It was the general opinion that narcissi, when allowed to grow untended, may become smaller, but never, in spite of a somewhat general opinion to the contrary, revert to the specific type, though seedlings may vary from the parent type. Sir John Llewelyn showed flowers of wild plants from S. Wales, including N. obvallaris and a large deep-coloured form with something of the coloration of N. Golden Spur. The plants occurring wild in S. Wales showed a good many variations in form and colour of flower, but there were two types of foliage only which never seem to intergrade. Canon Fowler wrote that he sometimes found forms among such varieties as Emperor producing finer flowers than the majority, and he believed these variations to be constant; one plant was found among Weardale Perfection last year having two flowers of only a fourth the size of that variety, and something like Johnstoni in form. Mr. Malcolm, of Duns, also alluded to a sport which he had found in his garden. Sporting appears to be rather frequent. Some discussion arose as to varieties that commonly produce seed, and Mr. Williams, of Lanarth, said N. cyclamineus reproduced itself by seed quite freely, but seedlings died out rapidly in the grass; N. pseudo-narcissus also produced itself freely from seed in the grass and reached flowering size. In Mr. Bowles's garden, N. pallidus præcox is the most abundant seeder, but the seedlings rarely gave the pale form, though they retained the early-flowering habit; pseudo-narcissus seeds freely, as to Triandrus albus, variiformis, and cyclamineus. Mr. Chittenden said that N. cyclamineus seeded very freely at Wisley, as do N. bulbocodium and N. Triandrus albus; other forms rarely produce more than a stray capsule or so. Mr. Shea had only found Sir Watkin with a seed pod once, and Empress rarely seeded, but White Wings frequently with him. Weather conditions appeared to determine to a large extent the amount of seeding that occurred, for in 1910 he found only nine varieties produce seed, but in 1911 21 seeded. Possibly bees were required to effect pollination satisfactorily. Mr. P. R. Barr found that self-fertilised seedlings of garden varieties of daffodils tend to revert to their parent types, e.g., Horsfieldi self-fertilised produces numerous poor forms of pseudo-narcissus. King Alfred, on the other hand, produces some very nice yellow trumpet forms, as a rule more or less dwarfer than their parents. Mr. Backhouse remarked in reference to the common belief that single wild daffodils may sport to double forms, that seedlings resulting from the first cross between the single wild form and the double one would, some of them, be double, and the idea might have arisen in another way as well, viz., by bringing into gardens poor, and practically single because poor, forms of double daffodils which, under better cultivation, would become typically double. Against this, however, is the fact that the true double form of the wild daffodil is rare in cultivation, Van Zion being the form commonly grown.

# BROCCOLI.

There is no other winter or spring vegetable so widely grown or so much in request as the broccoli, and none in which the season of usefulness extends over so long a period, for, thanks to the numerous varieties in the various sections into which the broccolis are divided, fine heads may be had from Michaelmas until mid-summer; therefore, in dealing with a vegetable of such general cultivation it is essential that each section should be treated separately, as the management differs considerably.

## Autumn Supplies.

If we take the autumn section, of which there are several varieties that are in use from September until the early winter, it will be found these are more tender than those in season from March onward, and not sufficiently hardy to withstand the frost of our climate unless in the most favoured portions of the kingdom. Their flavour, too, is more that of the cauliflower than the broccoli. For the sake of distinction, broccolis may be divided into four sections, autumn, winter, early spring, and summer.

To produce plants of the first section sufficiently early that the heads may turn in during September, seeds should be sown in March. As the climatic conditions and soil vary so much in different districts, it is useless to lay down any hard-and-fast rules as to the date of seed sowing, or whether the plants should be raised under glass in a cold frame, or on an open border; for while in the south the seeds might be sown in the open, in the north it would be necessary to raise the plants under glass. But whichever mode is adopted the plants should not be allowed to become overcrowded, and should be transferred to their permanent quarters as soon as large enough. This section requires deeply-tilled fertile soil to produce fine heads of close and delicate texture. We do not advocate allowing them to remain until full grown, like those one often sees in the markets; they should be cut when young and before the leaves have unfolded sufficiently to expose the curd.

To grow heads of this class the plants must be allowed ample space for the leaves to become fully developed, otherwise the heads will be disappointing. From two feet to thirty inches each way, according to the quality of the land, will be found a suitable distance; and if the land is extra fertile another six inches will be found none too much, as plants are apt to be drawn when grown within the four walls of the kitchen garden. Michaelmas White, Self-Protecting, and Autumn Protecting are all good varieties that may be included in this section.

## Early Winter Supplies.

We now come to the early winter kinds, such as Sutton's Winter Mammoth, Christmas White, Snow's, Vanguard, and some others. Most of these are somewhat tender; therefore, in cold, damp places they will require protection in severe weather. It is a good plan to lift them where possible and plant them in cold pits or frames, but where this is not practicable they should be transferred to a south border about the middle of November and planted with their heads towards the wall; here, should severe weather set in, they can be easily protected from frost with the aid of mats and litter. This is usually the season when broccolis are most appreciated, therefore a little extra pains in their management amply repays the cultivator for his trouble. To produce sturdy plants the seeds should be sown on a warm border in March, care being taken to protect it from the ravages of birds, which are usually very troublesome at this season of the year. When the plants are large enough to handle they should be pricked out, so as to induce them to grow as sturdily as possible. They should be large enough for transplanting by the end of May or early in June.

Do not overcrowd, as it is far better to have half a dozen presentable heads than a dozen poor ones. Keep the plants well supplied with moisture through the summer should the season be dry. In addition to the above-named there is a variety of Early Sprouting that is very useful, and being more hardy than the others it needs no protection.

BROCCOLI SUTTON'S WINTER MAMMOTH.
A mid-winter variety, remarkable for its large, finely-formed, self-protected heads, and excellent quality. Introduced by Messrs. Sutton and Sons, Reading.

## Late Winter and Early Spring.

In the third section there is a large choice of varieties, as this includes those in use during March, April, and the early part of May, and every seedsman has a special variety of his own to recommend. To grow good broccoli of this class, as most gardeners are aware, needs some special preparation of the soil; especially in old kitchen gardens that have been cropped for years with some of the brassica family. This is particularly so with the light soils, as on such the plants make slow progress in hot weather. It is a good plan where such ground has to be dealt with to manure in the autumn and dig as deeply as the soil will allow; then leave it to become somewhat consolidated so as to conserve the moisture as much as possible. It is also a good plan to give a surface dressing in spring, using such manure as dissolved bones, sulphate of ammonia, kainit, or sulphate of soda. The plants should be inserted in the ground as it was left in spring, there being no need to cultivate again. It is very annoying after one has been at the trouble to produce a fine breadth of plants which look promising in autumn to find the greater portion of them have been killed by the winter's frost. To guard against this lift the plants in the autumn so as to check their growth, and where they have grown at all leggy plant them deeper in the soil with their heads facing the north. It frequently happens, where the garden is situated in a low, damp position, and the soil is of a heavy retentive nature, that broccolis suffer seriously during severe winters unless some protection of this kind is afforded them; especially if the autumn has been mild, with more than the normal rainfall, as the plants then grow until quite late, and are therefore very sappy, and liable to suffer.

This section contains such varieties as Snow White, Main Crop, Leamington, Safeguard, and a whole host of others. The seeds should be sown in the open ground in April, and before the plants become crowded; if it is not possible to transfer them to their permanent quarters, they should be pricked out in an open place about six inches apart. If the soil is made fairly firm growth will not be so rapid, and therefore less liable to suffer when transplanted.

## Late Spring Supplies.

The last section contains such varieties as Universal, Late Queen, Standwell, Latest of All, and the like, and these when well grown will usually give a supply until cauliflowers are plentiful from the open ground. The seeds of this section should be sown from the middle of April to the first week in May, according to the district. Some of them are strong-growing kinds, making large leaves, and therefore should be allowed more room to develop than the dwarfer ones. Universal is the finest variety I have grown in this class, and those who have not already done so would do well to give it a trial. Broccoli is very largely grown for market; in some districts it follows the early potatoes. Whole train loads are sent to the various towns in the North, and at the present time Winter Mammoth is sent from Cornwall, packed in crates

H. C. Prinsep.

# NOTES FROM KEW.

## Greenhouse Flowers.

Apart from the numerous plants that flower at this season a great number of hardy subjects have been forced for the embellishment of the greenhouse. There is, of course, a wide choice of hardy shrubs, especially among the azaleas and rhododendrons, while others of this class that may be especially mentioned are the double-flowered cherries, Pyrus floribunda, Spiræa arguta, Staphylea colchica, the double-flowered form of Kerria japonica like little golden roses, and the uncommon Xanthoceras sorbifolia, whose white flowers have a distinct coppery centre. Of forced bulbs the hyacinths, tulips, and narcissi contribute bold masses of colour at Kew.

Of greenhouse plants proper there is a fine display, as apart from such well-known subjects as Indian azaleas, camellias, carnations, primulas, cyclamen, and cinerarias there are many others not so generally met with. A bold group of Coleus thyrsoideus shows off its rich cobalt blue flowers to advantage, and an allied but uncommon species, though less attractive, is decidedly ornamental. This is C. shirensis, which, like that just mentioned, is a native of central Africa. The finest begonias just now are Gloire de Sceaux, with bronzy foliage and rose-coloured flowers, and that valuable hybrid raised many years ago by M. Lemoine—Begonia semperflorens gigantea rosea, which is, and has been for a long time, quite a mass of blossoms. An exceedingly pleasing effect is produced by a group of the Mexican Begonia manicata interspersed with some bright-coloured hippeastrums.

Numerous hard-wooded subjects contribute their share to the floral display, notably chorozemas, acacias, particularly a very large specimen of A. pulchella, Boronia megastigma, Cytissus racemosus, and others. Of the many still remaining especial mention may be made of a finely-berried group of Ardisia crenulata, and of a flowering example of the curious South African Bird's Head Flower—Strelitzia Reginæ.

## Pinguicula Rosei.

This Mexican Butterwort is now in flower in the orchid range, the treatment given to many orchids being very suitable for this and its near relative, the well-known Pinguicula caudata. To this last, P. Rosei bears a great general resemblance, except in the colour of the blossoms, which in the newcomer are of a deep violet tint. Close by is a flowering example of P. caudata, so that the near relationship between the two, except in colour, may be readily seen.

## Eranthemum albiflorum.

This pretty acanthaceous plant is by no means a novelty, yet, considering its merits, one wonders that it is not more generally grown. Like many other members of the genus, it is of upright growth, and the flowers, which are borne in terminal spikes, are very suggestive of a spray of white lilac. Grown as in the T range at Kew in comparatively small pots with the entire plant not much more than a foot high, it is very pretty. This eranthemum is a native of the Solomon Islands, and is a plant of easy propagation and culture.

## Impatiens.

Several of the tropical balsams have proved to be thoroughly good decorative plants, not the least of their merits being their almost continual flowering qualities. Summer and winter alike, the huge specimens of Impatiens Olivieri, in the greenhouse, bear their large mauve-coloured blossoms, and in the T range the bright vermilion-tinted Impatiens Holsti supplies a distinct and welcome shade of colour. The old Impatiens Sultani is also of easy culture, and very floriferous.

## Clivia miniata citrina.

Though this pale yellow or straw-coloured variety of Clivia miniata has been at Kew for many years, it is still sufficiently uncommon to at once arrest attention when a good example is in bloom, as happens at the present time in the cool portion of the T range. While it is very distinct, and on that account noticeable, it is not so showy as some of the improved forms of Cliva miniata, which in gardens is more generally known by the generic name of imantophyllum.

## Veltheimia viridifolia.

The "Dictionary of Gardening" gives the month of August as the flowering period of this South African bulbous plant, but that it is not limited to that season of the year is shown by the fact that a number of plants are now in bloom in the cool compartment of the T range. The broad, strap-shaped leaves, which are about a foot in length, are disposed in a very regular manner, and from the centre of the tuft the flower scapes are pushed up. These reach a height of eighteen inches to two feet, and are terminated by a raceme of flowers, which are not particularly showy, being of a yellowish-green and rose colour, but they last in beauty a considerable time, and the whole aspect of the plant, leaves included, is decidedly ornamental. This veltheimia is an old plant in gardens, having been introduced as long ago as 1768.

## Tillandsia splendens.

This must be assigned a place as one of the most showy of Bromeliaceous plants, and it is also one of the best known. The leaves, about three inches in width, are of a pleasing green colour, and marked with dark transverse stripes. The sword-shaped scape bears a great number of large, closely-imbricated, bright red bracts, arranged opposite to each other. From these bracts the yellowish flowers are produced, but they do not remain in beauty for any great length of time. The bracts, however, keep fresh and bright for a long while. Some specimens in the stove portion of the T range are so attractive as to suggest that this and other Bromeliads might with advantage be more often met with in gardens than they are. This particular kind is also known as Tillandsia zebrina and Vriesia splendens.

## Tydæas.

Whether known as Tydæas or Isolomas, these form a very pretty class of gesneraceous plants, remarkable in some cases for the distinct markings of their flowers and in all for their continuous blooming qualities. A group in the T range now in flower shows the plants in that stage somewhat earlier than they are usually met with. It is surprising that tydæas are not more generally grown in gardens, as they are of easy culture, and flower over such a lengthened period.

## Columnea glabra.

This is an exceedingly pretty gesneraceous plant of which there is a good example in flower in the intermediate portion of the T range. It bears, generally speaking, a considerable resemblance to an æschynanthus, but, unlike the members of this genus (which are nearly all natives of South-eastern Asia and the neighbouring isles), this columnea comes from the mountains of Costa Rica, from whence it was introduced by M. Carlos Wercklé, the discoverer of Hidalgoa Wercklei. It is a plant of a half-shrubby character, with ovate leaves, thick in texture, while the blossoms of a somewhat curved tubular shape are bright orange-scarlet. Being in its native state an epiphyte this grows well in a mixture of leaf-mould, fibrous peat, coarse sand, and sphagnum moss.

## Pavonia Wioti.

A generation ago this pavonia was more generally met with than it is at the present day. Still, as now flowering in the T range, it is a very pretty warm house shrub, and, what is more, quite distinct from the usual occupants of that structure. Pavonia Wioti forms an upright-growing plant, clothed somewhat sparingly with pointed ovate leaves, about six inches in length. The flowers, which are borne in a loose terminal head, have a large outer calyx of a bright reddish-pink colour, split up into narrow segments. The petals are of a dull purple tint, and the anthers, which are crowded together at the mouth of the corolla, are blue. It is a relative of the abutilons, and is sometimes included in the genus Gœthea. An allied species—P. Makoyana—has darker flowers than P. Wioti, while of some seedlings raised by M. Lemoine, the best, as far as my knowledge extends, is Kermesina.

## The Alpine House.

This is now one of the most attractive features of the gardens, being filled with a delightful assortment of flowering subjects. They are, for the most part, grouped three or four of a sort together, and the effect is most pleasing. Among the occupants of the structure may be noted Shortia uniflora, anemones in variety, especially A. blanda atrocœrulea, and A. fulgens, muscari in variety, several narcissi, including the tiny Narcissus minor, and N. cyclamineus, Draba azoides, species of tulips, chionodoxas, Scilla sibirica, and a particularly fine white-flowered form, Leucojum vernum, Cyclamen Coum, and its white variety, hepaticas of sorts, saxifrages in variety—especially S. Burseriana grandiflora, S. Boydi, and S. Griesbachi, erythroniums, and Adonis amurensis flore pleno. This list might be considerably extended, but enough is given to show the attractive nature of the plants in flower. The singular little Chinese Rhododendron intricatum, with tiny lilac-coloured flowers, is also in full bloom in this structure. A notable feature of this rhododendron is that it often produces a second crop of blossoms in the autumn.

K.

---

**Lælia monophylla** is rarely grown, but, on account of its bright colour, is very interesting; it will also succeed under the conditions suggested. It has always been a difficult subject to deal with, and the greatest difficulty has been to find a suitable temperature and a suitable compost. Any plants that require fresh material should now be given attention. They should be placed in the smallest pans possible, but as they resent being disturbed, they should not be moved unless it is absolutely necessary to do so. Use well-drained pans and the same sort of compost as advised for dendrobiums. The plants should be grown in a shady position near the roof glass, and when established in their receptacles should never be allowed to become dry. The greatest mistake with these so-called difficult subjects is a too free use of water after they have been disturbed. These orchids all delight, when in full growth, in a moist atmosphere (but not unreasonably moist), and a circulation of air at all times whenever possible.—J. T. Barker, The West Hill Gardens.

## SILVER-LEAVED BEDDING PLANTS.

At the present day the furnishing of flower beds during the summer months is carried out on very different lines from those that were at one time almost universally followed. A notable feature is the far greater variety of plants that are now employed, and the important part that mixed beds play in the summer display. Even large examples of different greenhouse subjects are often bedded out with good effect at that season, and under these conditions they are frequently seen to greater advantage than when under glass.

Another feature in which the bedding-out of to-day differs markedly from the displays of old is that dense masses of colour are not so universally met with. Where large and showy flowers are extensively grown there is now a much greater tendency to break up these masses of colour by the judicious employment of plants grown for their foliage alone.

As a foil to brightly-coloured flowers, or as a direct contrast to the bright green of the grass which so frequently surrounds the flower beds, plants with foliage of a more or less silvery hue are in considerable demand. I do not refer to those in which the leaves are more or less variegated with white, but rather to the different subjects with leaves clothed with silky hairs, varying in density, pureness of tint, and other particulars.

One of the most useful of this class is Leucophyta (or Calocephalus) Brownii, an old plant in gardens, but never, I think, used so freely as now, for the tiny scale-like leaves are of an intense silvery whiteness, which almost seems to glisten in the sunlight. It used to be almost universally grown as an edging plant, being pegged down for this purpose; indeed, it can frequently be seen now treated in this way. Larger examples are, however, quite common, being employed either as dot plants over low-growing subjects, or associated in mixed beds with other plants of equal size. Bushy specimens, a yard or more in height, have, in bright weather, quite a dazzling effect.

Artemisia arborescens has become quite an established favourite within the last few years. It is of free growth, and as a bushy plant from 2ft. to 4ft. in height is very effective. The leaves are prettily cut, and very silvery. As a foil to pelargonium Paul Crampel or salvia Pride of Zurich, this artemisia is most useful. Last summer it was particularly fine, but owing to the bright sunshine much the same may be said of most silvery-leaved subjects, that is, where they did not suffer from want of water.

Cineraria maritima has long been grown for the sake of its prettily cut, whitish foliage. There are several garden forms of it now in cultivation, among the best being candidissima, whiter than the type; acanthifolia, with broad silvery white leaves; and Diamond, a pure white, large-leaved, very fine form.

Centaurea candidissima, also known as Centaurea ragusina, is well known as a white-foliaged plant, and has been long used as a bedding plant, especially in the days when long rows or lines of colour were so much in vogue. A somewhat taller and more graceful form, C. gymnocarpa, is very pleasing.

Gnaphalium microphyllum is, I suppose, a correct name, as one meets with it in the parks and gardens where summer bedding is in vogue, and occasionally in a catalogue. Still I cannot find it in any work of reference. It is a rather upright-growing plant of a shrubby character, and entirely clothed with whitish tomentum. This gnaphalium is very largely used as a dot plant, but it has not the intense whiteness of the leucophyta or the artemisia. One of this class much less grown now than it used to be is Gnaphalium lanatum, with roundish leaves about half an inch across. From its spreading growth it is more usually employed as an edging than in any other way.

Stachys lanata, which in my boyhood's days used to be known as the Flannel Plant, from the soft texture of the leaves, was at one time popular as a broad edging to long borders. It is not much used now, but, being quite hardy, it is occasionally met with. Of low-growing subjects that will simply cover the ground with a dense white carpet the best are Antennaria tomentosa and Cerastium tomentosum, both of which are now well-known subjects.

In conclusion, I may note the intense silvery whiteness acquired last summer by that tropical Knotweed, Polygonum lanigerum, thus surpassing any previous effects. The hot summer was, no doubt, answerable for this. S. W.

## EFFECTS OF THE WINTER ON HARDY BAMBOOS.

Hardy bamboos are generally supposed to suffer more from the cold winds at the present season of the year than from frost, but the severe weather has had a decidedly evil effect upon several kinds, and they all more or less show the effects of the winter.

The bamboos in these gardens are growing 700 feet above sea-level, on a slope facing S.S.E., but they are thoroughly protected from the cold winds by belts of ornamental trees and shrubs. The natural soil is a heavy loam resting on a clay sub-soil, but the bamboos, most of which have been established over twenty years have in many cases assumed large proportions. Arundinaria nitida and A. spathiflora have suffered more than any others, as they are very brown, and have lost quantities of leaves. A. aristata has been effected in a less degree, and this bamboo, with its purple-coloured stems, is one of the most ornamental of all. A. auricoma, A. Fortunei, and A. Hindsi are quite brown. A. metallica is decidedly dingy around the edges of its large leaves, but not worse than usual; while A. anceps and A. japonica have suffered less than any of this section.

Bambusa Laydeckeri is in rather a brown condition, but B. palmata and B. quadrangularis have suffered very little. Phyllostachys aurea presents a very uninviting appearance, and looks exceedingly brown and dingy. P. Castillonis, P. viridi-glaucescens, and P. Quilioi are very little affected; while P. fastuosa, with its handsome erect stems, is comparatively fresh and green.

The snow probably did more damage to the plants than the frost, for it was immediately after the snow that several kinds lost a great many leaves, and commenced to change colour. Nevertheless, hardy bamboos may still be regarded as very ornamental garden plants, for they add considerable beauty, and give a decided tropical appearance to gardens at a time of year when there is little else to beautify them. Now that growth is about to commence a good top-dressing of well-decayed farmyard manure will be a great assistance to them. J. Gardner.

Batsford Park Gardens.

## WORK FOR THE WEEK.

### CONSERVATORY AND GREENHOUSE.

Himalayan Rhododendrons. — These are most beautiful for conservatory and greenhouse decoration. In some kinds the flowers are purest white, and have most delicate fragrance. Large specimens, with 100 flower trusses or more, are a fine sight when in bloom. Their cultivation is very simple, and with care the plants are maintained in good health, and will flower profusely for many years. Himalayan rhododendrons resent hard forcing, and if subjected to it the buds drop prematurely. The plants are best grown quite cool. At the present some of our plants are in bloom, after being placed in the conservatory for a fortnight; others which are in a late vinery will come on naturally, and therefore extend the period of flowering. After flowering is over, all old flower spikes should be removed, taking care not to damage the growth buds surrounding the flowers. Any pruning that is necessary to make shapely plants should then be carried out by shortening back any long rank growths and trimming out dead wood, etc. Any repotting or top-dressing should then be attended to. If a shift is needed, choose suitable sized pots or tubs for the purpose, and use a compost of three parts peat and one part coarse sand. The new receptacle should be about four inches larger than the one the plant is taken from, to allow for a portion of the compost to be worked all round the roots. The compost must be rammed very firm, and if the work is properly done, the plants need not be disturbed again for some years. The third week in May the plants should be stood outside, and I find it best to plunge the pots up to the rim in an ash bed. They must never be allowed to become dry at the roots during the summer. Early in October they should be removed to a cold house and kept drier at the roots during the winter. Our plants are exceptionally well set with flower buds, no doubt owing to the abnormal amount of sunshine experienced during last summer.

Flowering Shrubs and Bulbs after Flowering.—It is often painful to me to see the waste of good material in some gardens. Many shrubs after they have been of service are laid carelessly aside, and soon die, while bulbs are often thrown away. Azalea mollis and A. indica, shrubby spiræas, Viburnum Opulus and V. plicatum, lilacs, prunuses, laburnums, deutzias, Staphylea colchica, etc., after flowering, should have all flower spikes carefully removed, and be pruned back hard, placed in a light airy house or warm frame, and syringed freely overhead early in the morning and again at shutting-up time to encourage them to break into growth freely. The third week in May they may all be moved outside, and plunged in an ash-bed. If the plants are chosen according to their height, and placed in beds six feet across, with paths between, they are easy of access, easily watered, and have a tidy appearance. Bulbs, such as tulips, hyacinths, and narcissi, after flowering, should be stood in cold frames, in separate varieties; and when all are over they should be planted out at the foot of south walls, in narrow strips two feet wide (they do not interfere with fruit trees), or in any sheltered spot where they are not in the way and can be left undisturbed. A splendid early crop of bloom can be gathered from these year after year, and they give no trouble. Narcissi may also be kept in pots or boxes until they have died down, and then planted in the grass for naturalising.

General Remarks.—With the increase of sunshine and consequent rise in temperature, growth will be very rapid. Fires should be banked up during sunny days, but kept ready for emergencies, as cold storms spring up suddenly. Ventilation should be given as early as possible in the morning, and increased during the day. Insect pests will increase rapidly, consequently vaporising must be resorted to frequently.—Lewis Smith, Shotesham Park Gardens.

## THE ORCHID HOUSES.

THE CATTLEYA HOUSE.—For some time to come, the inmates of this house will need attention, as the various species and hybrids reach the condition necessary to repotting. This family comprises the most beautiful of all orchids, and those that a great many find difficult to keep in a satisfactory condition over a series of years. This is not as it should be, as under proper conditions cattleyas are easily grown. I do not pretend to be able to give the cultural details of this large family in one week's notes.

VARIOUS SPECIES.—C. Percivaliana is the first to bloom, and opens its lovely flowers in January and February. This should be repotted now, provided it is about to push forth new roots. It should be grown in a position where it will receive the maximum amount of light and a free circulation of air. After repotting, and until re-established, they should be carefully shaded and watered. C. Trianæ follows, makes a grand display from February to April, and is a most variable species, and there is a large percentage of inferior varieties among an importation, therefore good varieties should be taken care of. C. Mendelli and C. Schroderæ are the next to open their flowers, and these last through April and May; and then, in June, we have C. Mossiæ and C. Warneri. In July and August C. Warscewiczi (gigas) and C. Gaskelliana are conspicuous. With many C. Warscewiczi is considered a shy bloomer, and undoubtedly there are individual plants that take some persuading to produce flowers. Then comes, for September, the beautiful C. Dowiana and its variety aurea, followed up in November by C. labiata. This latter is the species which the majority of growers have the greatest difficulty with, and often, in spite of all that can be done for it, it will deteriorate.

TEMPERATURE.—When growing cattleyas it is advisable to put them into two classes—the warm and the cool; they can be accommodated in one house by growing one set at the warm end and the other at the cool end. Where large quantities of cattleyas are grown it is much better to provide a house for each section. Those which require the warm position include C. Warscewiczi, C. Dowiana and its variety aurea, C. Lawrenceana, C. Warneri, C. Eldorado, C. superba, C. Luddemanniana, and C. intermedia. For the cooler position, such species as C. Mossiæ, C. Mendelli, C. Gaskelliana, C. Percivaliana, and C. Harrisonæ are suitable. There are hybrids which may be accommodated in the same house, but which space will not allow me to deal with at the present time.

POTTING CATTLEYAS.—Whenever they are pushing new roots, it is desirable to pot cattleyas if the compost in which they are growing is at all sour or decayed. The old decayed compost should be removed as far as possible, without causing injury to the roots. They should be placed in receptacles that will hold them comfortably; but beginners should guard against overpotting.

COMPOSTS.—The compost in which our cattleyas are grown consists of equal portions of peat, polypodium, A1, and osmunda fibre, and sphagnum moss, all thoroughly cleaned, and used in a rough state.

WATERING.—After the plants are potted keep them rather dry until the new roots are seen to be entering the new compost. When nicely established they should have an abundant supply of water, taking care that the compost becomes dry between each watering. I do not believe in dribbling water into cattleyas; when dry give them a thorough soaking, and then allow them to become dry again.—J. T. Barker, The West Hill Gardens.

## HARDY FRUITS.

GRAFTING.—As there is every prospect of an early fruit season, the appearance of the trees indicating active movement of the sap, grafting—more particularly in the warmer parts of the country—will require immediate attention. For effecting quick propagation of new or choice varieties of the apple, pear, plum, or cherry, grafting is of the utmost importance, although, in the case of plums and cherries, budding is more generally the method employed. There are varieties of pears which need to be worked a second time as they do not succeed perfectly on the first graft, either upon the pear or quince stock. Strong growing pears form the best stock upon which the weaker sorts may be regrafted. Orchard trees which are in a healthy condition, but either produce fruits of little or no value or bear indifferently, may, by grafting, be converted into profitable specimens in a comparatively short space of time. There are plenty of excellent varieties from which to select either for market or private use. If the trees are large, crown grafting is the most suitable method to adopt, and from three to six scions may be inserted according to the size of the tree. This applies to trees with stems up to 10in. in diameter, when sawn through five or six feet from the ground. If the intention is to graft on the branches they should not be cut back too close to the main stem, and from one to three scions be inserted, according to the size of the branch. Stems half an inch or so in diameter are best whip grafted. There are several methods of grafting, but whip grafting and crown and wedge grafting are those most generally adopted. A sharp knife is needed for preparing both stocks and scions, and whatever method is followed the work should be done expeditiously. The scions should be about nine inches in length, and the wood must be clean and well ripened.

WHIP GRAFTING.—Remove a slip of bark and wood with a clean cut, to fit exactly with a corresponding cut which must be made in the scion; a sloping cut must now be made in the scion, and a similar slit made in the stock to receive the tongue of the scion; care must be taken that the scion fits bark to bark on one side at least; bind the grafts fairly firm and cover with grafting wax.

CROWN GRAFTING.—Slice a piece off the lower part of the scion, about two inches long; make a slit the same length in the bark of the stock, then carefully raise the bark with a smooth, flat-pointed stick and insert the scion.

WEDGE GRAFTING.—As the name indicates, a cleft or division is made in the stock to receive the scion, which is cut like a wedge; care must be taken that at least on one side the bark fits to bark. In both crown and wedge grafting bind the grafts fairly firm and cover with grafting wax or clay to exclude the air. The clay should be well kneaded, and some finely-chopped chaff and cow manure incorporated with the clay to prevent it cracking and falling off.

REMARKS.—As there is an abundant show of flower buds on the pear trees, they should be examined, and where necessary, some flower buds should be removed to lighten the strain on the trees; extension growths may be showing flower buds at the tips if not properly pruned back to a wood bud, and this should be remedied at once. Examine stakes and ties supporting young trees and renew in both cases where necessary. When tying allow sufficient room for the swelling growth. Labels fastened on the trees with wire are often overlooked, and much damage occurs by the wire cutting into the bark where sufficient space is not allowed for expansion.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

CAULIFLOWERS.—Those sown during the autumn and duly wintered in cold frames have become splendid plants, sturdy, compact, and very hardy, and will now be in a capital condition for planting out. Plant the most forward plants on sheltered sunny borders, in soil that has been deeply dug, and liberally manured; plant firmly, and at distances according to the variety, the lesser kinds at eighteen inches apart. Utilise screens of evergreen branches to break cold, cutting winds, and assist quick growth. The small plants of this batch can be planted on the ordinary quarters to form a succession. If at all dry, water immediately after planting. If slugs are known to be in the land, place a ring of finely sifted cinder ashes around each plant at planting time. Magnum Bonum, Walcheren, and Early Giant are well proved varieties.

SPRING SOWN CAULIFLOWERS of the early types should now be in cold frames hardening off; pull the lights off when weather permits. A good batch of these small kinds is valuable if planted in cold and other frames at fifteen inches apart, and hurried on as fast as is safe, to form small early heads. Water regularly, and shut up early and spray overhead daily. Make a sowing of Autumn Giant and Early Giant.

CARROTS.—The main crop should now be sown in ground that has been specially prepared; too much care cannot be given to the preparation of the soil. If it is intended to sow on ground that was previously cropped with early celery, trench or deeply dig it, adding road scrapings, fine leaf-soil, and mortar dust, with a quantity of soot, and even any peat dust that may be on hand, should the ground be heavy. The plot should be dry on the surface when preparing for sowing. A dressing of burnt garden refuse should be given, and the surface be then brought into a fine tilth. Rake and level, and draw drills one inch deep and one foot apart. It is time profitably spent if the seeds are covered with finely sifted old potting soil. To procure good exhibition roots holes should be bored to a depth of three feet and fifteen inches apart, and these filled in firmly with three parts sandy loam, one part burnt garden refuse, road scrapings, and one quart of bone meal to each barrowful of the mixture. A good strain of Intermediate is still the best for exhibition and general use. For shallow soils Early Gem and Favourite are splendid.

PEAS.—From this date onwards the more tender marrowfat varieties can be sown with safety in the open. Trenches, or ground previously trenched and well manured, are necessary to procure good crops of highly-flavoured peas. Draw drills deep enough to form a shallow trench when the seeds are covered, as this depression is very beneficial for mulching and watering.

TOMATOES.—The hot summer of 1911 should prompt many to again take up outside tomato culture. To secure the best returns an early sowing should be made so as to have strong plants ready for planting out in sheltered positions by the end of May. Sow seeds in boxes of fine soil, place in a warm house to germinate, prick out, and pot off as required until they are established in five-inch pots, then gradually harden off, and plant out as suggested. Not much soil is required when first planting out; a hard base of ashes suits them well. On this place small mounds of loamy soil, plant, and top dress as the roots show; when four or five trusses of flowers have set, top-dress with horse manure and a little soot. Pinch out the growing point at the fifth truss to ensure a good set, and suppress all side shoots as they appear. Holmes' Supreme and Carter's Sunrise are excellent varieties.—Geo. Ellwood, Swanmore Gardens.

---

**Browallia speciosa major.**—This is more of a shrubby nature than most of the browallias, and a valuable subject for winter flowering. The blossoms are of a violet-blue colour with a light throat, and become somewhat paler in tint after being expanded a few days. It is of easy culture, and readily propagated by seeds or cuttings. —K.

THE BOURNEMOUTH HORTICULTURAL SOCIETY.

The Fifth Annual
EXHIBITION OF SPRING FLOWERS
Will be held at
The Winter Gardens Pavilion,
On TUESDAY and WEDNESDAY, March 26th & 27th.

To be opened on Tuesday at 12 Noon by
LADY RANDOLPH BAKER.

Autumn Show, Nov. 5, 6.

WOLVERHAMPTON.

GREAT FLORAL FETE, July 9th, 10th, 11th, 1912.

£900 IN PRIZES.

Schedules on application to the Secretary (post free),
R. F. AMPHLETT, 80, Darlington St., Wolverhampton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## British Gardeners' Association.

The first dinner held by the British Gardeners' Association took place at the Holborn Restaurant on Thursday, March 14, at seven p.m., the President, the Earl of Plymouth, presiding. The attendance was rather disappointing, less than fifty persons being present. The dislocated train service, owing to the coal strike, was the cause of absence in not a few cases, but a number of members of council resident near town were also absent.

The Earl of Plymouth proposed "The British Gardeners' Association," and first expressed his pleasure at being present, and the honour he felt conferred upon him in asking him to be President. After a reference to the coal strike, his Lordship spoke of the value of organisation, and said that the gardeners of Great Britain must be won to the ranks of the B.G.A. by concerted action, and for the purpose of protecting the interests of all concerned, and in the most practical way. It was necessary to be able to bring those who had services to offer in touch with those who needed such service. Membership of the B.G.A. should put the seal of competence upon those who called themselves gardeners, and the members should see incompetents did not trade upon the interests of the public. Not only should members' interests be protected, but also the interests of all lovers of horticulture. Such an association, strong in numbers and competence, would increase productiveness, and add to the beauty of the country. In all the aims and objects of the association he was in full accord, and he wished it every success and steady increase.

Mr. R. G. Frogbrook, chairman of council, replied, and, after thanking his Lordship for presiding, briefly reviewed the history and development of the association, and emphasised its objects and usefulness. The work was steadily advancing, and the recent examination in horticulture was but one of the steps forward in the right direction.

The President then presented the gold medal of the association and engrossed testimonial to Mr. J. Weathers, the late hon. secretary, for services so long and ably rendered. Mr. Weathers made a very able response. Mr. H. Chandler was presented with the medal and diploma awarded at the recent examination to the examinee passing with the highest number of marks.

Mr. E. F. Hawes proposed "The Branches," and said that the success of the association depended largely upon the number and strength of the branches. Mr. Collier, Gatton Park Gardens, Reigate, responded. "The Visitors," proposed by Mr. Thomas Bevan, was replied to by Mr. H. C. Preece, a blind gentleman, who made the speech of the evening, and in it referred to the close and pleasant relations so often existing between employers and the head gardener. Mr. Preece during the evening also contributed humorous stories of London and daily life in inimitable fashion. Mr. C. H. Curtis gave "The Officers and Council," to which Mr. T. Winter responded. Mr. Creswell gave "The Press" in kindly fashion, and to this Mr. T. W. Sanders replied with an inspiring speech.

"The Chairman," given by Mr. R. S. Garnett, the society's legal adviser, was accorded musical honours. The President suitably responded, and the meeting concluded with the National Anthem. Excepting the small attendance, the first dinner was a great success, and to this success the various musical items largely contributed.

## Surbiton and Tolworth Spring Show.

A large and altogether first-rate spring flower show was held on March 12 and 13 at the Assembly Rooms, Surbiton, by the Surbiton and Tolworth Society, which is a young but very enterprising Surrey body, with A. Zimmern, Esq., as president, Mr. J. Allwork as chairman, and Mr. Lionel P. Perkin as secretary. No fewer than 81 classes were provided, and between £40 and £50 were given by residents and traders towards the prize fund. The competition was wonderfully keen, the entries, together with trade displays, filled the large hall and several annexes. Classes for bulbs grown in fibre and classes open only to ladies were extremely popular and well filled with really good exhibits. Messrs. Cartwright and Goodwin, brought a very pleasing exhibit of the finer daffodils from Kidderminster; Messrs. James Carter and Co., Raynes Park, displayed some of their fine Chinese primulas; and Mr. Lionel P. Perkin, Berrylands Road, Surbiton, put up a large and good display of daffodils in great variety. The handsome silver challenge cup offered by the society for the best trade display, was won by Messrs. Cartwright and Goodwin.

Mr. F. P. Dickson, gardener to Mrs. Bunford Samuel, Marlow House, Surbiton, put up a non-competitive group of deutzias, clivias, hyacinths, tulips, and Primula Kewensis, this filling up a corner by the stage in bright fashion.

Premier award for a group of flowering and foliage plants was won by Mr. C. Burfoot, gardener to G. B. Windeler, Esq., Ditton Hill, Surbiton, with a very pretty exhibit in which amaryllis, tulips, hyacinths, primulas, cyclamens, daffodils, cinerarias, and schizanthuses figured largely, and were well disposed with suitable foliage plants. There were six of these semi-circular groups, and they produced a very fine effect. Second prize fell to Mr. T. Smith, gardener to the Marquis of Ripon, Kingston Hill, and the chief feature of his contribution was formed of lilacs, Prunus triloba, and Ghent azaleas; Indian azaleas, cinerarias, and tulips were used as a groundwork for the beautiful flowering shrubs. Third prize was awarded to Mr. G. James, gardener to Baron von Ernsthausen, The Manor House, Ditton, who made a great feature of hyacinths. Mr. C. Corps, gardener to A. Zimmern, Esq., Park Hill Drive, Surbiton, was placed fourth, and in this group a graceful laburnum attracted a good deal of attention.

First prize for a dozen hyacinths, four pots, was won by Mr. J. R. Martin, gardener to W. J. Cockburn, Esq., J.P., Lincoln House, Surbiton, with grand spikes of Jacques, King of the Blues, Her Majesty,and Le Grandesse; Mr. G. James second. For three hyacinths Mr. James was well to the front, and he was also a capital first for three pots of daffodils, showing finely cultivated examples of Glory of Leiden and Victoria; Mr. Martin was a good second here. In another class for three pots of daffodils Mr. F. Lock, gardener to S. P. Priestly, Esq., Arsmie Elmers, Surbiton, scored easily with Sir Watkin, finely grown and freely flowered. Mr. Martin was second here out of nine competitors. Mr. Martin had the best pot of Emperor daffodils, but Mr. Burfoot scored easily for a pot of Sir Watkin carrying nine fine blooms.

Tulips, three pots, was a capital class, and here Mr. Hainge, gardener to R. A. Hewat, Esq., Sonachan, Surbiton, led with white Joost Van Vondel and red Joost Van Vondel, and Prince of Austria, Mr. Martin coming second. Mr. Martin led for double tulips, closely followed by Mr. James. Mr. James was an easy first for a specimen pot of hyacinths, and he led with a potful of bulbs that carried about three dozen spikes of King of the Blues.

Mr. Burfoot scored for cyclamens, and Mr. T. Smith was ahead for half-a-dozen primulas, with first-rate examples of the graceful P. malacoides. Star cinerarias were largely shown, and filled a space in front of the platform; Mr. H. Hawkes, gardener to W. Williams, Esq., Allbury House, Surbiton, was first prize winner for six plants, and Mr. A. Corps second. This last-named competitor led for three pots of spiræeas, with beautiful examples of Gladstone; Mr. F. Lock following closely in a class of six entries. Mr. W. E. Fielder, gardener to W. Hudson, Esq., The Lodge, Surbiton Hill, was a quite easy first for six florists' cinerarias, with neat examples carrying big flowers in good heads; Mr. Burfoot second.

In the jobbing gardeners' section the chief prize winners were Mr. A. J. Cooper and Mr. H. Kelly. The division for amateurs not employing a gardener more than two days a week found Mr. A. Palk, Cranes Park, Surbiton, a leading first prize winner, his hyacinths and daffodils being excellent. Miss Trollope, The Crescent, Surbiton, was also successful in this division, and her three pots of tulips were capital.

For bulbs grown in fibre Mr. T. Hainge led for three hyacinths with Grande Maitre; Mr. Burfoot scored for eight daffodils in a bowl, these carrying 18 flowers of the variety Victoria; Mr. Burfoot had also the best six bulbs of Sir Watkin, these carrying a total of fifteen fine flowers. Mr. Lock scored for a bowl of polyanthus narcissi with the beautiful Poetaz variety Elvira, carrying seventeen spikes. For a specimen bowl of daffodils. Mr. Burfoot scored with about three dozen flowers of Victoria in a wide pan. For hyacinths in fibre Mr. Palk led with eight fine plants of La Grandesse in a fancy bowl; Miss Perkin, Matthew Avenue, coming second with the yellow City of Haarlem.

There were only two classes for cut daffodils, each for six varieties, and Mr. G. James and Mr. T. Smith were the first prize winners; the former had fine flowers of Aspasia, Madame de Graff, and Glory of Leiden, while Mr. Smith showed good blooms of Seagull, White Wings, and Fairy.

The lady judges placed Miss D. M. Hall, Victoria Avenue, first for table decoration, but as all the flowers, Barri daffodils, were grouped in the centre of the table, this decision did not feet with general approval; but this much could be said of most decisions in connection with such a class where personal taste so largely enters into the finding. Miss Packham, Ewell Road, Surbiton, came second, and Miss Ada Hewitt, Adelaide Road, Surbiton, third.

## Newcastle Horticultural Society.

Councillor W. E. Harker presided over a fairly good attendance on the occasion of the annual meeting, which was held at Tilley's Restaurant, Newcastle.

The Chairman, in moving the adoption of the report, said the accounts he had to submit to them were not very encouraging. They commenced the year with a deficit of £142 13s. 9d., and closed the year's work with a deficit of £314 11s. 4d. The loss on the summer show occurred on the second day, when they expected the largest gate, rain having fell continuously. Comparing that day's takings with the corresponding day of the previous year, there was a decrease of £101 11s. 3d. That in itself should explain the loss. The council exercised economy in conducting the show, and effected a saving of nearly £100. However, that was not the first time the society had been faced with a heavy balance on the wrong side, and it was gratifying to them to know that they still had many good friends. They had received donations amounting to £90 5s., and since the accounts were issued the secretary had received a further donation of £10. Their creditors had also come forward in a most generous manner, and had not only agreed to allow the balance of their accounts to stand over until funds are in hand, but were willing to co-operate to enable them to hold the summer show as usual this year. Other friends, through Mr. Cyril Millican, had promised to give an entertainment to assist the funds, and they hoped to receive £100 from that source. It had been suggested that they did not cater in any way for amateurs. That was hardly correct. Some years ago they provided numerous classes in the amateurs' division, but the entries were so poor that the council decided to allot more prize money to trade exhibitors, nurserymen, and gardeners who moved with the times. In last year's schedule they gave six classes for amateurs, three for roses, and one each for carnations, sweet peas, and grapes. Having simplified these classes in accordance with the wishes of local amateurs, the entries increased, and they were now hoping to add further classes. It must not be forgotten, however, that in the past few years numerous country shows had come into existence, where amateurs predominate. For such an important show as theirs, it was essential to encourage the trade and professional exhibitors, and he could only mention such shows as Shrewsbury and York Gala, who attributed their success entirely to the pursuance of that policy. It was the trade exhibitors, who, compelled to move with the times, gave the shows educational value. The society held the record of having held shows annually since 1824 without a break. The honour of maintaining that record was fully recognised by the council, but they must at the same time receive the support not only of their members, but the citizens of Newcastle and the residents of the north. They all liked good value for their money, and he certainly thought their members at least obtained a good return for theirs.

The motion was seconded by Mr. Campbell, and carried unanimously. Various votes of thanks were accorded to the officers for their services during the past year, and it was resolved that the show should be held on July 3, 4, and 5.

## Dundee Horticultural Association.

There was a record attendance of members at the ordinary monthly meeting on the 14th inst. The lecturer was Mr. John Machar, Fothringham Gardens, who selected for his subject "Sweet Peas." In glowing language Mr. Machar minutely described every detail in connection with up-to-date methods of cultivation. In doing so, he drew largely on his own practical observations, tests, and experiments carried out in the gardens under his charge. Autumn sowing and autumn preparation of the ground he considered of far-reaching importance. Indeed, the latter was imperative even for spring sowing. Trenches seven feet wide, worked three feet deep, with farmyard manure well incorporated, also ½cwt. of basic slag to 80ft., with kainit, formed his chief autumn preparation. In spring an additional dressing of superphosphate of lime, applied at the rate of 14lb. to 60ft. run of trench was given. In planting the sweet peas were shaken out of the pots and planted singly in a double row one foot apart each way. Three shoots were allowed to come away from near the base, these being trained to branches or other supports, and all lateral shoots removed. In the earlier stages of growth he kept the surface of the soil black with soot for two reasons—one to protect the plants from the ravages of slugs, snails, etc., and the other to make the soil absorb and retain as much warmth from the sun's rays as possible.

In regard to watering during the growing season, Mr. Machar thought it was generally too lavishly performed, and advised as preferable frequent stirring of the soil and mulching with short grass, stable manure, leaves, etc., as being far more beneficial. Sufficient stimulant was given by two or three subsequent dressings of superphosphate, sulphate of ammonia, and nitrate or sulphate of potash; the latter two—ammonia and potash—might be given in solution with water or spread on the surface during rainy weather.

After giving a list of the best dozen inexpensive varieties, Mr. Machar gave the names of another dozen choice exhibition varieties, supplementing these with twelve of the best novelties up to date.

Many helpful hints regarding cutting and staging for exhibition were gleaned also from the lecture as well as in the subsequent discussion.

On the call of Mr. James Slater, the lecturer was cordially thanked for his lecture. A like compliment to the president, Mr. W. Christison, closed the meeting.

## Dundee Chrysanthemum Society.

Wood's Rooms, Commercial Street, Dundee, was the scene of a social smoking concert on the 15th inst., when upwards of 100 members assembled to honour their late secretary, Mr. W. P. Laird, who retired in December last, after holding office for 21 years. The popular President, W. S. Melville, Esq., J.P., presided, and during the course of an enjoyable evening handed over to Mr. Laird a beautiful carriage clock, silver cigarette case, and silver match-box, bearing suitable inscriptions. In making the presentation the Bailie warmly commended the gentlemanly qualities of Mr. Laird, his keen business foresight and powers of organisation, and his genial, courteous demeanour. In all his relations, his word was as good as his bond; but, as their honorary secretary for the long period of 21 years, he had excelled and endeared himself to every member of the society, and doubly so to the members of the several committees which were associated with him in the work. As head of the firm of Laird and Sinclair in Dundee, they wished him every success life could afford.

In returning thanks, Mr. Laird gave a short, concise résumé of the "ups and downs" of the society, and deplored the fact that it had never gone past the struggling stage, but it was these struggles which brought about a greater bond of unity. The work to him was a real pleasure, and his association with the various members of committees was always most harmonious. With the exception of two or three members of their first committee (21 years ago), who had "passed away," all the others were yet "hale and hearty," some of them round the table looking as youthful as he felt himself.

## Reading Gardeners' Association.

The fortnightly meeting took place at the Abbey Hall, Reading (by kind permission of Messrs. Sutton and Sons), on Monday, March 4, the President occupying the chair. The stormy weather had a somewhat prejudicial effect on the attendance, but there was a fair gathering to greet Mr. T. Tunbridge, of The Gardens, Three Elms, Henley-on-Thames, who was the lecturer for the evening, and who, owing to indisposition, had been unable to attend the previous meetings during the present year.

The paper was entitled "The Pruning of Groups of Roses," and Mr. Tunbridge, in his opening remarks, stated that the subject was far too wide to be covered in any one evening, and he, therefore, proposed to speak on the treatment of the climbing groups only, namely, the Multifloras, Wichuraianas, and Chinas, thus leaving untouched the teas, hybrid teas, and hybrid perpetuals, except Gloire de Dijon, Marie Van Houtte, and some of the climbing noisettes. Mr. Tunbridge once more gave proof of his versatility in the profession, giving most valuable information as to the proper and varied treatment of these different groups of the national flower. The benefit of his experience with regard to the management of climbers used for covering arches, pergolas, pillars, walls, stumps, etc., was also given to the members. His method of regulating growth and other details necessary to the successful and artistic clothing of these supports being clearly explained. Mr. Tunbridge brought a number of specimens with him, and gave a practical demonstration as to the particular pruning, severe or otherwise, required by many of the varieties referred to in the course of his paper.

At the close of the lecture a prolonged and instructive debate took place, followed by a hearty vote of thanks to Mr. Tunbridge.

A beautiful exhibit of cyclamen, Sutton's Giant White, rich salmon-pink, and Giant Rose-Pink, was put up by Mr. H. C. Loader, The Gardens, Erlegh Park, the lovely shades of pink brightened by the effect of artificial light being seen in charming contrast with the white variety. Mr. F. Townsend brought from the gardens at Hillside a group of primulas and a collection of narcissi, and both exhibits were greatly admired.

## Dumfriesshire and Galloway Horticultural Society.

It appears that a private meeting of the directors of this society was held the other evening, when the secretary and treasurer, Mr. R. G. Mann, presented a statement of the accounts, which had been audited by one of the directors. It was to the effect that at the meeting, held after the last show, which was held in 1910, there was a deficiency of upwards of £76, but that this had been reduced by contributions made by the four largest trade creditors, amounting to upwards of £8, and special subscriptions totalling upwards of £30. The last of the trade creditors had been paid about three weeks ago, and all that was now outstanding was the prize money of the show, which amounted to about £39. All the special prizes had been paid but one, as to which some dubiety existed respecting who was entitled to it, owing to two names appearing in the prize book, and no claim according to the rules had been made for it. The income account showed receipts amounting to a little above £125, while the expenditure was a few shillings more than that sum, showing 11s. 8d. due to the secretary, and the prize money owing to the winners. About half of this amount is due to some of the directors. The statement was considered satisfactory by those present. On account of the financial position, it was resolved to hold no show this year.

## North of England Horticultural Society.

The following awards were made by the Floral and Plant and Orchid Committees of this society at the spring show, held at Bradford on March 14:

Large Silver-gilt Medal.—To Messrs. R. P. Ker and Son, Liverpool, for amaryllis; to Mr. C. Engelmann, Saffron Walden, for carnations; to J. Hill, Esq. (gardener, Mr. G. Dunmore), Chellow Dene, for bulbs and lilacs.

Large Silver Medal.—To J. H. Craven, Esq. (gardener, Mr. F. W. Corney), Keighley, Mr. W. Shackleton, Bradford, and J. Hartley, Esq. (gardener, Mr. W. Coupe), Morley, for orchids.

Silver Medal.—To Messrs. W. Artindale and Sons, Sheffield, for Primula obconica gigantea; to Mr. J. Brooke, Bradford, for bulbs and lilacs; to Mr. J. Wood, Boston Spa, for rock plants; to N. Galloway, Esq., Bradford, Messrs. A. J. Keeling and Sons, Bradford, and Messrs. Mansell and Hatcher, Rawdon, for orchids.

Large Bronze Medal.—To Messrs. Conway's, Lim., for rock plants; to Messrs. S. Broadhead and Son, Huddersfield, for rockery; to Messrs. S. Dean and Sons, Bradford, for bulbs; to Mr. F. Spencer, for bulbs.

First-Class Diplomas.—To Odontioda eboraicum, from J. H. Craven, Esq.; to Dendrobium Cybele alba, from W. H. St. Quintin, Esq. (gardener, Mr. F. C. Riddle), Rillington); to Carnation Lady Northcliffe, from Mr. C. Engelmann.

Second-Class Diploma.—To Dendrobium nobile Thwaites var., from J. Hartley, Esq., Morley (gardener, Mr. Wm. Coupe); to Dendrobium Chessingtonense, from J. Hartley, Esq., Morley; to Amaryllises Pink Perfection and Ruby Queen, from Messrs. R. P. Ker and Son.

## Croydon Gardeners' Society.

"The Culture of the Grape Vine under Glass" was the title of the lecture given to the members of this society at the Sunflower Temperance Hotel, George Street. The lecturer, Mr. W. Rawlings, Heathfield Gardens, Addington, is an active member of the society, and in this his initial attempt at lecturing he entertained a good audience.

To grow grapes well and to advise the proper treatment requires several years of careful study, and Mr. Rawlings, although only a young man, appears to have devoted very close attention to this phase of gardening. Permeating his whole discourse were the many details so necessary for successful culture, and entering into these details so lucidly his lecture was exceedingly instructive to those who have not had much experience in growing grapes, at the same time appealing to those who are acquainted with their culture.

A pleasing collection of miscellaneous plants, including azaleas, deutzias, acers, etc., was staged by Mr. T. Butcher. From Coombe House Gardens Mr. Mills brought two exceedingly well flowered pans of Saxifraga oppositifolia alba and S. Burseriana grandiflora. Mr. W. Paulley was in evidence with a dish each of Catillac pears and Sturmer Pippin apples, and Mr. F. W. Moore put up three dishes of young carrots. These exhibits were a great attraction, and the exhibitors were the recipients of warmest praise for their efforts in making the meeting a successful one.

## Royal Horticultural Society.

MARCH 19, 1912.

### CERTIFICATE AND AWARDS.

First Class Certificate.—To Odontoglossum crispum Samuel Gratrix, from S. Gratrix, Esq., Manchester.

Award of Merit.—To Cattleya Dirce Westonbirt variety, from Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester; to Odontoglossum Queen of Gatton, from Sir Jeremiah Colman, Bart., Gatton Park, Reigate; to Amaryllis Rose du Barri and Musigny, from Lord Rothschild, Tring Park, Tring; to Corylopsis Veitchi, from the Hon. Vicary Gibbs, Aldenham House, Elstree; to Narcissus Robespierre and Rubalite, from Mr. A. M. Wilson, Shorel, Bridgwater; to Narcissus Helios, from Messrs. Walter T. Ware and Co., Inglescombe, Bath; to Primula Knuthiana and Prunus Pissardi Moseri fl. pl., from Messrs. Jas. Veitch and Sons, Chelsea; to Abies Douglasi Fletcheriana, from Messrs. Fletcher Brothers, Ottershaw; to H.T. rose Rose Queen, from Mr. W. E. Wallace, Eaton Bray, Dunstable.

### MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse plants and flowering shrubs.

Silver Gilt Flora.—To Messrs. Barr and Sons, Covent Garden, for daffodils.

Silver-Gilt Banksian.—To Mr. A. M. Wilson, Bridgwater, for daffodils; to Messrs. J. Hill and Son, for ferns; to Messrs. W. Cutbush and Son, for carnations.

Silver Flora.—To Messrs. Sander and Sons, St. Albans, for orchids; to Mr. Day, gardener to H. S. Goodson, Esq., Putney, for orchids; to Messrs. Charlesworth and Co., Hayward's Heath, for orchids; to Messrs. R. H. Bath, Lim., Wisbech, for tulips and daffodils; to Mr. C. Bourne, Simpson, Bletchley, for daffodils; to Mr. M. Prichard, for hardy plants; to Mr. L. R. Russell, for flowering shrubs.

Silver Knightian.—To Messrs. Sutton and Sons, Reading, for vegetables and salading.

Silver Banksian.—To Sir D. Gooch, Chelmsford, for apples; to Mr. Weinholdt, Rhodes Fruit Farms, S. Africa, for apples; to Messrs. Dianellon and Vergopoulos, Cyprus, for oranges; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. J. and A. McBean, Cooksbridge; for orchids; to Messrs. Hassall and Co., Southgate, for orchids; and to G. H. Smith, Esq., Finchley, for orchids; to Mr. H. Burnett, for carnations; to Messrs. H. Cannell and Sons, for pelargoniums; to Messrs. Gill and Son, for rhododendrons; to Messrs. Stuart Low and Co., for carnations, etc.; to Messrs. H. B. May and Sons, for ferns; to Miss Ough, for floral paintings.

Bronze Flora.—To Mr. Box, for hardy plants.

Bronze Banksian.—To Mrs. Charrington, for cyclamen; to Messrs. J. Cheal and Sons, for rock garden; to Lady Holland, for amaryllis; to Mr. Reuthe, for hardy plants; to Messrs. Lane, for rock work; and to Messrs. R. and G. Cuthbert, for azaleas.

## COMING EVENTS.

Penarth Rose Show, July 3.

Midland Carnation and Picotee Show, July 31 and August 1.

Craig-y-don Horticultural Society, July 17, in the Town Hall, Llandudno.

Chislehurst Horticultural Society: Spring Flower Show, April 20; Summer Show, July 6, at Kemnal Warren.

West Birmingham Horticultural Society, August 24, at Lightwoods Park.

Sevenoaks Horticultural Society, July 10, in Knowle Park and Gardens.

Dundee Floral Fête, September 5, 6, and 7, on Magdalen Green, Dundee.

Leamington and County Flower Show, July 24 and 25, in Victoria Park.

National Carnation and Picotee Society, July 23, at Royal Horticultural Hall.

Leicester Flower Show, August 6 and 7, in the Abbey Park.

Hawick Horticultural Society; Summer Show, August 24; Chrysanthemum Show, November 22 and 23.

Formby Horticultural Society, Summer Show, July 10; Autumn Show, November 9.

Weybridge Horticultural Society, July 3, in the Old Palace Gardens.

Birmingham Horticultural Society, July 19 and 20, in Handsworth Park.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

LARGE-FLOWERED VIOLAS.—M. S., Saxmundham: Please give me the names and descriptions of a few very large-flowered violas as I wish to grow some for exhibition. —A few very large-flowered varieties are Kate Blythe, white, edged pale blue; Lizzie Wallace, heliotrope self; Maggie Melville, violet and purple; Duchess of Norfolk, creamy-white; Mary Burnie, primrose and heliotrope; Andrew H. Fisher, purple and rose; General Baden Powell, orange; Maggie Clunas, primrose self; Mrs. Chichester, white and mauve; Willie Farmer, white, edged purple; Bessie Murray, white and blue; White Knight, white; and William Lockwood, yellow.

WOODLICE IN GREENHOUSES.—Hibernia writes: In further reply to "A. J. B.," Cardiff, I would advise your correspondent to obtain a number of toads, and place them in his greenhouses, and he will soon find the number of woodlice diminish. It is interesting to watch the toads pick up the woodlice with their tongues with lightning speed.

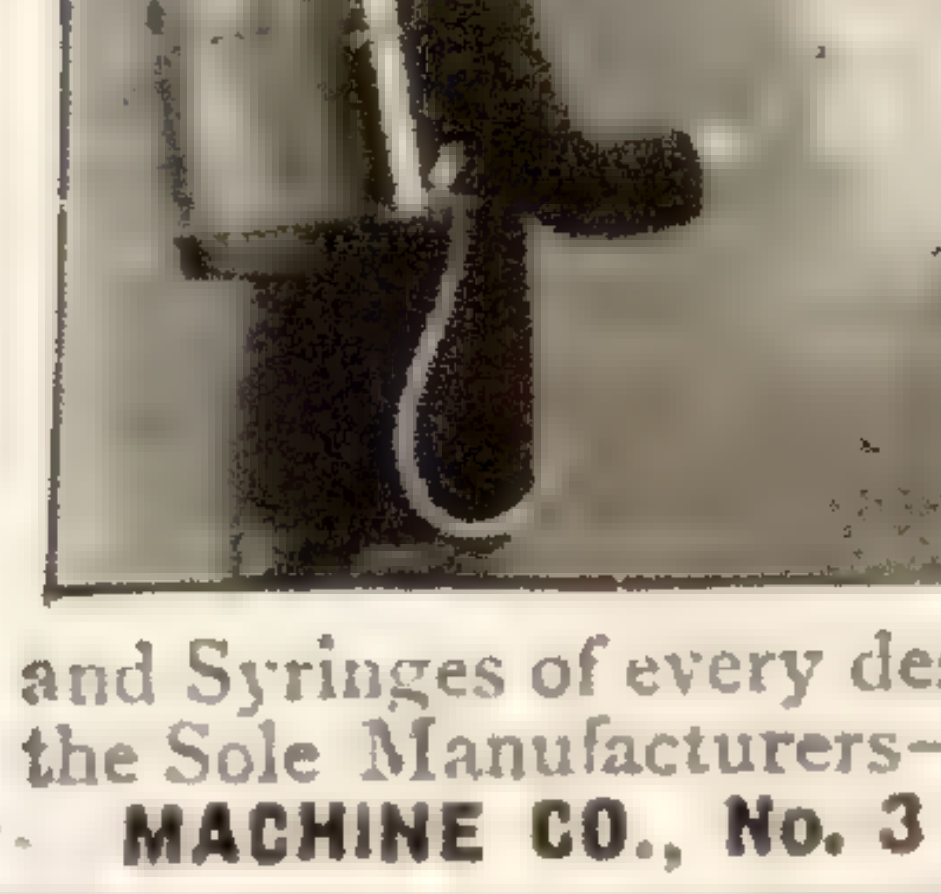
GLORIOSA SUPERBA.—D. H. W., Wales: Kindly give me a few particulars concerning the cultivation of Gloriosa superba. —Start the tubers in comparatively small pots in a temperature of 55 to 65 degrees, placing the tubers crown end upwards. When some progress has been made and more room is necessary for the roots, place several of the plants in a large pot to form a specimen. Use a compost of two parts good turfy loam, and one part each of peat, leaf-soil, and dried cow manure, adding sand liberally to keep the whole porous. Water sparingly for a little while after each potting. Train the growths to a trellis, and, later on, train them round the balloon trellis if for show purposes. When the large pot is fairly well filled with roots, give liquid cow manure twice weekly. An intermediate house or warm greenhouse will suffice when the plants are coming into bloom. Carefully reduce the water supply after flowering is over, eventually keeping soil and tubers dry throughout the winter.

MOORPARK APRICOT.—L. F., St. Albans: Was the Moorpark apricot raised in this country, or was it introduced?—According to the late Dr. Hogg, "the Moorpark apricot is said by some to have been introduced by Lord Anson from the Continent, and planted at Moorpark, near Watford, in Hertfordshire. By others its introduction is ascribed to Sir Thomas More, who, in the beginning of the last [18th] century, is also said to have planted it at Moorpark; and a

→ **Spraying** ←

The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested

**"FOUR OAKS"**



which have won **80** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-.** No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 C, SUTTON COLDFIELD.**

third account is that Sir William Temple introduced it. But by whomsoever it was raised or introduced, or at what period, it is quite certain it was very little known till late in the century. Neither Hitt nor Miller notices it in any of the editions of their works. I do not find it mentioned in any of the Brompton Park catalogues before 1784, when it was called Temple apricot. In 1788 it is first called Moorpark. In 1784 it was cultivated to the extent of three rows, or 300 plants; but in 1797 the quantity was increased to thirty-five rows, or 3,500 plants."

MALMAISON CARNATIONS. — G. G., Aberystwith: Kindly give me some information concerning the propagation and treatment of Malmaison carnations.—The Malmaison carnations are propagated by layering after flowering is over. We shall be dealing with this matter before long, and we advise you to watch our "Work for the Week" columns, as these carnations are frequently referred to therein.

ANNUAL MAIDENHAIR FERN. — S. E. G., Derby: Can you tell me anything about a fern called the Annual Maidenhair Fern I understand it is of annual duration, but was always under the impression that all ferns were perennial.—The fern to which you refer is not a Maidenhair, although so-called. It is Gymnogramma leptophylla, a native of Jersey and some parts of the Mediterranean district. It loves a moist situation, and when the conditions are favourable, it reproduces itself annually from spores, the parent plants dying at the end of the year. It can scarcely be called a hardy fern, although found in the Channel Islands, so that under cultivation a close case in a cool house, or out of doors in some sheltered, shady spot, would probably provide for its wants.

EXHIBITING SWEET PEAS.—G. W., Silsden: Does "Sweet Peas and Their Cultivation" contain information relative to exhibiting, and in such a way as to be of service to an amateur?—Yes; the book tells you how to show as well as how to grow sweet peas, and gives advice as to cutting and packing the flowers, and their arrangement in vases on the exhibition table. The book is published at the Gardeners' Magazine office, 148 and 149, Aldersgate Street, E.C., 1s. 2d. post free, or 1s. 8d. post free in cloth.

BOARD OF AGRICULTURE LIBRARY. —M. J. C., Romford: Has the Board of Agriculture a library; and, if so, is it available for consultation concerning matters relative to agriculture and market gardening?—There is a library at the Office of the Board of Agriculture, 8, Whitehall Place, London, S.W., and this may be consulted by persons interested in agriculture and market gardening on any week day between the hours of 10 a.m. and 5 p.m. (10 a.m. to 2 p.m. on Saturdays). Application should be made to the Publications Branch. In order to make the library accessible to students resident in the country, the Board of Agriculture is prepared to lend books where they are satisfied that the privilege will be of value.

PRIVATE GARDENS OPEN TO THE PUBLIC.—In answer to a question asked in these columns a short time ago, Mr. J. Castle, of Alnwick, kindly writes: The Duke of Northumberland's gardens, at Alnwick Castle, are open to the public free, from 10 a.m. to 4 p.m., every Thursday. I had charge of the flower garden department there before coming to take charge of the Cemetery, and I remember that the privilege was taken advantage of very largely in the spring and summer.

DAMAGED PELARGONIUM LEAVES.—F. D., Preston: Some friends have been discussing the cause of damage to pelargonium leaves (specimens enclosed); one gives bad root action, and another excessively moist atmosphere, and yet another says a fungus disease is the cause. Please give us your opinion.—The substance of the leaves suggests that root action is poor, therefore part of the trouble may be referred to this cause. The thin and flabby leaves further suggest an excess of moisture in the atmosphere, and the marks, due to scalding, further emphasise this point. The moisture has accumulated on the leaves, and the occasional bursts of bright spring sunshine have been focussed by the drops of moisture into points of burning heat, the water acting as a burning-glass. The remedies are less moisture at the roots and more ventilation, coupled with a little fire heat if necessary.

AMOUNT OF MINERAL MATTER USED BL CROPS.—N. O., Newport: I should be greatly obliged if you would tell me where I can find statements giving the amount of mineral that various crops, fruit crops especially, extract from the soil.—The information is given by Dr. Griffiths in "Manures for Fruit and Other Trees" (R. Sutton, Southwark Street).

CORRECTION.—A printers' error converted Mazus Pumilio into Mayus pumilio on p. 228 of our issue of March 16.

## NAMES OF PLANTS.

B. H., Hereford.—1, Allium neapolitanum; 2, Veltheimia vividiflora.

T. T., Tiverton.—1, Saxifraga oppositifolia; 2, Muscari botryoides; 3, Prunus Pissardi.

C. P. R., Exeter.—1, Prunus tomentosa; 2, Forsythia suspensa; 3, Saxifraga oppositifolia; 4, Erica mediterranea.

J. E. G., Crewe.—1, Dendrobium Findlayanum; 2, D. nobile, good form; 3, Cattleya Trianæ; 4, also C. Trianæ, but a poor variety.

L. S. B., Launceston.—1, Rhododendron arboreum; 2, Erica mediterranea; 3, Ribes sanguinea; 4, not recognised, send when in flower; 5, Cupressus funebris.

S. B. H., Lowestoft.—1, Quercus Ilex; 2, Coronilla glauca variegata; 3, Iris reticulata; 4, Sparmannia africana; 5, Lachenalia Nelsoni; 6, Primula Kewensis.

**Publications Received.**—Castle's Guide to the Fruit, Vegetable, and Allied Trades, 1912. (Castle's Directories, Lim., 22, King Street, Truro.)

## OBITUARY.

◆

### MR. W. R. PEARSON.

We regret to record the death of Mr. W. R. Pearson, which occurred on the 11th inst. at his residence, Widehough Gardens, Hexham, in his 67th year. Mr. Pearson was one of the best-known market gardeners in the Hexham district, and also in the Newcastle market, which he regularly attended for many years. Mr. Pearson and his forefathers have been tenants of the Widehough Gardens for several generations, and, as he leaves two sons, the tenancy will be continued in the family.

### REV. C. C. ELLISON.

We regret to record the death of the Rev. C. C. Ellison, which occurred at Bracebridge, Lincolnshire, on the 11th inst., in his 78th year. Mr. Ellison evinced much interest in outdoor life, and especially in gardening, as exemplified by the success he achieved as a cultivator and exhibitor of roses and fruit. He was not less successful as an angler and cricketer, and in ivory and wood turning he had few rivals among amateurs.

### MR. GEORGE HAMPTON.

We have to record the death of Mr. George Hampton, who had been sixty years in the Royal service, which occurred in his house in the grounds of Windsor Castle, in his seventy-sixth year. He was borne at Kensington Palace, where his father was employed, and entered as an apprentice the Royal gardens in 1852. After passing through the various departments of the Frogmore gardens, he went to Sandringham. After being in the gardens there for several years, he returned to Windsor to take charge of the plantations, roads, and walks in Windsor Home Park, and in the discharge of the duties connected therewith evinced much ability.

Robinsons' Guaranteed Gardenalities

have gained the praise of the greatest gardening authorities and experts. The reason why is because they always satisfy—are always reliable, and produce unequalled results. Professionals, amateurs, fertilizers this year? Without fertilization time testify to their unexcelled superiority. What about market gardeners, and allotment holders alike and labour are wasted.

"CARMONA" FERTILIZERS ARE THE CHAMPIONS.

This has been proved over and over again. They are scientific to a degree—pure, sure, and dependable. The plants assimilate their vital elements with avidity, and your products and crops bear testimony to this. A slight expense means a wonderfully increased profit. Made in many varieties to suit all needs. Special attention is drawn to the "Carmona" Sweet Pea Fertilizer. Bulks and prices are as follows:—1 cwt., 20s.; ½ cwt., 12s. 6d.; 28lbs., 7s. 6d.; 14lbs., 4s. 6d.; 7lbs., 2s. 6d. 1s and 6d. tins. Of all Seedsmen and Agents, or write direct.

CLIFT'S FLUID INSECTICIDE.

Messrs. Robinson Bros., Ltd., most strongly advise every gardener to write for a copy of the very convincing reports upon the extensive laboratory and outdoor experiments, conducted by an eminent expert, in relation to the efficacy of Clift's Fluid Insecticide. The facts and figures contained therein will at once demonstrate the absolute superiority of this standard insecticide. The prices are:—40 galls., per gall., 4s. 6d.; 20 galls., per gall. 5s.; 10 galls., per gall., 5s. 3d.; 5 gallons, per gall., 5s. 6d.; 1 gall., 6s.; ½ gall., 3s. 6d.; 1 pint, 1s.

ROBINSON'S GRAND £350 SHOW.

This will be held on August 28th and 29th next at the Botanical Gardens, Edgbaston, Birmingham, and all may compete. Numerous cash prizes and many Championship Medals. Free entry to every buyer of "Carmona" Fertilizers—look out for the free entry "fee" coupon contained in each packet. Send now for the Show Schedules and make early entry.

HAVE YOU A LAWN?

To obtain perfect grass colouring, and to be rid of foreign plants, apply "Velvas" Lawn Sand. It transforms the worst lawn into the best. Of all Seedsmen and Agents, or write direct.

WEEDS ARE NOT WANTED, and are soon expelled if you apply "Eradiweed" (the guaranteed cent. per cent. weed-killer).

ROBINSON'S INVITATION.

Send for their two famous booklets, Robinson's Gardenalities Booklet, and Robinson's Garden Enemies Booklet. Full of hints, advice, and information, Gratis and post free on application to—

Guaranteed: Gardenalities

FLORA ABUNDA

ROBINSON BROS. LTD., WEST BROMWICH, STAFFS.

## Situations Wanted—*continued.*

M. HERBERT, Meadow Walk, Ewell, Surrey, seeks SITUATION as Improver (Inside or Inside and Out); age 18; has a good reference; Bothy preferred.

MR. G. STURT, Oakdale Gardens, Holmwood, Dorking, Surrey, wishes to highly recommend J. DEW as JOURNEYMAN (Inside) in a good establishment; five years' experience; age 21; two years in Fruit and Plant.

MR. APLIN, late of Hasfield Court Gardens, highly recommends A. STRAWFORD, age 22, as UNDER GARDENER (Inside and Out); was with him 8 years. Address Mr. APLIN, Haw Farm, Apperley, Tewkesbury.

MR. GILL, Apley Castle, Wellington, Shropshire, wishes to recommend L. GIBBS, Coombe, Woodstock, Oxon, as JOURNEYMAN (Inside); six years' experience; age 21 years.

MR. CATERER, Dunorlan Gardens, Tunbridge Wells, wishes to recommend H. CHESSON, as Second Journeyman; Fruit Houses. Bothy preferred. Age 23; two years here; previously four years at Compton Place, Eastbourne.

SITUATION required under a Gardener by willing LAD, age 16, where two or more are kept; slight experience. F. LANE, 125, Keslake Road, Kensal Rise, London, N.W.

THOS. BAKER, late Manager for Wm. Lowe and Thos. Cripps and Sons, is open to Re-engagement; first-class references regarding abilities. 9, High Street, Eltham, Kent.

THOS. ALLISON, Gardener to Baroness Amherst, of Hackney, Didlington Hall, Stoke-ferry, Norfolk, wishes to highly recommend two JOURNEYMEN for Inside; leaving through estate having been sold.

W. MEREDITH, The Gardens, Firbeck Hall, Rotherham, can thoroughly recommend a Young Man for the KITCHEN GARDEN in a large place, or as GARDENER for a small place; age 25; accustomed to fires and duty.

YOUNG MAN, age 24, seeks SITUATION, Kitchen Garden and Pleasure Grounds; used to hand and pony mowers; good reference. Apply W. RADFORD, Poncheydown, Kentisbeare, Cullompton, Devon.

# MANURES

## FOR GARDEN AND FARM CROPS

***By W. DYKE.***

***Edited by T. W. SANDERS, F.L.S., Editor of "AMATEUR GARDENING."***

A book for which Gardeners—amateur and professional—have been waiting, and one which will fill a gap in many a garden lover's library. Mr. Dyke is an authority and treats his subject in a lucid and simple style that will without doubt convince the reader of its great importance. What he has to say on manures and fertilisers is the outcome of profound study, and long and practical experience. From this work you may learn why manures are needed, and obtain practical information in regard to the food of plants, the constituents and properties of natural and artificial manures and their application, with the object of increasing the quantity and quality of plants, flowers, and all garden and farm crops.

***116 Pages. Illustrated. Paper Boards 1/- net. Cloth 1/6 net.***

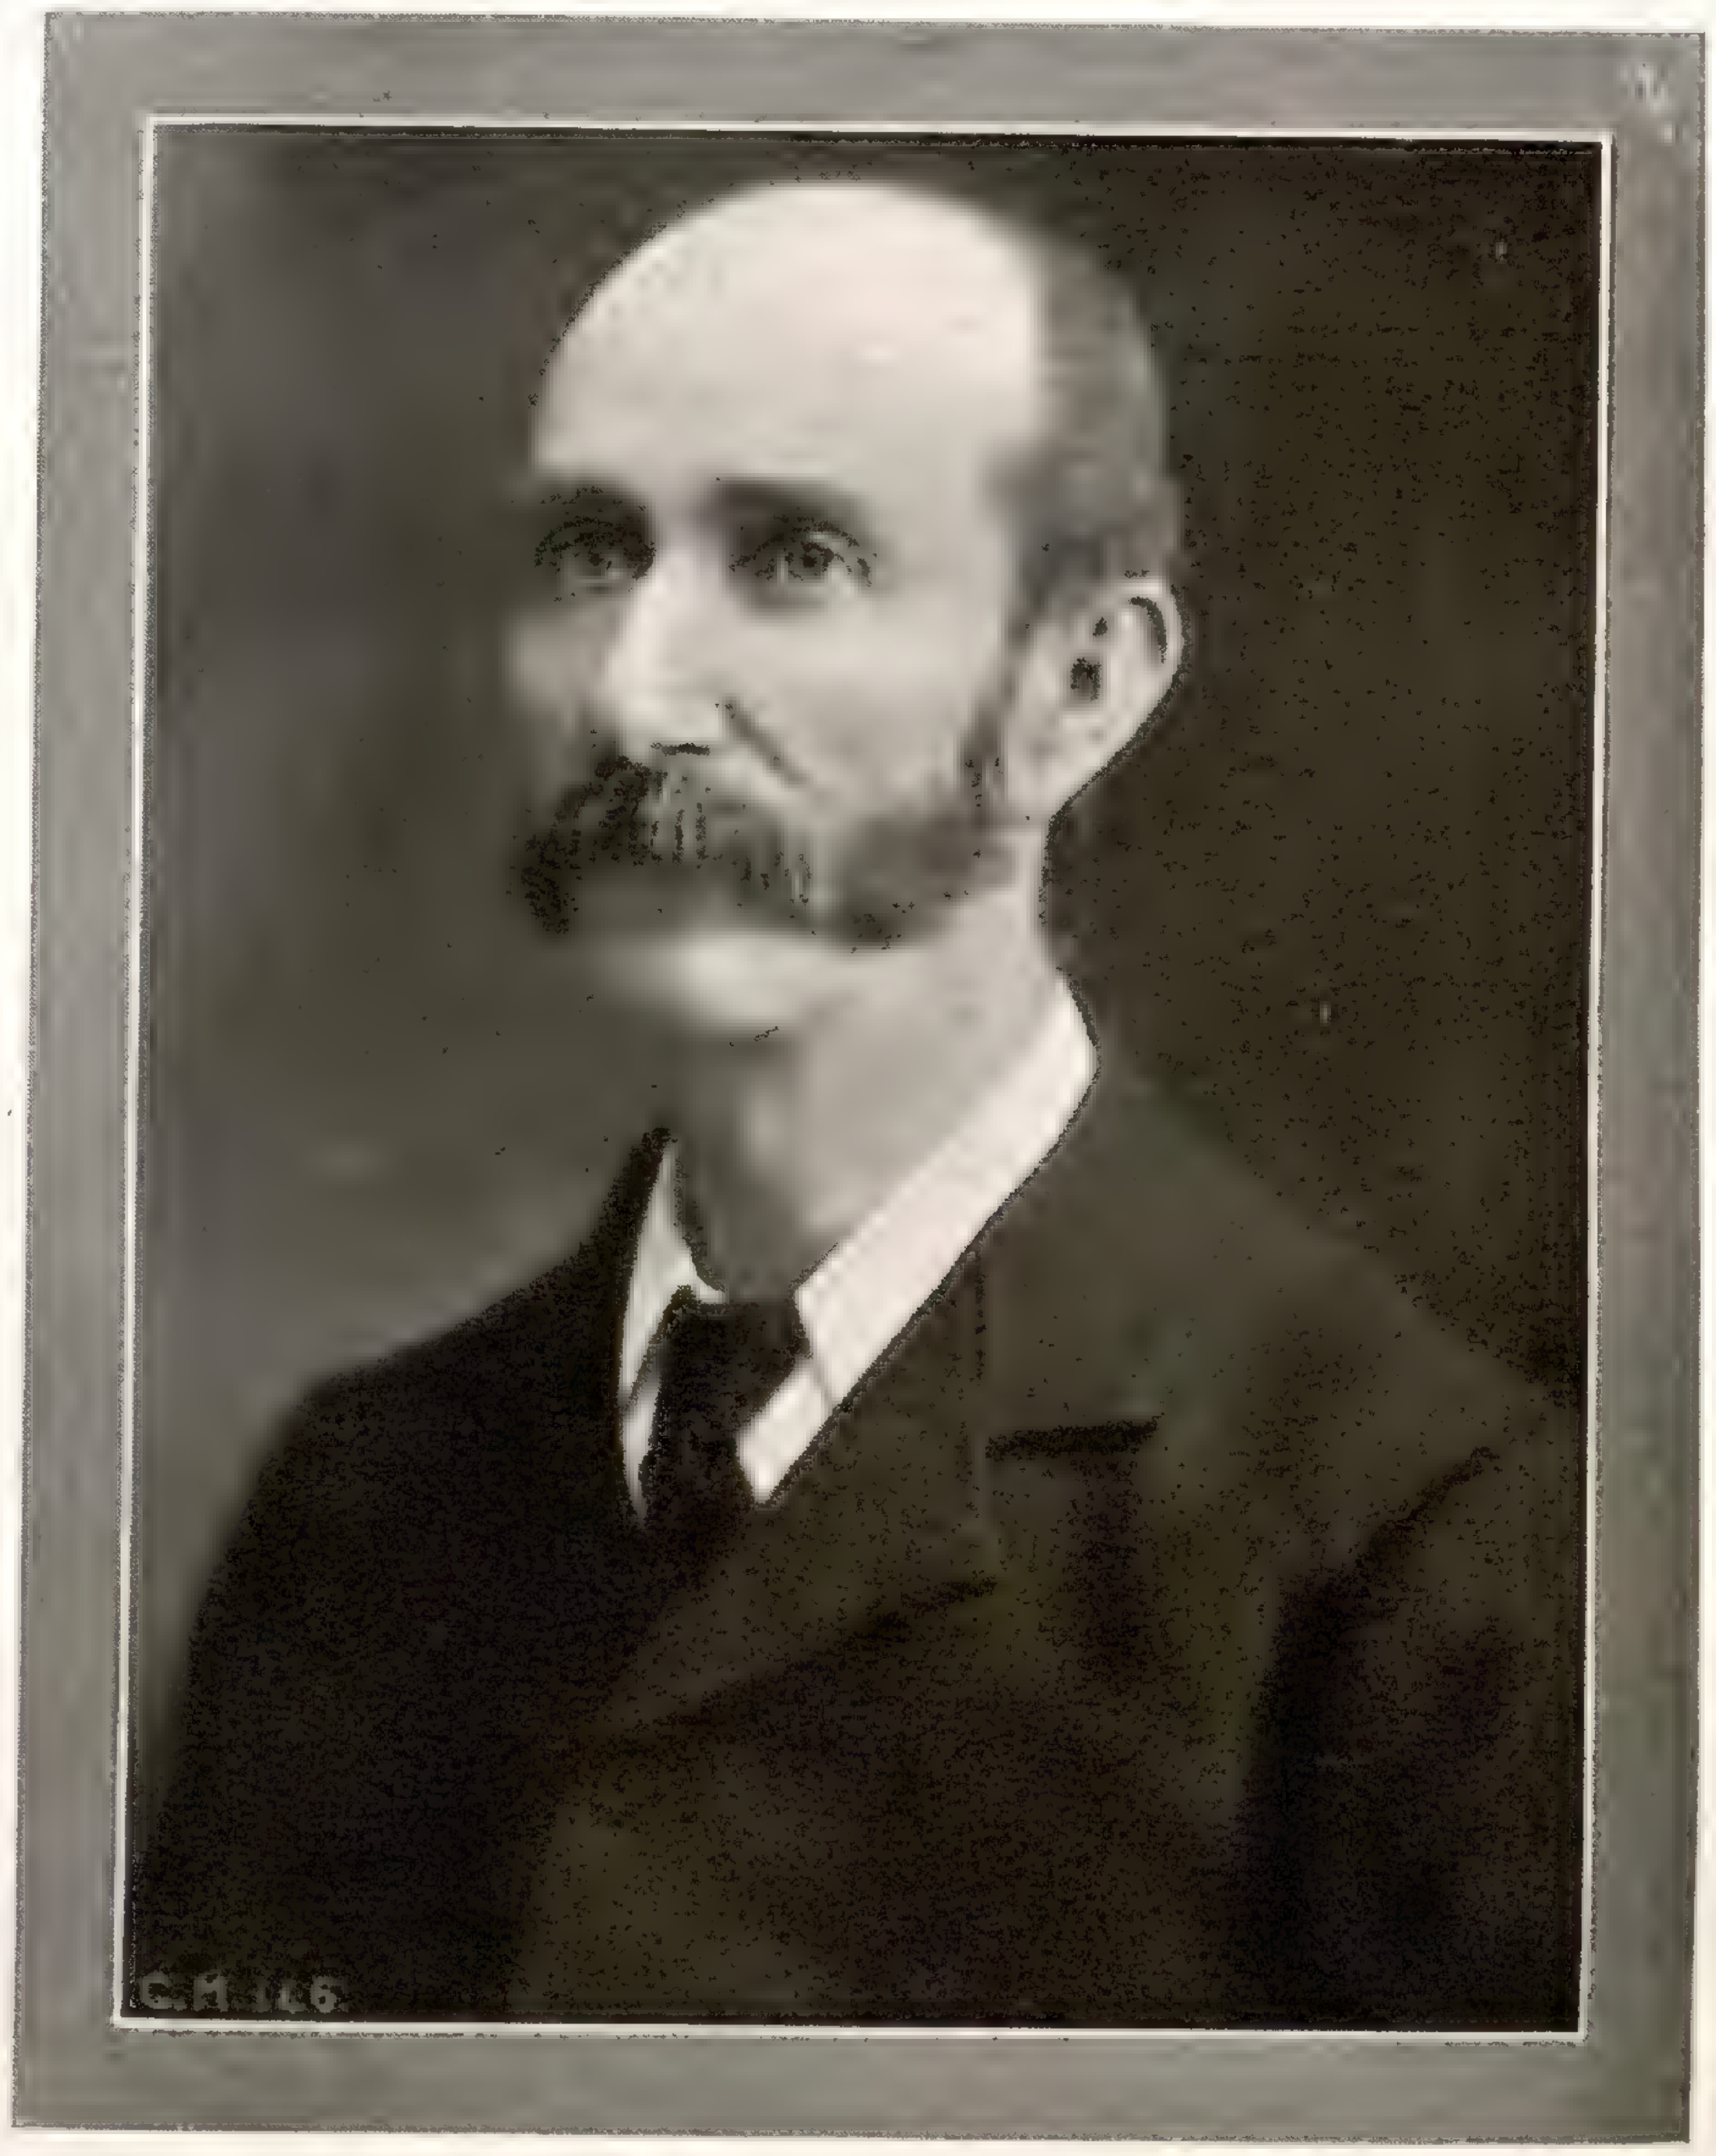
THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Tree Sales in Ireland.

Some correspondence has recently taken place between the Horticultural Trades Association and the Irish Department of Agriculture with reference to the practice which obtains among the various County Councils, which are under the control of the Department, of engaging in the sale of fruit and other trees. The question involved is one of considerable importance, not only to the members of the Association, but to all who are engaged in the nursery trade in Ireland, and should have the most careful consideration. That it is important there can be no doubt, for, unless the circumstances are quite exceptional, there is the gravest objection to public bodies entering into competition with private firms who have to contribute to the funds by which they are able to compete with those engaged in trade, and, it may be, undersell them. It will be admitted, unless we are much mistaken, that the circumstances in which the Irish County Councils are placed are of a quite exceptional character. If this be so, the point to consider is not whether the Councils have done wrong in selling trees, but whether they have exceeded the limits that should have been placed on their sales. We are inclined to think, from the trend of the correspondence, that there has been some excess of zeal, but to understand the position it is necessary to remember that, whereas fruit growing was practically unknown in Ireland twenty years ago, excepting in gardens under the charge of experienced men, it is now an important industry. When in 1889 Mr. Lewis Castle and Mr. George Gordon made a journey through Ireland for the purpose of investigating the condition and possibilities of fruit growing in that country, it was quite the exception to meet with a fruit tree that had been planted within a recent period, and few were the farmers who appreciated the importance of replacing old and exhausted fruit trees that had become worn out. This being the state of things, it is obvious that no ordinary course of procedure would have brought about so great a change as to fully justify the optimistic views expressed by Messrs. Gordon and Castle in their report on the possibilities of Ireland as a fruit-growing country. It would have been little use at the outset of the educational movement for instructors to have gone into country districts to teach the peasants and small holders the principles and practice of fruit culture unless they had received some assistance in the purchase of fruit trees. This was done as part of the educational work, and, as proved by the results, the practice has been most satisfactory. Whether it should have been continued after the growers had acquired experience may be an open question, but there is no justification for the supply of trees to the public at large, which the Association states is now being done. In the letter with which the correspondence was opened, the secretary of the Association calls attention to "the very serious injury which is being done to the nursery trade in Ireland through the County Councils supplying fruit trees, forest trees, and even ornamental trees at very low prices to land owners and occupiers throughout the country." It is also pointed out that if it were a matter of assisting the poorer and more ignorant part of the population to improve their surroundings, no objection would be raised, but it was understood from numerous complaints that this was not the case, but that the various County Councils were pushing the business in all directions. In reply, the Department states that "the County Committees do not, as a rule, supply fruit, forest, or ornamental trees to landowners; their operations in this direction being mainly confined to small holders, cottagers, and labourers." From this extract, it is evident the sales have not been limited to the three classes of cultivators last named, as they unquestionably should have been. It is further stated that "the committees who adopt this method of distributing trees always obtain competitive tenders from nurserymen in Ireland. The best tender, not necessarily the lowest, is accepted; and the committee then proceeds to re-sell the trees to occupiers in the county at cost price, plus carriage. It can scarcely be contended, therefore, that the committees are in ruinous competition with nurserymen. Moreover, as trees are sold by the committee at cost price, the buyers paying carriage, neither the rates nor the Department's funds are used for the purpose of reducing the cost of the trees to the purchasers, so that the public funds are not used in competition with private enterprise." This may have been regarded as an excellent defence of the practice of which the Association complains, but we are unable to regard it as such, because no information is given with regard to the manner in which the cost of the several transactions are defrayed if not from the funds at the disposal of the committees, which, being raised from the rates, are of a public character. It is also stated by the Depart-



MR. H. CARVER.

ment that "in some counties it has been found that farmers can themselves obtain trees at practically the same price as that at which the County Committees can sell them, and that in such counties the practice of obtaining trees in bulk and selling them to occupiers has been discontinued." It is also stated in this letter that the Department's scheme has been the means of largely extending the sale of trees in Ireland. Also that over 600,000 trees were purchased by farmers in this manner last year; but the increase in the sale of the trees under the scheme and the distribution of over half a million of trees in 1911 can hardly be a source of satisfaction to the nurserymen, whose business is of a retail character, if they have not derived any advantages from such sales. The Association, it need hardly be said, did not accept the Department's view of the question, and in a second letter the secretary states that he has made fuller enquiries, and that "the result of these enquiries is to fully confirm the statements made in my previous letter. Correspondents from all parts of the country state that these operations are not confined to cottagers and small holders. I enclose three lists for tender, in which you will see that more than half the trees for which tenders were asked, or orders solicited, are totally unsuited for small holders, such as forest trees, and more especially ornamental evergreen and flowering shrubs." The letter from which the foregoing is a short extract was evidently unanswerable, for the only point in the reply is to the effect that what is done with the trees obtained in the open market by tender is a matter which concerns the Department and the County Committees only. We certainly do not agree with that view of the case, for the competition by public bodies with private traders on the lines indicated by the correspondence is a matter of public interest, and assuredly concerns those who help to provide the funds by which these bodies are enabled to carry on their work.

---

**Mr. George Carver.**—Few men are better known in the horticultural circles of the Leeds district than Mr. George Carver, of the Grange Gardens, Scarcroft. Born at Great Bardfield, in Essex, Mr. Carver commenced his gardening career in the vicarage gardens of his native place, and in 1874, at his employer's suggestion, went to Marton Vicarage, North Yorkshire, where he spent two years, and then passed on to Busby Hall, Stokesley. Here he remained four years, and the varied experience gained enabled him at an early age to take charge of gardens at Nordley, Stockton-on-Tees, but, after a short period of service, he was invited to become head gardener to the late T. Fenwick, Esq., Allerton Hill, Leeds. Mr. Fenwick died in 1905, but Mr. Carver remained as head gardener to Mrs. Fenwick until her death in November, 1911, having been thirty-one years in the service of the family. Since then he has occupied his present position as head gardener to C. F. Ryder, Esq., and it is interesting to notice that Mrs. Ryder is granddaughter of Mr. Carver's old employer at Marton. Soon after coming to Leeds, Mr. Carver joined the Professional Gardeners' Friendly Society, and became its secretary in 1899; he has done excellent work in this connection, and it is due largely to his efforts that the society was reorganised, and is now on a sound financial basis as a special Lodge of the Oddfellows. Mr. Carver has a penchant for helping others, and it is probably due to the keen recollection of his earlier years, when, having lost his father, his mother struggled bravely to maintain a family of five, that Mr. Carver takes such a keen interest in the Royal Gardeners' Orphan Fund, and acts as local secretary for the Leeds district. If every gardening district had such an energetic and self-sacrificing horticulturist as Mr. Carver, the varied interests of gardeners throughout the country would be geatly improved. Mr. Carver writes: "We appear to have made a speciality of long service in our family. My father had been over 30 years in his situation when he died. I am the youngest of four brothers, and all the others have a better record in their present positions than even my thirty-one years at Allerton Hill." We wonder who to congratulate the most, the Carver brothers or their employers!

**Rock and Water Gardening.**—In our next issue we shall give special attention to rock and water gardening, and the matters that will be dealt with will, for the most part, be directly associated with the work that should be carried out at this season. The contents will include articles on the renovation of rockeries, aubrietias on walls, moss pinks, the finer saxifrages, the making of water gardens, choice water lilies, primrose-fringed streamlets, and plants for water margins. The issue will be freely illustrated.

**The Late Sir Joseph Hooker.**—A portrait bust of this distinguished botanist from a sitting taken a short time before his death has now been completed by Mr. Pennachine, the sculptor. Those who have had an opportunity of seeing the bust in Mr. Pennachine's studio describe it as an excellent piece of work. Sir Joseph Hooker left estate of the gross value of £36,861, of which £32,390 is net personalty. The testator left £100 each to the Linnean Society and the Scientific Relief Fund of the Royal Society.

**Austria and the Royal International Horticultural Exhibition.**—The great international horticultural exhibition, to be held at Chelsea, to which we are all looking forward with much interest, is evidently receiving a full share of atention from the Austrian horticulturists. The Vienna Horticultural Society is arranging a ten-day excursion to London for the purpose of enabling its members to visit the exhibition under the most favourable conditions. The party will leave Vienna on May 22, and will proceed direct to London. In addition to spending some time at the exhibition, visits will be made to the principal nurseries, the Royal Gardens, Kew, the Royal Horticultural Society's gardens at Wisley, the Hampton Court Gardens, and other places of interest. On the return journey the Austrian horticulturists will make a halt at Rotterdam, and spend a few days in Holland and Belgium, the programme terminating at Frankfort-on-the-Main after a visit to the celebrated palm garden in that city.

**R.A.S.E. Nursery and Plantation Competition.**— For several years past the Royal Agricultural Society of England has given special encouragement to forestry, and included in the schedule of prizes offered for competition at its annual shows classes for plantations and home nurseries. The encouragement will not be less liberal at the Doncaster meeting this year, for the old classes for plantations are retained and several new ones added. There are four classes for plantations, of which the final crop is to be hard-woods, and four for plantations of which the final crop is to be conifers. The new classes include one for plantations not exceeding two acres, consisting of Corsican pine, Douglas fir, Japanese larch, and Sitka spruce, and one for the best example showing systematic management of an existing woodland area, including the renovation and conversion of an unprofitable wood into a thrifty condition. The prizes consist of gold, silver, and bronze medals. The forestry exhibition, to be held in the show grounds at Doncaster from June 2 to 6, should be extensive and of much interest, for twenty-one classes have been provided, with silver and bronze medals as prizes, and promises of support have been received from some of the principal landowners in England.

**Spring Flowers at Kew.**—As the result of the relatively high temperature that has been experienced for some time past, spring flowers are now abundant in the Royal Gardens, Kew. Especially attractive are the great breadths of daffodils in various parts of the gardens, the groups of forsythias, and the specimen magnolias in the azalea garden. The forsythias are flowering with exceptional freedom, and in no year have we known them to be so effective as they are this season.

**Wart Disease of Potatoes.**—An order of the Board of Agriculture, entitled "The Wart Disease Order," was published in the "London Gazette" on the 22nd inst. It makes compulsory the notification of the disease to the local authority, and forbids the removal of tubers from any premises on which the disease exists or appears to exist until investigation by the local authority. The order applies to Great Britain.

**Cinerarias from Wordsley.**—From Messrs. E. Webb and Sons, of Wordsley, we have had the pleasure of receiving a gathering of flowers of cinerarias, representative of their fine strain known as "Webbs' Superb." The flowers before us fully justify the title that has been given the strain, for they are equally remarkable for their large size, breadth of floret, fine form, and the rich and diversified colours. The latter, it should be mentioned, range from the richest shades of crimson and blue to the more delicate shades that are so well represented in strains of the highest class. Very beautiful also are the white-centred varieties.

**Women and Horticulture.**—In moving the adoption of the report at the annual meeting of the Horticultural College, Swanley, Sir John Cockburn, who presided, said that it was twenty-one years since women were first admitted to the college as students, and later it was open to women only. The work done by the college was most important, for women were noted for their care of all living things, and gardening was an occupation well adapted to their abilities. The prosperity of the college was shown in the number of students. In the spring term there were seventy-three, in the summer term ninety, and in the autumn term eighty-four. The Colonial branch, under the care of Mrs. John Hopkinson, was doing good work in sending out trained students to the Colonies. They prided themselves on their exports from this country, but there was no export which approached in value the export of educated British women. In sending to the Dominions some of the very best of their trained young women they were, he considered, doing Imperial work of the highest importance.

**Market Gardeners' Compensation.**—The Market Gardeners' Compensation Bill, which has been introduced to the House of Commons, has been printed. The object of the Bill is to restore the right of the market gardeners to compensation for retrospective improvements, which was intended to be given by the original Market Gardeners' Act

## LIVERPOOL SPRING SHOW,

MARCH 27 and 28.

The Liverpool Horticultural Association has held a good many very fine spring shows, but that which opened in the Corn Exchange on Wednesday last was in some respects more interesting and pleasing than any of its predecessors we have seen. Probably nowhere in England is it possible to see more or better grown azaleas, rhododendrons, specimen orchids, and other spring subjects than are exhibited year after year by the gardeners around Liverpool, who, with a fine enthusiasm, support their horticultural society, and keep it always up to date.

A TASTEFUL ARRANGEMENT OF FRAU KARL DRUSCHKI ROSES EXHIBITED BY MESSRS BEES, LIM., AT LIVERPOOL SPRING SHOW.

The North of England Horticultural Society sent a deputation, including the Rev. J. Bernard Hall, Rev. J. Jacobs, Colonel J. Rutherford, M.P., Messrs. W. Bolton, W. H. Hatcher, W. Haig, R. P. Ker, H. Hicks, N. F. Barnes, B. Ashton, and J. S. Brunton.

The deputation awarded a gold medal to Mr. W. Hignett for dendrobiums, Messrs. Mansell and Hatcher for orchids, and Mr. E. Rogers for clivias; silver-gilt medals to Messrs. Charlesworth and Co., for orchids, Messrs. Young and Co. for carnations, Messrs. R. P. Ker and Sons for amaryllis; silver medals to Messrs. H. B. May and Sons for ferns, Messrs. Bakers for alpines, Mr. G. Reuthe for alpines, and L. Thomson, Esq., for narcissi.

The schedule opened with a class for six pots or pans of hardy herbaceous and four of bulbous plants, Mr. E. R. Finch, gardener to W. J. Lockett, Esq., Grassendale House, Grassendale, taking first with Dielytra spectabilis, Polygonatum multiflorum, Astilbe longifolia, and other well-grown plants. Mr. George Eaton, gardener to W. Tod, Esq., Drygrange, Allerton, stood second with similar subjects, but rather smaller plants. Mr. F. Atkin, gardener to T. N. Wright, Esq., Mossley Vale House, Mossley Hill, was third.

### FLOWERING BULBS.

The class for twelve hyacinths in single specimens brought only two entries, Mr. T. Hitchman, gardener to Arthur Earle, Esq., J.P., Childwall Lodge, Wavertree, being the winner; Mr. George Osborne, gardener to Drs. Tisdall and Ingall, Tusbrook, following. Mr. Hitchman again led for six specimens, Mr. Loo Thomson, Ailsa Craig, Formby, being second, and Mr. E. R. Finch, gardener to W. J. Lockett, Esq., Grassendale, third. There were six entries in this class. In the class for six pots, three bulbs in each, Mr. E. R. Finch scored, the runner-up being Mr. D. Little, gardener to J. Smith, Esq., The Knowle, Blundellsands, third prize going to Mr. T. Rigg, gardener to Miss McKean, Wavertree Lodge, Wavertree. Mr. G. Osborne was awarded first for three pans containing not more than ten bulbs each, Mr. Hitchman coming second. A fine show was made by the exhibits of six pots of daffodils, the pots not exceeding seven inches in diameter. The successful exhibitor was Mr. F. Atkin, gardener to T. N. Wright, Esq., Mossley Vale House, Mossley Hill. He had splendidly grown pots of Glory of Leiden, Mme. Plemp, Mme. de Graaf, and Emperor. Mr. E. R. Finch was a good second with similar varieties, third place being allotted to Mr. George Osborne.

Tulips made a brilliant show of colour, some very good exhibits being staged in the class for twelve pots of singles. The winner was Mr. F. Atkin, gardener to T. N. Wright, Esq., Mossley Hill. Roi Pepin, Van Vondel, and Fabiola were among the most telling of his varieties. Mr. E. R. Finch took second, his flowers not being so even in size and condition; third prize was awarded to Mr. J. Williams, gardener to C. J. Proctor, Esq., J.P., Boscobel, Oxton.

Mr. E. R. Finch led the way for six pots of double tulips, his flowers of Murillo, Toreador, and Tournesol being very fine. Second place was taken by Mr. F. Atkin, and third by Mr. H. Spencer, gardener to A. Heywood Jones, Esq., Holly Bank, West Derby. Mr. E. R. Finch scored for six pots of singles, showing some very nice flowers, Mr. J. Williams, gardener to C. J. Proctor, Esq., J.P., Boscobel, Oxton, taking second, and Mr. F. Atkin third place. Mr. Williams was successful with a basket of cut daffodils, his flowers being of good quality, and arranged with great taste; second prize was claimed by Mr. Ed. Wharton, gardener to John Findlay, Esq., Mairscourt, Sefton Park. Nine vases of daffodils, distinct varieties, brought only one entry, the exhibitor being Mr. George Osborne, who showed Glory of Leiden, Empress, Sir Watkin, Golden Spur, Rubens, Gloria Mundi, and Commander, as well as one wrongly labelled Almira.

Five competitors staged six hybrid amaryllis, the quality throughout being very good. Mr. Thos. Rigg was worthily placed first, his flowers being broad and of good texture, while the colours were very clear and bright. Mr. E. R. Finch followed with another nice set, third place being taken by Mr. W. R. Bentham, gardener to A. A. Paton, Esq., Greenbaun Drive, Sefton Park.

### PLANTS.

We have on previous occasions complimented the Liverpool growers on their splendidly-grown dendrobiums. We cannot do less than remark that this year they seemed to be as good as ever. Mr. Wm. Hignett showed Dendrobium Ainsworthi and D. nobile that were just huge masses of clean, bright flowers. Nothing in the show more worthily received firsts than these two plants, a Cultural Diploma also being given by the North of England Horticultural Society.

Mr. E. R. Finch had three splendid greenhouse azaleas, for which he received first prize, as he did also for four forced hardy plants, showing big specimens of Azalea occidentalis, Deutzia gracilis, Rhododendron Doncaster, and a well-flowered lilac. Mr. Finch also scored for one greenhouse rhododendron, and was second for three pot roses, being beaten in this class by Mr. Hitchman, who was also awarded firsts for one hardy rhododendron, showing a good plant of Pink Pearl, one specimen azalea, and three azaleas. Mr. Geo. Eaton had the best three rhododendrons, the same gentleman taking seconds for the single plants in both hardy and greenhouse classes. Some very pretty Cineraria stellata were staged, the group put up by Mr. Geo. Eaton receiving first prize. The blues in this group were very bright and pleasing. Mr. Eaton also led the way for four plants, Mr. F. C. Keightley, gardener to Mrs. Duncan, Grassendale, taking second, and Mr. John McColl, Allerton, third. Mr. McColl was the winner with six Primula sinensis, Mr. Keightley and Mr. F. Atkin taking the other awards in the order named.

Splendidly-grown cyclamen were shown, there being six entries of half a dozen plants.

A GROUP OF SEEDLING CLIVIAS EXHIBITED BY MR. E. ROGERS, GARDENER TO O. O. WRIGLEY, ESQ., AT LIVERPOOL SPRING SHOW.

Mr. T. Hitchman led off with a set of grand plants, carrying a wonderful quantity of flowers; Mr. E. R. Finch was second, and third place was taken by Mr. H. Spencer, gardener to A. Heywood Jones, Esq., Holly Bank, West Derby.

Of five decorated dinner tables the one arranged by Mr. J. Armistead, gardener to T. A. Vlasto, Esq., Bonnevaine, Sefton Park, was awarded first; daffodils, lily of the valley, and lonicera being used. Miss Newsham, Old Hall, Aughton, was second with Primula malacoides, schizanthus, and lily of the valley; third prize went to Mr. J. H. Warrimer, Rivington Road, Seacombe, for an arrangement of carnations.

In the local amateurs' section some first-rate exhibits of daffodils, tulips, and other seasonable subjects were staged, and great credit is due to the private growers in the locality for the manner in which they filled their classes. Our space, unfortunately, does not admit of a detailed record of the prizewinners in this section.

## NON-COMPETITIVE.

The exhibits of the trade added considerably to the interest and attractiveness of the show, there being on this occasion a larger number and greater variety of exhibits than we have previously seen at Liverpool. The big bank of orchids put up by Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds, was a striking feature. A number of excellent dendrobiums and some very fine odondoglossums were well arranged with cypripediums, a few cattleyas, and other good things to add variety of both form and colour. Mr. W. Hignett, gardener to C. W. Carver, Esq., Woodbourne, West Derby, filled a table with dendrobiums that were really remarkable for excellence of culture. Every plant was a specimen, full of flower, and beautifully clean; some of the seedling forms were very rich in colouring.

An improvised rockery furnished with alpine and kindred plants, was arranged by Messrs. Bees, Lim., Liverpool. Primula Forresti and several other of the firm's Chinese novelties were well represented, the exhibit also containing such old favourites as the double primroses, hepaticas, and daisies. Messrs. Bees also exhibited some very fine floral designs that had the merit of showing originality without the vulgarity that so often mars attempts at striking designs.

A beautiful lot of ferns were staged by Messrs. H. B. May and Sons, Upper Edmonton, the finer adiantums and the crested nephrolepis being well shown. Messrs. R. P. Ker and Sons, Aigburth Nurseries, Liverpool, made a bold display of their brilliant amaryllis. The vivid crimsons and the scarlets were thrown into greater relief by the inclusion of some very fine white and delicately-tinted varieties. Messrs. Charlesworth and Co., Hayward's Heath, put up a small but choice group of orchids. Cattleya Trianæ varieties, some beautifully marked Odontoglossum crispums, and a fine plant of Brasso-cattleya Cooksoni were noted among other good things on the stand.

Messrs. Bakers, Wolverhampton, showed alpines, which were arranged in clumps between stones and moss. A few particularly good things on the stand were Myosotis Ruth Fischer, Morisia hypogæa, Phlox Laphami, and several choice primulas. Another nice collection of alpines came from Mr. G. Reuthe, Keston, Kent. Shortia uniflora grandiflora, Schizocodon soldanellioides, and the pretty little Soldanella montana were noticeable. Himalayan rhododendrons and camellias made a fine background to the exhibit. Messrs. Young and Co., Hatherley, Cheltenham, made a splendid show of perpetual carnations. The varieties were up-to-date and the arrangement very tasteful. A variety that appealed to us on acount of its breadth and smoothness of petal was Montgomery, a distinct musk-rose-tinted flower.

Messrs. Youngs, West Derby, showed a nice collection of perpetual carnations, such varieties as Triumph, Sunstar, and Lady Northcliffe being among other favourites.

Messrs. W. Rowlands and Co., Childwall Nurseries, Liverpool, put up a big bank of Primula Kewensis, the flowers in the mass being very pleasing. The same firm also staged a group of tulips in distinct colours. Mr. Fred Cross, Sherbrook Road, Daybrook, Nottingham, put up a table of daffodils in ornamental receptacles, which certainly are well adapted for these flowers.

A group of the very distinct and showy Ranunculus cortusifolius came from the Liverpool Corporation, Bowring Estate, the foliage as well as the bright yellow flowers being very ornamental. Messrs. Conway, Lim., Halifax, arranged a model rockery on very artistic lines, the pockets and crevices being furnished with small shrubs, ericas, anemones, primulas, etc. Mr. E. Rogers, gardener to O. O. Wrigley, Esq., Briodge Hall, Bury, showed a group of remarkably fine clivias, there being about fifty specimens, every one a really good one, and all home-raised seedlings.

### MEDAL AWARDS.

Gold.—Messrs. Bees, Lim., Liverpool; Messrs. Young and Co., Cheltenham; Messrs. Mansell and Hatcher, Lim., Rawdon; Messrs. R. P. Ker and Sons, Aigburth; Messrs. Baker's, Wolverhampton; Mr. W. Hignett, West Derby; Messrs. Charlesworth and Co., Hayward's Heath; Mr. G. Reuthe, Keston, Kent.

Silver.—Messrs. H. B. May and Sons, Edmonton; Messrs. Youngs, West Derby; Messrs. W. Rowlands and Co., Liverpool.

---

**Nuts.**—The position assigned to cob and filbert nuts is usually a part of the garden which is considered to be of no value for any other purpose, irrespective of position and shelter; under such conditions it is not to be wondered at the trees fail to give satisfactory crops. A warm, sheltered position is required, and trees which annually bear heavy crops should be fed liberally as other kinds of fruit trees are. The trees should be kept to a single stem, and all suckers removed as soon as they appear; the heads of the trees should be kept shapely by cutting out cross-growing branches or other ungainly growths. Nut trees prefer a light, well-drained soil, and should be planted 10 to 12ft. apart. Big bud in nuts is caused by a mite similar to that which attacks the black currant, and should be treated in a similar manner.—W. Messenger.

## NEW PLANTS, ETC.

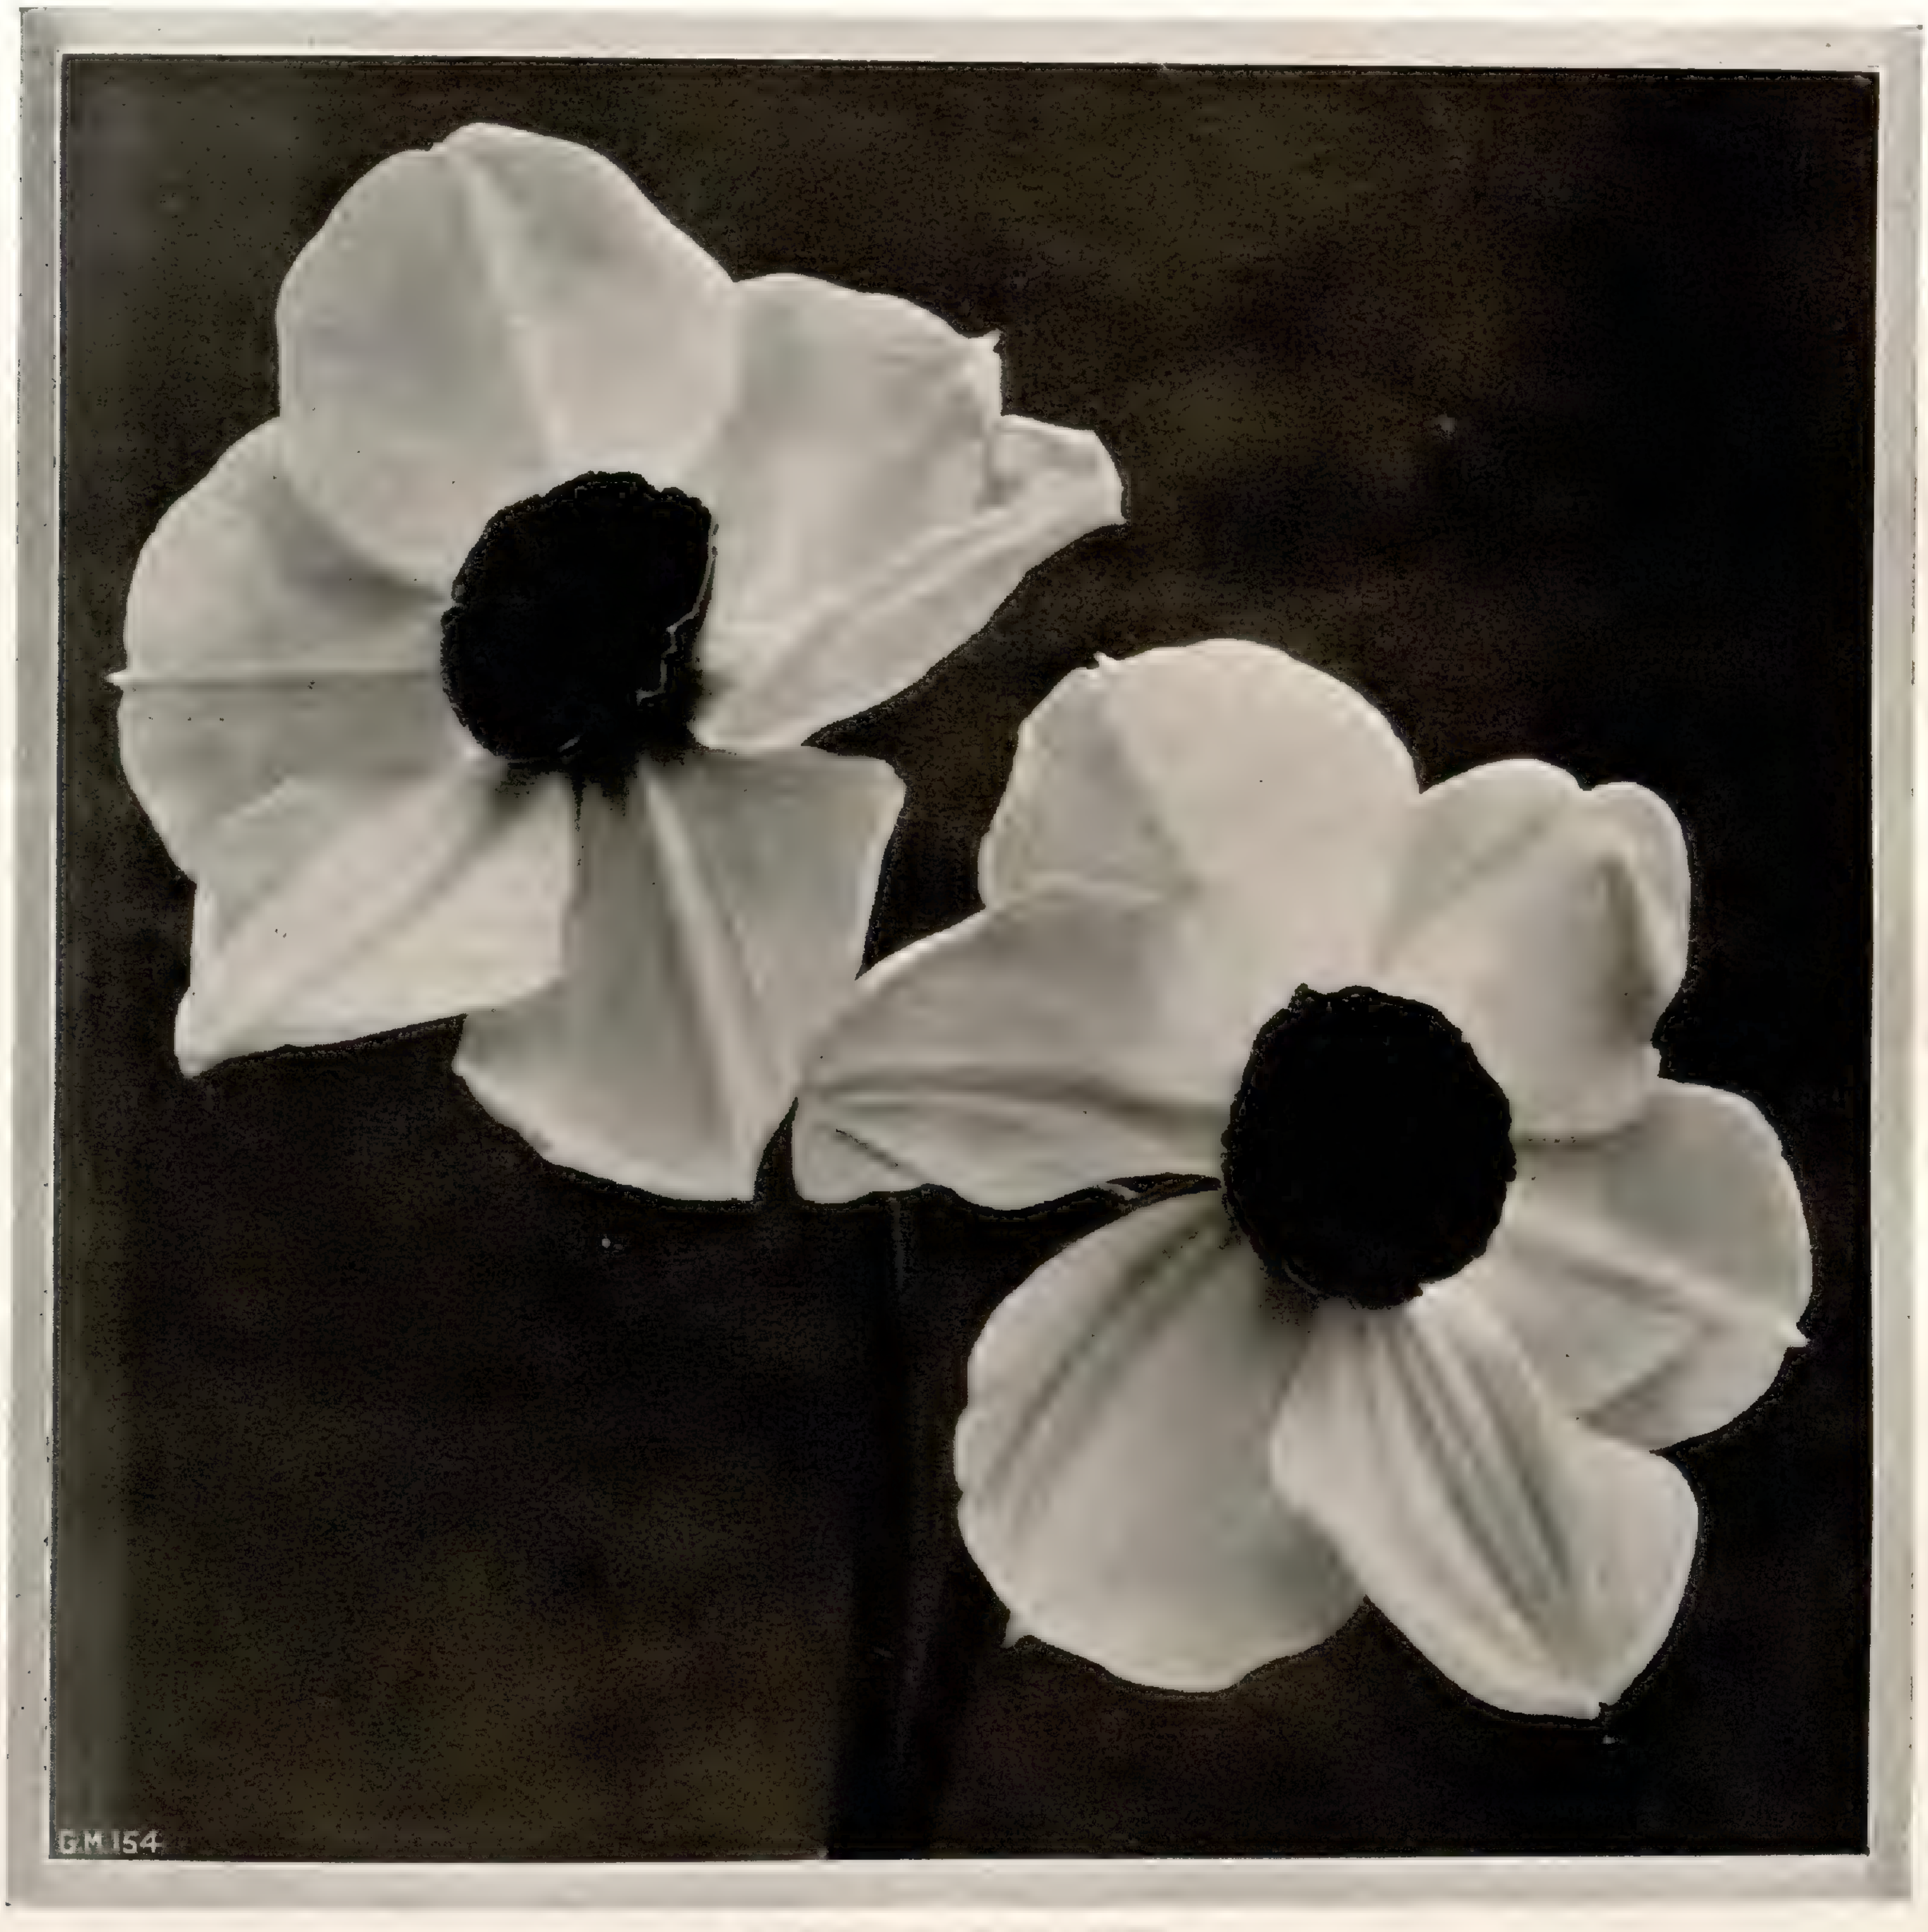
◆

### DAFFODILS.

Helios.—A splendid incomparabilis variety of grand form; the perianth is light golden-yellow, and the broad cup, or crown, is deep yellow, shaded with orange. A.M., R.H.S., April 19. Messrs. Walter T. Ware and Co., Inglescombe, Bath.

Robespierre.—A large and elegant incomparabilis variety, with spreading, soft yellow perianth segments, and a medium-sized cup of vivid orange hue. A.M., R.H.S., April 19. Mr. A. M. Wilson, Shovel, Bridgwater.

Rubalite.—This is a fine poetaz variety, with large white flowers and red centre; the flowers are borne, several together, on a stem, and each has a long flower-stalk. A.M., R.H.S., April 19. Mr. A. M. Wilson, Bridgwater.



NARCISSUS RUBALITE.

A beautiful new poetaz variety, with large, rounded, white flowers, each with a rich orange-crimson crown. A.M., R.H.S., March 19. Mr. A. M. Wilson, Shovel, Bridgwater.

### ROSE, ROSE QUEEN.

An American-raised hybrid tea rose of great beauty and worth for forcing. The flowers are of excellent shape, broad-petalled, full, fragrant, and of a deep reddish-rose colour. As shown, it was very much admired. A.M., R.H.S., March 19. Mr. W. E. Wallace, Eaton Bray, Dunstable.

### PRUNUS PISSARDI MOSERI FL. PL.

This is a delightful early-flowering shrub or small tree, and one that holds its flowers for a good while. It is extremely free-blooming, and the semi-double flowers are of an exquisite light pink shade. It should become a popular plant. A.M., R.H.S., April 19. Messrs. J. Veitch and Sons, Chelsea.

### CORYLOPSIS VEITCHIANA.

Another recently-introduced Chinese species, with catkin-like spikes of light green flowers. It is much like C. multiflora, recently described, but appears to be a stronger grower, as well as more free in blooming. A.M., R.H.S., March 19. Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

### HIPPEASTRUMS.

Rose du Barri.—This is a grand variety, with large rounded flowers of great substance and beauty; the colour is deep rose, with a tint of salmon. A.M., R.H.S., March 19. Mr. Dye, gardener to Lord Rothschild, Tring Park, Tring.

Musigny.—Another finely formed variety of rare size and substance. The colour is the most vivid and deep shade of crimson imaginable. A.M., R.H.S., Mr. Dye, Tring Park.

### PRIMULA KNUTHIANA.

This species has been sent home from Shensi, in China, by Mr. Purdom. It is of lowly growth, from four to six inches high, with slightly mealy leaves, and neat trusses of rosy-lilac flowers that show some slight variation in form and colour in a small batch of plants. Lovers of hardy plants will welcome this addition. A.M., R.H.S., March 19. Messrs. Jas. Veitch and Sons, Chelsea.

### ABIES DOUGLASI FLETCHERIANA.

This pigmy form of a noble tree was raised from seed at Ottershaw about sixteen years ago, and is now about 1½ft. high, and as much through, the bush being of quite rounded form. Its close, compact, and slow-growing habit will render it suitable for rock gardens and other places where miniature trees and shrubs are desirable. A.M., R.H.S., March 19. Messrs. Fletcher Brothers, Ottershaw, Chertsey.

### ODONTOGLOSSUM CRISPUM SAMUEL GRATRIX.

This finely-formed and finely-grown orchid has also the merit of beautiful and attractive colouring. The blooms are disposed regularly along the spike, and sepals and petals are of equal breadth. The colour is white, with abundant markings of light and bright brown. On the waved white lip there are markings of deep crimson-purple. F.C.C., R.H.S., March 19. Mr. Brown, gardener to Samuel Gratrix, Esq., West Point, Whalley Range, Manchester.

### CATTLEYA DIRCE, WESTONBIRT VAR.

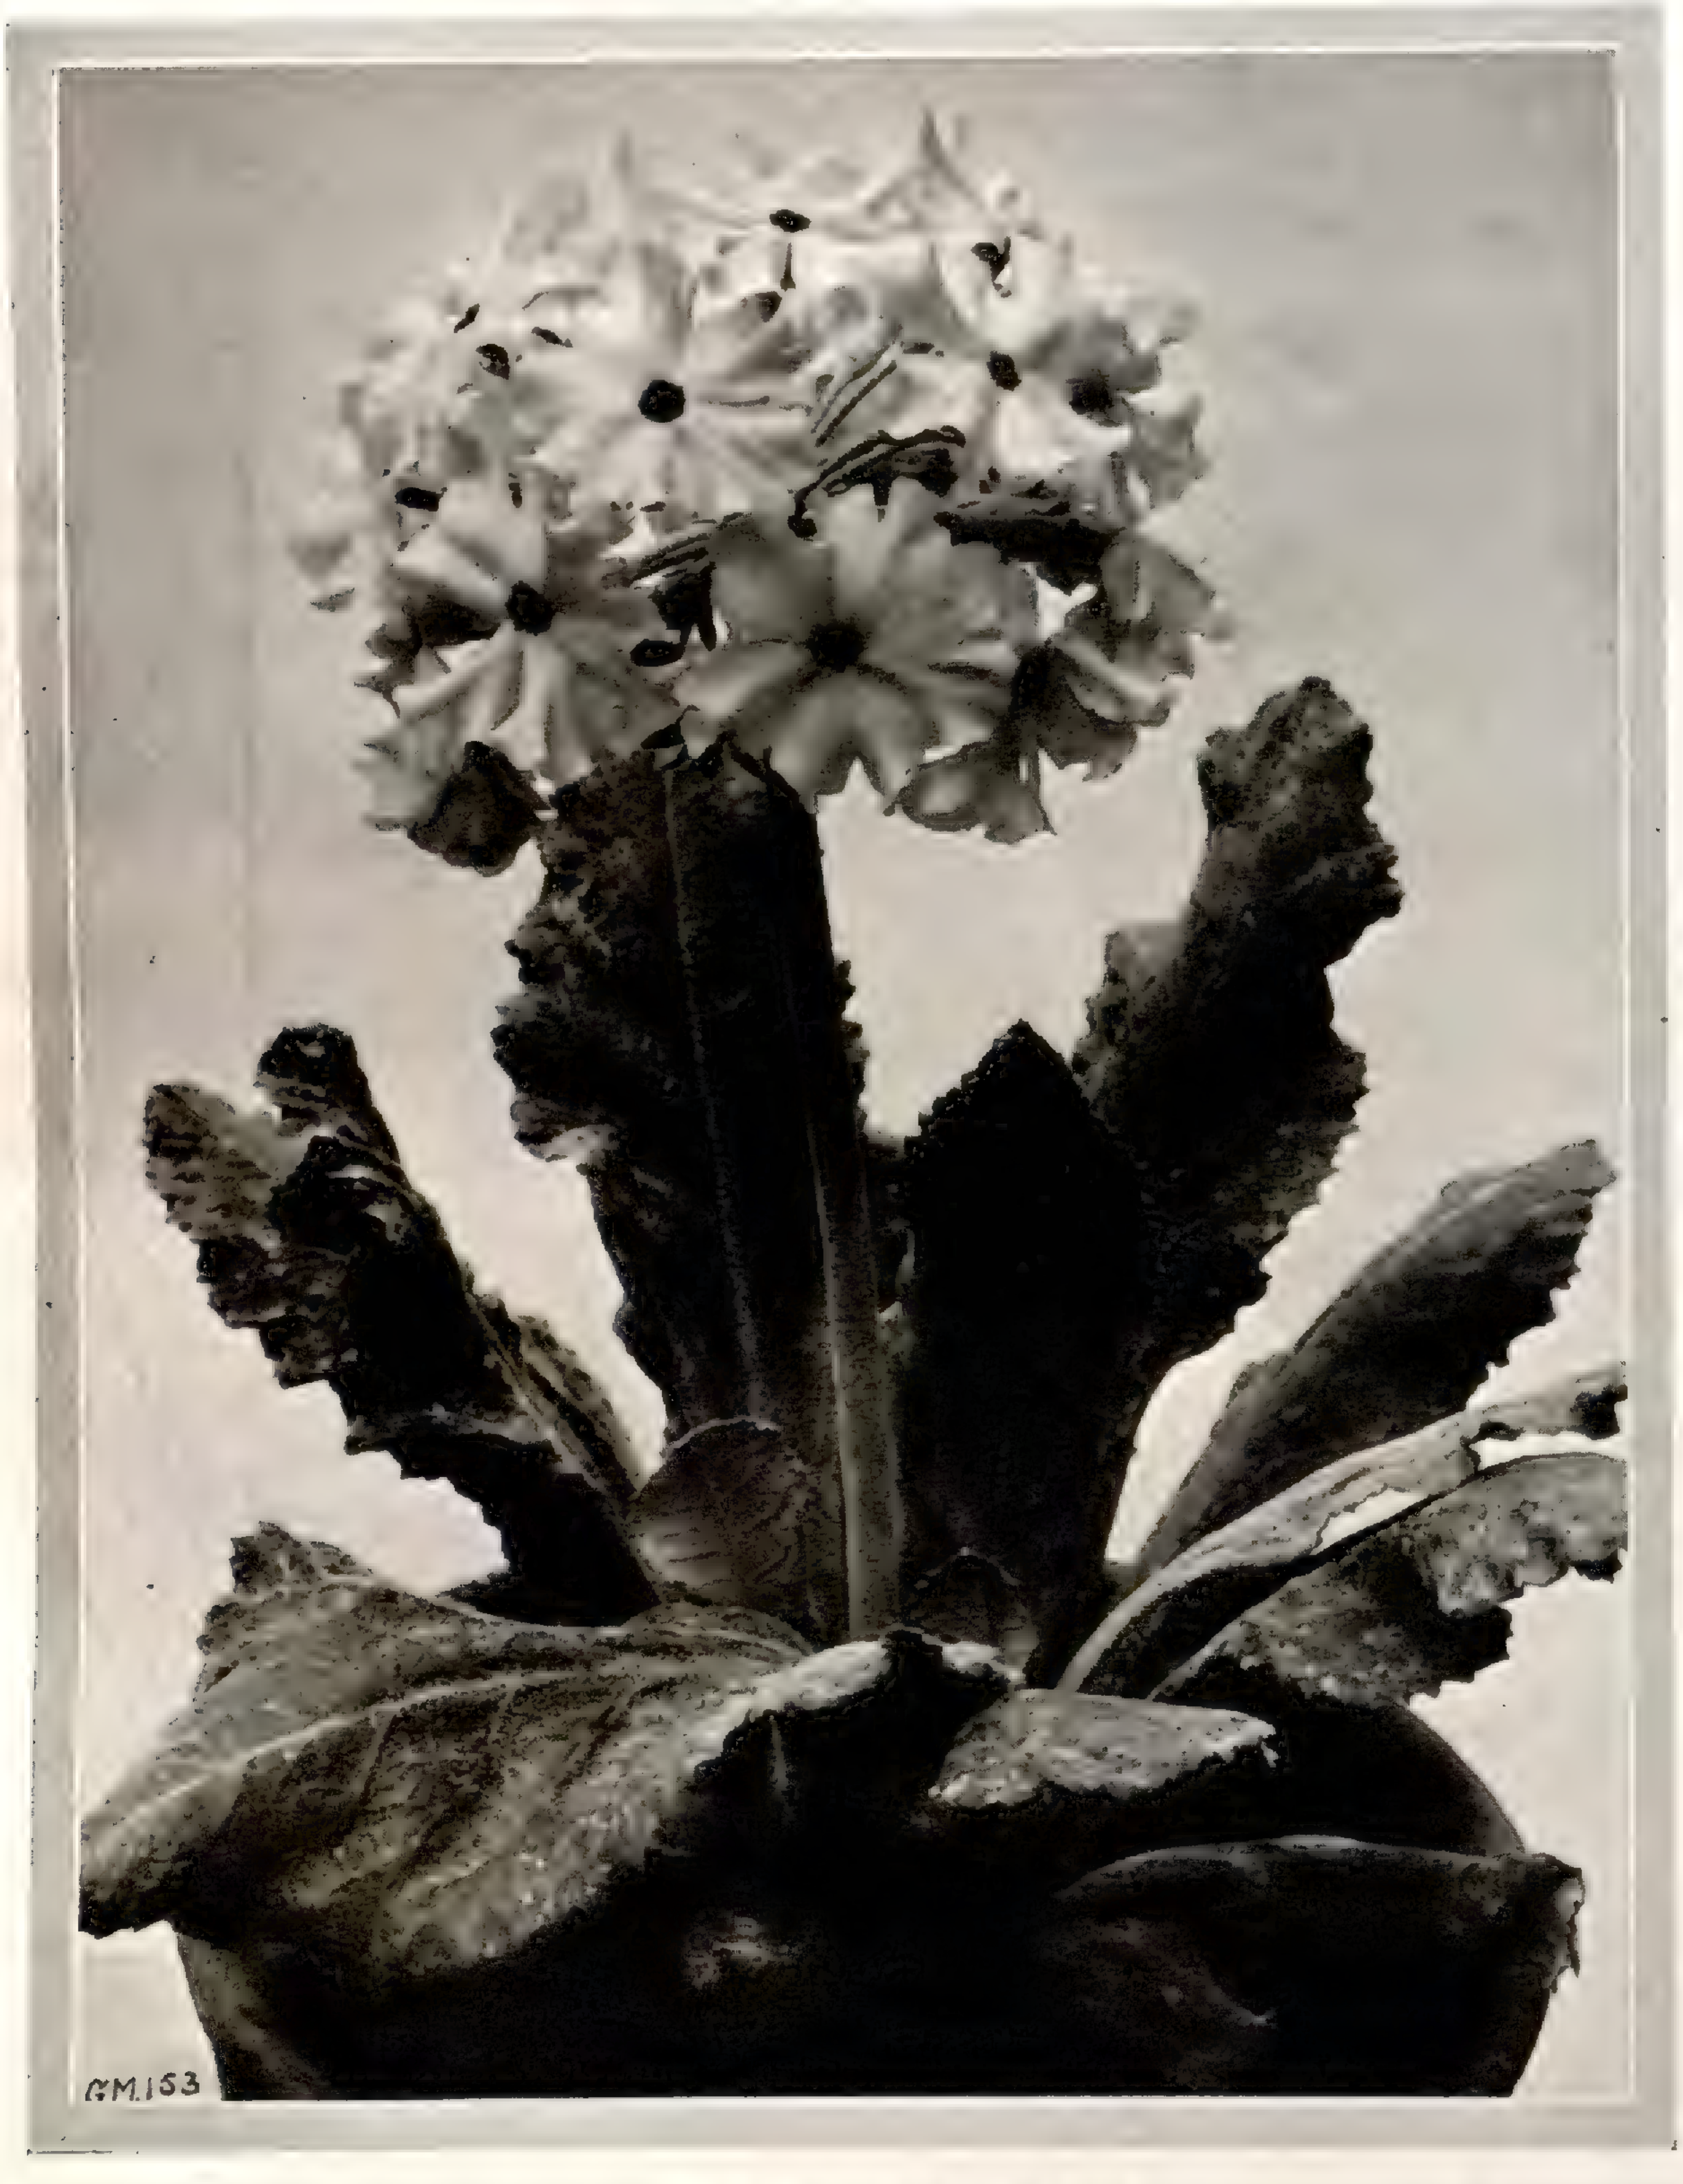
A handsome bold flowered hybrid derived from C. Vulcan and C. Warscewiczi. The flowers are soft purplish rose, with deep purple veinings, and gold markings on the large lip. A.M., R.H.S., March 19. Mr. H. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

### ODONTOGLOSSUM QUEEN OF GALTON.

A very handsome and free-flowering hybrid obtained by crossing O. percultum with O. triumphans. It has a good deal of the form of the last-named and the bright chestnut brown markings on the yellow ground also indicate the influence of this fine old species. The whitish lip has a few small red-purple markings. A.M., R.H.S., March 19. Mr. Collier, gardener.

### BEGONIA DICHROA.

A handsome Brazilian species, of tall growth and lax habit. It has large rhomboid-elliptic leaves, blotched with white, and the brilliant orange-scarlet flowers are carried in a large branched panicle at the end of a stout peduncle. The species needs tropical treatment under cultivation, and where there is ample room it should prove worthy of attention. "Bot. Mag.," t. 8,412.



PRIMULA KNUTHIANA.
A dwarf Chinese species with rosy-lilac flowers and mealy leaves. A.M., R.H.S., March 19. Messrs. Jas. Veitch and Sons, Chelsea.

### ELLIOTTIA RACEMOSA.

A beautiful shrub or small tree, from the Southern United States. It is hardy at Kew, and does well among rhododendrons and heaths, but while it belongs to the heath family it is quite unlike a heath in appearance, as the oblong, dark-green leaves are whitish underneath, and from two inches to four inches long; the white flowers are borne in a loose terminal raceme from six inches to ten inches long. Unfortunately, this plant is not easily propagated, but once a ready means of increase is found it should become fairly popular. "Bot. Mag.," t. 8,413.

### BERBERIS WILSONÆ.

This is a sub-evergreen shrub introduced from Western or Central China by Mr. E. H. Wilson, when collecting for Messrs. J. Veitch and Sons. It is of dwarf-spreading habit, and therefore is desirable for undergrowth to taller, light-growing trees, or for planting in the rock garden. The flowers are golden yellow and freely borne, and followed by yellowish or salmon-red berries. "Bot. Mag.," t. 8,414.

### DISA LUGENS.

A South African terrestrial orchid of slender growth, with long narrow, linear leaves and an erect spike, carrying several flowers of moderate size, with blue-green striped sepals and an elongated beautifully fringed lip. "Bot. Mag.," t. 8,415.

### CALCEOLARIA CANA.

A Chilean species of perennial, tufted habit. The loosely-branched inflorescence carries a number of small flowers, that are white, suffused with rose, and freely marked with deep rose or purple. The throat is yellow and purple-brown. The flowers are violet scented. "Bot. Mag.," t. 8,416.

## SPIRÆA THUNBERGI.

This is the earliest of the spring-flowering spiræas to open its flowers, and it is not uncommon for a number of the earlier blossoms to appear in February, although the normal flowering time is the latter end of March and early in April. A native of China and Japan, it has long been an occupant of our gardens, its presence being valued almost as greatly by reason of its elegant leafage as by its star-like white flowers. Growing two to three feet in height, it forms a shapely bush of small wiry branches, on which the delicate green linear leaves appear in April. The flowers are from axillary buds from almost every part of last year's growth. They are small individually, but lack of size is compensated for by numbers.

S. Thunbergi is considered to be one of the parents of the popular S. arguta, a form which is easily one of the best dozen early-flowering shrubs. From this reason there would appear to be a chance of its turning out to be a valuable plant in the hands of the hybridist. A number of hybrid spiræas are already in cultivation, but they are mostly natural hybrids, and very little appears to have been done with the genus towards systematic hybridisation. In addition to being a good border plant, S. Thunbergi can be used with effect as a forced shrub for greenhouse decoration.

W. D.

## CALLICARPA AMERICANA.

Habitues of the Royal Horticultural Society's periodical flower shows must be well acquainted with Callicarpa purpurea, the stove species which bears such a quantity of shining violet-purple berries. But to be successful with that plant plenty of air is necessary during the flowering period, or there will be no berries, and the flowers are so insignificant that unless the plants are well fruited they have no ornamental value. As a rule, the stove houses in private gardens have to accommodate such a diversity of plants that it is almost impossible to afford ample ventilation just for a few particular plants, so Calliandra purpurea rarely finds a place.

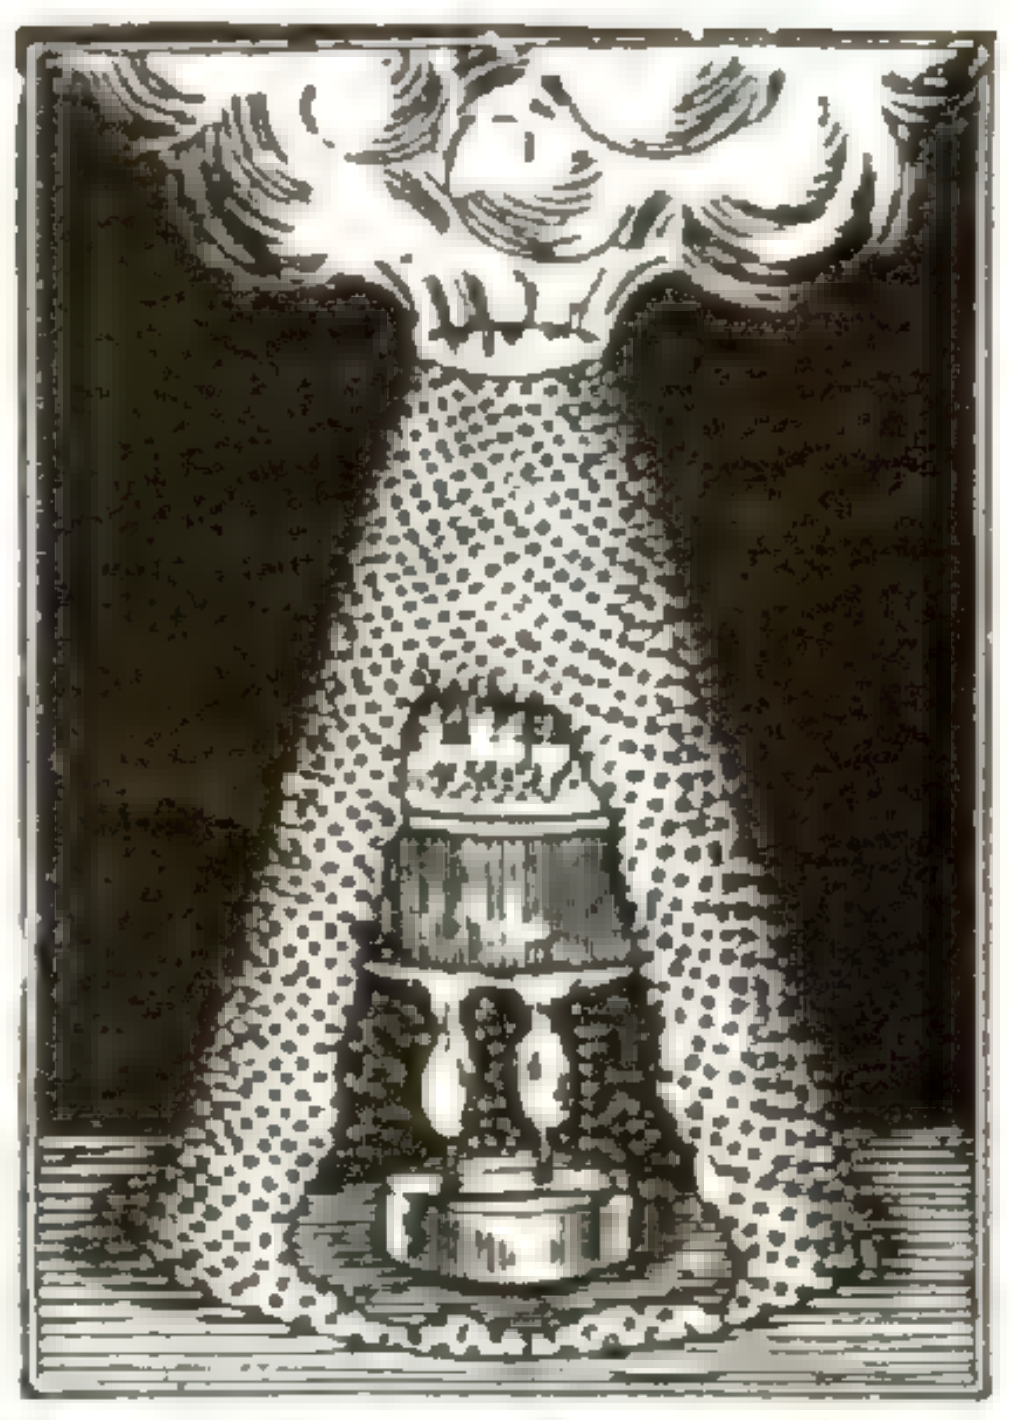
But the subject of this note, being much hardier, is more easily grown, and might with advantage be cultivated in establishments where uncommon greenhouse plants are admired. As with the Indian species, the coloured berries are its chief attraction, but in this case the branches of the shrub are whitish, and the leaves have a dense tonestun on their undersides. The small flowers, which are red in colour, are borne in axillary cymes, and the juicy berries are also brighter in colour than those of the stove species. The berries of Callicarpa americana become a vivid reddish-purple colour, and make an almost startling contrast with the whitish stems of the plant.

With their customary methods of affixing popular names, the Americans have called this plant the "French Mulberry," and as it is neither a native of France nor a mulberry, we suspect that they are immensely pleased with the inspiration. The cultural conditions to be recommended for the successful treatment of Callicarpa americana are those of the greenhouse fuchsia, except that peat should be used instead of leaf-mould. After the plants have been cut back in the spring, the young shoots, taken with a heel of old wood, root readily under a hand-glass. When the plants commence to flower they should be given abundance of air in order to set their fruits, which the negroes of Alabama are said to esteem as a preserve.

Cecil Aubrey.

**LETHORION**

**Improved Metal VAPOUR CONE FUMIGATOR**



INTRODUCED 1885. Regd. Trade Mark, 62,957.

The marvellous effect of this simple and cheap method of Fumigating Greenhouses is fully borne out by the enormous increase of sales year by year.

Only a match required for the proper starting of the cone to secure startling results.

Cone No. 3, for a well-secured house of cubic 2,000 to 2,500 feet. Price 1/- each.
Cone No. 2, for a well-secured house of cubic 1,000 to 1,200 feet. Price 8d. each.
Cone No. 1, for frames cubic 100 to 600 ft. Price 6d.

*Full Directions accompany each Cone.*

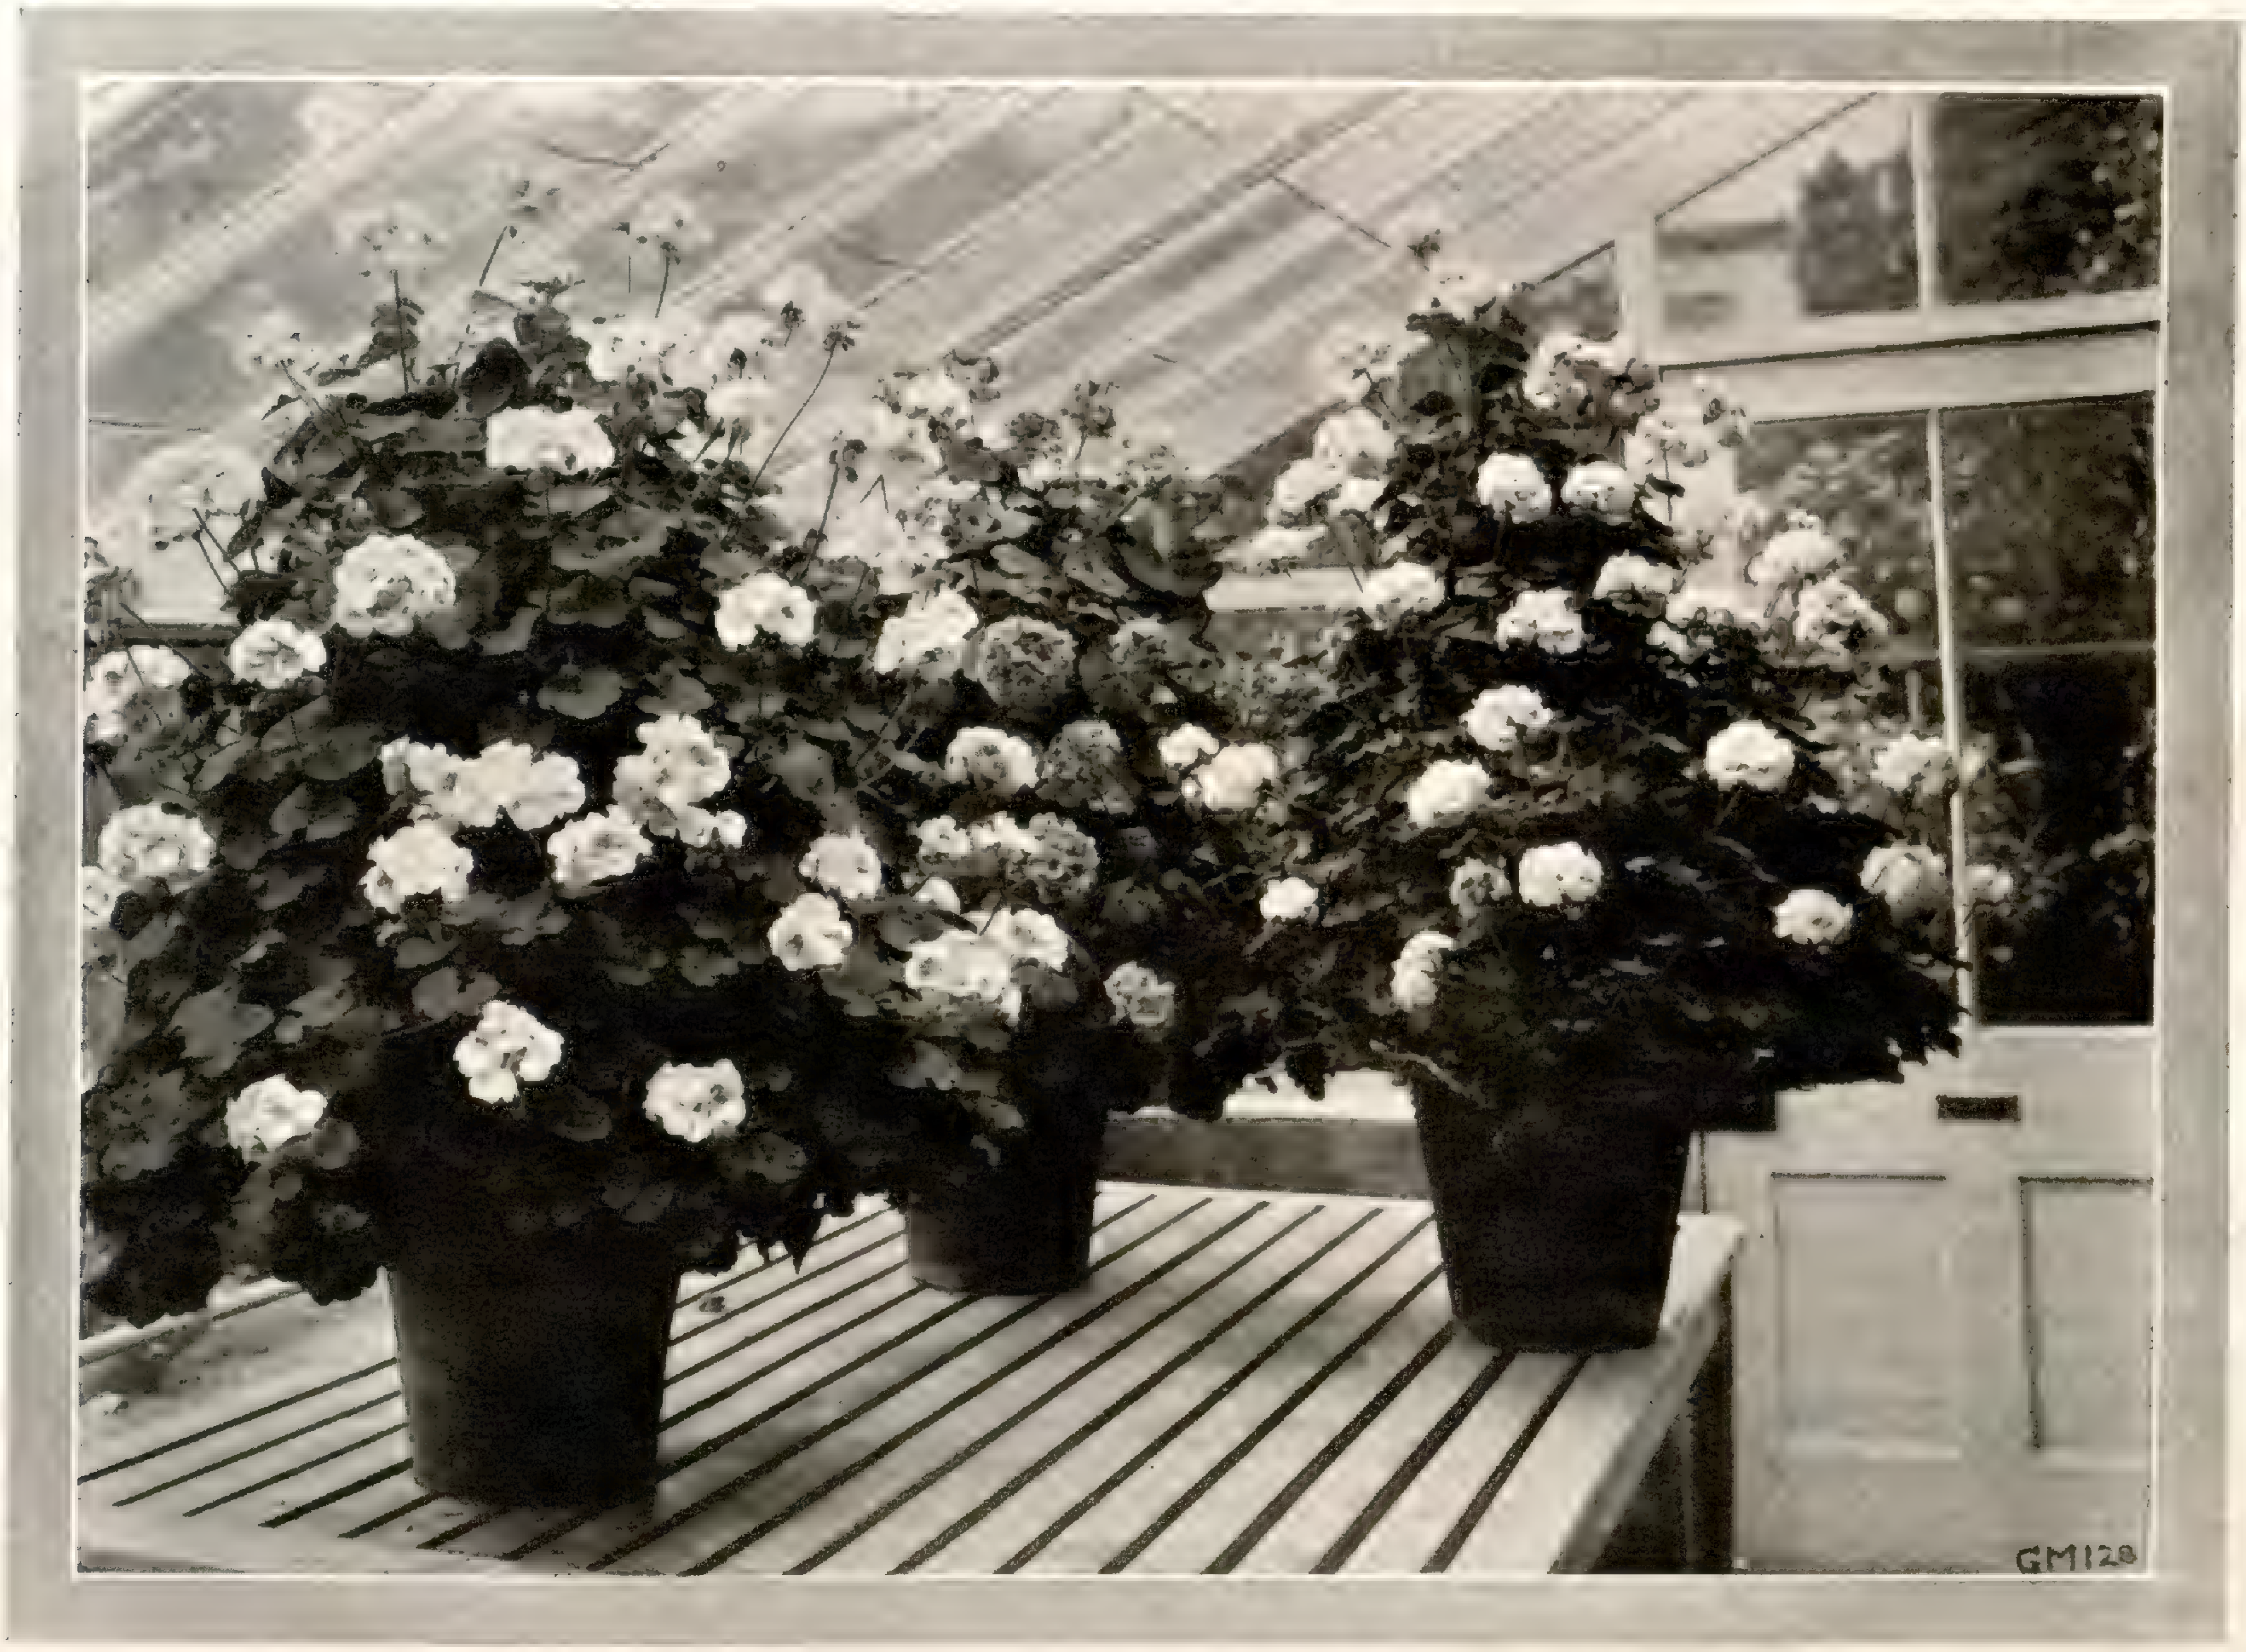
Standards for same, 10ft. high, 1s. each. Garden Netting, 30 square yards for 1s. Orders over 5s. carriage paid. List of Fancy Tents free. Write for Flag List. H J. GASSON, Net Works, Rye. Established 126 years.

# SPECIMEN ZONAL PELARGONIUMS.

The cultivation of specimen plants of any sort is an art that is fast dying out, the craze for quantities of cut bloom having done much to oust from popular favour what was once the pride of almost every garden.

Certainly we see quite good examples of specimen plants at some of the leading exhibitions, York probably providing a display of zonal and other pelargoniums unequalled at any other show in the country. The question might reasonably be asked What is there that makes a bolder or brighter show, or continues to bloom over a longer period, than the zonal pelargoniums? Bright and interesting as there are when cultivated in small pots, either for winter or summer flowering, they are infinitely grander and more striking when cultivated as specimen plants. The accompanying illustration admirably indicates the adaptability of these plants for pyramidal specimens.



GOOD PYRAMIDAL SPECIMEN ZONAL PELARGONIUMS.
Left, Bertha de Présilly, soft rose; centre, Gustave Emich, scarlet; right, Olive Schreiner, white with red edge.

Such plants take some considerable time to grow, and, needless to say, occupy a great amount of space, so that anyone undertaking their cultivation must needs have a fair-sized house to devote to them if many specimens are to be grown.

If it is desired to grow specimen plants from a single cutting, three to four years is not too long to allow, but where good bushy plants are established in 48 or 32-sized pots, very fair specimens may be obtained the year after making up; by this I mean that two or three plants (the latter number for preference) may be put in a 12in. or 16in. pot. The compost for such specimens should consist of good turfy loam, not broken up too finely, with just sufficient leaf-soil and sand to keep it porous; to these should be added a fair proportion of bone-meal. Potting should be done very firmly, so as to induce a good short-jointed growth, as strong sappy shoots do not branch as nicely as might be wished the following season. Plants that have bloomed through the winter, and have good hard wood in them are just suitable for the purpose. The shape of the plants having been decided on, a framework must be made of stakes and stiff wire, firmly fixing this to the top of the pots. All flowers should be rigorously removed, and as growth is made, the side shoots should be gradually drawn to the bottom framework, pinching them when necessary to secure sufficient growths to fill up nicely, the central shoots being allowed to grow freely to furnish the apex of the pyramid, though some few of them must be stopped and tied in position, so as to secure a good line from the bottom circle to the apex. Very strong and sappy shoots should be pinched at once unless they are absolutely essential to fill up some gap.

A light, airy house is by far the best to grow these plants in, keeping them turned round, so that all sides of the plants get an equal amount of light. Watering must be carefully done, as an excess produces the soft shoots already referred to, and though these appear to make the plant quickly, they nevertheless are likely to die back once the growth becomes dense. No feeding of any sort should be necessary for some few months after potting, but when the pots are full of roots a little must be given to keep up the vigour of the plants; soot water is useful, as also is Peruvian guano given in small quantities. The growth of such plants should go on right through the summer and autumn, and with good management they should make fair specimens, but if they have not filled up sufficiently they may be kept going very steadily through the winter. I have found it advisable, however, to give them a rest if possible, during the dullest days of winter, by keeping them quite cool and giving only sufficient water to keep them healthy.

The following spring a top-dressing should be given, and a little more warmth allowed to start them into growth again. If they are not needed to bloom early in the season, and they are of good shape and well filled, practically the whole of the shoots may have the tips taken out, as this will naturally induce them to break evenly all over, and on being allowed to flower the plants should be furnished from top to bottom with a good mass of bloom, which, by judicious feeding, will continue for some considerable time either indoors or out.

Such specimens are very suitable for plunging on the lawn or for furnishing large vases on a terrace, and once grown to the desired size they may be kept so with careful management for quite a number of years.

The selection of varieties is largely a matter of personal taste, the whole of the singles being amenable to this system of cultivation, but for usefulness the semi-doubles are far the best, the blooms standing better than the singles. Gustave Emich, King of Denmark, Bertha de Présilly, Olive Schreiner, F. V. Raspail, Improved, Hermoine, Ville de Poitiers, Wonderful, and White King of Denmark are all varieties that can be recommended for the purpose. THOMAS STEVENSON.

Woburn Place Gardens.

## FATALITY AMONGST PLUMS.

In spite of seasons of scarcity and years of glut, with the consequent low prices in the latter case, and the shortage of fruit in the former, the plum growing industry is an important one in this country, and, taking one year with another, there is probably no other fruit crop that pays better. A characteristic about plum culture from a commercial point of view is the extent to which it is localised and dotted about the country in different parts, and on varied classes of soil are areas which in some peculiar way are adapted to plums, and having found this out men have developed the cult of the fruit until it has become an important commercial industry.

### Local Varieties.

It may also be observed that in nearly every one of these plum districts there is a local variety peculiar to the neighbourhood, which originated in a natural way, and needs no working on a stock, for it propagates itself from suckers and grows on its own roots in a natural manner. Speaking generally, in every plum-growing district it is the local variety that predominates, and one reason for this may be because it is so easily propagated, but another is that, taking an average of years, the local plums are the most profitable to growers, because they are produced in quantity, are sold wholesale, and supply the needs of the jam maker.

Even in that favoured fruit-growing county of Kent there are many less profitable varieties grown than the native round purple Bush plum that belongs to Kent, and is rarely seen outside its borders. If you stand in the vale of Evesham by the meandering Avon, in the early spring you may look over sloping hillsides for miles that are white as snow with pearly plum blossoms, and most of these are on trees of the famous Pershore or the native yellow egg plum of Worcestershire. It is not a high-class plum; no one ever argued that in its favour, but it serves a certain purpose, and, all things considered, there is none more profitable in the Evesham valley. The neighbouring county of Gloucester has its native plums, and one of them fills many of the orchards that skirt the banks of the Severn. This plum, which flourishes like the proverbial bay tree in its own particular district, originated in the little village of Blaisdon, from which it takes its name of the Blaisdon Red, and if you ask any grower in the locality he will tell you that it pays better than any other, and a lot of the fruit is consumed in the mining valleys of South Wales. Bristol is the chief commercial centre in the West, and to cater for its requirements in the way of fruit orchards and plantations have been established in its immediate vicinity. Bristol gets its earliest strawberries from the Cheddar Vale in Somerset, but some of the best come from Winterbourne in Gloucester, where plums also flourish, and the most popular local variety bears the name of the Magnum Bonum.

### Silver-leaf Disease.

So much for local plums, but where they will grow other commercial varieties will flourish also, and into the plum districts have been introduced Victorias, Prolifics, Czars, Monarchs, Pond's Seedling, Belle de Louvain, Gages, and other varieties, the names of which are to be found in any nurseryman's catalogue It is not among the native so much as the introduced varieties that plum growers in certain places are perturbed and puzzled in respect of the fatality amongst the trees. As an illustration of what I mean, I walked last autumn through the orchards of a West Country grower, who some years ago planted a few Victorias, and, finding that they did well, he put in more and more. For a time everything was smooth sailing, for the Victorias flourished and cropped heavily, but the trouble began when a tree here and there became affected with silver leaf. At first the grower thought little of it, but put it down to lightning, which is a common thing in the West of England when a fruit tree dies without there being any apparent reason for it. The man knows better now, for, a few at a time, his once profitable Victorias are being killed by silver leaf, while he is helpless, and can only talk of the money that the trees brought in before the deadly disease attacked them. This is only one instance, but hundreds of trees of soft-wooded varieties of which Victoria is the worst, are dying every year, and no remedy is as yet forthcoming. From what I know and have seen, I can say without fear of contradiction that the fatality amongst Victorias in particular owing to silver leaf is becoming very serious, and in some places the very existence of this popular variety is threatened.

### The Shot Borer.

One day last summer, I was in a district where plums are an important source of income to the small holders and farmers, and I observed a large number of trees that had died suddenly, and some of them had crops of withered fruits hanging on the branches. Most of the dead trees were of introduced varieties, but I do not remember the particular names at the moment, and the growers thought it must be lightning or some other mysterious cause. A close examination of the bark, however, proved it to be pitted with tiny holes, and the mystery was solved, for the death of the trees was due to the ravages of the Shot Borer (Xyleborus dispar), which bores inside the bark into the stem, and brings about the death of the tree. From what I could see the growers were taking the trouble very philosophically. They knew that nothing could be done in bad cases, but cut down the trees, and though they had been advised to keep the stems of other specimens coated with limewash as a means of prevention, few of them were doing it, and as another tree went wrong they deplored their ill luck, and enlarged on the uncertainties of fruit culture as a means of livelihood. Though one might blame the growers for not being more ready to adopt preventive methods one cannot help sympathising when losses of this kind occur, because a plum tree does not grow in a week, and after waiting until it comes to a fruiting state, it is disappointing, to say the least of it, to watch it collapse and die, without giving any warning.

### Need for Research.

Lastly there is a fatality about which there is some mystery atached, and in plum growing districts there are several varieties which are apt to die suddenly when the trees have arrived at a state of bearing. There is a reason for it, of course, but it is not an easy matter to locate the cause in some cases, and I have examined more than one dead plum tree that betrayed no evidence of either Shot Borer or other trouble that could be discerned with the naked eye. Perhaps, when we get the centres for research in matters of fruit culture, which, I suppose, are to be established sometime out of the much-talked-about Development Fund, fruit growers will have places where they can send trees that die mysteriously, and have them scientifically examined, with the object of finding out the cause. H.

## LIME.

Much misconception exists as to the action of lime in soils, or its effects on plant growth, and it is clearly evident that many old kitchen garden soils have been sadly neglected as regards suitable applications of this most essential constituent. A great many of these soils are highly charged with humus, due to repeated dressings of garden refuse, farmyard manure, cow and horse manure, and many other forms of organic matter; they become sour and acid in consequence, with the result that plants sicken and die in them. Here is evident necessity for the application of lime to correct such acidity.

Mention of the word "Lime" brings to the minds of most people visions of lime kilns and fine powdery slaked lime. The natural form of lime, however, is calcium carbonate, and it may exist either as old grey chalk, white chalk, or the Buxton and North-East of England carboniferous limestone. The crude limestone when burnt in the kiln undergoes chemical changes which alter its nature and composition completely. From 44 to 46 per cent. of carbonic acid gas is given off in the process, and the original carbonate of lime is changed into caustic lime or quicklime.

Exposure of the latter material to air results in a further change; moisture and carbonic acid will be absorbed, and a substance known as air-slaked lime is produced. This in time reverts to its original state, and gradually assumes the old properties it possessed prior to burning. When chalk is burnt in the kiln, one ton will be found to yield about 11 or 12cwts. of quicklime, and the latter will vary in weight from 70 to 100lbs. per bushel.

Quicklime or caustic lime is of a powerful nature, and some care must be exercised in using it on garden soils, especially where it is merely required for manurial purposes. Tomatoes, for example, are apt to wilt and sicken where an excess of fresh lime has been incorporated with the soil. The plant roots cannot penetrate into the soil freely, and sometimes the magnesia contained in the lime exerts a very injurious action on plant growth. Caustic magnesia is harmful to plants, but carbonate of magnesia is a positive necessity, although many gardeners do not think it worth while to use this material.

In a lecture delivered a year or two ago before the Scottish Horticultural Association, Mr. John Hunter, F.I.C., F.C.S., stated that the great advantage of carbonate of magnesia is that it is capable of being made soluble as required by the micro-organisms in the soil, and the proportion in which to use ground lime and carbonate of magnesia is five or six of the former to one of the latter. The small addition of magnesia was said to increase nitrification twenty-fold. It is this constituent of soils that gives the fine juicy sweetness to cultivated apples, which is so strikingly deficient in the crab apple, and it affects all fruits similarly. Both earlier maturity and finer quality are ascribed to carbonate of magnesia.

Ground lime is often recommended for horticultural use, the rate of usage being something like 7lb. to 30 square yards. In any case, where it is intended to employ this material in the garden, nothing but the best quality lime is worth using, there being a guaranteed percentage of no less than 85 per cent. of carbonate of lime. Moreover, this material should always be sown at the time of digging the ground. Where the land has long been manured with farmyard manure, small applications of lime prove very advantageous in assisting the decay of the vegetable matter. Ground lime is exceptionally useful on soils that are infested with finger-and-toe, eelworm, etc., and commercial growers sometimes use a material that has been prepared from magnesium limestone, because this retains its cleansing powers longer. Such forms of lime are, however, injurious to many soils, except, perhaps, where eelworm infestation is very acute.

It should be noted that lime has a much stronger attraction for carbonic acid than magnesia, so that as long as any caustic lime remains in the soil the caustic magnesia cannot be converted into carbonate of magnesia—in which form it is so essential to plants. As long as it remains in a caustic or calcined state, it is a positive source of danger to plants, especially certain vegetables, and rich soils highly charged with humus or organic matter appear to be the only suitable mediums wherein this caustic magnesia cannot work any ill effects. This is because the organic matter supplies the necessary carbonic acid to enable it to change into a carbonate. On these rich soils and on peaty soils also, ground lime prepared from the magnesium limestones may be used with safety and advantage, provided proper quantities are given. The carboniferous limestones, however, yield the best quality ground lime for horticultural purposes generally, and some of the best firms advertise a grade of lime containing no less than 95 per cent. of pure lime (CaO).

The neglect of liming inevitably leads to trouble, and it is quite wrong to suppose that superphosphate, sulphate of lime (gypsum), sulphate of iron, sulphate of ammonia, and other acid manures are capable of warding off trouble. The question is, simply, what becomes of the carbonate of lime in the soil? Acid manures will not conserve it, but merely convert it into sulphate of lime. Natural causes, such as rain, for example, help to work it out of the soil; in fact, it has been stated that in a normal rainfall the land will lose naturally from 700 to 1,000lbs. of lime per acre in a single season.

This is what becomes of the carbonate of lime in the soil. On the other hand, if this soil constituent is lacking—as it always is in sour acid soils—there will be no "base" such as will enable the phosphoric acid and the potash present in the soil, and in the sulphatic manures that may be applied to that soil, to be rendered available as plant food. A deficiency of lime is, indeed, one of the first defects that a gardener should remedy.

Old Basing. J. C. Newsham.

---

**Impatiens Olivieri.**—This is one of the largest of the warm-house balsams, and, what is more, one of the most continuous flowering of them all. It may be grown in a large pot or tub, and, given space for its development, will form a specimen six feet high or thereabouts, and nearly as much through. The flowers, with which the plant is freely sprinkled throughout the greater part of the year, are large, and of a pleasing shade of pale mauve.—W. T.

[Photo: W. J. Vasey.

THE CLOSE, BURCOT, THE RESIDENCE OF LADY GLYN.
View from the River Thames, showing the large arches of Dorothy Perkins rose.

## THE CLOSE, BURCOT.

Burcot-on-Thames is a modest little village nestling close to Dorchester, on the Oxfordshire side of the river, about halfway between Wallingford and Abingdon. Like many another riverside place from Kingston to Oxford, it contains some delightful gardens, gardens that are a continual delight to the owner, and a never-ending source of pleasure to those who love our chief river and know something of the beautiful scenes through which it passes and helps to make.

At Burcot Lady Glyn has a residence named The Close, set amid charming gardens that slope gently down to the water's edge. The very waterside is overhung with rambling roses, and roses are planted freely all over the garden, and grow so well that their beauty and fragrance delight many others besides her ladyship. Viewed from the river, the gardens are particularly pleasing as there is sufficient expanse of well-kept lawn to form a good setting to the beds, arches, and arbours of roses, and the large groupings of the finer varieties of herbaceous phloxes and similar showy hardy flowers, in an extensive herbaceous border.

In this view the rosery is a conspicuous feature. It is of circular design, and access is obtained through four large arches, each completely covered by the beautiful Dorothy Perkins rose. Between the arches are standard roses in great variety, as well as beds of dwarf hybrid tea and other useful sorts. Nearer the house and skirting the lawn is a grass path, which runs between borders of roses where tall pillars and arches of Blush Rambler, Crimson Rambler, and other free-growing and abundant blooming roses are perfectly at home, with groups of the choicest delphiniums between them. Farther on, where the orchard comes up to the flower garden roses are again pressed into service, a long and high wirework screen, affording support to numerous rambling varieties, and so forming a dividing line of great elegance and beauty between these two departments.

Besides the rosery and the rose walks and beds, there are roses in the kitchen garden, these furnishing a light pergola-like arrangement through which a very pretty view of the lower garden and the river is obtained. Old-fashioned flowers are a feature at The Close, but in all cases the finest varieties are planted. The numerous side walks and their attendant flower borders serve to show these to advantage. Some of these walks are depicted in one of the accompanying illustrations. Roses are again very much in evidence, while delphiniums and pinks are other flowers boldly and freely cultivated, so that fragrance as well as beauty is a feature of these gardens, wherein high cultivation and originality of design are noteworthy.

**Fancy Pelargoniums.** — This pretty small-flowering race of pelargoniums seems to have almost dropped out of cultivation, yet time was when both as small plants and large specimens they were met with in most gardens. The reason for their disappearance is, I think, to be found in the fact that they are more particular in their requirements than the decorative kinds.—W.

## THE SPECIES OF BRYANTHUS.

The genus Bryanthus belongs to the order Ericaceæ, its closest allies being the Alpine Azalea (Loiseleuria procumbens) and the St. Dabeoc's Heath (Dabæcia polifolia). Some considerable confusion has existed concerning the proper generic name for most of the species, and one or all have been alternately included under Bryanthus, Menziesia, Phyllodoce, Andromeda, and Erica. In this country it is usual to follow Asa Gray's descriptions in "Proceedings of the American Academy," vii. (1868), pp. 367-368, and call them all Bryanthus, though in some countries there is still a disposition to split the genus. The reason for this is probably to some extent due to there being two distinct types of flowers amongst the species, one group having urn-shaped blooms, and the other campanulate. All are strictly alpine plants, for they are found in the mountainous regions of North America, Siberia, and Europe, one species extending into Scotland. Probably on this account they are sometimes found difficult to grow for any length of time in the warmer parts of the country, although three or four of the species thrive in many places, and are particularly happy in those parts of the North where peat-loving shrubs thrive.

As is the case with several other small genera of the heath family, the various species are of a particularly showy character when in flower, and, being evergreen, they are useful for carpeting ground in a similar manner to dwarf-growing heaths. For rockery planting they are peculiarly adapted, and patches of the several species might be introduced with advantage where they do not already exist. They are in perfect unison with the heaths, insomuch as the superior qualities of young plants over old are concerned, for comparatively young plants always look better and flower more profusely than old ones. A stock of young plants may be kept up by rooting cuttings of half-ripe shoots, an inch and a-half long in August. These ought to be inserted in a similar manner to erica cuttings, in pots of sandy peat, made very firm. They should then be stood in a close frame until rooted. A cool corner, shaded from bright sun, is preferable to a hot position for all the species. The following species have been described:

### B. Breweri.

This is a native of the Sierras of California, where it grows up to an altitude of 10,000ft. At its strongest its branches attain a height of 12 inches, although we are familiar with it about half that height. The dark green, linear leaves are sometimes half an inch long, often less, and they have revolute margins and a felty under-surface. During June the rose or reddish-purple flowers appear in terminal heads. In this case they are campanulate, and each one is about half an inch across. It may be obtained in this country, and is a very choice plant.

### B. empetriformis.

B. empetriformis is widely distributed in North America, for it is found from North California in the South to Vancouver Island and the Rocky Mountains on the adjacent mainland in the North. Howell, in his "Flora of North-West America," p. 420, says that it sometimes grows from 1ft. to

2ft. high, and forms clumps 1ft. to 3ft. in diameter. Here it is found from 6in. to 9in. high. Its leaves are usually below half an inch in length, and they are of the familiar linear-oblong outline. The campanulate flowers are borne 10 or 12 together in terminal heads, the colour being a pleasing rose or pale red.

### B. glanduliflorus.

It is doubtful whether this species is in cultivation in this country. In America it occurs from Oregon to Alaska, Howell describing it as growing on rocky banks and cliffs near perpetual snow. The branches are rather stiff, 3 to 12 inches high, bearing small leaves scarcely half an inch long. The young wood, flower stalks, and calyx lobes are intensely hairy, by which means it is easily distinguished from other kinds. Its urn-shaped flowers differ in colour from those of other species, for they are of a yellowish shade.

[Photo: W. J. Vasey.

ROSES, DELPHINIUMS, AND PINKS AT THE CLOSE, BURCOT.

### B. Gwelini.

This was originally described by G. Don, in the "Edinburgh New Philosophical Journal," xvii. (July, 1834), p. 160. Herbarium specimens show it as a tiny prostrate-growing, heath-like shrub with leaves scarcely more than an eighth of an inch long, with ciliated margins, and bearing short terminal racemes of small red flowers. Loudon refers to it as being found covering extensive areas with a close mass, after the manner of Wild Thyme. It is a native of Kamtschatka and the adjacent islands, and of Siberia. It is doubtful whether it is in cultivation in this country.

### B. taxifolius.

This species enjoys a very wide distribution, for it is met with in North America, Siberia, North China, Japan, North Europe, and has been collected in Perthshire in Scotland. It forms a dwarf shrub, 4 to 6 inches high, with small linear-oblong leaves one quarter to a third of an inch long, and urn-shaped flowers borne several together in terminal heads. An illustration of the plant is given in Brown and Britton's "Flora of the Northern States and Canada," p. 565, under the name of Phyllodoce cœrulea. From this it might be inferred that the flowers are blue. This, however, is not usually the case, for, although forms with bluish flowers are sometimes met with, more familiar shades are rosy purple and reddish-purple. The above-mentioned work refers to its distribution upon the summits of the higher mountains of Maine and New Hampshire, Mount Albert, Quebec, Labrador, through Arctic America to Alaska, North Alpine Europe, and Asia. It is one of the most easily obtained species.

### B. aleuticus.

This is a little-known American species with small serrate leaves up to half an inch long, and small rosy flowers, resembling, but smaller than, those of B. taxifolia.

### B. erectus.

This pretty little plant is a garden hybrid between Bryanthus empetriformis and Rhodothamnus Chamaecistus. An early description of it appeared in Lindley and Paxton's "Flower Garden," i, p. 97, Fig. 19. According to this description, the plant was originally obtained by Mr. Cunningham, of Comley Bank Nursery, Edinburgh. Although one parent is there given as B. taxifolius, a doubt is cast as to its being correct, and the plant now considered to be the parent is suggested. Growing from six to nine inches high, it bears flattened leaves nearly an inch long, and rosy-pink flowers upwards of half an inch in diameter. Reference is made to its dislike of bright sun and a dry atmosphere, the north side of a wall or a cool shady frame being recommended as the most suitable position for its well-being. After the lapse of 60 years no better advice can be advanced for the successful cultivation of this charming little shrub. There does not appear to be any large stock of plants in the country, for propagation is slow, layering in this case being found to be more satisfactory than cuttings.

W. Dallimore.

**A Good Dry-weather Vegetable.**—The note on the New Zealand spinach (Tetragonia expansa), page 174, should serve to direct attention to this most valuable vegetable. In my suburban garden, which slopes away sharply to the south, practically all vegetables were burnt up during the intense heat and drought of last summer. This New Zealand spinach proved quite the exception, and, though the space allotted to it was limited, we were able to pick a good dish therefrom two or three times a week during the entire summer. As the neighbouring gardens yielded no vegetables of any account, the resolution to grow New Zealand spinach another year was almost universal owing to my success in the matter. Seeds were sown in shallow drills towards the end of April, and the plants thinned out well, for, as stated by your correspondent "C.," it requires, from its trailing habit, plenty of room to develop. During the long-continued drought the hoe was freely used, and the plants were occasionally given a soaking of water. In a wet season, owing to other vegetables being available, the New Zealand spinach does not assert itself.—S. W.

# DECORATIVE, PÆONY-FLOWERED, AND COLLARETTE DAHLIAS.

The following paper was contributed by Mr. J. B. Riding to the Conference recently held by the National Dahlia Society:

The subject of my paper may not seem a particularly entertaining one, dealing as it does with all the nondescript sections, as apart from the recognised show, cactus, pompon, and singles. I say "recognised sections" because they have always been acknowledged by the National Dahlia Society and the Royal Horticultural Society, while the subjects of my paper have only just began to assert their rights to be regarded as recognised flowers, for until last autumn neither of these societies had granted any awards to the collarette or giant decorative varieties, but for some unknown reason about three sorts of the collarette type and one giant decorative sort gained honours in 1911, I think much to the surprise of the committees themselves. At any rate, we have now placed in the thin edge of the wedge, and it will require very few blows to send it home. Up to the present neither of the leading societies have stooped to grant an award to the pæony-flowered varieties, but you may rest assured they will so honour them in the near future. I do not like to prophesy, but I can quote you that celebrated little sentence, "Wait and see."

I can quite understand the aversion to these types from some of our growers, amateur and professional alike, especially those who regard the dahlia solely from an exhibitor's point of view. I remember the day when the popular cactus varieties were reviled in the same way, but we have only to go back about thirty years to the coming of Dahlia Juarezi, and then compare it with the cactus dahlia of to-day. It is quite the same with the types I have to deal with: there is already plenty of evidence that they will be improved upon during the next few years. So I think we can safely ask the exhibitors to bear patiently with us until they ascend to their particular standard. Not that I think for a moment, Mr. Chairman, the exhibiting world should rule the roost, for I maintain that for every exhibition dahlia planted in this country there are at the lowest estimate a thousand others that are planted out in our gardens solely as decorative plants, to produce a fine effect in the autumn months, and the plant to surpass the dahlia for this purpose is still unknown. What have we to compare with their brilliancy in colouring during September and October? Nothing whatever. So I maintain, although the dahlias that I am about to deal with may not come up to the exhibition standard, they do, and will, assert themselves in our gardens.

## Decorative Dahlias.

Taking the sections in their order of introduction to this country, we come to that nondescript class known as decorative dahlias. Well, what is a decorative dahlia? I take it to be a section that cannot be placed in any of our recognised divisions at the present day. As far as I can remember they followed closely on the heels of D. Jaurezi, and were first of all sent out as cactus varieties. I am now alluding to such old varieties as Constance, Henry Patrick, Harry Freeman, Mrs. George Reid, Maid of Kent, Honoria, etc. As the cactus improved in form, these round-petalled sorts were cast aside, and only used for decorative purposes, and, although so old now, they are still grown with the same object in view, but their progress was very slow for some years, due simply to the fact that, when they appeared in the seed beds, they were ruthlessly cast on the rubbish heap. How many garden gems have been lost in this way it would be difficult to estimate, but no doubt many hundreds. It is only within the past ten years that dahlia growers have given them any attention, but I am glad to say we are now on the right track and have some really good additions to this class, some of the most prominent at the present time being Delice, clear pink; Kaiserin Augusta Victoria, Princess Juliana, Attraction, Loveliness, Ch. Ducrot, Gintry, Mad. Keller, Source de Feu, and Mad. A. Lumiere.

We now come to another section or subsection, generally known as Giant decorative varieties. These were of Continental origin, and have become more or less popular according to people's ideas. From my point of view they are valuable for garden decoration, or producing fine colour effects in our borders, in the front of shrubberies, rhododendron beds, and similar places, but they are not so useful for room decoration or cut flower purposes, except in certain cases, where the space or receptacle is unusually large. They are in some instances as large as sunflowers, and the effect they produce is quite gorgeous. They are not recognised as exhibition flowers, therefore it is rare that we see them at an ordinary flower show. For creating a huge mass of colour they are unsurpassed. The best selection I can give are Souv. de G. Douzon, F. Grinstead, Le Grand Maniton, Le Colosse, Yellow Colosse, Ph. Charmet, Glory of Paris Souv. de M. Silvent, Tener Alvarez, Le Triomphe, La France, Mons. Gondcheaux, Mad. A. Nonin, Le Fils du Ciel, Jeane Charmet, Grand Duc Alexis.

## Pæony-flowered Dahlias.

The pæony-flowered section has come in for more abuse from the British horticulturist than any other modern type. They have been described in the press by various writers as "ugly mongrels," "bunches of coloured rags," and other similar and uncomplimentary phrases. They came from Holland in the first place as something new, and so they were, from a certain standpoint, but doubtless you are all aware that these or similar kinds were known to our own raisers, just in the same way as they were to our Dutch neighbours, but they were too busy raising seedlings after their own hearts to think of making them into a collection and placing them before the public. I am under the impression that I was growing one of the first collections in this country, at any rate before Mr. John Green had the happy inspiration of naming them pæony-flowered dahlias. This, I think, was in 1904. The collection came to me privately for trial, and I well remember my judgment on them, which was as follows—"very pretty in the garden, but would not take on in this country; altogether much too rough."

But, luckily, I did not destroy the stock, and after events proved that I had made a mistake, for the pæony dahlia has come to stay, not, perhaps, in its original form, for one can see clearly year after year most striking improvements not only in the colours but in the form of the flowers, and, greatest of all, the advance that has been made in the habit of the newer plants, with their sturdy growth and fine stiff stems. I am looking forward to seeing great development in the near future. In passing, one must acknowledge the valuable help given by the superintendents of our public parks, by educating the general public as to the uses of this particular section, and those of you who have seen the diplays in the London parks will agree with me when I say these have done far more to popularise this flower than any trade displays ever could do in so short a period.

I should like everyone to regard the pæony dahlia as a garden flower, and not judge it from an exhibitor's standpoint, and I do not think that staging large disbudded flowers will help it forward in the least degree, though I am prepared to admit that where they have to be displayed in large vases or bamboo stands the surplus buds and lateral growth have to be rubbed out to obtain a long stem, but for ordinary floral work this is quite unnecessary. I do not advocate producing huge flowers either for garden or room decoration, for by so doing the stem will not remain rigid without artificial support. It has been said that we have no guide or standard to work up to. This may be true, but if we take the Geisha or Liberty as an ideal pæony flower, we cannot go far wrong. No doubt in the next few years we shall be able to discard all those sorts that do not carry their flowers erect and well above the foliage.

Varieties are now so numerous that it is impossible to mention all that I think are good, so I shall confine myself to one dozen varieties: Bertha von Suttner, Nora Lindsay, The Geisha, Holman Hunt, Liberty, South Pole, Mrs. G. Gordon, Mrs. J. B. Riding, Titian, Codsall Gem, Merveille, and Ruskin.

## Collarette Dahlias.

We now come to the collarette type, a section that has been very much to the front during the past two seasons, and no doubt the coming season will see it very much in evidence. It is not a new type, as many people suppose, for it has been grown in this country at least eleven years to my knowledge, but, like a good many other plants, its worth was not recognised at the time—I believe because the first variety, President Viger, was not very free flowering.

I have it on the authority of Mon. Maurice Rivoire that the collarette dahlia appeared in the year 1889 in the municipal gardens of the Park Perle de la Tete d'Or, at Lyons. The first two varieties appeared as sports on different plants, but he does not name the varieties that so sported, but he writes me, "The fact of the simultaneous appearance upon two different plants of a character so abnormal is truly extraordinary." The varieties having been obtained in an official establishment could not be sold therefrom. So Messrs. Rivoire and Son acquired them and placed them in commerce in 1901. These varieties or sports were President Viger and Joseph Joujou. Since that period this firm has introduced many excellent varieties, and Mons. Rivoire says he is persuaded that this section has not said its last word, and that it yet holds some surprises in store. He lays great stress on the fact that last year the collarette dahlias were remarkable for their continuous flowering when all other kinds of dahlias had almost ceased to flower owing to the extreme heat. It seems to me that while our French and German neighbours have been steadily improving this section, we in this country failed to recognise their merits at all. True, a few of us added some fresh sorts, but in a very desultory fashion—why I do not know. I suppose because they were not fashionable, and consequently there was very little demand for them.

It was in the autumn of 1909 that I decided to form a large collection, so I purchased almost every variety I could lay hands on both in France and Germany, and exhibited them in London and elsewhere the following autumn, staging them as decorative flowers and not show specimens. As you know, they were favourably commented on in the whole of the horticultural Press. The trade dahlia specialists also began to see something in the type, with the result that last year several of the leading dahlia growers made features of them at the autumn shows, with the result that the collarette as a type has come to stay. I do not claim that they will oust any other section, neither is it desirable they should do so; but I do claim that they are worthy of a place in our gardens. The majority are very free flowering, while the plants have a good sturdy habit, and throw their flowers well above the foliage, while in a cut state in vases they appear to last longer than the ordinary single form.

We have two distinct types, the round flower with slightly recurving florets, which are all of French origin; and the pointed type or star-like form, which hails from the Fatherland. Then, again, we have distinct "collars," the close fitting one as seen in the variety Maurice Rivoire, and the large loose one that is associated with Baronne Rothschild. No doubt we shall soon see improvement both in the range of colours and form. At present I favour the round-flowered varieties, because they have greater substance, and travel best. I am hoping that our raisers will not try to increase them in size, for should this occur there will be a danger of losing the stiff erect stem. I mention this because I have noticed that some of the latest varieties from the Continent are larger in size, but the stems are not so good, and when too large they lose their decorative value. This can be seen in the varieties Crown Princess Charlotte and Johannesfeur. Neither do I think disbudding should be practised for exhibition purposes, for it has a tendency to deceive the public, which does not pay in the long run.

I only propose to give a short list of the most distinct varieties at the present time, feeling, as I do, that in the next few years such a list will be quite out of date: Maurice Rivoire, Souvenir de Chabanne, Albert Maumene, Henri Farman, Baronne Rothschild, Gallia, Mad. R. Crozy, Exposition de Lyon, Grand Papa Charmet, Souvenir de Bernadeau, Mad. F. G. Bruant, and Mad. Perrier, of the round-flowered type; Diamant, Diadem, Burgomaster Siefurth, Betty, Leuchtfeur, Mad. L. Viger, Meteor, and Rhinekrone, of the starry type.

## LACHENALIAS IN BASKETS.

When Cape Cowslips are well grown in baskets, large or small, they show off to great advantage, much more so than when in pots, as the habit of growth, flowers and foliage is naturally of a pendant character. In this way they are easily managed, occupying space that would not be otherwise utilised, and giving the opportunity to grow other subjects on shelves and stages at a crowded period of the year. For instance, the roof of a vinery or peach house will suffice for a long time during growth, and when in flower there is no greater ornament in the conservatory than a well-grown basket of lachenalias, especially of L. tricolor or L. pendula. The foliage, also, is attractive in colour, and is of the right type for covering the baskets and forming a setting for the flower spikes. The rich golden-amber blossoms of L. Nelsoni, with its vigorous growth, make a lovely combination in the conservatory where much greenery is usually employed.

The making of baskets, wire or rustic, is a simple matter; the size should be according to the number of bulbs in hand and position for the plants when in flower. For a bold display of the commoner forms as L. pendula and L. tricolor, a basket not less than a foot in diameter will suffice. Early in August is the time to make up the baskets; suspend them from a beam in the potting shed, line the inside with flakes of green moss, place the bulbs inside the basket with the growing point outwards in moss, allowing at least two inches from bulb to bulb. Fill in the bottom of the basket with a suitable compost of loam, leaf-mould, sand, and half-decomposed cow manure. By the time the basket is completed with bulbs set all round and above, it will contain a good mass of soil, which will maintain the bulbs in a vigorous state for at least two seasons, especially if during the second year liquid manure is given. Cool treatment is best at all times for lachenalias.

E. M.

**Calceolaria deflexa.**—This, which is also known as Calceolaria fuchsiæfolia, is valuable for its winter-flowering qualities. It forms a neat bushy specimen clothed with fuchsia-like leaves of a deep green colour, and the rich golden-yellow blossoms are borne from autumn till the spring. Apart from its own intrinsic merit, it is also worthy of note, as one of the reputed parents, Calceolaria Javoni being the other, of that popular hybrid Calceolaria Burbidgei.—W. T.

## BORONIAS.

Among the limited number of hard-wooded plants that are popular nowadays the boronias must be included, or at least some of the members of the genus. They are all natives of Australia, and all form freely-branched, free-flowering shrubs. These features stand them in good stead under cultivation, for it is possible to have neat bushy little specimens laden with flowers in pots five to six inches in diameter.

The species most generally cultivated are three in number—namely, Boronia elatior, B. heterophylla, and B. megastigma. The last-named is the first to bloom, as the earliest flowers may often be had by Christmas, and a succession is kept up till the end of March or thereabouts. If pinched during its earlier stages, Boronia megastigma forms a freely-branched little bush, clothed with very narrow leaves. While the principal shoots are more or less ascending, the minor ones are disposed in a somewhat horizontal manner. From the undersides of these the flowers depend. They are small, bell-shaped, and in colour chocolate on the exterior, and yellowish within. A well-flowered specimen is certainly very pretty, but cannot by any stretch of imagination be called showy, yet the blossoms are so deliciously fragrant as to compensate for any shortcomings, and for this reason alone this boronia occupies a foremost position among popular hard-wooded plants. The perfume is very suggestive of the violet, and is so penetrating that a single specimen will make itself manifest throughout a good sized structure. At the same time, however, numerous the plants, the scent is not at all overpowering. Boronia megastigma was introduced from South-west Australia about forty years ago. A certain amount of individual variation occurs among the members of this species, for in some the flowers are deeper tinted than in others. The lighter-coloured flowers rather surpass the darker ones in fragrance. In the spring of 1903 a form with yellowish blossoms was, under the name of Boronia megastigma aurea, given an Award of Merit by the Royal Horticultural Society, but it does not appear to have made its way into cultivation.

Boronia heterophylla is a far showier plant than the preceding, while it is also later in blooming, being, as a rule, at its best in March and April. It is of comparatively recent introduction, for though known to botanists for many years, it was first grown in this country from seeds sent to Kew by the late Miss North, the artist, in 1881. The resulting plants flowered in 1885, and this boronia was distributed by Messrs. J. Veitch and Sons, of Chelsea, a couple of years later. The flowers with which the main shoots are closely packed are globular in shape, and of a bright carmine colour. When in good condition a specimen of this boronia is very showy. The leaves vary a good deal in shape, hence the specific name of heterophylla, but, as a rule, they are slender and narrow. The blossoms of this species do not possess the fragrance of B. megastigma, but the leaves, when handled, give off a very unpleasant odour.

Boronia elatior is a more vigorous growing plant than either of the preceding, and one that forms an admirable succession to Boronia heterophylla. Of rather upright and free growth, B. elatior is more densely furnished with foliage than the others, and the leaves being pinnate and bright green in colour, it forms, irrespective of flowers, a decidedly ornamental shrub. The blossoms, which are of a drooping urn shape, are bright rosy-red in colour.

Other species include Boronia serrulata, an old-time favourite, which used to be considered a good test of the cultivator's skill. It is a plant of rather spreading habit, with curious trapeziform leaves, and rich rose-coloured flowers. Boronia alata, B. Drummondi, B. pinnata, B. polygalæfolia, and B. tetrandra may also be mentioned, but they are very seldom seen.

Boronias require much the same treatment as epacris, heaths, and other hard-wooded subjects; that is to say, the plants should be shortened back into shape after flowering, and then encouraged to make fresh growth by maintaining a genial atmosphere. Should the plants need repotting the best time to carry this out will be when the young shoots are about half an inch long. The soil should consist of fibrous peat and sand. Especial care must be taken to have the pots clean and effectually drained, while it is most essential that the new soil be pressed down very firmly, and that the old ball of earth is not buried deeper than it was before.

W. T.

## PRUNING ROSES.

After so many annual notes upon this subject, there can be little to add, and the following is simply a reminder rather than an elaborate instruction. Pruning is certainly one of the most important things in rose culture, and so there is no need to excuse repetitions of reference to it.

As I write, we are having wet weather after severe frost, which immediately followed an exceptionally mild winter, when many roses had not ceased growing, the consequence being a much greater quantity of soft, unripened wood than usual. So much so that the present frosts cannot fail to have punished them severely. There has also been early or continuous growth, and my chief object in noting this precocity is to warn readers against the temptation to prune earlier than usual. This should be resisted, and is among those who give due consideration to the danger of late spring frosts, with which we are visited upon so many occasions.

Early pruning means early growth from the buds left on the plant. All have noticed how persistently the top buds of any rose growth break first; and, if we make it impossible for this to be from any but the small number left after pruning, it stands to reason we shall be getting the growth too forward for average safety. Left unpruned, the top growth is really a great advantage, as it keeps the lower eyes dormant much longer, simply because those above have used the early sap. This is clearly seen among pegged-down roses; for, unless the sap is stayed from rushing to the top at once, we have a large number of dormant eyes below, which, if secured in a horizontal position, would break and produce by far the best flowers.

Nor would I be much inclined to prune earlier because of a mild March. Quite the end of the month, and the first week in April, have proved the most serviceable times with me, and no illusive genial weather will tempt me to prune earlier. We notice how very rapidly growth unchecked overtakes that which has been checked, and we obtain the former by later pruning than many practise.

How to prune is a worn-out subject, but I would like to say a word against leaving crowded growths, even among the long rods or trails of the weeping and rambling varieties. A smaller number, and these the best, will often give better results. It is also most essential that all wood upon this class of rose should be well matured.

Rosarian.

## GARDENS OF GORGEOUS COLOUR.

Colour is a greater factor in the creation of joy than is generally recognised; as years pass scientists tell us more and more of the influence of bright hues upon mental and even physical health, so the gardener who uses a bold palette when painting his pleasure grounds for the year may congratulate himself upon adding to the sum total of contentment and sanity. It is so easy to create a magnificent effect, a display that will arouse public enthusiasm and live in memory, simply by massing gorgeous colours. There need be nothing vulgar or garish, no inharmonious contrasts, no crudeness to jar upon the most sensitive taste, but the heart may be lightened, the eye charmed, the very soul upraised by the outspread perfectness of vivid tints.

One essential is to have a sufficiency of each hue employed. To blend many, in small patches, is successful only as yielding a curious effect, a kind of kaleidoscopic beauty, or one reminiscent of some rich stained-glass window through which the sun shines. This is a legitimate interest to create as a feature in a large garden, not as a method of planting the whole one, whether large or small. For example, if a six-foot wide border runs for a half-acre length against a gray fence, or old wall, there will be a grand show gained by employing not more than four colours in it. The back might be all massed with the royal blue of delphiniums, anchusas, cornflowers, and open glades of Phacelia campanularia and larkspurs of the new perennial dwarf type; in the next two-foot breadth could be varying groups of lemon, gold, and carmine, represented by chrysanthemums, sunflowers, and Coreopsis lanceolata and grandiflora, phloxes, hybrid pyrethrums, and godetias, while the foreground's two feet could show rose-pink and azure.

A glorious result can be gained by the unusual blend of violet, carmine, royal blue, and rose; if arranged in this order the harmony from a slight distance will be perfect. As a further extension of foreground mauve may appear, culminating in azure blue. When carmine and royal blue are mingled on a palette, or pale pink and azure, violet and mauve are produced respectively, hence the sympathy that all these gay colours possess, and their readiness to live happily together, when suitably situated.

For a still more striking border or bed royal blue, orange, amber, and scarlet can be used; again, in this order they are a treat for the artist's eye, or equally so if the amber comes next the blue. If the scarlet were in that position the effect could not fail to be crudely unpleasant. Pure lemon-gold is a perfect associate for blues, whether indigo, royal, or azure. By using it between these blues all may be safely employed near together. The clear yellow, of a lemon, not an amber shade, is offered by many chrysanthemums and sunflowers, the viola Ardwell Gem, the Iceland poppy, and the yellow carnation.

A gardener was once called upon to complete with scarlet zinnias and verbenas a bed in which carmine phloxes already reigned. For a while he felt in despair of ever achieving anything but a disastrously vulgar show, until the happy idea occurred to him of separating the antagonistic hues by a line of maroon, then one of orange. These last hues suit each other; the former subdues the garish shade of carmine, the latter softens down the scarlet into which it blends. The annual known as Bidens atrosanguinea, or the Black Dahlia, and the darkest scabious were the maroon flowers used; the orange was the African marigold, a line of French dwarf ones in front.

Whole borders of blue violet and orange, of red purple and amber, of deep rose and azure blue can be recommended as brilliant in the extreme. Vermilion is enhanced by the presence of masses of snow-white; magenta is suited by a carpet of cream-coloured flowers. M. H.

## APPLE GALLOWAY PIPPIN.

Many of the old-world apples have, with the progress in horticulture, and the introduction of improved varieties, almost disappeared from cultivation, and their one-time high position is now untenable, yet there were some that the very best of the newcomers could not easily displace. One of these is the variety named Galloway Pippin, which for several centuries has been extensively cultivated throughout the southern parts of Scotland. After many years' experience, during which it has been pitted against apples of great renown, I am inclined to think that, although it may be nearly equalled by some, yet for long keeping, and good qualities both as a culinary and dessert fruit, it is unsurpassed by any.

Strange as it may seem, after such a record, it must be admitted that at present fewer fruiting trees exist in its native province than has been the case since its excellence and adaptability to the climate and district were first recognised. How to account for this apparent neglect on the part of cultivators is difficult to explain, except that, having obtained possession of a healthy and fruitful tree, no thought was given to the raising of young stock to replace it when age and decrepitude slowly but surely advanced. In recent years some improvement in this respect has become more manifest, and young trees have been sought for and planted; but, as a rule, it is old and almost worn-out specimens that are encountered.

Locally, but more especially by persons well advanced in years, the variety is known as "Croft-an-righ"—[Dr. Hogg refers to it as "Croft-en-Reich."—Ed.]—derived, no doubt, from its early association with an old monastery that, together with its orchard, or croft, existed in close proximity to the county town of Wigtown, and upon the shores of the bay of that name. Whether it originated here as a seedling, or was introduced from some distant source by means of the monks, who were well versed in pomology, I cannot say.

Scarcely a trace of masonry of the old monastery marks the spot where this haven of rest formerly stood; and the glebe attached, wherein a few rugged fruit trees stood as late as the middle of the last century, is now a grass field, though its position can still be defined by the more luxuriant growth that tells of the higher fertility of the soil compared with other parts of the field. In mediæval ages this was a place of considerable importance, and was used as a halting place by Scottish kings and their numerous retinue when on pilgrimage from the Scottish capital to the Shrine of Saint Ninian (Whithorn Priory), a few miles distant.

To return, however, to the subject, it may be stated that the tree is a strong grower, and has a spreading habit which renders it very suitable for the formation of a stately standard. For such the crab stock should be used, but for garden purposes the paradise stock answers well, and, of course, earlier productiveness is thereby engendered. The fruit is large, deep yellow in colour after being stored for a few weeks, and is then of excellent quality for any purpose. As a culinary fruit it may be used from October onwards, but here it is seldom wanted until midwinter, except, perhaps, in seasons of scarcity, when, owing to paucity of other varieties, it is requisitioned earlier. From January until May it holds the place of honour both for cooking and dessert purposes; and, although connoisseurs might possibly object to its classification as a dessert fruit proper, the great majority of consumers have no compunction in the matter, and many prefer a firm, juicy, and highly-flavoured fruit to one that is quite the reverse of this.

The variety is not precocious in fertility, especially when grafted upon the crab stock, but this may to some extent be overcome by using the broad-leaved paradise stock instead; but those who can wait patiently for a few years might with advantage choose the former, where space for full branch development can be allowed. Several of our best and most fruitful trees here have, to all appearance, withstood storm and stress for a century—perhaps longer than this—and are yet pictures of health and vigour. **James Day.**

Galloway House Gardens, Garlieston.

## OUTDOOR PEACHES.

I have read with pleasure the recent article on the above subject by Mr. Alger Petts. I think he is doing good work by noting so clearly the requirements of peaches in the open. Few people will deny the fact that peach trees out of doors are most wretchedly managed in many instances. When we see the manner in which so many trees are trained, there is small wonder that peach culture on walls in the open has fallen into bad odour.

There are two points omitted in Mr. Alger Petts' article that I would like to draw attention to, points that most likely escaped his notice at the time. First, the management of the roots of the trees. Very often the peach trees are growing in a border with a southern aspect and the regular occupants of the border may be herbaceous flowers or vegetables. In any case, the crop, especially if the latter, will receive considerable manurial assistance, and if the peach roots are allowed to ramble at will in such surroundings the trees will make gross growth. The borders in front of the peach trees should be trenched every alternate year to within 4ft. of the wall. This will result in a quantity of fibrous roots being formed on the strong, and what would be otherwise fibreless, roots. Such a precaution as this will save the trees from gross growth, and its attendant consequences.

The second point I wish to note is that of supplying peaches with a sufficiency of water after the fruits have been gathered. This is a detail much more important to the future welfare of the trees than many persons think. Take, for example, such a summer and autumn as we experienced last year, and consider how a wall prevents the trees securing as much moisture at the roots as they would if growing in the open, and also think of the amount of moisture the bricks absorb from the soil. How can the roots perform their natural function of storing the required nutriment in the trees if they are denied a proper supply of water? This is a detail too often forgotten after the fruit has been removed from the trees until the time again comes round to expect another crop. E. M.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

THE COOL HOUSES.—There are plants of odontoglossums, especially O. crispum and its hybrids, which for various reasons were not repotted in the autumn. These are now starting into growth, and any repotting they may require should be carried out when the young growths are two or three inches in length, and are seen to be pushing forth new roots. The sooner they are potted the better, as they will then become established in the new compost before the hot weather arrives. Undoubtedly, in many places, the abnormal heat of last summer was very trying to these orchids; but owing to the favourable winter we have just passed through, they should by the present ime have recuperated and be none the worse. Healthy plants will need but little disturbance, merely turning them out of their pots, cutting away any leafless and exhausted pseudobulbs, and picking out as much of the old compost as is practicable, in order that the plant may be placed in about the same sized pot as it formerly occupied. The compost in which I find these plants succeed is as follows: Equal portions of peat, polypodium, osmunda fibre, and sphagnum moss, with a fair sprinkling of half-decayed oak leaves, which should have been previously rubbed through a half-inch sieve.

POTTING.—One often hears many excuses put forward for the failure of some one or more plants, and in most cases the compost is blamed; but I am firmly convinced that the cause does not lay there at all, but is generally improper watering. All repotted plants should be placed together in a house, and be given extra shade. The newly-potted plants must be watered with care, and only sufficient must be given them to keep the moss alove until the roots are seen to be pushing through the new material. In gardens where only a few orchids are grown, to repot a plant is to end its days, and in most cases the end is attributable to excess of water, the old roots being decayed as a result. Those who grow odontoglossums indifferently will probably have noticed from time to time that the foliage has a decided tendency to become more or less marked, or spotted, and that the tips of the leaves decay, and have to be trimmed. These are sure signs that the existing conditions are too wet or too cold, probably both. This state of affairs is frequently brought about during winter when, instead of having slight warmth in the pipes with a little air on, the house is insufficiently ventilated, in order to keep the thermometer to the desired figure without turning on the heat.

PROPAGATION.—The back pseudo-bulbs of any varieties it may be desirable to increase the stock of, may be put into quite small pots, and treated as newly imported plants, and in most cases these will make new growth. Odontoglossum seedlings may also be potted as they require it. Odontoglossum Rossi, O. Cervantesi, O. Oërstedi, as they go out of flower, should be kept only moderately moist at the roots, and be allowed to rest as long as possible.

SOFT - ROOTING ODONTOGLOSSUMS must not be potted too firmly; pot rather lightly than otherwise, and avoid crushing the roots at any time. Keep a sharp search for insect pests, especially yellow thrip. At the least sign of it, fumigate at once with one of the approved preparations that are on the market. Slugs also must be diligently sought for, and destroyed.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

EUPHORBIAS.—Old plants of the species E. pulchellum and E. fulgens (Jacquiniæflora) that have been resting should now be placed in a moister atmosphere and higher temperature for the production of cuttings. Assuming that they were cut down to within a foot of their base immediately after flowering, no further shortening will be necessary; but if a greater length of stem was retained they may now be cut down to about that level, taking the precaution to apply styptic to the cut to prevent bleeding. The removed portions of stem make good material for cuttings when the stock is short; cut into lengths of a few inches, with a plump eye at the apex, and a straight cut immediately below a joint at the bottom, and insert in peaty soil with plenty of sharp sand added. The best cuttings will, of course, be produced from the ripened stems of the old plants later on, when growth has recommenced. Maintain a temperature of 70 degrees, rising to 80 degrees with sunheat. Very little water will be required beyond using the syringe frequently. Aim at producing short-jointed cuttings by keeping the stock near the roof-glass, and admitting air at the apex of the structure during bright weather. Take the cuttings with a slight heel when two or three inches long, and insert at once in sandy soil, and plunge in the propagating frame.

IXORAS.—Although these handsome plants are not so frequently met with as formerly, they are well worth a place where room can be given them. Repot any requiring it, using a compost of three parts fibrous peat, one of flaky leaf-soil, and sufficient sharp sand and nodules of charcoal to keep the soil open. As is pretty well known, ixoras delight in plenty of heat; indeed, it is hardly possible to accord them a too high temperature provided it is accompanied with ample humidity and a slight shade during the hottest part of the day during the season of active growth. Large specimens should have the long, straggling shoots shortened before new growth commences, and the cuttings may be inserted in sandy soil and placed in the propagating frame if young plants are wanted. Unfortunately, Ixoras are liable to attacks of mealy-bug and scale, and unless constant attention is devoted to keeping these pests down good results will not be obtained.

COLEUS.—The tops may be taken from the plants kept over the winter for stock, and inserted in any light soil where they will quickly emit roots at this season. These when well grown and highly coloured are very useful for house decoration during summer. In my opinion the most effective form of training is the pyramidal. To be successful in coleus culture, golden rules to observe are light rich soil, plenty of light, and no check to growth at any time.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

PEACHES AND NECTARINES. — The young growths on permanently planted trees will require to be carefully tied in when about four to six inches long. Care should be taken to select shoots which start from the base of the fruiting wood, and these should be tied in, to ensure a good quantity of fruiting wood for next season; no hard-and-fast rule can be laid down with regard to the number of young growths it is necessary to maintain, but sufficient care should be exercised, so that the number does not act to the detriment of the full development of medium-sized, well-ripened wood for next season. Every effort should be made to form an evenly-balanced tree, furnished with fruiting branches, equally distributed from the centre to the utmost limits. Gradually thin the fruits down to the required number, giving preference to those that take the lead in swelling, and are well placed. The borders will require copious supplies of clean tepid water, with occasional applications of diluted farmyard manure and some approved chemical fertiliser; damp down the paths and walls several times a day to maintain a moist atmosphere, frequently syringing the trees to keep the foliage clean. Admit air early in the morning—before there is any perceptible rise in the house temperature—which should be gradually increased as required; maintain a day temperature of 70 to 75 degrees with sun heat, allowing a night temperature of from 60 to 65 degrees. Damp down the paths and walls late in the afternoon with a weak solution of cow-manure, as this will not only materially assist the full development of strong, healthy foliage, but will also help to ward off the attacks of red spider. If red spider appears, the affected parts should be immediately dusted with flowers of sulphur.

CUCUMBERS.—Constant attention will be required to regulate and pinch the laterals at two leaves; the plants are making rapid growth with the advent of the lengthening days and increased sunshine. The shoots must be sufficiently thinned to allow plenty of room for the full development of the foliage. Cut all fruits when ready so as not to overtax the plants; give top dressings as required, using light rich soil, and water frequently with some farmyard liquid or artificial stimulants. Syringe the plants at least once a day, and damp down occasionally to maintain a moist humid atmosphere; admit air when possible, with a day temperature of 70 to 75 degrees, allowing a rise of 10 degrees with sun heat.

TOMATOES.—The lower bunches of fruits have set well, and are swelling away freely. Carefully attend to watering. It is not a wise plan to commence giving manurial assistance until more bunches of fruits have set, or otherwise there will be a development of too much foliage and soft sappy growths; remove all side growths as they appear. Carefully tie and train the plants to one stem, and admit air when possible, but in such a manner as not to cause any cold draughts. A day temperature of 60 to 65 degrees will be sufficient, with a night temperature of 58 to 60 degrees. Should white fly be troublesome, vaporise the plants on alternate nights for a week.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

BORDER CARNATIONS. — Carnations wintered in cold frames can now be planted out in their flowering quarters. If the soil is heavy and retentive, it should be given a good dressing of wood ashes, which may be lightly forked into the surface. Carnations are sometimes planted in groups in the herbaceous borders, but they look especially well in narrow borders of one variety. When numbers are grown they should be planted in breadths with an alley between every four rows. Allow 15 inches between the plants each way. Plant firmly, and give a good watering; they will then need little subsequent treatment until they are staked, except having the surface soil stirred occasionally with the Dutch hoe.

SWEET PEAS.—Those that were raised in pots under glass are large enough to be planted out at the first favourable opportunity, such as on a mild showery day. One pot will be quite sufficient to each clump. Place a few twiggy sticks around them at the time of planting, for these will to some extent afford protection as well as support. Should there be a spell of very cold winds, such as we sometimes experience in April, it will be necessary to protect with small spruce branches. A light sprinkling of soot round the plants will be an advantage. The present is a good time to sow sweet peas in the open ground, provided the soil is fairly dry, and can be broken down finely. A space of two inches between the seeds is necessary to obtain sturdy plants.

GENERAL WORK.—Attend to potting and pricking out the various subjects required for bedding purposes, and keep them near the glass to promote sturdy growth. Perennial lobelias that have been wintered in boxes are making new growth, and should be put separately into 48's, in which they will make good plants. Harden off pentstemons ready to plant out next month. Violas that were rooted from cuttings in the autumn may now be planted out where they are to flower. They are frequently used with good effect as a groundwork for rose beds, and planted beneath Japanese maples. If not already done, grass verges should be trimmed with the edging iron where necessary, and the lawns be kept well rolled, as this greatly facilitates the use of the lawn mower, which must now be brought into play every week. Ivy growing on walls needs to be trimmed, and can be cut back fairly hard, as it will soon become quite green again.—J. Gardner, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## Perpetual Flowering Carnation Society.

The exhibition held by this society at the Royal Horticultural Hall, Westminster, on Thursday and Friday, March 21 and 22, was an altogether good one. The arrangement of the show was a distinct improvement on previous efforts, while the number and quality of the flowers showed a marked advance. The officers and committee are to be congratulated upon the success of their efforts to popularise a beautiful flower. Among market growers and in large private gardens the perpetual carnation already holds a foremost position, but the amateur with a greenhouse is but slowly taking up the culture of these carnations, and we are glad the society that cares for the flower is encouraging these smaller growers.

### OPEN CLASSES.

Three fine displays, each arranged on a space 10ft. by 3ft., were staged, and the class compelled admiration. Foliage and foliage plants were admitted, and not fewer than twelve varieties had to be set up. The judges had no small difficulty in awarding the prizes, and eventually their decision placed Mr. W. E. Wallace, Eaton Bray, first for a bold, high arrangement of beautiful blooms of White Wonder, R. F. Felton, Marmion, Gloriosa, Scarlet Glow, White Perfection, Delight, Mrs. C. M. Ward, Winsor, and May Day, all associated with asparagus sprays; Colonel Rideout, Langley, second, with a rather flat arrangement of good blooms; and Messrs. Allwood Brothers, Wivelsfield Nursery, Haywards Heath, third.

There was only one exhibit of three vases of British Novelties, and this was from Mr. C. Engelmann, who won first prize with Carola, Lady Northcliffe, and Triumph, the latter a good crimson. Mr. W. E. Wallace led for American novelties with fine flowers of unnamed sorts.

For two varieties of market carnations, two dozen blooms of each, in boxes, and three dozen of each in vases, the premier award fell once more to Mr. W. E. Wallace, Eaton Bray, for lovely blooms of Gloriosa and Winsor. This exhibit won the Covent Garden cup. Three competitors.

The class for six vases of twelve blooms each, a split calyx to disqualify, brought out but one exhibit, and to this, from Mr. W. E. Wallace, was awarded the first prize of £5: the varieties staged were Delight, Scarlet Glow, Winsor, White Perfection, Rose Pink Enchantress, and May Day.

As usual there was a series of classes for twenty-five flowers of a variety or colour. Mr. E. Guille, Newport, led in the Enchantress colour class with Lady Meyer; Mr. Wallace coming second with Enchantress. For a variety of the Mrs. H. Burnett colour Mr. C. Engelmann scored with Lady Northcliffe; Mr. Wallace second with Delight; and Messrs. S. Low and Co. third with Baroness de Briener. Rose-pink varieties found Mr. A. F. Dutton, Iver, to the front with the fine pink Mrs. A. F. Dutton; Colonel Rideout second, and Mr. Wallace third.

Mr. Wallace scored in the Lawson class with Mrs. C. W. Ward, followed in order by Mr. C. Engelmann and Mrs. Collins, Heathfield Nursery, Swanley. White Perfection was the only variety in the white class, and this, from Mr. Wallace, merited the premier award. The scarlet class was more popular, and here Mr. Wallace led with the fine Scarlet Glow, and Mr. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, was second with Britannia. Carola, shown by Mr. C. Engelmann, was the finest crimson, Mr. Wallace gaining second place with the same variety, and Mrs. Collins third with Harlowarden.

In the class for any other self variety, Colonel Rideout, Swanley, led with Mikado, and Mrs. Collins came second with Rose Doré. Mr. Engelmann set up the best vase of a fancy carnation, and showed the scarlet-flaked Fancy; Mr. Usher second. For a variegated variety not in commerce, Mr. Engelmann led with Hilda, which is somewhat like Lady Northcliffe.

### GARDENERS AND AMATEURS.

Mr. Usher won Messrs. S. Low and Co.'s cup for a vase of novelties, and Mr. Burnett's cup for a dozen blooms of novelties, but in neither case were the varieties labelled. For six of Mr. Burnett's novelties, Mr. Lloyd, gardener to Captain Wilner, Ewell Castle, Surrey, scored with Orpheus, Plato, Marmion, Mrs. Burnett, etc. Mr. Usher won the prize offered by Messrs. W. Wells and Co., and had a capital vase of White Wonder; Mr. Usher was also first for six blooms of Enchantress, and for six blooms of May Day.

In the rose-pink class Mr. Allan, gardener to Lord Hillingdon, Uxbridge, scored with R. F. Felton. Mr. Usher scored again in the Lawson class with Mrs. C. W. Ward, and was second in the white class with White Wonder, being the only competitor. In the scarlet class Mr. Usher had six fine flowers of Scarlet Glow, but he was second to Mr. S. F. Jackson, Danehurst, Epsom, for a crimson variety, Carola being the favourite flower. For any other self carnation Mr. Usher was to the front with Mikado, and Mr. Jackson second with Rose Doré. Mr. Usher's Marmion was the best in the fancy class, Mr. Allan coming second with Aurora. Mr. Johnston, gardener to Lord Burnham, Hall Barn, Beaconsfield, was also a successful competitor in this division.

Mr. J. H. Bruce, grower to Mrs. Bischoffscheim, Warren House, Stanmore, won Lord Howard de Walden's challenge vase for a group of perpetual carnations in pots, with a very fair exhibit, in which the flowers were a trifle small.

### SMALL GROWERS.

Some classes were provided for amateurs who employ a part-time gardener, and in the case of those residing upwards of fifty miles from London the flowers might be sent to the show and be staged by the committee. Some of the flowers were very good, especially those from Mr. T. H. Plowright, Windsor, and Mr. P. M. Patterson, St. Anne's-on-Sea; and Mr. F. S. Elgar, Salisbury, who secured the premier awards.

### FLORAL ARRANGEMENTS.

In the open class for a table decoration of carnations there were five competitors, and Mrs. A. R. Bide gained the first prize with blush flowers associated with asparagus and croton leaves; Mr. F. G. Bealing, Bassett, Southampton, second; and Mrs. A. W. Ruff, Sharnbrook, Beds, third. In a similar class open to gardeners and amateurs there were six entries, and here the first prize fell to Mrs. A. R. Bide, who had a combination of white and scarlet flowers—a trifle hard; Mr. Usher came second; and Mr. E. Guille, Newport, third. Mrs. Robinson and Mrs. Ruff each had good arrangements.

Messrs. R. F. Felton and Son, Hanover Square, were easily first for a basket of carnations with a splendid arrangement of Delight; Mrs. Hammond, Chelsea, second; and Mrs. A. R. Bide, Farnham, third. Mrs. Hammond led for a bouquet with Britannia, and she was first also with ladies' sprays and gentlemen's button-hole bouquets of carnations. Mr. Wallace scored for the best decorative vase of blooms with a charming arrangement of Delight; Mr. H. J. Dudney, Erith, second. Mr. Usher was awarded a second prize for a table of carnations suitable for a sitting-room; he had grand blooms rather heavily disposed.

### NEW VARIETY.

Mr. C. Engelmann, Saffron Walden, was granted an Award of Merit for his fine new large-flowered pink variety named Lady Northcliffe. It is a charming carnation, the exquisite pink colouring being laid over palest cream. The flowers are broad-petalled and carried on fine stiff stems.

### NON-COMPETITIVE.

Messrs. W. Cutbush and Son, Highgate, put up a bold exhibit of shrubs, daffodils, and carnations, the latter including Lady Meyer, Rose Pink Enchantress, Miss Winnie Hey, Winsor, and Rose Doré in good form. The display from Mr. C. F. Waters, Balcombe, included good vases of Miss Waters, Mikado, Mrs. Burnett, and Rose Pink Enchantress.

The largest exhibit, arranged across the top end of the hall, was from Mr. C. Engelmann, Saffron Walden, who had an enormous quantity of flowers, and set up large numbers of Lady Northcliffe, Salome, Triumph, Scarlet Glow, a fine lot of White Enchantress, the fringed Regina, Rose Pink Enchantress, Victory, Harlequin, the large crimson Carola, and other good things.

From Mr. Guille, Newport Carnation Nurseries, Shortgrove, Newport, came about a lozen large vases of the new light pink variety named Lady Meyer, which is evidently a free bloomer. Messrs. Young and Co., Hatherley, were also extensive exhibitors, and their light and elegant display included good vases of Carola, Mrs. Greswold Williams, Cheltonia, the buff Queen, Mrs. C. W. Ward, Rose Enchantress, and Britannia.

Mr. A. F. Dutton, Iver, Bucks, set up carnations in his usual artistic fashion in large glass vases, and presented good bunches of Scarlet Glow, Beacon, Niagara, Mrs. H. Burnett, Mrs. A. F. Dutton, Winsor, and Lawrence Enchantress. Mr. Bertie Bell, Castel, Guernsey, confined his attention to his new pink variety Coronation. Messrs. W. Wells and Co., Merstham, had a neat little exhibit of such good things as Wodenette, Dorothy Gordon, R. F. Felton, Mrs. C. W. Ward, and Scarlet Glow; a plant of Wodenette shown carried fourteen buds just ready to expand.

Mr. H. Burnett, Guernsey, put up an exhibit of splendid flowers, all large and bright; he had Marmion, Mrs. H. Burnett, R. F. Felton, Mikado, Mrs. Raphael, White Enchantress, Alma Ward, White Wonder, and Mrs. Felton, all grandly represented. Messrs. Stuart Low and Co., Enfield, were extensive exhibitors, and used bamboo stands freely for holding the flowers, with low bowls below; leading sorts on view were Lady Alington, Baroness de Brienen, Carola, the bright pink My Favourite, Samuel Gratrix, Alma Ward, and Beacon.

Mr. R. D. Day, Sutton Scotney, put up some very fine bunches of Mrs. Raphael, Belle Chinois, and Louise, varieties of Spanish irises, and these made a very attractive exhibit. Messrs. H. B. May and Sons contributed ferns in variety; and Mr. F. Cross, Nottingham, exhibited a collection of daffodils.

### MEDALS.

Large Gold.—To Mr. C. Engelmann, Saffron Walden.

Gold.—To Mr. H. Burnett, Guernsey.

Silver-Gilt.—To Mr. A. F. Dutton, Iver, Bucks; to Messrs. Young and Co., Hatherley, Cheltenham; to Messrs. Wm. Cutbush and Son, Highgate; and to Messrs. Stuart Low and Co., Enfield.

Silver.—To Mr. Guille, Newport Carnation Nurseries, Shortgrove, Newport; to Mr. C. F. Waters, Balcombe; to Mr. B. E. Bell, Guernsey; and to Messrs. W. Wells and Co., Merstham.

## East Anglian Horticultural Club.

A large muster of members assembled on the 13th inst. at the Boar's Head Hotel, Norwich, when the subject for discussion was "The Pruning of Fruit Trees, and the most suitable stocks upon which to grow them." This was opened in a most admirable manner by Mr. A. Reeves, manager of Messrs. Daniels Bros.' nursery, who also went to the trouble of bringing trees worked on various stocks to show root action, and by them he was also able to demonstrate various forms of training and pruning. As might be expected, the subject was one which lent itself to a spirited discussion.

A pleasing feature of the evening was the presentation of a framed photograph of members of the club to Mr. W. Laws, Norwich, who is leaving the district for the fruit-growing country of Kelowna, British Columbia.

The exhibits, both non-competitive and competitive, were a feature of the meeting; in the former section special mention is due to Mr. F. J. Endersby, gardener to J. H. Gurney, Esq., Keswick, for the best display of cyclamen ever seen at the meetings; to Mr. Frank Neave, Lingwood, for his array of large, brilliant-flowered polyanthuses; to Mr. W. Laws for carnations, which included a sport from Marmion, which has deeper coloured flowers; and to Messrs. Daniels Bros., Lim., for forced flowering shrubs.

## Bournemouth Spring Show.

The fifth exhibition of spring flowers was held in the capacious pavilion of the Winter Gardens on March 26 and 27. This show was an improvement on all previous ones, and the arrangement of the exhibits was all that could be desired. The entries were numerous, and the produce staged of very high merit indeed. The groups of miscellaneous plants, azaleas, pot plants of narcissi, tulips, hyacinths, and cyclamen, and the floral displays were very good, the table decorations being a charming feature.

In the class for a group of miscellaneous plants, Mr. T. K. Ingram scored with a very effective arrangement. With a palm in the centre, lilacs, crotons, staphyleas, liliums, narcissi, carnations, azaleas, and a neat edging of ferns, the arrangement and harmony of colour were especially good. The Park Nurseries (Mr. Welch, manager) were placed second, and this group was also a beautiful one. Lilacs, coleuses, carnations, lily of the valley, heliotrope, hydrangeas, and a neat edging of fibrous begonias, lightly arranged, made a beautiful arrangement. Messrs. Watts and Sons, Lim., were a good third.

Mr. Ingram won in the classes for Azalea mollis and A. indica. He also scored in the class for twelve pots of narcissi. Mme. Plemp, Emperor, and M. J. Berkeley were notable varieties staged. Mr. Pearce, gardener to Mr. Ormond, came second. Mr. Ingram had the best six pots of polyanthus narcissi and also the best twelve pots of hyacinths. Mr. George Garner second. Mr. Pearce scored with twelve pots or pans of tulips, Messrs. Ingram and F. G. Bealing being second and third respectively. The last-named had the best six pots of lily of the valley.

Mr. Usher, gardener to Sir Randolf Baker, Bart., staged a beautiful collection of cut blooms of narcissi in eighteen distinct varieties, Vanilla, Lucifer, Beauty, White Lady, and Mme. de Graaff being especially noteworthy. Mr. Ingram was a close second. Mr. Usher won in the class for five blooms, Magni-Coronati, one variety, staging Glory of Leiden. He also had the best five blooms Parvi-Coronati, showing Cassandra. Mr. Usher scored with violas and winter-flowering carnations. Messrs. Ingram, Kent, and Garner were first, second, and third respectively in the class for shower boquets.

Mr. Nippard, gardener to J. J. Norton, Esq., had the best six pots of cyclamen; Mr. Barge, gardener to Rev. C. H. Burrows, was a close second. Mr. Nippard had a beautiful group of miscellaneous plants arranged in a space of 9ft. by 6ft., second honours going to Mr. Pearce, and third to Dr. Crallen.

In the class for three specimen Azalea indica, Mr. Nippard staged the best in the show. Mr. Garner scored in the class for six hyacinths, six pots of tulips, and three pots of polyanthus narcissi; second honours going to Mr. Pearce. The last-named exhibitor had the best four pots of lily of the valley. Primulas, schizanthuses, deutzias, stellate cineraria, and spiræas were well shown. Mr. J. Taylor, gardener to Walter Child Clarke, Esq., had a grand specimen of imantophyllum in the class for any flowering plant not named in the schedule.

Non-competitive exhibits made a very fine display indeed, and the following awards were given by the council:

Gold Medals.—Messrs. Sutton and Sons, cinerarias, cyclamen; Mr. Maurice Prichard, alpine and rock plants; Messrs. D. Stewart and Sons, miscellaneous plants; Messrs. Charlesworth and Co., orchids; Messrs. Cartwright and Goodwin, narcissi.

Silver-gilt.—Messrs. J. Cypher and Son, orchids; Mr. Chamberlain, floral designs; Messrs. Stuart and Co., tree carnations; Mr. R. Prichard, alpine and rock plants.

Silver.—The Burton Hardy Plant Company, Messrs. Young and Co., tree carnations; Mr. Vincent Slade, zonal pelargoniums; Messrs. Watts and Sons, Lim.; R. Sydenham, Lim.; and Mr. J. Stevenson, Wimborne.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE.

MARCH 19.

PRESENT.—Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Canon Fowler, Rev. G. Engleheart, Messrs. J. O'Brien, W. Hales, C. T. Druery, J. T. Bennett-Poë, C. E. Shea, E. M. Holmes, R. Hooper Pearson, F. J. C. Chittenden (hon. secretary), and Rev. J. Jacob (visitor).

HYBRIDS WITH NARCISSUS CALATHINUS.—Rev. G. Engleheart made some remarks regarding the apparently very restricted distribution of this beautiful form of Narcissus triandrus. It is not apparently found outside a small area on an island in S. Europe, about 1½ degrees out of the latitude in which the type occurs on the mainland of Spain and Portugal. He also showed a beautiful and vigorous white hybrid between this and a variety of N. Leedsi, which might be likened to a hardy eucharis. Several of these white and vigorous seedlings had now been raised. The committee unanimously recommended a Certificate of Appreciation to Mr. Engleheart for his work with these hybrids.

OSYRIS ALBA.—Mr. E. M. Holmes showed roots of vines with the suckers of the parasite Osyris alba, a plant belonging to the Santalaceæ, attached to them. This parasite attaches itself to the roots of a large number of plants, over 60 hosts being known, but up to now it has not been recorded attacking the vine. The specimen came from Montpellier.

CAMELLIA TUCKIANA.—Mr. Bennett-Poë showed flowers of a seedling camellia, which he had raised from seed ripened in S. France, now flowering for the first time in a cold greenhouse. The flowers were single, about three inches in diameter, of a delicate pink, with numerous yellow stamens. It had been identified as Camellia Tuckiana.

BEETLES IN BEANS.—Canon Fowler showed French beans attacked by the beetle Bruchus lentis. This and other species of Bruchus are well-known pests of various species of bean and pea, boring holes into the cotyledons, but they appear rarely to interfere with germination.

ATHYRIUM WITH BULBIFEROUS SORI.—Mr. C. T. Druery showed portions of the fronds of Athyrium filix-fœmina plumosum with large numbers of small plants arising from the sori, each sorus producing several bulbils.

SNOWDROPS.—Mr. E. A. Bowles showed specimens and drawings of a double green snowdrop, in which both stamens and ovary were aborted and replaced by rather narrow, foliose segments. He also exhibited the double yellow form of Galanthus nivalis, and drawings of the white form of G. Elwesi recently shown by him to show that there were a few small green lines on the inner perianth pieces of that flower.

MALFORMED ORCHIDS.—Mrs. Taylor, of Bowerdens, Henley-on-Thames, sent two abnormal flowers from a newly-imported plant of Dendrobium Wardianum giganteum. In one of them two stamens of the other whorl had developed and become petaloid and bore pollen sacs on their inner edges near the base. In the other, the column bore at its apex three stamens, the usual one fully, the other two partially developed, and three lips, one inside the other (but the two inner and progressively smaller ones arising slightly to the right and left respectively of the normal one). Mr. J. Gurney Fowler sent an odontoglossum with four symmetrically disposed outer perianth pieces, six inner perianth pieces, including two lips, and two normal columns, side by side. The ovary also was double, but fused into one.

## National Hardy Plant Society.

A council meeting of the above society was held on Thursday, March 21, at the Hotel Windsor, the members present including Messrs. T. W. Sanders, W. Irving, J. Collingridge, E. H. Jenkins, R. Morton, J. Dickson, H. Hemsley, R. Pinches, F. Bouskell, and A. J. Macself. The principal business before the meeting was to report the progress in the arrangements for the society's first exhibition, to be held in the Royal Horticultural Hall, on June 19.

A preliminary schedule of classes has been distributed among members and hardy plantsmen generally, and, as promises of exhibits in these classes have been received from many of the leading trade growers and amateurs, it was decided to finally adopt this classification, and to offer medal awards in all classes rather than money prizes.

The Publications Committee was instructed to prepare the schedule for press.

A discussion arose as to the advisability of the society publishing a quarterly journal for free distribution among members, the matter being referred to the Publications Committee for consideration, to be reported upon at next council meeting.

Plants of Anemone pulsatilla rosea Mrs. Van der Elst were submitted to the council, the exhibitor being Mr. Van der Elst, Tottenham Nurseries, Dedemsvart, Holland. An Award of Merit was unanimously accorded this very pretty and decidedly distinct break in the popular Anemone pulsatilla.

The council were gratified that a goodly number of new members have been enrolled of late, and trust there will be a considerable increase prior to the date of the show, to which members will receive free admission.

## North of Scotland Horticultural and Arboricultural Association.

The fifth and penultimate meeting of this association for session 1911-12 was held in the Botany Classroom, Aberdeen University, on Wednesday evening, the 20th inst. There was a very large attendance, and Mr. John McKinnon, head gardener to the Earl of Aberdeen, at Haddo House, president of the association, occupied the chair. The first item on the agenda was a paper on "The Carnation," by Mr. W. B. Clark, head gardener, Balgownie Lodge, Aberdeen.

In his opening remarks, Mr. Clark referred to the border variety of the carnation as being the one most generally grown, and requiring considerable attention. He dealt with the cultural treatment of carnations, his remarks being of an eminently practical character. The propagation of carnations by means of cuttings and layering next engaged attention. August, he stated, was the best month for layering, and he recommended early layering and planting. Carnations, he maintained, were hardy plants, and resisted coddling. In the North of Scotland, however, they had everything to gain and nothing to lose by deferring planting until the spring.

Haphazard treatment of the carnation he deprecated, for they must have attention. Carnations cannot have too much sunshine, and they grow and flower best in garden soil, where he had always obtained the best results. Nothing better suited to the successful cultivation of the carnation could be found than a change of ground—in fact, ground that had grown carnations for some time should have a supply of fresh loam. Mr. Clark concluded with an admirable description of the foes of the carnation, and how best to deal with them. An animated discussion, taken part in by leading members, followed, dealing chiefly with the cultural difficulties growers of carnations have to deal. Thereafter a very warm vote of thanks was passed to Mr. Clark for his interesting and instructive paper.

Mr. James Ogg, head gardener, Skene House, Aberdeen, then read two short papers, one on "Cottage Gardening," and the other on "Garden Cities." He advocated greater attention being given to the encouragement of cottage gardening, and the awarding of prizes for the best gardens by local horticultural societies, apart from the awarding of prizes to particular flowers, fruits, or vegetables. Mr. Ogg's second paper gave a very succinct account of the origin and development of garden cities and of their value from an economic point of view.

In the discussion which followed, Councillor Esson, a popular member of the City Council, pointed out that Aberdeen might do more than had been done to follow out the garden city idea. Mr. C. S. France, retired forester, complained of the "barbarous ruination" wrought by the city authorities in the pruning of the trees in several of the avenues and drives within the city. Hearty thanks to Mr. Ogg for his papers, and the chairman for presiding, concluded a delightful evening.

## Bournemouth Gardeners' Society.

At the meeting held in the Avenue Assembly Room on March 19, Mr. J. J. Kettle, Violet Nursery, Corfe Mullen, Dorset, gave a very interesting and instructive lecture on "Violets, Past and Present." There was a good attendance of members, and a keen interest was taken in the lecture throughout.

Mr. Kettle is an expert cultivator of violets, both in the open air and under glass. His plants under glass are not grown extensively in frames, but in large houses; several acres are devoted to these fragrant flowers in the open.

The lecturer referred to the cultivation of violets in America, Central Asia, China, Japan, and the South of France, and quoted many references to the violet by authors both ancient and modern, making one to the fact that is recorded of a golden violet gem being bestowed as a reward of merit in Egypt two hundred and eighty years before Christ, which seemed to prove that this pretty, fragrant flower was grown and appreciated in the distant past.

Mr. Kettle said that violets did not like sun-heat beyond a certain degree, that the flowers only lasted three days under glass as spring advanced before they closed up. He had tried the plants in various kinds of soil; in almost pure sand, in stiff clay, and in a rooting medium chiefly made up of material from old mud walls. The result was that he could grow violets in almost any kind of soil, but he found out that for quality of bloom, a rather stiff soil, well drained, was by far the best. In a sandy soil there were plenty of flowers, but they were small. All plants grown in a rather poor soil must be fed, and fresh organic manure was the worst for them. Violets grown on ground manured with rather fresh strawy manure suffered most from attacks of red spider. The plants did well, he said, after crops of potatoes, and potash was essential to success. Mr. Kettle never entirely closed his frames, but placed them on bricks so that plenty of air passed under. In the case of the houses, front air was freely admitted, and abundance of water was given in winter and spring time. So treated there was not any trouble from damping. Runners, when layered, produced too many runners in turn, and he preferred the suckers which bore the finest flowers and fewest runners.

The lecturer recommended the varieties La France, Princess of Wales, Wellsiana for flowering during a long period, De Parma, and John Raddenbury. There was a good discussion, and many questions were replied to by Mr. Kettle.

An exhibition of cinerarias, imantophyllums, spiræas, and cyclamen was made by the following members: Messrs. Pearce, Evans, Heath, and Pardy.

Votes of thanks were heartily accorded the lecturer, and Mr. Evans, who presided.

## Broughty Ferry Horticultural Association.

The usual monthly meeting was held on the 19th inst. The President, Mr. James Bethel, presided, and Mr. Alex. Duncan, St. Andrews University Experimental Gardens, Dundee, gave a lecture on "Ferns." After a general survey of the family, and referring to the part played by it in the economy of nature, the lecturer dealt with the life-history, explaining, by the aid of diagrams and models, the interesting life-cycle of ferns. After a short but complimentary discussion the lecturer was cordially thanked.

The exhibits consisted of cyclamen from Mr. D. Eggo, Dunalistair Gardens; a vase of Rose Niphetos, from Mr. John Bell, Taypark Gardens; vases of iris, from Mr. D. K. Meston, The Lodge Gardens; Amaryllis, from Mr. Brown, Cambustay Gardens; and one seven-inch pot of Richardia æthopica, carrying eight flower spathes, from Mr. James Bethel, The Grange Gardens. On a vote being taken, it was found that the cyclamen were the most meritorious, and consequently Mr. Eggo was awarded the prize for the evening.

## Bristol Gardeners' Association.

The usual fortnightly meeting was held on March 14 at St. John's Parish Rooms, when Mr. A. Perry presided over a large attendance. This was the occasion of the annual visit of the Bristol Amateur Horticultural Society, and Mr. Board read an interesting paper on "The Sweet Pea." The lecturer favourably compared the sweet pea in colour and perfume to other well-known flowers. Speaking on cultivation, Mr. Board recommended sowing in pots, in February, and when two or three inches high pinching out the point in order to induce strong branching growths, and planting about the middle of April on well-prepared ground in shallow trenches. Cut out all weak growths, and apply a dose of nitrate once a week when in full growth.

For two pots of cyclamen Mr. Jennings was first, Mr. Springham second. A special certificate was awarded to Messrs. Garaway for three pots of King Alfred daffodil. Messrs. Scott and Woodward referred to the departure of the Chairman, Mr. A. Perry, to take up a new appointment at Northampton.

## Croydon Gardeners' Association.

At the fortnightly meeting of this association, which was held at the Sunflower Temperance Hotel on the 19th inst., Mr. John Gregory gave a most interesting lecture entitled "Life in our Ponds and Ditches," illustrated by an excellent series of lantern slides, mostly made by himself.

It was with many expressed regrets from his audience Mr. Gregory concluded his lecture, and the appreciative feeling from the members found vent in the proposal of a hearty vote of thanks to him.

Some excellent exhibits were staged by members of the society. Mr. T. Butcher had an attractive collection of forced flowering plants. Mr. W. Coles brought from Wallacefield Gardens, Coombe Road, four pots of hyacinths showing good culture; and Messrs. E. W. and S. Rogers staged four bowls of hyacinths and two of narcissi grown in moss fibre, these being typical of this popular way of growing them in indoor apartments.

## North of England Horticultural Society.

On the occasion of the spring exhibition, held by the North of England Horticultural Society at Bradford, Mr. W. F. Giles, of Messrs. Sutton and Sons, gave a lecture on "Salad Plants: British and Continental." The lecture was illustrated by some sixty lantern slides, and created much interest.

In the course of his lecture, Mr. Giles said that great interest had recently been aroused in this country in the various types of Continental vegetables and salad plants, doubtless partly due to the increasing numbers of visitors to the Continent. He considered, however, we were still a long way behind our Continental neighbours in the productions and use of salads, especially in the winter time. Even in the summer, immediately the temperature falls, so does the demand for salads. He was well aware that English private gardeners can, and do when required, produce tender salads during a considerable portion of the year, but as this produce does not, as a rule, find its way to the markets, it is not to be obtained by the general public. Until quite recently, however, few English market gardeners did much in the forcing of such things as lettuces, carrots, radishes, etc., with the result that the produce, being of slow growth, was often anything but tender.

On the Continent, however, many market gardeners make a speciality of producing "primeurs," that is, forced salads and other vegetables by the means of hotbeds, frames, and cloches, and it was the tender produce from these gardens which, obtaining such good prices in our markets in early spring, started the boom in England in what is now generally known as "French gardening." The Continental idea of a salad does not entirely agree with the British view of the same, for there one frequently has such things as potatoes, beans, cauliflowers, and other vegetables suitably dressed and served up.

Mr. Giles explained in detail the methods adopted by the French maraicheres in making up the hotbeds and growing the various vegetables by means of frames and cloches, pointing out that quick growth induced by the hotbeds, accompanied by copious waterings, was the secret of producing the tender crops. The French gardener usually has three or four crops growing together, but in different stages of growth. Radishes and carrots are usually sown together, and the same beds are then planted with lettuces and cauliflowers, and by the time the radishes and lettuces are cleared (these being the quickest-growing crops) the carrots and cauliflowers are well established, and making good growth. The hotbeds are never vacant all the season.

Mr. Giles illustrated the special way in which early crops are grown in Holland, also salads in Italy, and fully described the methods of culture at Brussels for the production of witloof. He mentioned the fact that Continental salads were usually prepared with oil, which is often at first disliked by many English people, but that once the taste for it is acquired the salads are much more enjoyed. He described the correct Continental method of preparing a salad, which should always be served freshly made; lettuce, if washed, should be dried with a soft cloth, the leaves should either be put into the bowl whole or torn, and no steel knife should touch them. Oil and vinegar are used in moderate quantities, and additional flavouring is secured by adding small quantities, finely chopped, of some of the various plants he had referred to. The great art of preparing a salad is to so judiciously mix the ingredients that the taste of one does not overpower the remainder. They should fall into their places like notes in music, in which there is nothing harsh or grating.

Besides dealing with all the salad plants usually grown in England, such as beet, cucumber, tomato, celery, radish, lettuce, endive, onion, cress, etc., he illustrated and fully described, amongst others, the culture of chicory, witloof, blanched dandelion, celeriac, purslane, tarragon, chervil, pimpinella, sorrel, chives, mercury, orache, and poiree, all of which are used in considerable quantities abroad in the preparation of salads.

In addition to these, the frugal French and Italians gather almost anything green and tender, and use them as salads, such as the tops of nettles, leaves of wood sorrel, cuckoo-flowers, scurvy grass, nasturtiums, and wild cress, besides the shoots of hops, of vines, and asparagus; and even the pods of young peas are sometimes used.

Mr. Giles did not consider all the Continental plants he had referred to were worth cultivating generally in this country, but thought many things were well worth greater attention here than is now given to them.

### Reading Gardeners' Association.

The fortnightly meeting of this association was held in the Abbey Hall (kindly lent by Messrs. Sutton and Sons) on Monday, when, notwithstanding another very wet evening, there was a good attendance, the President occupying the chair. The lecture for the evening was delivered by Mr. H. Wilson, The Gardens, Lower Redlands, one of the association's oldest members, the subject being "How to Maintain a Supply of Vegetables Throughout the Year." Although the culture of vegetables has been rather freely dealt with at comparatively recent meetings, Mr. Wilson gave a thoroughly instructive paper on the production of an adequate and continuous supply for the whole twelve months of the year. A prolonged and highly interesting discussion followed the conclusion of the lecture. On the proposition of the President, Mr. Wilson was accorded a hearty vote of thanks.

Mr. F. Townsend staged a large and very beautiful collection of forced narcissi from the vice-president's gardens at Hillside, which was greatly admired by all present.

## ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.

### The Orchids.

As the time for holding this great exhibition draws near, it becomes possible to obtain some idea of the exhibits that will be displayed in the different sections. The scope of the schedule is so wide that provision is made for no fewer than 428 classes; many of them of a character to test the capacity of the most redoubtable exhibitor. The orchid classes alone number 32, and the entries show that there will be competition in most of them.

There are two entries in the amateurs' class for the best and most varied group of orchids, arranged in a space not exceeding 500 square feet. These exhibits will occupy 1,000 square feet, and there are two valuable cups to be awarded to the competitors. In the nurserymen's class for similar groups there are four entries for Sir George Holford's cup; there will therefore be nearly 2,000 square feet of orchids in this class.

Those who profess to despise hybrid orchids in favour of the natural species and their varieties, will be interested in class 68, in which nurserymen will compete for the best and most varied group of species, and varieties of species, arranged in spaces not exceding 200 square feet. Liberal provision, however, is made for the showy hybrids, which are due to patient and skilful cross-breeding, carried out in British and foreign collections, Baron Bruno Schröder's presentation cup being offered for the best group of hybrids occupying a space of 200 square feet.

There is one entry in an open class for a group of the resplendent lælias, cattleyas, and brasso-lælias—varieties and hybrids—in a space of 100 square feet; this exhibit will be amongst the most showy. More numerous entries are forthcoming in a class for the same type of plants where the specimens are limited to 25, and again where the number must not exceed 12. The effect of the scarlet Cochlioda Noezliana is manifest in the more brightly-coloured hybrids of odontoglossum, and it is hoped that the exhibit will show what genera and species have been crossed with this gay little gem. Such information would be valuable, not merely to specialists, but to all interested gardeners.

Then there are classes for specimen orchids in collections of 100 specimens, and others in which the specimens are limited to 50, 12, and 6. There will be keen competition for the silver cup offered for the best specimen orchid in the show. One exhibitor will contribute a group of orchids in which the interest is botanical rather than decorative. The visitor will here be able to see the wonderful forms and devices exhibited by the different flowers, illustrating the numerous ways by which the important process of fertilisation is brought about, necessary for the perpetuation of the species.

We have as yet referred only to competitive orchids, but these will not exhaust the exhibits of these marvellous flowers, for some of the most able amateurs and nurserymen will confine their efforts to exhibiting honorary collections. For instance, Sir George Holford, K.C.V.O., C.I.E., is expected to exhibit the largest group of orchids an amateur has ever shown in this or any other country, and the excellent quality of the plants may be judged by previous exhibits from the Westonbirt collection.

It is a notable fact that in the orchid section the number of entries from foreign orchidists is very nearly one-half the number received from Britain. The exhibitors of orchids will be as follows:

Messrs. Armstrong and Brown, Tunbridge Wells, Kent.
Mr. J. Birchenhall, Alderley Edge.
Messrs. Charlesworth and Co., Haywards Heath.
Sir Jeremiah Colman, Gatton Park, Reigate.
Messrs. J. Cypher and Sons, Cheltenham.
Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common.
Mr. J. Evans, Manor House, Key Green, Congleton.
Mr. J. Gurney Fowler, South Woodford.
Messrs. Hassall and Co., Southgate, N.
Lieut.-Colonel Sir G. L. Holford, Tetbury, Gloucester.
Mrs. Willie James, West Dean.
Messrs. Cowans, Lim., Gateacre, Liverpool.
Messrs. Stuart Low and Co., Enfield.
Mr. E. V. Low, Haywards Heath.
Mr. J. MacCartney, Bolton.
Messrs. Mansell and Hatcher, Rawdon, Leeds.
Mr. F. Menteith Ogilvie, Oxford.
Mr. P. Ralli, Epsom.
Mr. C. F. Raphael, Shenley.
Mr. J. Roberts, Rotherham.
Mr. J. Robson, Altrincham.
Mr. Lionel de Rothschild, Acton, W.
Colonel J. Rutherford, Blackburn.
Messrs. Sander and Sons, St. Albans.
Mr. F. Wellesley, Woking.

### Foreign Exhibitors.

M. G. Arends, Nurseryman, Ronsdorf, Barmen.
M. E. Dietrich, Château du Val Duchesse, Bruxelles.
M. Graire, 5, Rue St. Fuscien, Amiens.
M. C. Jules, Hye de Crom, 8, Conpure, Gand.
M. F. Lambeau, Rue du Fosse aux Loups, 39, Bruxelles.
Mr. W. A. Manda, South Orange, New York.
M.M. Maron et Fils, Brunoy, France.
M. G. H. Abeken Müller, Scheseningen.
M.M. A. A. Peeters et Fils, Ancienne Chaussée de Meysse, Laeken, Bruxelles.
Dr. E. Regel, Botanic Garden, St. Petersburg.
M.M. A. H. and L. Vincke, Scheepsdaele, Bruges.
M. Ch. Vuylsteke, Loochristi, Gand.

This great exhibition will take place in the spacious grounds adjoining the Royal Hospital, Chelsea. His Majesty the King will open the exhibition in person at noon on May 22, and it will remain open until May 30.

### Invitations to Jurors.

Invitations have just been issued to upwards of 350 specialists in every branch of horticulture to officiate as jurors at this great show. In awarding the prizes, British judges in every group will have the assistance of one or more foreign colleagues.

R. HOOPER PEARSON,
Hon. Press Secretary.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, April 2.—Royal Horticultural Society; Narcissus Committee meets at 11.30 a.m.; Fruit, Floral, and Orchid Committees meet at 12 o'clock; Lecture at 3 p.m., on "Tender Plants for a Warm Corner" by Mr. R. Irwin Lynch, M.A.; Scientific Committee at 4 o'clock.
Scottish Horticultural Association.
THURSDAY, April 4.—Manchester Orchid Society.
SATURDAY, April 6.—French Horticultural Society of London.
TUESDAY, April 9.—Weybridge Horticultural Society's Monthly Meeting.
WEDNESDAY, April 10.—Edinburgh Spring Show; two days.
Kingsbridge Daffodil Show.
East Anglian Horticultural Club
THURSDAY, April 11.—Cornwall Daffodil Show, at Truro; two days.

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅓ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3G, Sutton Coldfield.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

"JACK" CARNATIONS.—M. N. G., Beaconsfield: Please tell me if it is possible to distinguish genuine named carnations from frauds from the appearance of the plants at this time of the year? I was persuaded to purchase some strong-looking plants from a stranger last week, and I am now told by a friend who had a similar experience last year that I have been "had," and that my purchases will turn out to be "jacks," or singles only.—We very much fear that your friend is right, and that the very strong plants purchased will give you only worthless single flowers. You may be forgiven, as an amateur, for once falling into this old trap laid for the unwary. These "jacks," as they are known to market growers, are grown for sale by, apparently, not over-scrupulous growers; they are purchased by costermongers chiefly, who often attach labels bearing the names of well-known carnations, and so find a ready sale for their wares among amateur gardeners. We have frequently urged our amateur readers not to purchase carnation plants from hawkers, but to do so from those specialists and nurserymen who advertise in our columns, and who have everything to gain by supplying good plants of first-rate varieties. The price will, of course, be higher than that paid to the hawker, but there will be a pleasurable return for the money expended instead of great disappointment. We are glad you have been interested in our articles on carnations.

OUTDOOR VINES.—B. J., Tavistock: Kindly tell me which are the best varieties of grapes to plant in a sunny position out of doors, against a wall?—Everything depends upon the situation. Black Hamburgh ripens out of doors under exceptionally good circumstances, while Royal Muscadine, Reine Olga, Black Cluster, and Gamay Noir are all likely to give very fair results.

LIME AND SOIL FERTILITY.—A. R., Notts: As an old reader of the "G.M.," I should be glad of your opinion regarding the following matters: I have been reading "The Chemistry of the Garden," by H. H. Cousins, and another book on manuring, by R. A. Berry, F.I.C., and am convinced that a knowledge of chemistry as applied to gardening is absolutely necessary if one is to cultivate crops in the best possible manner. For instance, one must know the composition of the soil one has to deal with. I have been making a few tests of our garden soil with muriatic acid, and find it contains no lime. Mr. Cousins says that chalk, or lime, is the chief basis of fertility, and without it successful results cannot be obtained, nor can the soil be brought into a high state of fertility without its help. The soil here is light, over gravel, and has never been liberally manured. What should be done with it? I have also a heap of light turfy soil, and it does not show evidence of a particle of lime by the acid test. Last season I grew tomatoes in this material, and they did badly, and were a great disappointment. Nearly all plants potted in it did badly. Having a heap of clay near by, I tested this, and found it respond to the test for lime, and so I mixed two parts of this with one part of the light, limeless soil, and have found that geraniums and young tomatoes are doing very well in the mixture. Now, what should I do to make the light turfy soil fertile?—Lime sweetens soil by neutralising organic acids, and it combines with the soil ingredients in such a manner as to set free the food materials that would otherwise remain unavailable to the crops. Lime by itself will not improve a poor, light soil, because the latter contains so little decayed organic matter, and it is upon this that lime acts so usefully. Add about half a bushel of lime to the square rod of ground, and when it is slaked fork it in, a few weeks before planting or sowing. Put in a summer crop, heavily surface-dress the ground with old manure, charred garden refuse, decaying leaves, and other matter that will provide humus. In the winter this dressing can be dug in. It would also be a good plan to follow the summer crop with one of clover or tares, this to be dug in later on as a green manure. In the case of the turfy soil for potting, you have practically answered your own question, because the addition of a heavier medium containing lime has already improved matters. Make up a stack of soil, consisting of alternate layers of light soil, cow manure, and heavy soil, and let all remain under a rough shelter for a few months; then chop down, mix well together, and add about a half pound of lime to each bushel before use. Old plaster rubbish, broken fine, would do instead of lime.

STEPHANOTIS SEEDLING.—E. R. B., Rugby: In our garden we have a plant of Stephanotis floribunda carrying a seed pod which is like a green plum, but about the size of a turkey's egg. Could you tell me if it is a rare thing for a stephanotis to produce seed pods in England, as I do not remember having heard of such a thing before? Should I let the pod remain on the plant, or cut it, and place it on a shelf this summer to ripen?—It is by no means a common thing for a stephanotis to form a seed pod; but there are many instances of such an occurrence, so that it can hardly be considered rare. Allow the seed vessel or fruit to remain on the plant until it shows signs of dehiscing or splitting, when it may be cut down and placed on a sunny shelf to completely ripen. Place a small piece of netting around the seed pod and tie it to the wire above, to guard against accidents.

SIX HONEYSUCKLES.—C. G. H., Bath: Will you please name half a dozen good climbing honeysuckles for a sheltered position?—Six good kinds are: Lonicera caprifolium major, L. etrusca, L. japonica aureo-reticulata, L. Periclemenum, L. flava, and (if the soil is light and the position warm) L. sempervirens.

MIXING MANURES.—A. C. W., Hereford: I have been told that it is wrong to mix nitrate of soda with superphosphate or guano. Is that right?—Yes; nitrate of soda should not be mixed with superphosphate, dissolved bones, or guano, because such mixture would quickly become a sticky mass, difficult to sow, and there would be a considerable loss of nitrogen. Sulphate of ammonia should not be mixed with a manure containing free lime, like basic slag, because of the loss of nitrogen that would result from the lime attacking the ammonia.

---

## NAMES OF PLANTS.

N. S., Bridgwater.—Lomaria gibba.

G. W., Lewes.—1, Cœlogyne cristata; 2, Oncidium concolor.

C. P. J., Carshalton.—1, Coleum thyrsoideus; 2, appears to be a leaf of Phœnix Roebelini.

J. E., Horsham.—1, Ribes sanguinea; 2, Muscari botryoides alba; 3, not recognised; 4, Prunus Pissardi.

W. O. S., Ripon.—1, Lonicera japonica aureo-reticulata; 2, Eupatorium ianthinum; 3, Grevillea Thelymaniana; 4, Odontoglossum triumphans.

Robinsons'—
Guaranteed Gardenalities

Every one is the best of its kind, for the Robinson reputation guarantees this. They make your gardens bright, beautiful, and profitable, and realise your highest ambitions.

Be up-to-date—be practical, and see to it that your soil is thoroughly fertilised. Let the plants have the utmost vitality; let them draw their essential elements from a soil rich in such requisites. The wise gardener knows what to do, and therefore applies

"CARMONA" FERTILIZERS.

There's all the difference in the world between the inferior and the superior. "Carmona" Fertilizers have no equal, for test, analysis, and results manifest their unrivalled excellence.

If you want THE Fertilizer, then get "Carmona."

Many varieties, and of special interest, is the "Carmona" Sweet Pea Fertilizers.

Made in bulks to suit all gardeners. See below:

1 cwt., 20s.; ½ cwt., 12s. 6d.; 28 lbs., 7s. 6d.; 14 lbs., 4s. 6d.; 7 lbs., 2s. 6d. 1s. and 6d. tins.

Of all Seedsmen and Agents, or write direct.

WAGE EFFECTUAL WAR ON INSECTS

and destroy all these pests by means of Clift's Fluid Insecticide.

Here you have a guaranteed insecticide. Wireworms, millipedes, leather-jackets, eelworms, maggots, and the like are always exterminated when Clift's Fluid Insecticide is sprinkled on the soil.

You should use Clift's Fluid Insecticide in both flower and kitchen garden for frames, conservatories, greenhouses, and fruit trees. A little goes a long way. Prices below:—
40 galls., 4s. 6d. per gall.; 20 galls., 5s. per gall.; 10 galls., 5s. 3d. per gall.; 5 galls., 5s. 6d. per gall.; 1 gall., 6s. Of all Seedsmen and Agents, or write direct.

A FREE ENTRY FOR ROBINSON'S Great £350 SHOW IS AWAITING YOU.

A splendid chance to secure one of the many cash prizes and championship medals awaits you, for a free entry "fee" coupon is enclosed in every packet of "Carmona" Fertilisers. This great Show will be held on August 28th and 29th next, at the Royal Botanical Gardens, Edgbaston, Birmingham. Robinson's have the Show Schedules ready, and will send them post free upon request. Don't fail to enter, for you have as good a chance as anyone.

Note these Gardenalities.

1. "Velvas" Lawn Sand—absolutely the finest dressing known. It kills the weeds, intensifies the colour, and improves the grass. If you want an ideal lawn, use "Velvas." Sold in convenient quantities. 14lbs., 3s. 6d.; 56lbs., 11s.; 112lbs., 20s. Tins at 6d., 1s., and 2s. Of all Seedsmen and Agents, or write direct.

2. "Eradiweed"—the guaranteed cent. per cent. weed-killer. Keep your paths, drives, and roads clear and clean. One application in 12 months is all that is necessary. The "Standard" weed-killer. Tins, 1s., 2s., and 3s. 6d.

Of all Seedsmen and Agents, or write direct.

## Situations Wanted.

A GENTLEMAN wishes to recommend his HEAD GARDENER for a similar post where three or more are kept. Surrey preferred. He is of excellent character, competent, and successful; age 40; married, three children. Apply JOHNSON, 62, Halifax Road, Enfield, Middlesex.

ADVERTISER, age 18½, seeks SITUATION as Improver in Gentleman's Garden; 4½ years' experience, partly Inside and Out; good reference. J. WILKINS, Abbotsmead, Elstree.

CAPTAIN THORPE, of Coddington Hall, wishes to recommend his Gardener as HEAD of several; been here as same 14 years. F. STEADMAN, Coddington Gardens, Newark.

COUNTY Horticultural Instructor wishes to highly recommend LAD, who has received 2½ years' training; Bothy preferred; age 16½. Address H. MATTHEWS, 1, Chapel Street, Newport, I.W.

CARPENTER seeks SITUATION; Greenhouse Repairs, Glazing, Painting, etc.; Estate preferred; age 28; Single; 13 years' experience. W. PALIN, Pinvin Farm, Pershore, Worcs.

E. DEAN, Esq., highly recommends GARDENER (Head or Single-handed); 5½ years with him; 29 years' experience Inside and Out; age 43. Apply WELSTEAD, Woodvale, Woodvale Avenue, South Norwood.

E. VENTIN, Gardener to A. D. SELKIRK, Esq., can with every confidence recommend Young Man, age 18, as JOURNEYMAN, or IMPROVER in good establishment; disengaged. J. EATON, Government Lodge, Clewer, near Windsor.

ELECTRICIAN wants SITUATION; Gas and Oil Engines; own repairs; married; well recommended; and fill up spare time in Garden. Apply E. COOK, Debden Hall, Loughton, Essex.

FRENCH GARDENING. — Married man requires Situation as FOREMAN (Working); four years' practical experience on Intensive system; excellent references from past and present employers. GOODMAN, Winkton, Christchurch.

FOREMAN (Inside), or good Second; 11 years good experience; 3 as Foreman; all Fruit, Plant, and Carnation Houses, also Begonias, Chrysanthemums, and Decorating; excellent references; age 25; married when suited. J. M., Penzance Lodge, Arthur's Hill, Shanklin.

GARDENER (Head, where two or three are kept). H. WEEKS, Thrumpton Hall Gardens, Derby, can highly recommend N. DRING, as above; thoroughly experienced in all branches; age 28; total abstainer

GARDENER (Head of Two or Three or more).—W. H. PARTON, Carnation Specialist, highly recommends W. CARPENTER; thoroughly capable in all branches; 23 years' experience; last place 5½ years; married, two children. CARPENTER, Church Road, Yardley Wood, near Birmingham.

SUTTON AND SONS, The King's Seedsmen,
READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s., post free, from KELWAY and SON, LANGPORT, SOMERSET.

From an article in "The Field," August 12th, 1911, on The Best Gardening Books:
"I do not know of anything dealing with herbaceous borders more comprehensive than Kelway's Manual."

NOW is the time to plant KELWAY'S DELPHINIUMS—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.

——, Esq., ——, Ravenscourt Park,
London, W.

"The Delphiniums you sent me some years ago have been a great success, and have been much admired."

Choice named collections, 15s., 24s., 34s., 56s. a dozen.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

——, Esq., Putney, S.W.

"The Delphiniums, Carnations, and Picotees have arrived safely, and beautifully packed. There were two plants more than I had a right to expect. Everything is obviously in splendid condition, and I thank you for your careful attention to my humble order."

NOW IS THE TIME TO PLANT KELWAY'S NEWEST GLADIOLI.
These New Gladioli are a revelation. They have taken America by storm, and should be planted in this country by all who want glowing effect of colour in their beds and borders, and flowers for the house in July, August, and September. Kelway's large-flowered Gladioli have received more Medals and Certificates than any plant of modern times. We recommend trial of a selection of our "Cream of the World" Collection of named varieties, flowering bulbs; for instance, one dozen for 9s.
Full descriptive list of this Collection on application. Postage free for remittance with order.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

## NOTE OF THE WEEK.

### Environment.

In the process of evolution of both animals and plants, the innate power of adaptation to different circumstances of their surroundings has undoubtedly played the chief rôle in bringing about that wonderful diversity which characterises their innumerable types. It must be largely due to this power that we owe all the orders, genera, and species, and also the varieties with which particularly it is the province of the animal breeder and the selective horticultural and agricultural cultivator to deal. Nevertheless, despite the immense amount of study which has been devoted to the question as to how far the power of response to environmental stimuli has led up to this diversity, it is still regarded as an open question, and the actual cause of variation as an entirely unsolved one. Some scientists maintain that without a change of environment species remain constant; but there is a great mass of evidence on the other side, in the shape of quite unaccountable "sports," where the environmental conditions appear to be identical, which go far to contradict that theory, and leave the question as much as ever in statu quo ante. In point of fact, the great mystery of the "cell," and the profundity of the marvel which is incorporated in the "nucleus" of that cell, are embodied in matter of so microscopic a nature as practically to defy investigation; and, as it is precisely in the primary cell of every "sport" that the subtle change is introduced, or originates, which eventually leads to difference of structure and even of function, the difficulty is enhanced by the fact that when such difference appears it is far too late to investigate its origin, much less to ascertain whether any environmental local difference determined it. Environment, too, is a very broad term, since, in the case of a plant, it embraces not merely the temporary local conditions of the habitat of the individual concerned, nor those of climate, soil, humidity, etc., but also the varying phases of these throughout its existence, and even prior to it, as affecting its immediate parents and ancestors, from whom it derives its constitution and peculiarities. It also embraces its relations with all the other forms of organic life which may affect it either as friend or foe. In an ordinary garden, where everything is done that can be done to favour plant development, the environment, viewed superficially, may appear to be simple enough, but in point of fact no two spots are identical in this respect. The soil, however carefully tilled, is never quite homogeneous; the tender rootlets of young plants are unequally favoured or handicapped; and below the surface the competition of other roots, the intrusion of worms, etc., come in as disturbing factors. Above the soil the presence or absence of neighbouring walls or trees, or other plants, determines differences of shelter from, or exposure to, wind and sun at all points; while in the plant concerned, it may have flavours or odours which repel or attract other organisms, all of which, as we have said, must be regarded as environmental factors. The soil itself, apart from its chemical constituents, permeability, or otherwise, is, as of late years we have learnt, a veritable cosmos of minute life, which exerts its influence in varied degrees, and which are bound to be affected by external conditions, and therefore to vary as do the plants themselves, thriving here and failing there, and thus inevitably adding to the complication of factors which render the environment even in a small suburban garden anything but a simple matter of light and shade. Added to all this, we have the most variable factor of all, the weather, with all its innumerable phases of wet and dry, heat and cold, calms, gentle breezes, and stormy winds, each and every one of which plays its part as an environmental factor in the life of a plant; and, in the case of an old tree, has had a definite record, if we could only decipher it, written in every ring of its massive trunk. Bearing all these diversities in mind, and remembering that they are universal, it is seen how difficult it must be to determine the underlying cause or causes of responsive variation to which specific evolution undoubtedly owes so much, but which, for the reason given, we can only assume as such, but not assert.

MR. J. ROGERS,
Superintendent of Battersea Park.

**Mr. J. Rogers.**—The superintendent of a large and important London park must needs have ability of no mean order, wide experience, and cultural and executive skill. Such qualities are to be found in Mr. J. Rogers, who has been superintendent of Battersea Park, one of London's most beautiful and famous open spaces, since May, 1902. He commenced his gardening career at an early age at Hursley Park, Hants, then the residence of the late Sir W. Heathcote, Bart., and added to his experience by a course of training in several private establishments in Hampshire. In 1877 he came to London, and became employed at Finsbury Park, then under the Metropolitan Board of Works. After several years' service there he was sent to Highbury Fields as foreman in charge of the work of laying out that open space. Afterwards he was foreman at Southwark Park, and in July, 1892, was appointed superintendent of the Royal Victoria Gardens, North Woolwich. Five years later he was transferred to Kennington Park, and early in 1900 was promoted to the superintendence of Waterlow Park, Highgate. Promotion to Southwark Park followed, and then came his appointment to the charge of Battersea Park. For twenty years he has been a parks superintendent in London, and has had charge of five different parks. He holds the record for long service among the parks superintendents under the London County Council, and during his service has seen many changes in the system of control and management, and in the public demands. We have so frequently referred to and illustrated examples of Mr. Rogers' work at Battersea Park, that it would be superfluous to add verbal commendations here. Indeed, Mr. Rogers would prefer that his works should praise him.

**The Royal Gardens, Kew,** promise to be unusually attractive this Eastertide. The season is an early one, and at the moment of writing there have been no serious frosts or heavy gales to spoil the beauty of the early spring flowers. The magnolias are especially fine, as also are the yellow forsythias, while the double-flowered peaches near the Directors' House and the large bed of flesh-coloured ones near the Victoria Gate are magnificent. The amelanchiers and many pyruses and prunuses will also be in bloom, while daffodils appear on every hand, in the grass, in beds and borders, on the Cumberland Mound, in great drifts near the North Gallery, and elsewhere. Tulips add their quota of gay colouring, and in the Conservatory (No. 4) and the Temperate House flowering shrubs and greenhouse flowers are making a brave show. The Rock Garden is bright with hardy heaths, saxifragas, anemones, cardamines, chionodoxas, muscaris, pulmonarias, primulas, erythroniums, and a host of other beautiful plants, while the greenery of the freshly-mown lawns and the newly-expanding leaves of many trees and shrubs add to the many attractions. In the Succulent House the Blue Amaryllis (Hippeastrum procerum) is flowering, and just outside the house is a giant specimen of Agave atrovirens coming into flower. This plant is about 9ft. high, and a dozen feet through, whilst its huge flower-spike reaches about 18ft., and is still growing. All being well, it will begin to branch from the upper portion ere long, and then produce its flowers, probably about the time of the International Horticultural Exhibition.

**Perpetual-flowering Carnation Society.**—The committee of this society have decided to entertain the American and Continental carnation growers who are visiting the Royal International Horticultural Exhibition. In accordance with this decision, the committee have arranged for a banquet at the Holborn Restaurant on Thursday, May 23, 1912.

**Fruit Prospects.**—The plum trees are now enveloped in their snowy blossoms, and the great display of flowers that whitens the landscape in districts in which plum orchards have a place is giving rise to considerable discussion as to the prospects of the yield of hardy fruits in the current year. Those who hold optimistic views suggest that, as a consequence of the thorough ripening of the wood last year, the flower buds are so abundant as to practically ensure a crop of fruit. Other observers, who are more or less pessimistic, regard the development of the flowers thus early as a certain indication of an indifferent fruit harvest. It is, however, too early to formulate an opinion on which to base an estimate of the yield of the various kinds of hardy fruit. Flower buds are plentiful, and appear to be well developed, and there will consequently be a fine display of bloom. It need hardly be pointed out, for it is a matter of common knowledge to those who take an interest in fruit culture, that the earlier the period of flowering the greater is the risk of injury from frost. It is not however, invariably the case that early flower-production is followed by a shortage in the fruit supply, or that late flowering is followed by an abundant harvest. The next six or seven weeks will be a period of great anxiety to growers of hardy fruits, and but little that will be useful can be said relating thereto, excepting to advise the protection of pear, plum, and cherry trees on walls, as far as is practicable, on the same lines as peach and nectarines are protected. In gardens an endeavour should also be made to protect bush and pyramidal fruit trees, including those of apples, even if the most primitive methods of protection have to be resorted to. The shelter of a few branches of fir, or a double thickness of old fish netting, may make all the difference between a good and an indifferent crop.

**International Horticultural Exhibition.**—We have much pleasure in recording the fact that the directors of the International Horticultural Exhibition have decided to issue transferable season tickets to the public at £3 3s., admitting whenever the exhibition is open. These tickets will be a great convenience to large numbers of those who are interested in the various aspects of horticulture that will be represented at the exhibition, and their issue should contribute materially to the financial results. To the Fellows of the Royal Horticultural Society they will be a great advantage, for in pursuance of the agreement entered into by the Council of the society with the directors of the exhibition every Fellow can purchase one of these season tickets, at a cost of £2 2s. 6d. As with all other R.H.S. privileged tickets, they can only be had by Fellows, who apply direct to the R.H.S., in accordance with the directions given on page 276 of the last Journal. Fellows who have already ordered tickets from the R.H.S. can, if they wish, change their order into a season ticket by transmitting the difference in cost, together with express instructions that their previous cheques, etc., be taken as part-payment for the season ticket. Each Fellow can only purchase one season ticket at the reduced rate.

**Presentation to Mr. W. E. Barnett.**—Much regret will be felt by all who have taken part in the great flower shows annually at Wolverhampton that Mr. W. E. Barnett has, through ill-health, been compelled to resign the secretaryship of the Wolverhampton Floral Fête. Mr. Barnett held the position he has just vacated for twenty-one years, and has seen the annual exhibition grow from a really small gathering to one of first-rate importance. At the recent general meeting the following resolution was unanimously carried: "That the members of the Wolverhampton Floral Fête, having received the resignation of their respected secretary, desire to express their deepest regret at the circumstance, and their sincere appreciation of, and thanks for, the very faithful and valuable services he has rendered in the important position he has held during the past twenty-one years, and at the same time their best wishes for his speedy restoration to health. That, as a slight token of appreciation of Mr. Barnett's invaluable services to the Wolverhampton Floral Fête, an honorarium of £150 be voted to him and sent with a copy of this resolution." Councillor R. F. Amphlett, of Messrs. Adams and Amphlett, of Darlington Street, Wolverhampton, has been unanimously elected as successor to Mr. Barnett, and those who are interested in the fête, and are acquainted with his abilities, are much gratified by his having consented to assume the responsibilities of the office.

**Trial of Violas at Wisley.**—The Rev. W. Wilks informs us that the president and Council of the Royal Horticultural Society have arranged for a trial of violas, to be conducted at the Wisley Gardens during the season of 1912. It is hoped that a large number of varieties will be sent to the superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey, for this purpose, that the trial of so important and popular a flower may be made as useful as possible. Six plants of each variety should be sent at once.

**Presentation to Sir William Schlich.**—The officers of the Indian Forest Department, and the probationers for that service now under instruction at Oxford, have presented Sir William Schlich with a handsome Burmese silver bowl bearing a suitable inscription, and a cheque, on the occasion of his retirement after forty-five years' service. On the completion of nineteen years' service in India Sir William Schlich retired from the post of Inspector-General of Forests, and organised in 1885 the first School of Forestry in this country in connection with the Royal Indian Engineering College at Cooper's Hill. On the closing of the latter, the Indian School of Forestry was, in 1905, transferred to the University of Oxford. Under the late orders of the Secretary of State for India the State endowment of the chair has come to an end, but Sir William Schlich hopes to raise a sufficient sum for the endowment of a chair of forestry at the University of Oxford. He has decided to give the proceeds of the cheque presented to him, further augmented by himself, as the first donation to the endowment fund.

**New Open Space at St. Leonards.**—The owners of the gardens in the lower part of Warrior Square, St. Leonards-on-Sea, offered to present them for the use of the town. The Corporation of Hastings accepted the offer, and have decided to adapt them to public use and construct a sunken band-stand, at a cost of £4,500.

**The Flower Spikes of Eremuri** have become very popular in Paris within recent years for decorative purposes, and a considerable demand for them has arisen in the Parisian markets. Owing to the extension of their culture in the market gardens in the vicinity of the city, the prices have been considerably reduced during the past year or two, and now range from one to four francs per spike.

**Doubleness in Stocks.**—In the fourth part of the "Journal of Genetics," Miss E. R. Saunders contributes a paper on the inheritance of doubleness and other characters in stocks, in which she follows up her conclusions that have been previously published. Having proved to demonstration that certain single races of stocks produce single flowers, while others, ever sporting, produce both double and single blossoms, and that the pollen grains apparently all carry doubleness, while the ovules carry in some cases double and in others single characters, Miss Saunders now shows that the sulphur-white, a double throwing race, is also highly sportive in regard to colour of the seed-bearing parent. She states that the singles are all white, and the majority of the doubles are cream-coloured. Miss Saunders also gives expression to the belief that plants destined to produce double flowers are more vigorous in growth than are those which will bear single flowers.

## ROYAL HORTICULTURAL SOCIETY.

There was a full hall again at Westminster on April 2, and there was a grand display of glorious daffodils, a fair display of orchids, flowering shrubs, roses, and carnations. The attendance was also good, but the people seemed to be in a holiday mood.

### FLORAL COMMITTEE.

Messrs. J. Veitch and Sons, Chelsea, exhibited some new shrubs, the chief of which were the white-flowered Viburnum Davidi (A.M.), Camellia cuspidata (A.M.), with white flowers, Pæonia Delvayi with elegant foliage and red flowers, Dipelta ventricosa, with tubular pink, white, and yellow flowers, and the green-flowered Decaisnea Fargesi. The camellia and the viburnum promise to be good garden plants, and have stood several winters at Coombe Wood; the viburnum is evergreen, and has deep green leafage. Messrs. J. Cheal and Sons, Crawley, exhibited some flowering shrubs, and choice things among them were Hydrangea macrocephalum, Spiræa arguta, double peaches, and standard cytisuses. Mr. E. Renthe, Keston, had a large and interesting exhibit wherein camellias, magnolias, Himalayan rhododendrons, skimmias, hardy heaths, pieris, etc., were associated with hardy primulas, daffodils, etc. Set amid bamboos and Japanese maples, Messrs. J. Piper and Sons, Bishop's Road, Bayswater, displayed Daphne Fioniana, Primula malacoides, Caltha polypetala, the gay Azalea amœna Hinodigeri, and other choice hardy flowers.

A beautiful group of double-flowered peaches, Pyrus malus atrosanguineus, P. Scheideckeri, and P. angustifolius fl. pl., all in pots, and grandly smothered in blossom, was arranged by Messrs. Wm. Paul and Son, Waltham Cross. Clematises and hardy flowers in variety were exhibited largely by Mr. L. R. Russell, Richmond. Messrs. R. Gill and Sons, Falmouth, had a group of lovely varieties of Himalayan rhododendrons; Duke of Cornwall, Gill's Triumph, Beauty of Tremough, Shilsoni, and forms of R. arborea, with R. argenteum, and R. Thompsoni formed a fine exhibit.

Mr. C. Fielder, V.M.H., gardener to Miss Willmott, V.M.H., Warley Place, Essex, staged a very interesting collection of Primula viscosa hybrids, the colours ranging from white to deepest rose-red and purple. P. Warleyensis (A.M.) is a little low-growing kind, with bluish lilac flowers about as big over as a shilling, and freely borne on the tiny plants. Mr. Jas. Douglas, Edenside, Great Bookham, presented a collection of auriculas, the colouring being most varied, and the plants finely grown. He also exhibited several new forms of much merit of Primula intermedia, of which the finest was Mrs. J. Douglas (A.M.), the flowers large and the colour rich purplish blue.

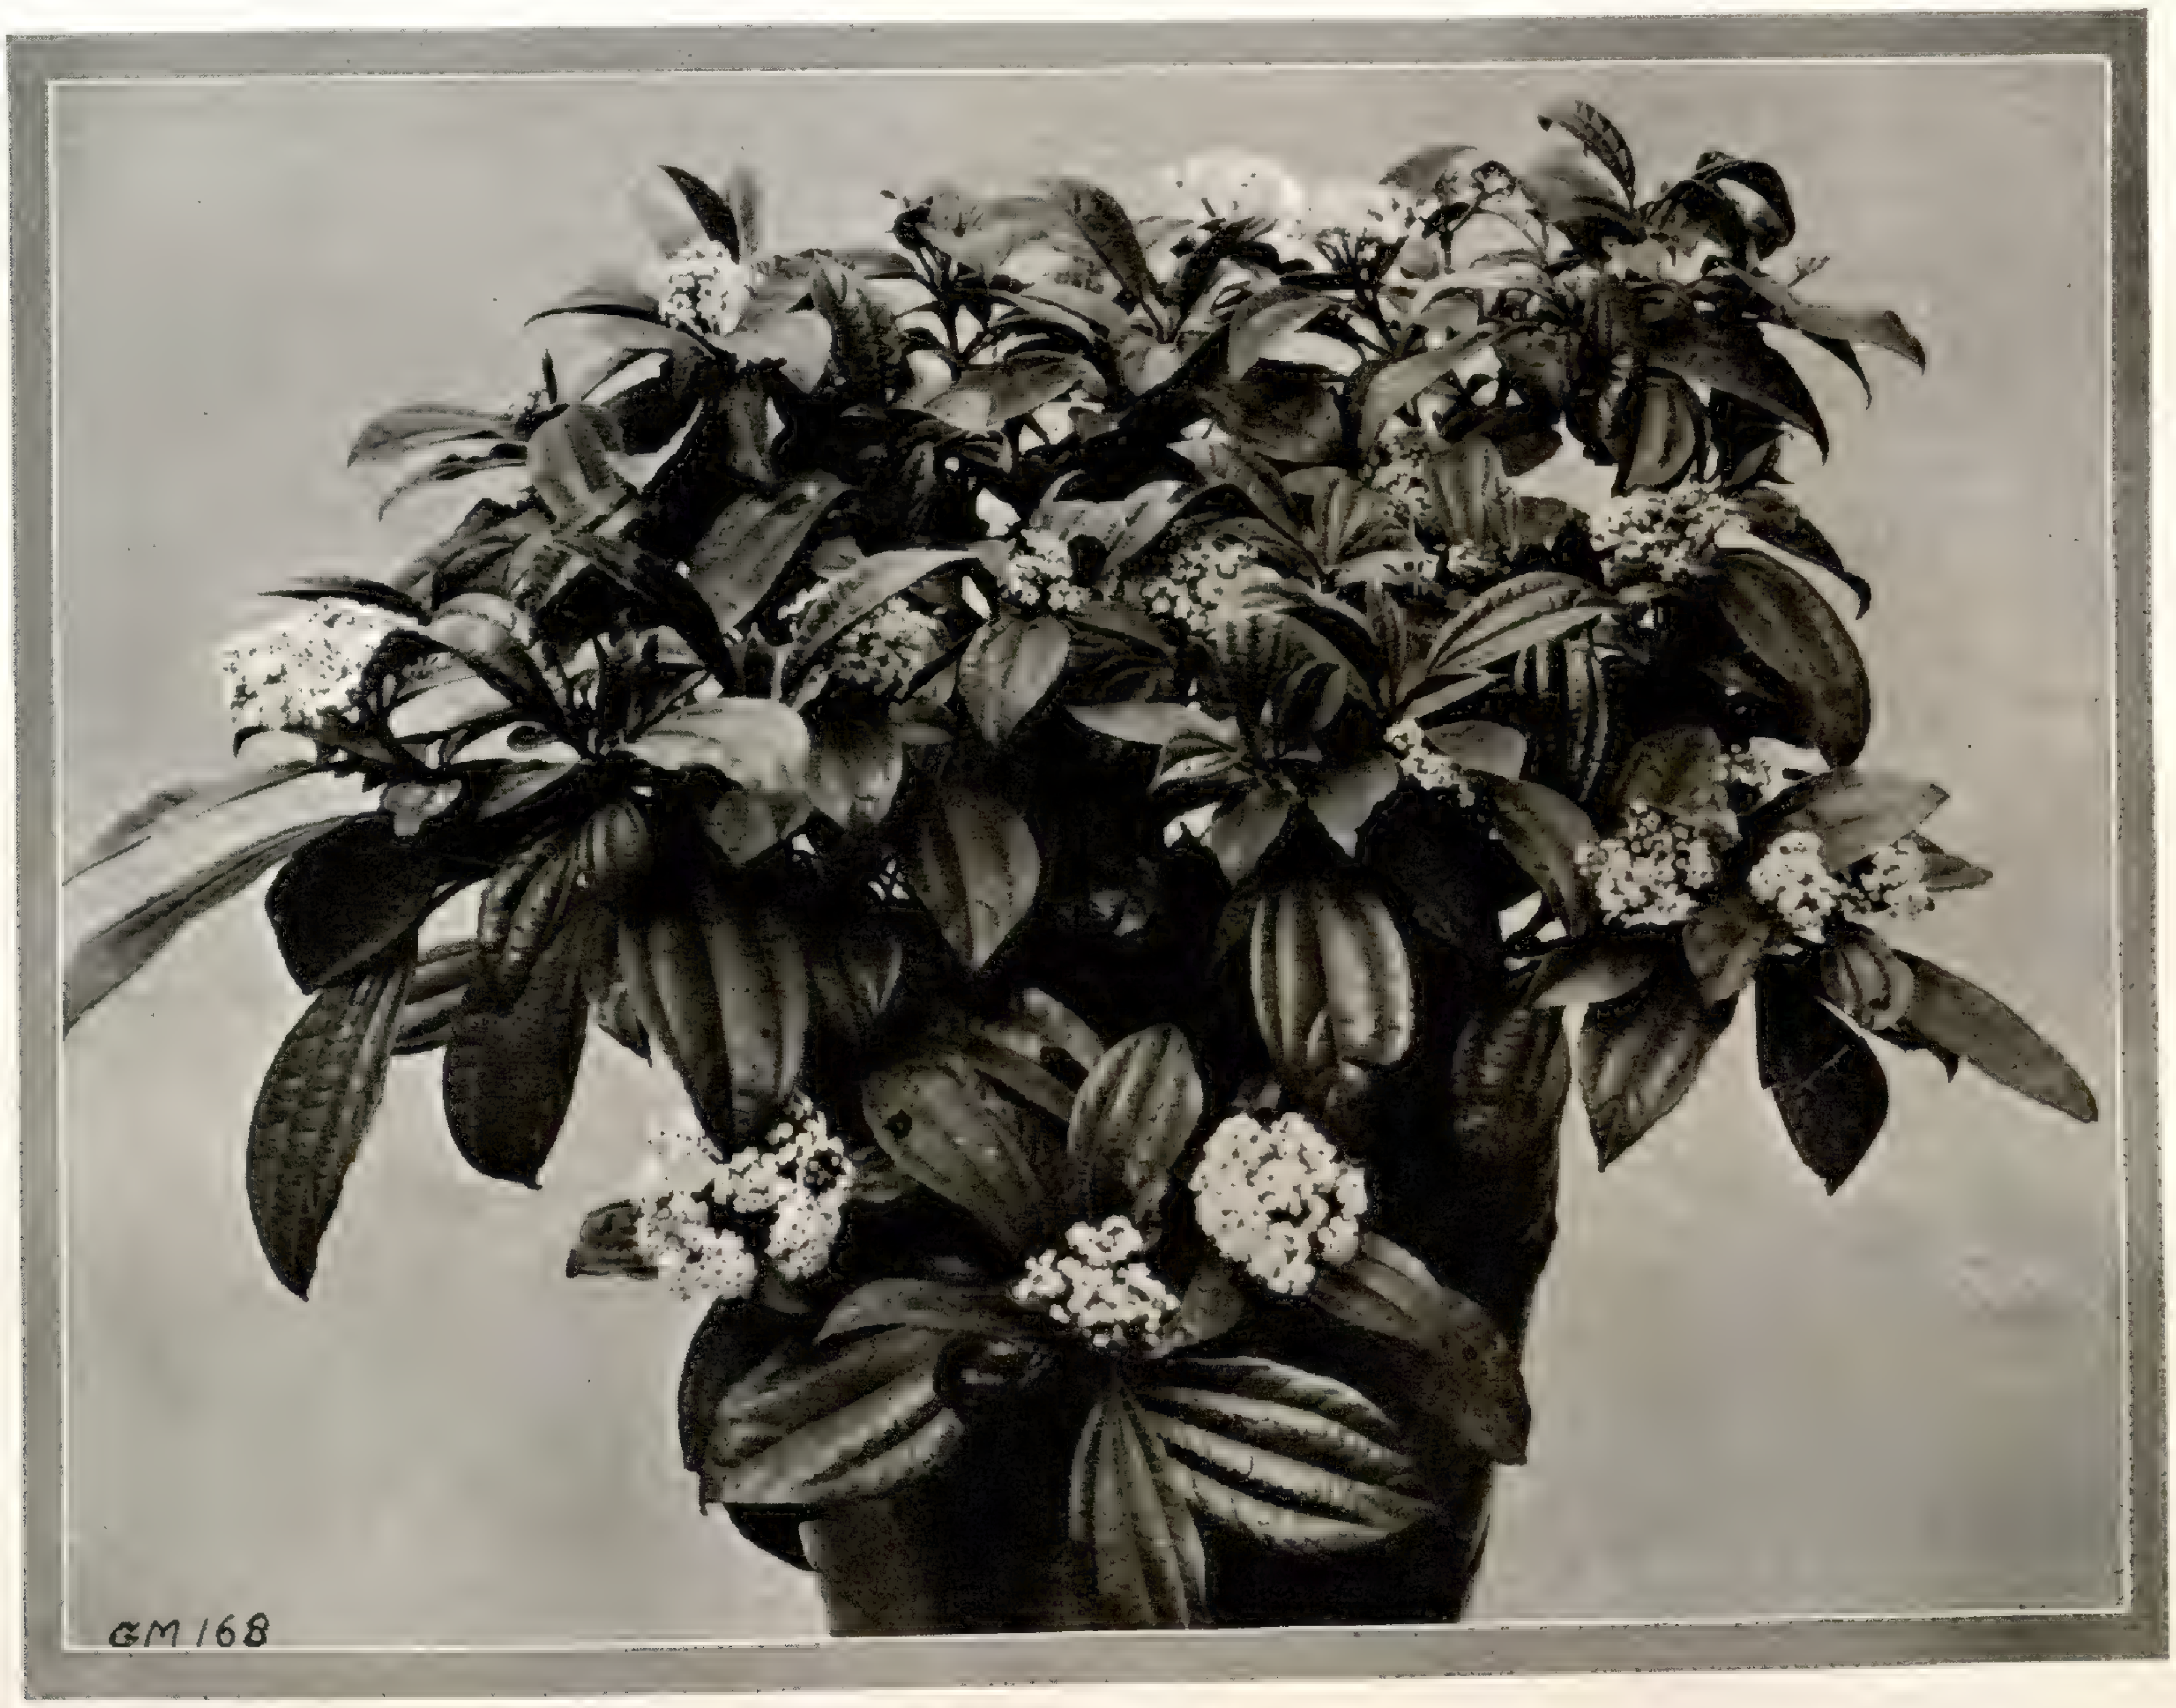
Messrs. Whitelegg and Page, Chislehurst, exhibited a pretty rock garden in one of the annexes, and on it displayed splendid masses of the dainty Saxifraga Bakeri, a particularly attractive subject for the rockery, as also another very fine variety named S. H. T. Stokes, the brilliant S. Red Admiral, which is certainly unsurpassed for vivid colouring of its large, well-formed flowers; and the fine S. Clibrani, which has beauty of form and foliage, as well as handsome flowers; they also staged their very fine new Geum Mrs. J. Bradshaw, a first-rate garden plant. Messrs. R. Wallace and Co., Colchester, were represented by Iris bucharica, aubrietias, Primula viscosa Mrs. J. H. Wilson, and other beautiful little plants.

Messrs. W. Fells and Co., Hitchen, and Messrs. J. Peed and Sons, Norwood, were exhibitors of hardy flowers, chiefly alpines. Mr. Jas. Box, Lindfield, contributed a pretty collection of anemones, primulas, and saxifragas. Messrs. Bakers', Wolverhampton, grouped Primula vera, P. frondosa, Phlox subulata, Viola gracilis, and Ranunculus montana—the latter a lovely little buttercup—on rockwork. The Guildford Hardy Plant Company had also a collection of hardy and alpine flowers. Messrs. Thompson and Charman, Bushey, were other contributors of rock gardening.

Messrs. T. S. Ware, Lim., Feltham, had colonies of Trillium californicum, Saxifraga Bathonensis, Lithospermum Heavenly Blue, Primula frondosa, P. cortusoides, aubrietias, and the large white saxifraga Arkwrighti. Messrs. G. Jackman and Son, Woking, presented colonies of Iris excelsa, I. cyanea, I. pumila Cœlestis, Muscari botryoides alba, Tulipa Greigi, and Erica mediterranea, and its white form. Primulas of the cashmiriana group, Aubrietia Prichard's A1, Daphne cneorum, the noble Caltha palustris fl. pl., and C. polypetala, with several good saxifragas, made up a pretty rock garden display from Mr. Maurice Prichard.

Messrs. H. B. May and Son, Edmonton, grouped gardenias with Rose Tausendschoy, plumose nephrolepsis, clematises, and polyantha roses. Messrs. Mount and Sons, Canterbury, displayed grand flowers of Liberty, Mrs. C. Reed (A.M.), a new cream-pink H.T. rose; Mrs. E. Alford (A.M.), a lovely rich pink H.T. variety of great beauty; and the yellow Lady Hillingdon. Among the roses displayed by Mr. George Prince, Oxford, the long flowering growths of Wm. Allen Richardson and Maréchal Niel were as attractive as the big blooms of Juliet and Mdme. Jules Gravereaux. Messrs. Frank Cant and Co., Colchester, set up some lovely rose blooms under the clock, their Lyon Rose, Molly Sharman Crawford, Lady Alice Stanley, and Mrs. Walter Easlea being very fine.

The graceful Lachenalia Nelsoni was splendidly shown by Messrs. R. and G. Cuthbert, Southgate, and a display like this was will do much to popularise a deserving plant; the firm also contributed corner groups of lilacs, magnolias, Ghent azaleas, wistarias,



VIBURNUM DAVIDI.
An evergreen Chinese species, with white flowers. A.M., R.H.S., April 2. Messrs. J. Veitch and Sons.

and laburnums. Messrs. Felton and Sons, Hanover Square, exhibited a lovely fragrant lot of lilac sprays, arranged in very artistic cane-plaited receptacles.

Cinerarias and Primula obconica formed the bulk of the contribution from Messrs. Jas. Veitch and Sons, Chelsea. Of the former their Feltham Beauty, in dark blue, carmine, white, pink, and light blue varieties were very attractive, while the striped Pompadour was very quaint and distinct, and the brilliant Matador attracted everyone. A table of cut zonal pelargoniums from Mr. H. J. Jones, Lewisham, provided a rare blaze of colour. A number of the varieties were Ryecroft seedlings, and these show exceptional vigour, and bear big blooms on huge trusses; Fred Gulliver, Mrs. Bunting, Mrs. Tom White, Harry James, and Nellie Hemsley appealed strongly to our taste.

Various greenhouse-flowering plants from Messrs. S. Low and Co., Enfield, included acacias and new hydrangeas, and perpetual carnations in great variety and beauty. Mr. Phillip Ladds, Swanley Junction, again exhibited the fine Salmon Paul Cramfel zonal pelargonium, and a very attractive rich pink variety, named Ambrosia (A.M.).

Mr. H. Burnett, Guernsey, once more delighted everyone with his splendid perpetual carnations, especially his Mrs. C. Raphael, White Wonder, and Marmion. Messrs. Allwood Brothers, Haywards Heath, and Messrs. W. Wells and Co., Merstham, both staged good collections of perpetual carnations.

Messrs. Young and Co., Hatherley, Cheltenham, put up a fine exhibit of perpetual carnations, and set up their flowers in excellent style. We were particularly struck by the fine vases of Marmion, the new A. S. Montgomery, Irene, a bright cerise; Cheltonian, Duchess of Devonshire, White Perfection, Mikado, and Havard. Messrs. W. Cutbush and Son, Highgate, presented good vases of Winsor, Enchantress, Mikado, Mrs. Fortescue, and Lord Rothschild carnations, and a capital exhibit of lilacs, the lovely fragrant Viburnum Carlesi, Iris bucharica, Iris iberica, Rhododendron Pink Pearl, and Magnolia Lennei.

## ORCHID COMMITTEE.

Mr. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, sent up several handsome forms of Odontoglossum crispum and O. percultum. The white-petalled Cattleya Luddemanniana Stanleyi, shown by Mr. E. V. Low, Haywards Heath, was greatly admired. F. M. Ogilvie, Esq., The Shrubbery, Oxford, showed Lælio-cattleya Myra finely, and also Brasso-cattleya Cliftoni.

Cymbidium Pauwelsi Dell variety (F.C.C.), carrying a grand arching spike of twenty large creamy buff, brown-marked flowers, was exhibited by Mr. Shill, gardener to Baron Bruno Schröder, The Dell, Egham. Odontoglossum His Majesty, of perfect shape, was staged by Mr. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester. A fine plant of the green and black-flowered Cœlogyne pandurata, carrying a spike of ten flowers, came from Messrs. Armstrong and Brown, Tunbridge Wells.

Messrs. J. Veitch and Sons, Chelsea, showed Lælio-cattleya Oroma (A.M.), a large, rich purple flower with crimson-purple lip; and Lælio-cattleya Frederick Boyle Veitch's var. (A.M.), very beautiful. Francis Wellesley, Esq., Woking, put up the splendid Cattleya Trianæ F. McBean; and Walter Cobb, Esq., Normanhurst, Horsham, brought Odontioda Goodsoniæ Cobb's var. (A.M.), with scarlet and rose coloured flowers and a white-tipped lip. Sir Trevor Lawrence's Lælio-cattleya Trimyra, a broad flower of lovely orange-yellow hue, worthily gained a F.C.C.; Mr. White also brought a number of yellow seedling dendrobiums and some finely-flowered masdevallias from the Burford Lodge collection.

Odontiodas were charmingly shown by Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham; these were forms of O. Charlesworthi, O. Cooksoniæ, O. Chessingtonense, and O. Bradshawiæ. Messrs. Hassall and Co., Southgate, were represented by the showy Cattleya trianæ Backhousiana, Cymbidium Lowianum concolor, and a fine Odontoglossum percultum. Messrs. J. and A. McBean, Cooksbridge, showed some capital odontoglossums, good forms of Cattleya Trianæ, and Odontioda Cooksoniæ.

Messrs. Sander and Sons, St. Albans, had a quite large exhibit of orchids, the whole of the centre being occupied by lovely forms of Cattleya Schroderæ; flanking these were Renanthera Imschootiana, Brasso-cattleya Mdme. Chas. Maron, Miltonia St. Andre, Cypripedium Roger Sander (A.M.), a cross between C. glaucophyllum and C. Godefroyæ, and many good odontoglossums.

Messrs. Stuart Low and Co., Enfield, showed oncidiums extensively, with Cattleya Schroderæ, L.-c. Dominiana, Lycaste Balliæ, and dendrobiums.

The odontoglossums and odontiodas exhibited by Messrs. Charlesworth and Co., Haywards Heath, were very graceful, and among the latter were noted O. Bradshawiæ, O. Vuylstekiæ, O. Felicia, and O. Lambeauianum; Lælio-cattleya Bella alba, L.-c. Feronia, and the buff-pink L.-c. Calabria were other good things.

## DAFFODIL COMMITTEE.

A large collection of daffodils, well set up by Messrs. Barr and Sons, Covent Garden, W.C., contained a very large number of new varieties; we have only space to mention a few, such as Ruby, orange cup; Lolah, a white trumpet; Clothilda, yellow flat crown; Hippolyta, a big incomparabilis; Bride of Lammermuir, cream trumpet; Aurelius, deep golden-yellow; Golden Jubilee, a fine rich incomparabilis; Ruby, a deep red crown; Cleopatra, Herod, Cassandra, etc.

In the group of daffodils from Mr. F. H. Chapman, Rotherside Gardens, Rye, there were a number of very dainty seedlings that included Rotherside, a white-petalled Barri form; Searchlight, with lovely deep orange cup; Sentry, an improved Beacon; and a number of large-flowered unnamed triondrus hybrids of great beauty. Besides these Mr. Chapman had a number of the newer daffodils already in commerce.

Messrs. Cartwright and Goodwin, Kidderminster, had an effective exhibit of daffodils, chiefly new sorts; Circlet, Creole, Harry James, Chough, Southern Star, Dorothy Pearson, Incognita, and Mohican formed a good set of flat-crowned varieties; Giant Leedsi forms were also well shown.

Messrs. J. Carter and Co., Raynes Park, contributed another very pretty spring flower garden. There was a background of conifers, with a low rockery in front, this latter filled with aubrietias, muscaris, squills, and daffodils. The foreground was a lovely green lawn, with two beds of King Alfred daffodils and a central square pool of water, with high fountain and a surrounding margin of anemones, polyanthuses, scillas, and daffodils.

Messrs. J. R. Pearson and Sons, Lowdham, Notts, presented a very cheerful lot of daffodils, all very bright and fresh. The giant Leedsi forms were very much in evidence, while of special importance were La Lune, a primrose trumpet with white perianth; Tamerlane, Macebearer, Hon. Mrs. Franklin, Patrician, Orange King, a broad rich golden trumpet variety named King George, Gold Cup, Argent, and Margaret.

The Darwin tulips grown in bowls of fibre and shown by Messrs. R. H. Bath, Lim., Wisbech, were very fine, especially such varieties as Pride of Haarlem, King Harold, Bartigon, Isis, Clara Butt, and Wm. Copeland. Among the daffodils staged by this firm Lowdham Beauty was exceptionally large and good; Firebrand, Fireflame, Pearl of Kent, Homespun, Diana, Lord Kitchener, and Rivalis, the latter a white trumpet variety of great beauty.

Messrs. R. and G. Cuthbert, Southgate, arranged a big group of tulips in pots, across the end of the hall, staging each variety in some quantity. Messrs. J. Veitch and Sons, Chelsea, had a bright exhibit of daffodils; the varieties were staged in rather large bunches. King Alfred, Van Waveren's Giant, Glory of Leiden, Silver Spur, Sunrise, and Blackwell were conspicuous varieties.

A fine bank of tulips from Messrs. W. Cutbush and Son, Highgate, provided a fine display of colour. The flowers were good, and the varieties numerous. A collection of this sort has a distinct educational value. Couleur Cardinal, Pres. Taft, Keizerkroon, Prince of Austria, Golden Lion, Rose d'Amour, White Joost van Vondel, Gris de Lin, Wouverman, and Ophir d'Or make up a good selection of varieties.

Miss F. W. Currey, Lissadel, Ireland, had a pretty and well-arranged group of daffodils that seemed to have enjoyed their journey from the Sister Isle. The blooms were large and fresh, and they included such capital varieties as Croesus, Atalanta, and Lady of the Snows, two white trumpeters; Whitewell, Gloria Mundi; Rosetta, Bernardino, Lord Kitchener, Lyric, the handsome Great Warley, and the vivid cupped Oriflamme.

The Rev. G. H. Engleheart, Dinton, Salisbury, showed a marvellous lot of seedling daffodils, round which daffodil lovers crowded all day long. There were some dainty flowers, but the huge trumpet varieties, giants, or white, gold, yellow, and cream, were the feature of a wonderful set. Such a group as this compelled people to wonder what the end of daffodil-raising is to be.

Mr. A. M. Wilson, Shovel, Bridgwater, presented a lovely lot of seedling daffodils, many of them not yet named, while the new named sorts included such lovely flat-crowned sorts as Gold Coin, Hypatia, Gaybird, Cossack, Ivorine, Tunic, Radiant, and Tara Ranee, the latter of exquisite beauty. Buttercup, Psyche, Florizel, the double Inglescombe, and Victory were other charming, chaste, and lovely varieties.

Mr. Christopher Bourne, Simpson, Bletchley, was represented by a bright exhibit, wherein Southern Star, Duke of Bedford, Buttercup, China Ware, the fine Victory, and the neat trumpeter named Lord Muncaster, were conspicuous.

## FRUIT AND VEGETABLE COMMITTEE.

Tempting spring cabbages, from Messrs. Sutton and Sons, appeared to be the only exhibit before this committee. The varieties so admirably shown were Sutton's April, Flower of Spring, and Harbinger.

## CERTIFICATES AND AWARDS.

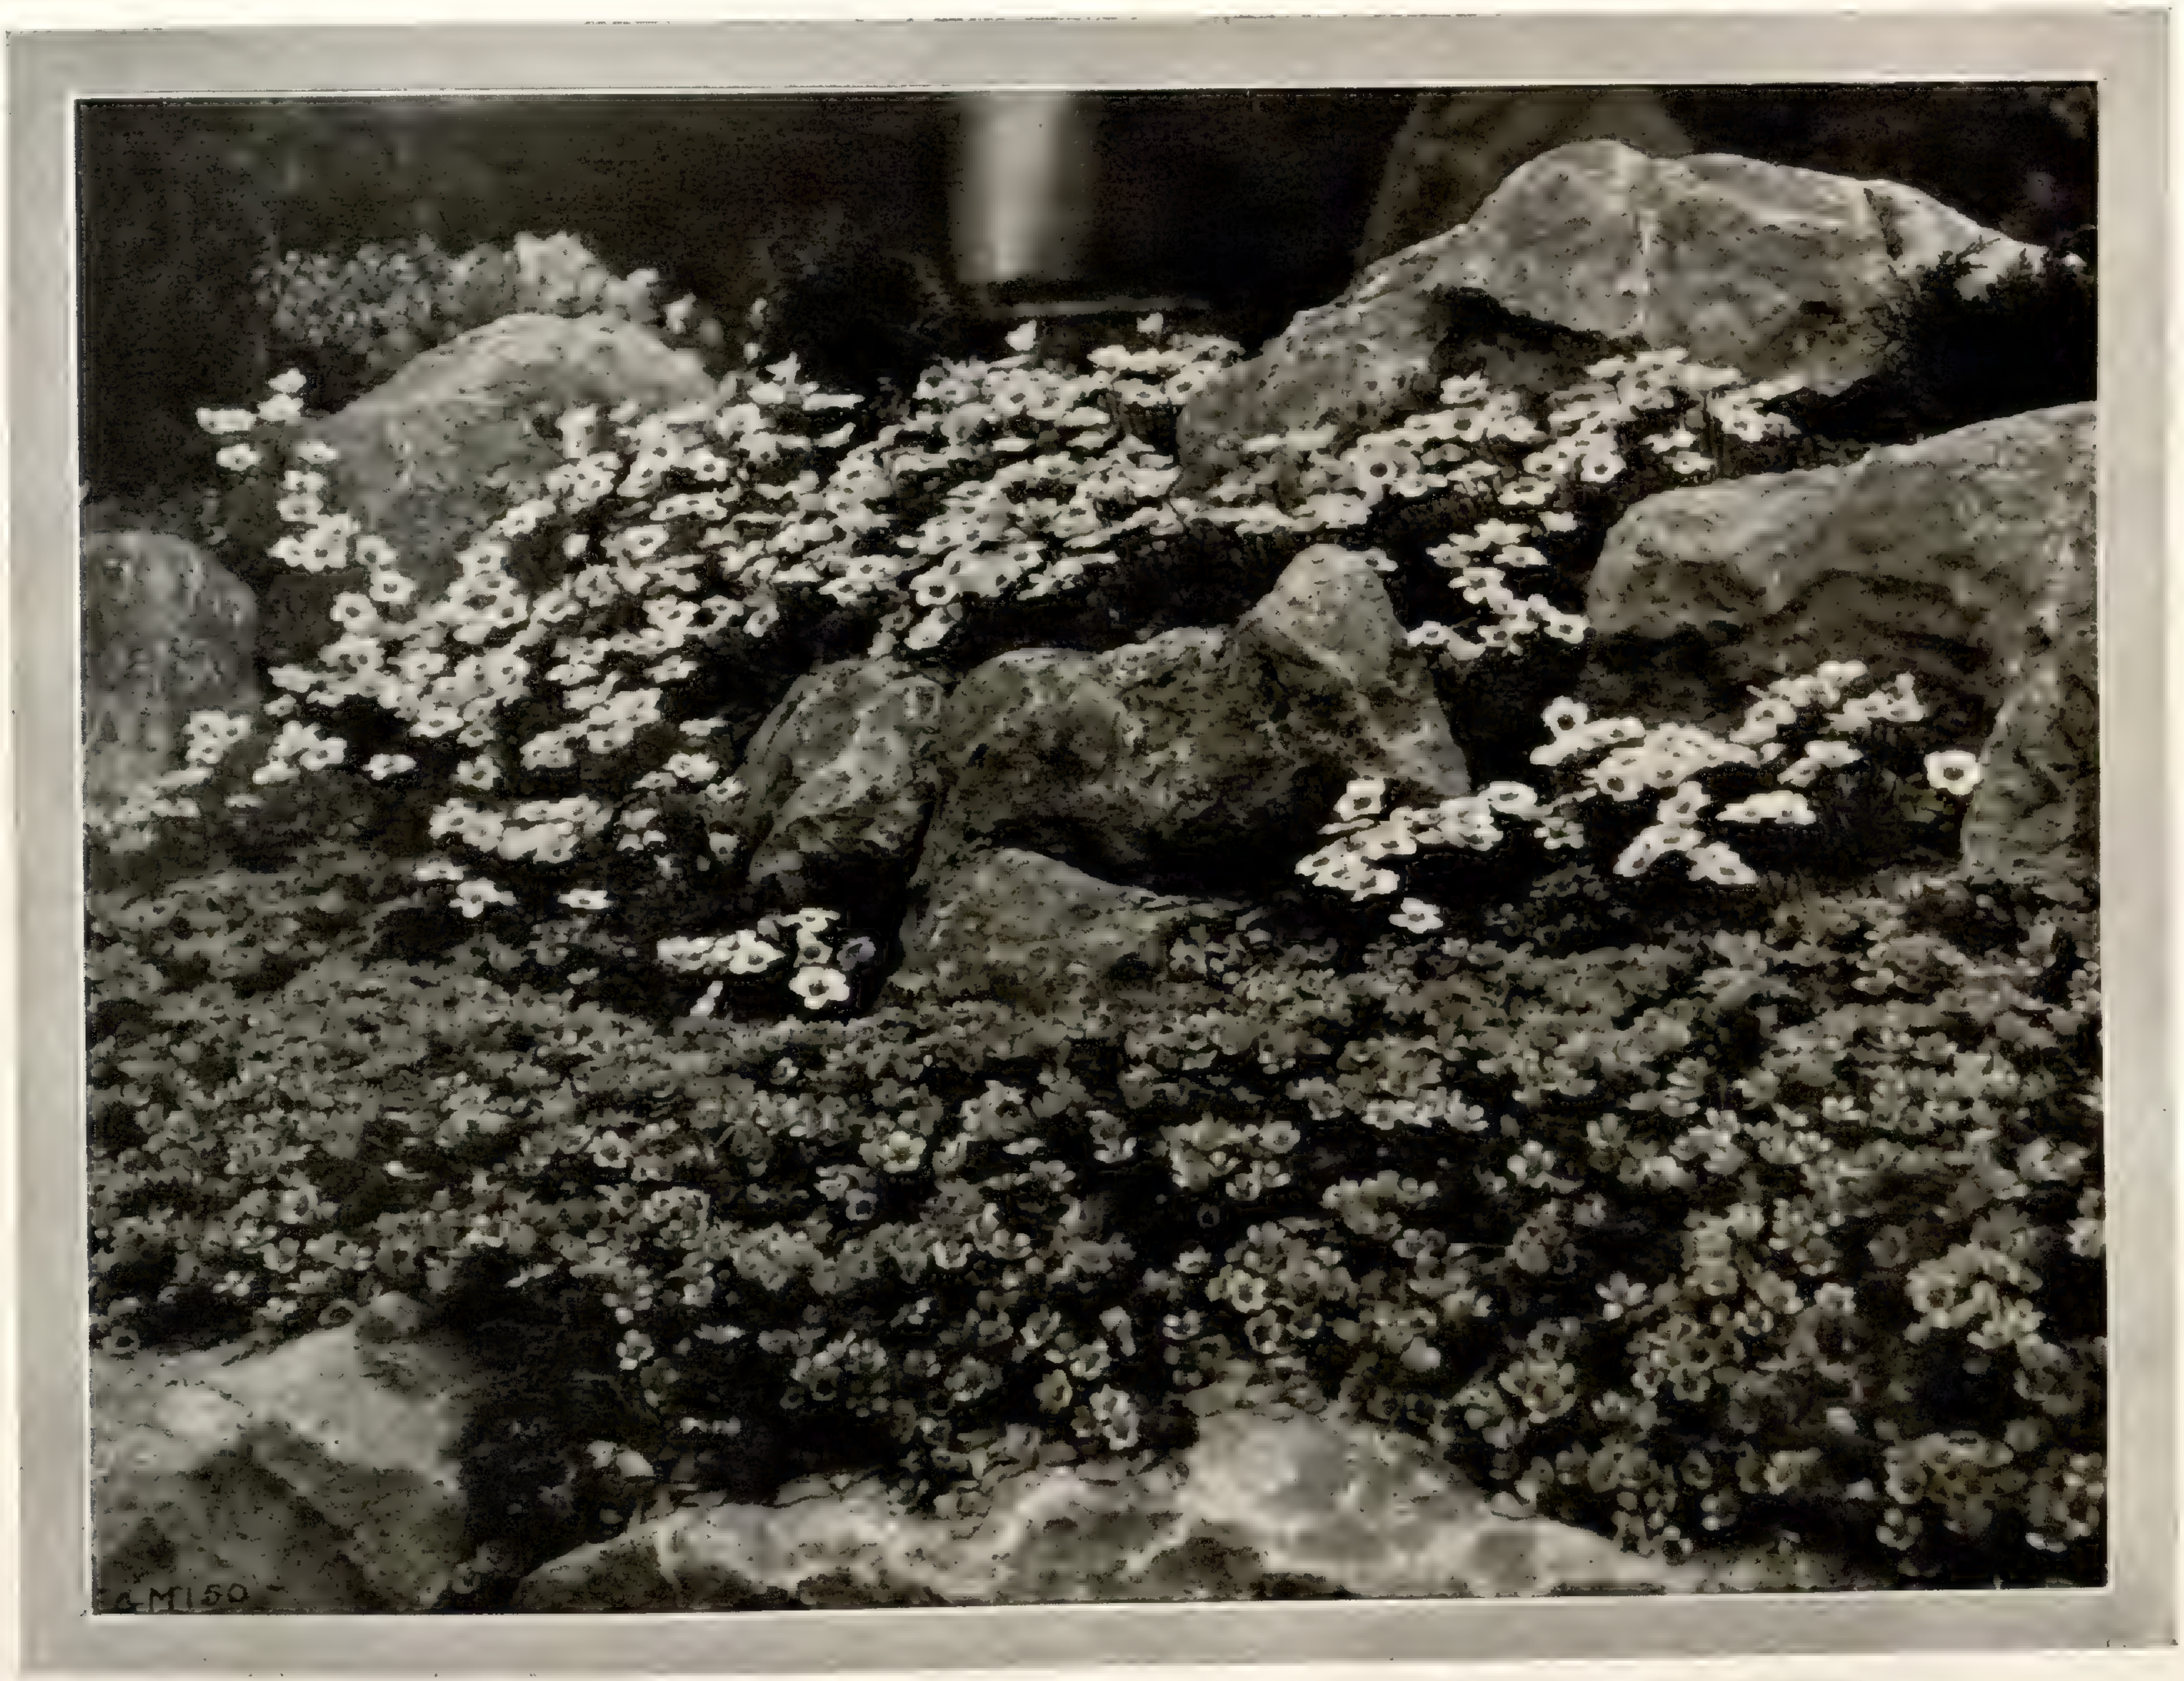
First-class Certificate.—To Narcissus Crœsus, from Mr. A. M. Wilson, Bridgwater; to Cymbidium Pauwelsi, Dell variety, from Baron Bruno Schröder (grower, Mr. Shill), The Dell, Egham; to Lælio-cattleya Trimyra, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking; and to Lælio-cattleya McBeaniana, from Messrs. J. and A. McBean, Cooksbridge.

Award of Merit.—To Narcissus Pedestal and Narcissus Killiecrankie, from Mr. A. M. Wilson, Bridgwater; to Camelia cuspidata and Viburnum Davidi, from Messrs. J. Veitch and Sons, Chelsea; to Primula Juliæ, from Mr. Baker, Oxford Botanic Gardens; to Primula Mrs. Jas. Douglas, from Mr. J. Douglas, Great Bookham; to H. T. roses, Mrs. E. Alford and Mrs. C. Reed, from Messrs. Low and Shawyer, Uxbridge; to Primula Warleyensis, from Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Great Warley; to Pelargonium Ambrosia, from Mr. Philip Ladds, Swanley Junction; to Odontioda Cooksoniæ, Cobb's var., from W. Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper, Horsham; Cypripedium Roger Sander, from Messrs. Sander and Sons, St. Albans; to Lælio-cattleya Orama, and L.-c. Frederick Boyle, Veitch's var., from Messrs. J. Veitch and Sons, Chelsea; and to Odontoglossum His Majesty, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

[Owing to the pressure on our space we are compelled to defer the publication of the medal awards until our next issue.]

# THE BEST TWELVE SAXIFRAGES FOR THE ROCK GARDEN.

To select twelve saxifrages from the host of species and varieties of the numerous classes of the beautiful family is hardly less difficult than that of choosing "the hundred best books," and an effort to do so is certain to meet with considerable criticism. Yet it is often needful for the small garden, or for those who are desirous of embarking upon the cultivation of a few only of the choicest alpine flowers that attention should, so to speak, be focussed upon a few of the best. With the proviso, therefore, that the selection is a somewhat arbitrary one, and is not made in a dogmatic fashion, the twelve which follow are suggested as the best for the garden and as plants that every rockery should possess.



SAXIFRAGA BURSERIANA GLORIA AND S. OPPOSITIFOLIA SPLENDENS.
A tasteful arrangement of these two fine saxifrages, exhibited by Mr. C. Elliott, Stevenage, at a recent meeting of the Royal Horticultural Society.

### Saxifraga Burseriana Gloria.

Undoubtedly in the first rank of the beautiful Burseriana rockfoils we have the variety Gloria, which was sent out from a Yorkshire nursery a few years ago, and which has received the highest commendations. It is a lovely plant with a close carpet of small spiny foliage, above which rise in earliest spring dainty little flowers of white. Its character is well displayed in the illustration here reproduced.

### S. Elizabethæ.

Though there are several charming yellow saxifrages of much the same character, such as S. Boydi, S. Cherrytrees, and S. Faldonside, the most satisfactory of the yellow ones at the present time for all-round culture is S. Elizabethæ, named, it is said, after Queen Carmen Silva, of Roumania, and a plant even royalty might be pleased to have its name associated with. It is a charming plant, forming a low carpet of grey-green leaves surmounted by bright, yet soft yellow flowers. It is an "easy" plant to grow, but seems to prefer a dry, hard, poor soil, with the reservation that it may require some water in a summer like that of 1911. I find it likes full exposure.

### S. Wallacei.

Of its class there is no saxifrage to equal S. Wallacei, frequently said, by the way, to be synonymous with S. Camposi, but this is an error, as S. Wallacei was raised in Edinburgh, and is a hybrid plant. It is a great beauty, being practically a large "mossy" one, appearing to have some of the "blood" of the S. ceratophylla class in it, and affording a profusion of large white flowers. Hanging over a stone, it is exquisite in its season, while it is so easily cultivated that it is certainly one of the best. My finest plant is on a north-west exposure well up on a rockery, and some six feet or more above the ground level. S. Wallacei is figured in the accompanying illustration.

### S. longifolia.

When we come to the silvery saxifrages we are confronted with the difficulty of choosing a few out of the many gems included in this section. Yet S. longifolia cannot be omitted, although it suffers from the failing that it makes few offsets, and that seeds saved from flowers grown near other saxifrages have a tendency to yield plants not of the true type. Yet S. longifolia, with its symmetrical rosettes of long narrow leaves and its fine plumes of flowers, is one of the élite plants which every rockery should possess. It and the other silvery saxifrages named like a small proportion of lime in the soil, and a good amount of sun.

### S. Aizoon.

One cannot well omit to name two of the Aizoon saxifrages among our twelve elect. It is difficult to choose these, but we must make the selection, and in this case it will light upon S. Aizoon Rex and S. Aizoon rosea. The first is the finest of the white Aizoons, giving charming rosettes and lovely white flowers on good-sized panicles, and they are really of a decidedly better colour than those of most of its sister flowers.

S. Aizoon rosea is another one not too well known, although it is not such a novelty as S. Rex. It has lovely panicles of rose-coloured flowers.

### S. lantoscana superba.

Another silvery saxifrage nobody should be long without is S. lantoscana, and I prefer the fine variety, superba, which is of beautiful habit in every way, with handsome rosettes and lovely plumes of white flowers. It is a gem, and will yield but little even to S. longifolia. If anybody selects S. cotyledon, a well-known one, in preference to S. lantoscana superba I cannot well complain.

### Red Mossy Saxifrages.

Among these an ever-increasing number of "dear charmers" present themselves, and it is impossible to give satisfaction in a choice from among them. Upon the whole, I think, S. bathonensis is the finest at present offered, although I could choose a dozen almost, and say that they are lovely enough for anybody. It makes carpets of lovely green foliage covered in spring with fine red flowers. S. Rhei superba is such a dainty thing and so distinct, as being a larger grower, that it cannot well be passed by, although not one of the "novelties." It has fine flowers, opening deep rose and passing off almost white.

### S. oppositifolia.

Wonderfully hardy, and, vide the handbooks, from "Northern and Arctic regions," S. oppositifolia has much to commend it when we consider very low-growing and freely-spreading rockfoils. There is scarcely an end to the varieties of this species, and the Pyrenean forms are especially interesting. In the matter of colour S. oppositifolia splendens gives a deep shade of purplish-rose that is unusually attractive.

SAXIFRAGA WALLACEI.

A beautiful saxifrage, with pure white flowers. From a photograph taken in the nurseries of Messrs. T. S. Ware, Lim., Feltham.

### S. primuloides.

It would hardly do to confine our twelve to one or two sections of the great genus, and one would commend a dainty, easily grown one, of the London Pride section—S. primuloides—as choice and beautiful. It is only six inches high, and has neat little rosettes of leathery leaves and small pink flowers. It likes shade, and is all the more valuable on that account.

### S. cæsia.

We must not omit at least one representative of the more minute silvery saxifrages, and for the purpose in view I should include S. cæsia, a charming one which makes densely-packed silvery rosettes of miniature size, these being crowned in the flowering time with little spikes of white flowers, borne in an airy manner above the rosettes. It is a lime-lover, and likes a half-shady place, doing better, perhaps, on the moraine than on the rockery, but not difficult to grow in the latter in loam, leaf-soil, made firm, and sand, with some pieces of calcareous stone or old mortar about the plant.

Such is an endeavour to choose from among a vast number some of the saxifrages likely to give satisfaction as possibly the most beautiful plants of the class which everybody should grow.

S. Arnott.

---

## THE CARDINAL FLOWER.

The herbaceous Lobelia cardinalis ranks as one of the best subjects of a half-hardy character for summer bedding. The erect stems attain a height of about two feet, and the exceedingly bright scarlet flowers are borne in profusion on terminal spikes. Given good cultivation, the flowers continue to open from the month of July into late in the autumn if the weather remains open.

Not the least of this plant's good qualities is the ease with which it can be wintered. All that is necessary is to lift with a good ball of soil on the approach of autumn frosts, and pack thickly in boxes for storing in a fairly dry place in a cool greenhouse until early in February, when they should be put in an early fruit house and be kept moist to induce them to produce new shoots. When these latter are two or three inches in height carefully divide the plants. Put them singly in small pots, using a compost of equal parts loam and leaf-soil, adding a little sand, wood ashes, and decayed manure. Place in a warm house or mild propagating frame, and water with tepid water. When it is seen that they are taking to the new soil place on a shelf in the greenhouse for a few days, and finally in a cold frame. Shift into large 60's or 48's as needed.

When once the young plants are well rooted avoid coddling them, and admit plenty of air to the frame on all favourable occasions. Except in warm districts it is not safe to plant these lobelias out until the end of May, so that it will be seen there is ample time to produce strong robust plants before then.

This and similar lobelias are most effective when massed in beds, or in colonies on the margins of shrubberies. As dot plants about the borders their true beauty is not seen to advantage.

H. T. Martin.

## PRIMULAS AT FOREST HILL.

Over a period of many years we have made an annual pilgrimage to Messrs. James Carter and Co.'s nurseries at Houston Road, Forest Hill, to see this firm's stocks of Chinese primulas, and, after due consideration, we feel quite safe in saying that never have we seen the plants so finely grown or so splendidly flowered as on the occasion of a recent visit. One is compelled to acknowledge the great beauty and usefulness of primulas when they are presented in such fine condition, and seen in large blocks of a variety. Moreover, it is only when seen in this fashion that the considerable difference in habit and size of flower between certain varieties is fully understood.

The Messrs. Carter have achieved a high reputation for Chinese primulas, and their long years of work in improving habit, increasing the number of flowers, adding to the size of the blooms, and giving purity and brilliance to the colouring, has resulted in a series of varieties second to none. And still the work goes on. It is not many years since we saw three plants only of Bouquet, the splendid white variety with foliaceous calyx; this is now largely represented, and is very popular for its extremely compact habit. Now there is another new white, soon to be sent out, and it is remarkable for the breadth and substance of its blooms and the wonderful purity of its whiteness. Several new blue varieties have been evolved, and in due course will be fixed and distributed; there is also an interesting set of cross-bred seedlings, several of which give promise of a successful future.

It is interesting to watch the work of fertilisation at this season. Fine as they are, these primulas are not grown merely to be looked at and admired, but for the production of seeds to supply an ever-increasing demand. According to the weather, the plants are dealt with once a fortnight or once a week from mid-February to the end of April, every flower being pollinated by means of skilful fingers and a camel-hair brush. Each variety and each block of a variety has its own brush, and this brush is never used for any other variety, and so the stocks are kept perfectly true. The giant strains are shy seeders as compared with the older type, and one seed vessel will contain ten or twelve seeds as against from twelve to twenty in the capsule of an older form. This means that the giants must be grown more largely to provide the necessary seeds, and it also means an increase in price.

All the varieties offered by Messrs. J. Carter and Co. in their handsome catalogue are of high merit, and the range of colours is sufficiently wide to accommodate all tastes. For those who like the colour, Giant Magenta is particularly striking, but Coral, Giant White, the lovely blush Princess May, the old vivid Vermilion, King Edward VII., a superb white, Crimson King, Rose Queen, and Elaine can hardly fail to please the most fastidious primula lover.

A capital race of Star primulas has been evolved at Forest Hill, the flowers larger and more rounded than in most strains, but on plants as free-flowering and quite as graceful. In this set the colours are lilac, white, salmon, pink, crimson (with golden eye), carmine, scarlet, and blush. In double varieties the firm has a goodly set, but Double Scarlet, unusually double, and Prince of Wales, double rose, and the new deep rose variety with oak-leaf foliage are three especially fine forms. The latter is particularly free flowering; indeed it suffers a little from its own good qualities, for if it bloomed a little less and carried its flower stems a little higher it would be still more effective.

When firms like Messrs. J. Carter and Co. take so great pains and incur such great expense in their efforts to secure purity of stock, high germinating power, good habit. fine colouring, and new shades, the work not only redounds to their own credit and adds to their business, but creates a high standard of excellence for others to aim at, and so the particular subject considered is improved throughout the country, and its culture extended as the result of such enterprise.

## PERPETUAL CARNATIONS AS BEDDING PLANTS.

The following is the text of an address given by Mr. E. F. Hawes at the Conference on Perpetual Flowering Carnations held at the Royal Horticultural Hall, S.W., on March 21:—

Prior to the formation of the Winter Flowering Carnation Society, now the Perpetual Flowering Carnation Society, had one contemplated holding a special exhibition of tree or perpetual carnations, such a display would have been considered impossible. Yet, in less than a decade, this society has become well established, and its ultimate position assured.

At first grown only for winter flowering, and in a few gardens, the decorative value of the plant, with its long-stemmed flowers, lasting quality when cut, and rich colouring even in mid-winter, soon brought it into public favour, with the result that its cultivation in this country was quickly undertaken on a large scale for market purposes. Up to this period the principal varieties, which were limited in number, had been raised in the United States, where the culture had already become established, but with its increasing popularity growers turned their attention to raising new varieties. The first British-raised seedling Britannia (scarlet) was certificated by our society in 1907, and was quickly followed by Mrs. H. Burnett (salmon-pink) in the same year. Since that date the number of new varieties raised in this country has largely increased, and several new and distinct shades of colour have been obtained.

It has also been proved by more extensive cultivation that the present race of carnations thrives better in a much lower temperature than had been previously given the older tree varieties.

Having obtained some of the first plants of Britannia that were exhibited, I raised a good stock, and planted them out in May, 1909, on a border sheltered slightly from the north-east, and facing due west. The subsoil was London clay, which is always very damp and cold during the winter and early spring months. After blooming throughout the entire summer, about thirty-six plants were left in the open ground during the winter in order to ascertain their hardiness. The lowest temperature recorded during the winter of 1909-10 was 15 deg. Fahrenheit, showing 17 degrees of frost. The last blooms opened at a minimum temperature of 22.5 Fah., and the plants then became dormant. The great majority of them passed through the winter uninjured, and commenced blooming again the following May, and continued until December. The cold winds experienced in April, 1910, killed the softer growth of a few plants, but on being cut back they rapidly made new growth, and flowered freely through summer and autumn, not a single plant being killed. These experiments have been continued and extended, and several gentlemen have had plants of many varieties growing in the open garden during the past winter, when the temperature fell below zero, and these have suffered no apparent injury, and in some the buds are even now showing colour.

Having thus established the hardy constitution of the perpetual flowering carnation, the chief object in this direction has been attained, but further series of trials will be continued.

We desire now to compare this type of carnation with the various summer bedding plants of the present day. Carnations, like roses, are always welcome, and a bed or border of these favourite flowers in continuous bloom from May to December will certainly prove a valuable acquisition to any garden. Two types of plants may be used for this purpose, i.e., (1) those well established and having several flower buds well developed, which, on planting, will flower at once and continue to give a display of bloom, until the plants become dormant owing to the low temperature usually experienced in December; (2) young plants well established in small pots, and having from three to five strong shoots, which commence to bloom within a month or six weeks after planting, and continue as above. In either case they should be planted out in May, in an open position, in either bed or border, where the soil has been previously well prepared for their reception by thorough digging and liberal manuring.

The plants should be properly staked at the time of planting, in order to secure them from damage by wind. No stopping, except by the removal of dead blooms, or the cutting of fully-developed flowers, both with long stems, is required. Water carefully, and keep the surface soil of bed stirred at intervals. Occasional spraying with a reliable insecticide will prevent serious attack from insect pests, and the plants will well repay the time involved.

To those who have not already tried these charming plants for the open garden, I would certainly say do so, as they are thoroughly deserving of attention.

---

## THE ANDROSACES.

This beautiful and interesting group of plants contains some of the choicest and rarest gems for the rock garden. As they are natives of high mountainous regions, the androsaces revel in a dry atmosphere, however cold it is during the winter; hence the difficulty experienced in this country in keeping them in a healthy condition through wet and damp weather. This difficulty is to be overcome by carefully selecting suitable spots, and protecting the plants from excessive moisture during the late autumn and winter months. The majority of the species delight in sunny positions, but there are a few which thrive best when planted in half-shady situations. Sloping crevices between the rocks are the most suitable places for them, as the water drains off quickly, and does not remain round the crowns or rosettes, as it otherwise would do if the plants are grown on flat spaces. In many cases the foliage forms woolly rosettes, which naturally hold any superfluous moisture there may be about; this proves most injurious, and often fatal.

With the exception of A. carnea, A. Laggeri, and A. Vitaliana, the soil should consist of sandy loam, with plenty of limestone grit and sand mixed with it, and given sunny positions. The three mentioned thrive better when grown in half-shady situations, in a non-calcareous soil. During the late autumn and winter the most effective protection is afforded the plants, by fixing a sheet of glass overhead, leaving the sides open, to allow a current of air to pass through. There must be no attempt to coddle the plants, the protection being necessary to maintain the foliage in a fairly dry condition. When these points are attended to, much of the difficulty regarding the cultivation disappears.

Top-dressing is an important point to consider when dealing with the androsaces. Being grown in sloping crevices, the soil naturally becomes washed away by heavy rains and frequent waterings, however tightly it is packed in with stones. The top-dressing should consist of the same kind of soil as that in which the plant is growing, and be applied from time to time as may become necessary. Species having tufted growths, such as A. carnea and A. Laggeri, will require to have the soil worked well amongst the growths. Trailing species, such as A. lanuginosa, must be top-dressed round the collars of the plants, whilst the rosette-forming kinds are given fresh top soil when the young rosettes are forming, and pressed into it, when they quickly form roots. This is the quickest method of increasing the stock of all species having the latter habit of growth. The young rosettes are put into small pots, and grown on in frames. Cuttings of lanuginosa and A. Leichtlini should be taken in the early part of August, and dibbled into pots of sand. These are placed in a cold frame, and kept close for a time, when the cuttings quickly form roots. When sufficiently rooted, the young plants are potted up singly, and given frame protection, through the first winter. The following spring they may be planted out in their permanent quarters. Those species which form tufts or cushions of foliage should be increased by seeds. Division of the plants is sometimes advised, but it is rather risky, for androsaces do not care for root disturbance. The seeds are sown in April, in pots which have been filled with fine soil, and placed in a cold frame. Transplanting and potting must be attended to as the seedlings grow.

With reference to the species that should be selected for the rockery, the following may be specially recommended: A. carnea has rose-coloured flowers with yellow centres. A. coronopifolia is a biennial, and when once established, reproduces itself freely from seeds. A. Chumbyi is one of the prettiest of the androsaces, and of fairly easy cultivation. Its rosy flowers are borne in umbels on stems about three inches high. The woolly rosettes of foliage are formed on the ends of thread-like runners, and when top-dressed in July or August these rosettes will, if slightly pressed into the soil, and held in position by a small wire pin, quickly root into the soil. The variety is said to be a cross between A. sarmentosa and A. villosa. A. foliosa has rose-coloured flowers in umbels. A. helvetica is of spreading habit, the foliage being in the form of rosettes, which produce almost stemless bunches of white flowers, with yellow centres.

A. Laggeri is similar to A. carnea, with a greater freedom in flowering than the latter. A lanuginosa should be afforded a position where its slender growths can trail over the face of a stone. The flowering season of this lovely species extends over a considerable period, and a good-sized patch is usually much admired. The rose-coloured flowers are borne at the ends of the shoots, and as growth is very free during the summer, there is usually an abundance of flowers. It is one of the easiest to propagate. The young growths will root quickly in sand in August, if kept close in a cold frame. A. Leichtlini is similar to the preceding, requiring the same treatment, but having white flowers with rosy centres. A. sarmentosa has something of the habit of A. Chumbyi, but the rosettes are larger and the blossoms are more numerous than those of the latter. E. C. Pooley.

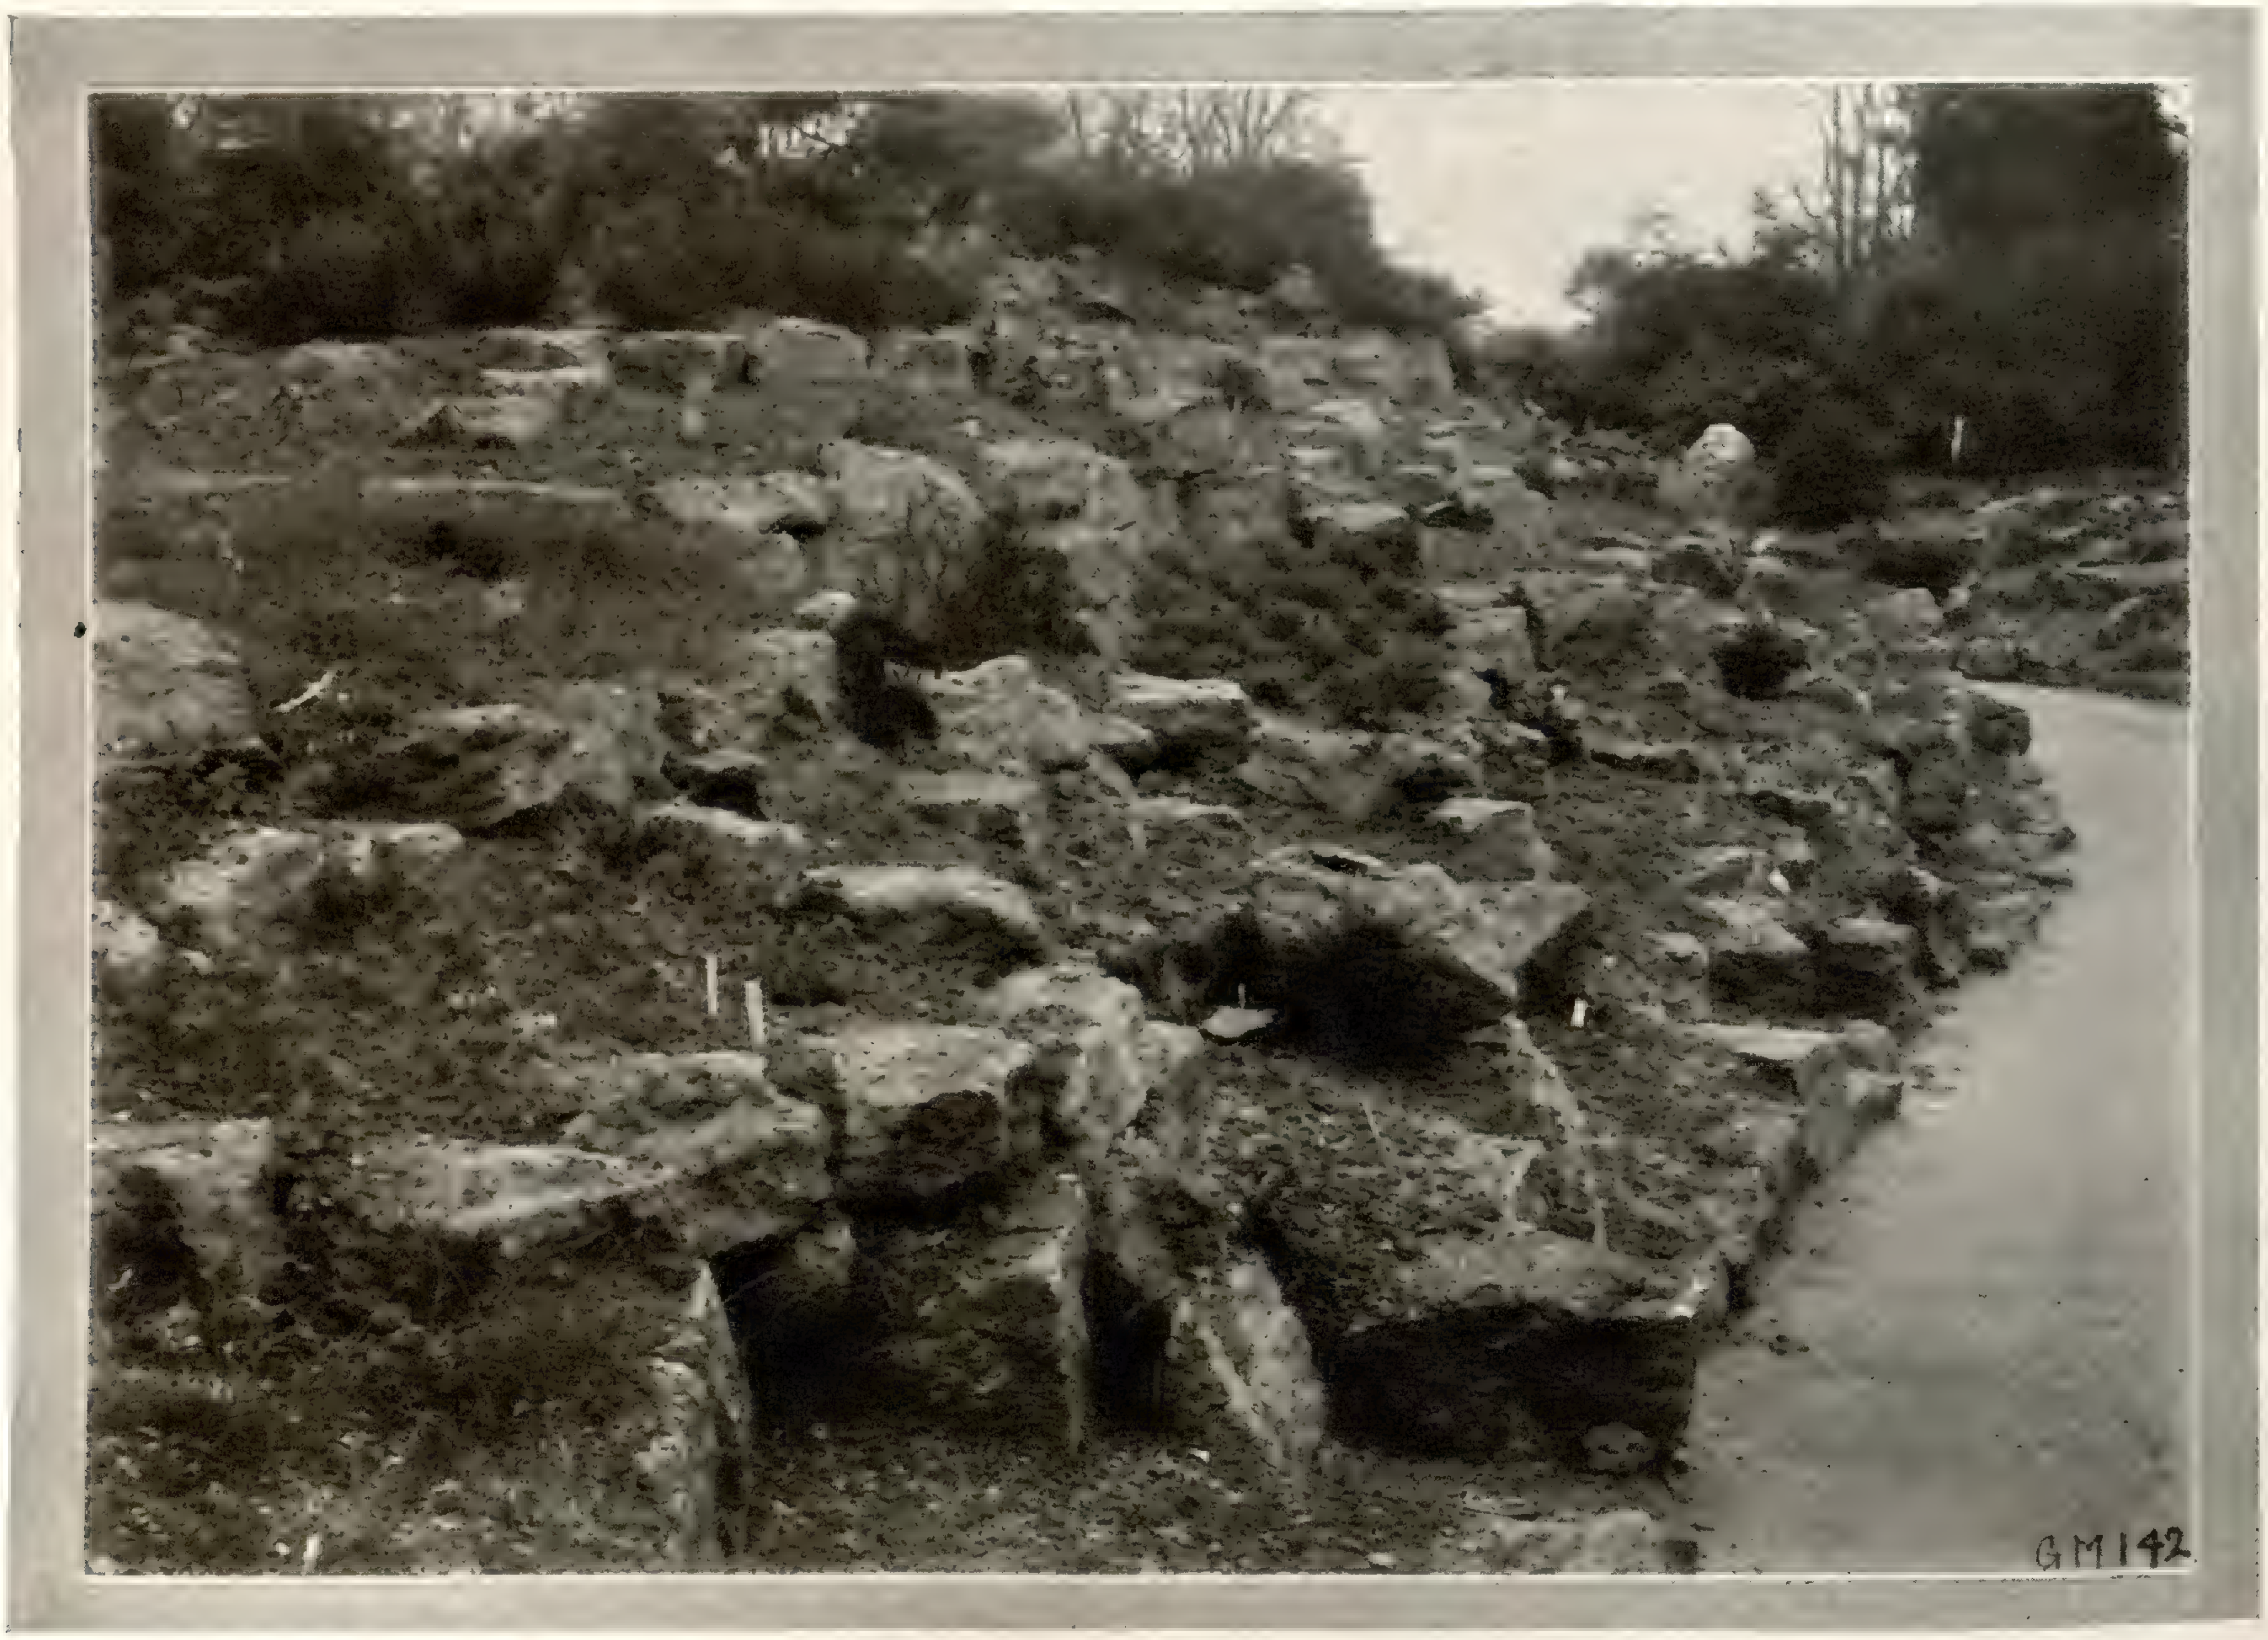
Gnaton Gardens.

---

**Anemone and Pompon Chrysanthemums.**—I have noticed the endeavour of the committee of the N.C.S. to resuscitate these sections of the chrysanthemum by offering prizes for seedlings in 1913. What a project! If the committee would formulate a class or classes for one or both of these sections, and offer handsome prizes in an open class, restricting no one from entering, be he nurseryman or amateur, they would obtain a meritorious display, and would prove to the public that the varieties now in existence are not nearly so exhausted as the committee appears to think they are in 1912. To make any real progress in the subject it is useless for the society to wait until the month of March before acquainting the public of its requirements in the current season. Too late an issue of the prize schedule is not the way to ensure success.—E. M.

## RENOVATION OF ROCK GARDENS.

A rock garden may be thoroughly well constructed in every way, both in the matter of material and plants, but still it requires periodical overhauling and even rebuilding. The latter is sometimes necessary as time goes on, owing to the settling of the soil and stones throwing them out of their original positions. For no matter how well a rockery has been built, such displacement takes place to a certain extent. Also in course of time the stronger growing and more vigorous plants tend to occupy more space than was intended for them, and encroach on their weaker neighbours, to the detriment of the latter. Many plants also exhaust the soil of certain constituents which they require, and gradually become so weak that they do not produce the amount of bloom given by a younger plant. Of course, there are many plants which will grow and flourish year after year, only requiring a little top-dressing in the shape of grit and leaf-soil once or twice annually. Such a plant is Saxifraga sancta when planted in a half-shady position, where it is not likely to be burned by the sun.



REMADE AND NEWLY-PLANTED PORTION OF THE KEW ROCK GARDEN.

The reason for the rebuilding of the rockery shown in the illustration was that originally the material used for retaining the soil of the bank consisted of tree stumps, round boulders of sandstone, and various other kinds of material little suited for the choicer plants which one expects to find in a rock garden. Tree stumps may be picturesque enough, but they afford a favourite harbour for mice and other vermin, and it is only possible to grow coarser subjects as geraniums and such-like plants on the more sunny portions and ferns in the shady corners. Then the tree stumps were always undergoing the process of decay, necessitating frequent patching, which did not tend to improve the appearance of the rockery as a whole.

The stone used for rebuilding came from Gloucestershire, and is of a yellowish colour like sandstone, but is full of lime. The strata is quite evident, and in constructing care was taken to place the blocks so that this is running in one direction throughout the whole bank. But although care was taken to make a solid bed for all the stones, it may be noticed in the illustration that some of them appear to be tilting in a different direction. This fault is probably accentuated or produced by the inequality of the stone, or by the point of view from which the photograph was taken. Such defects as these are easily remedied by means of wedges of stones, and by ramming in soil till the block of stone is in its proper position.

The best time for reconstruction is in the autumn, so that if possible the plants may be back in their places well before the winter sets in. But if the alteration is too extensive for this, and it is impossible to finish the work before the winter, then the planting should be deferred till early in the spring. When commencing to rebuild a portion of the rock garden it is necessary to carefully lift all the smaller and choicer plants; and if the alteration is likely to take some time, they should be potted up temporarily and placed in some sheltered position or in cold frames till the place is ready for them again. The larger and coarser growing plants may all be packed close together in large boxes, or even on the ground in some sheltered place, with leaf-soil or other light material in between to keep them from becoming dry. When the rocks have all been pulled down, the ground should be thoroughly forked over so as to get rid of all weeds before starting to rebuild. If the soil is heavy, plenty of grit should be mixed with it, and where necessary ample drainage materials, like broken bricks or stones, should be worked into the soil. In rebuilding, the soil should be well rammed before placing the boulders in position, and in some cases it will be necessary to quite bury some blocks of stone in order to have a good foundation for others. When the building is finished, the pockets may be prepared for planting by taking out unsuitable soil, putting in plenty of drainage at the bottom, and then filling up with a suitable compost necessary for the particular plant which is to occupy the position.

Where rebuilding is not necessary, but some of the plants are out of hand or are exhausted, they should be lifted, and the old soil taken out. The new soil may be put in the pocket, and the old plants, or preferably a younger stock, be replanted. If a little replanting be done every season then the rockery will not suffer in general effect, and it will be easier to keep up with the work of renewing and replenishing so necessary from time to time. The above remarks apply to such things as aubrietias, arabis, arenarias, and such like plants that will move readily and do not suffer from replanting, in fact, they are much better for it. Some kinds are very impatient of removal, like gentians of the septemfida and asclepiadea type, and in these cases a good top-dressing of rich soil should be given from time to time. Plants like Saxifraga oppositifolia and others which form spreading carpets are benefited by having grit and leaf-soil worked in between the growing points and covering up the trailing stems.

Primulas also tend to grow out of the ground and form stems; these also should be earthed up to the base of the leaves.

Early in the spring all dead plants should be removed and the blank spaces filled up by others, taking advantage of the opportunity to change the soil in the various pockets where the plants have died. With the heavy rains during the winter the surface of the soil becomes caked, and so should now be carefully gone over with a hand fork to break it up in order to allow it to sweeten. Care should be taken not to disturb the roots by digging too deeply. Weeds at this time of year are coming on apace, and will require constant attention. W. I.

## BULBS AND IRISES BY THE WATERSIDE.

The study of reflections in water is a special branch of the painter's art. There are laws governing the shapes and colours of reflections, intricate and bewildering laws truly, since they are different for morning, afternoon, and evening, being varied by the position of the sun, the amount of cloud, the sky tints, and even the hues of neighbouring objects.

Gardeners may congratulate themselves that they can create fair water reflections without any of the perils that threaten the artist who works on canvas, and none of the other floral effects of the pleasure grounds possess quite the same charm. Perhaps the Japanese iris stands out pre-eminently as the loveliest waterside plant, but safer and less expensive displays can be made with German and English irises, which should always be closely associated in order that a succession of blossom may be gained. It should be remembered that German irises will flourish in almost any soil, high up upon banks, flanking banksides, or occupying low, marshy levels.

There are numerous iris lovers still who regard the German section as coarse, but this would not be the case if the named varieties were grown. They are a trifle less free-blooming than the familiar violet, but even this reproach cannot be applied to clumps that are well established, and have been suitably fed. A few barrow-loads of old manure and leaf-mould, wheeled round in late autumn and cast down among the iris plantations, will ensure a noble blossoming the following May.

The following may be taken as a fairly representative list of German irises, which cost from 6s. to 12s. a dozen: Maori King, yellow and crimson; Poiteau, purple and white; Sir Walter Scott, bronzy-gold and terra-cotta; Aigle d'Or, lilac, striped with violet; Cordelia, peach-mauve and purple-crimson; Celeste, lavender, with orange beard; Victorine, white, blotched with blue; Faune d'Or, gold, streaked with crimson; Harcourt Thorse, brown, streaked with violet; John Fraser, gold and white; Canary Bird, yellow; Bridesmaid, lavender and white; Gem, straw-yellow and violet; Plumeri, copper-red; and Victor Hugo, gold and red. Early autumn planting is advisable, and care should be taken only to lightly cover the rhizomes with soil, as deep planting retards development, even if it does not actually destroy the plant.

Named English irises, to closely accompany the German irises, can fortunately be planted at the same time; so colour combinations are easily accomplished. Excellent representative varieties are: White Queen, white, shaded with lavender; Pharon, claret, with purple-crimson and white; Miss Barclay, white, flaked with magenta and violet; Rosa Bonheur, white, rose, and crimson; Viceroy, peach, with purple and mauve; Lilacina, lavender, with violet and blue; Blanche Fleur, white, shading to blush; Delicatesse, white and crimson; Electra, pale blue; and King of the Blues, deep blue. Those groups that are so placed as to be reflected in water should always contain plenty of yellow or white, because blue and purples, though splendidly rich in hue, have a gloomy effect if over-massed without any relief. Against thickets of golden privet, however, golden elder, or silver-leaved trees or shrubs, they are admirable alone.

Camassias are grand plants by lakes or ponds, also on river margins, and flower in July, after the irises. The best are Camassia Leichtlini, though rare, is inexpensive, and hybrids often prove of exceeding value for yielding light tints; then the indigo-violet of C. esculenta Royal Purple is meritorious, if kept far from the ordinary blue C. esculenta. Few gardeners make sufficient use of Camassia Cusicki, a large plant with handsome foliage and spikes of lavender bloom.

With camassias nothing can tone better than the montbretias, gold and vermilion, and the latter will thrive even when planted in sedgy margins, so that their bells overhang the water, and cast spent petals of orange upon its surface. In full sunshine the florescence and the reflection of montbretias should glow like firelight when seen from a little distance.

Warm colour in September and October, upon shady banks and stretches either of soil or turf, may be spread out lavishly by the use of Colchicum byzantinum, a free-flowering rose variety of Meadow Saffron; a few groups will not make much effect, of course, but when a couple of hundred bulbs have been planted there will be a fine reward. The ruby-crimson Colchicum speciosum rubrum can be used to give a deeper shade. November crimson can be gained from a sufficiently generous use of Schizostylis coccinea. For white or pale rose flowers, produced in trusses, or umbels, on three-foot stems, out of a forest of deep green, Crinum capense cannot be rivalled, but the position must be sunny and fairly sheltered from cold winds; given such places the deeper pink Crinum Powelli should also be tried. Hyacinthus candicans is another of the numerous stately bulbous plants that are marvellously economical and safe to use for furnishing river and lake sides.

It is not always the largest plant, however, that produces the finest effect by water; as an example of this I may mention a garden in which heaps of rough rockery were thrown down against the ends of a rustic bridge, spanning a stream, and thoroughly planted with Geissorhiza rochensis. This unfamiliar South African bulb produces during June flowers of a vivid blue, blotched with crimson. M. H.

**Clerodendron fallax.**—As a bright autumn-flowering plant this is unsurpassed and an early start should be made to raise the required number so that strong plants are built up by the summer. Those raised from seed sown now, and given bottom heat, make good specimens the first year. The old plants should be placed in strong heat for the production of cuttings, and these should be taken off with a heel when two or three inches long, inserted in sandy soil, and placed in the propagating frame. Put them into small pots when rooted, and grow on a shelf near the light. Shift on into larger pots as thought necessary, using a compost consisting of two parts loam to one part each of peat, leaf-soil, and dried cow or sheep manure, adding sufficient sharp sand and wood ashes to ensure porosity. It is a mistake to overpot these plants; when well grown, seven-inch pots are large enough to flower them in.—H. T. Martin.

## PRIMULA-MARGINED RILLS.

A most delightful way of utilising the moisture-loving primulas is in the embellishment of tiny rills and streamlets. The picturesque effects evolved by the free use of these primulas along the margins of little waterways entirely justifies an adoption of the idea in gardens where at present they do not exist. The overflow from the lily pools, or a small regular flow of pure water from any given source, could be converted into a streamlet fit for the reception of the bog primulas.

In good loamy soils, moistened by the water, the primulas will grow grandly, and if, when planting, a little rough sand and a small quantity of decayed manure is added to the soil, the plants will derive greater benefit. Heavy shade must be avoided in the culture of these primulas. Though partial shade, if not too dense, is helpful to some species, particularly such forms as P. Sikkimensis and P. algida.

Of all the primulas available for the purpose in view none are better known, or more widely utilised, than the favourite P. japonica. Certainly this glorious species, and its many varieties, are exceptionally good for this work of "margining the rills." The range of colour is fairly extensive, for, in addition to the crimson-purple of the type, one gets such diverse hues as white, lilac, rose, carmine, salmon, blood-red, and various blotched and oculata forms, which, in planting, can be blended, or else kept in separate groupings. The popular P. rosea is well adapted for moist positions, and its profuse habit of blossoming and its pleasing rosy-carmine colouring, entitle it to a place in every garden. Its varieties grandiflora, an improved form of the type, and splendens, a rich-hued gem, approaching to scarlet in colouring, are both worthy of notice.

P. Sikkimensis, the delightful Himalayan cowslip, is worthy of a good place; the dainty habit and exquisite fragrance of this soft yellow species combine to make it of the utmost value. The rarer P. Poissoni, with its vigorous habit and its fine whorled spikes of purple flowers, is near to P. japonica in habit, but it is grander and nobler even than that free-growing species. In favoured localities, perhaps the splendid Javan species, P. imperialis, would prove sufficiently hardy. Certainly it would be well worth trying, particularly in the south-western counties. It makes good rosettes of foliage, and the flower spikes somewhat resemble those of P. japonica, but the flowers are of a pleasing yellow colour. P. grandis should do well at the waterside. It is a good bold-habited species and the large umbels of small yellow blossoms are distinctly pleasing.

Other good moisture-loving primulas include P. algida, with reddish-purple blossoms and glabrous leaves; P. capitata, a pretty Himalayan species with violet-coloured blossoms; P. denticulata, and its many pretty varieties, which love a moist soil, but must not be planted too low against the water; P. involucrata, a charming white-flowered Himalayan kind, and its pretty variety Munroi, suffused with pale blue; and P. luteola, a handsome yellow species, good growth and appearance. Another useful subject should be found in the recently-introduced P. decorum, a free-growing crimson-purple species from the river banks of Servia and Bulgaria.

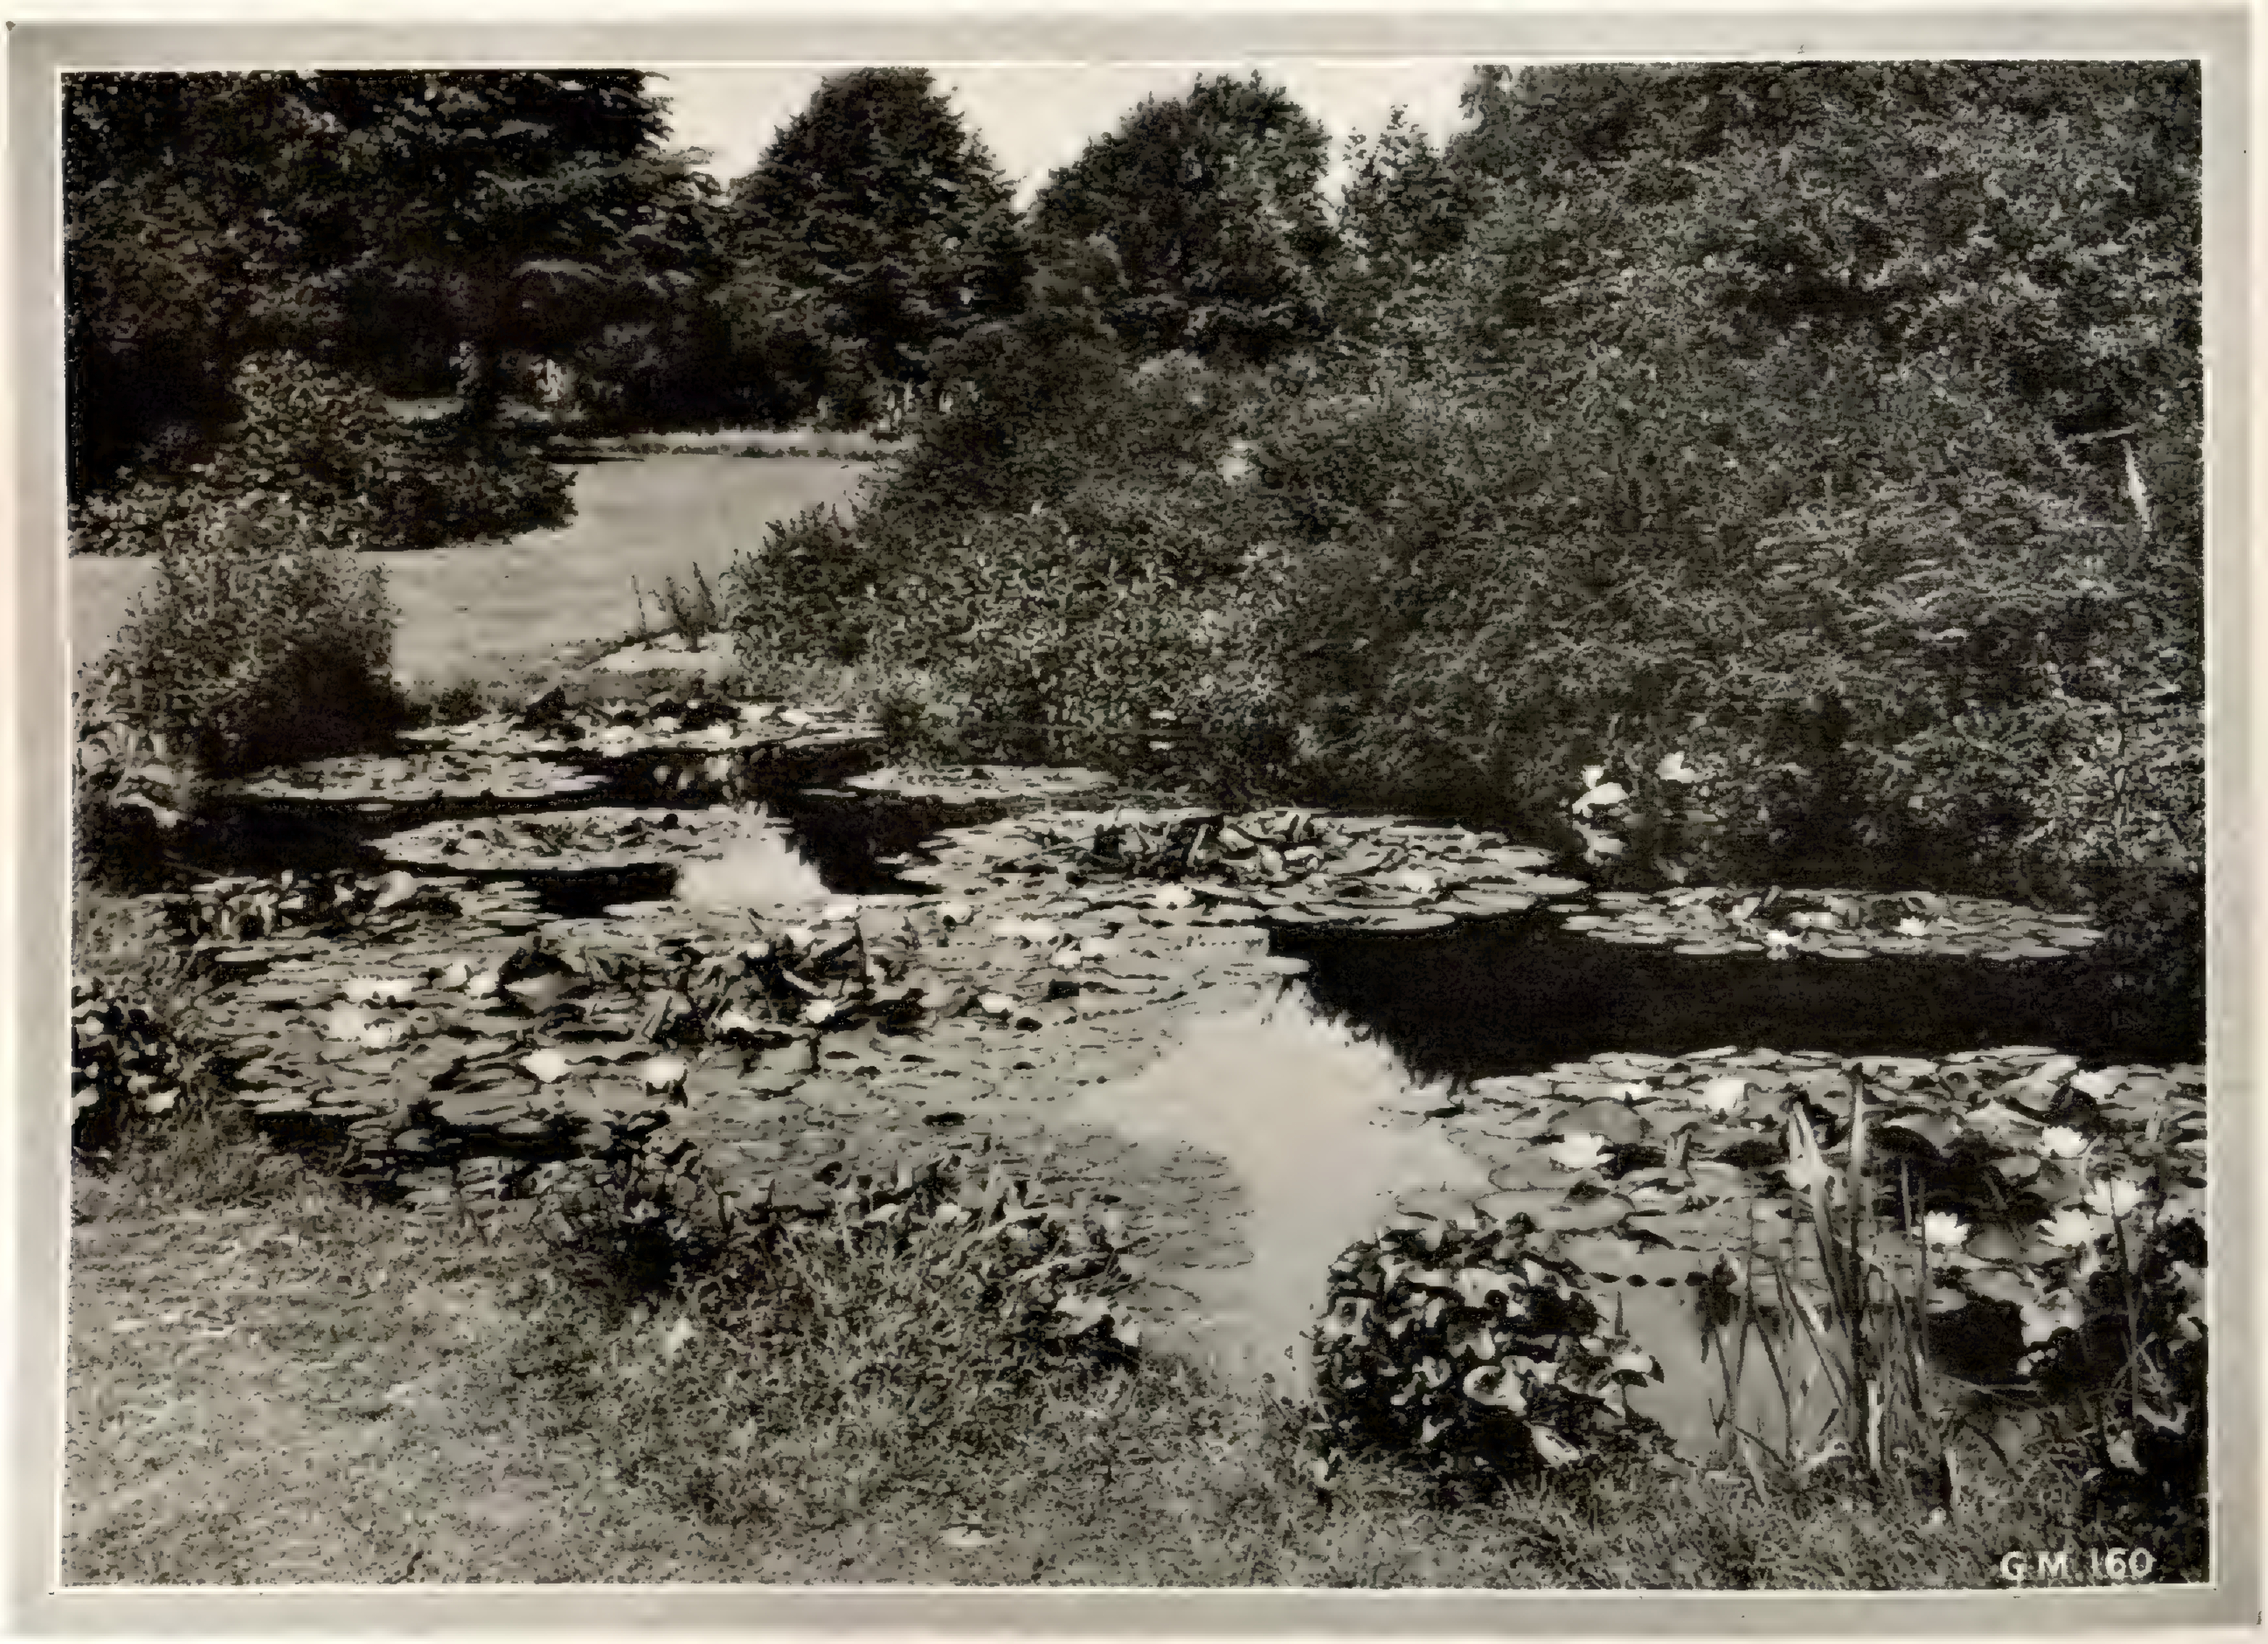
The range of moisture-lovers is certainly extensive enough for all planters, and a streamlet or narrow pool fringed during late spring and throughout the summer with these exquisite primulas will form a pretty feature of the garden.

P. S. Hayward.

## THE FINEST WATER-LILIES.

In treating upon this subject, I only propose to deal with the hardy kinds, and will leave the tender ones for future consideration.

It is some few years now since the first of the newer race of hardy hybrid water-lilies made an appearance upon our lakes and ponds in this country, thanks mainly to the indefatigable efforts of the late M. B. Latour-Marliac, who, after many years of most persevering efforts, was successful in raising those well-known varieties that have become so popular. It is only a reasonable expectation, when we survey the past, to look for newer varieties at the present time. There has been a very steady improvement, even from the first; but during the past few years a distinct advance has been made. This has been apparent in at least two ways. The newer water-lilies are, on the whole, more floriferous than the earlier ones were; while we have now several novelties in point of colour. In size, also, there has been an advance, notably during the past season or two. I have often been applied to for information as to the best kinds to grow. For the benefit of the readers of the Gardeners' Magazine I now give a list of the best up-to-date varieties that have come under my observation during the past few years.



SMALL WATER-LILY POOL AT KEW.

### White Varieties.

There are at least three under this head that stand out prominently as most desirable ones to grow.

Nymphœa virginalis, one of M. Latour-Marliac's later seedlings, is, in my opinion, the purest white yet raised. The individual flowers are of the largest size; by this I mean they are as large as N. Marliacea albida and N. Gladstoniana, two other whites. I shall not be surprised this season if N. virginalis does not surpass these in size. It has flowered here now for two seasons, and last year it improved greatly. It is one that will be suited to somewhat deeper water than many, and this is indicated by the length of the petioles, or leaf-stalks. In M. Latour-Marliac's catalogue it is described as being both early and late in flowering, as well as being sweetly scented; this latter feature is in its favour.

N. Caroliniana nivea is another variety of the purest possible white. It belongs to the odorata section, being only of medium vigour and growth. Each flower has a multiplicity of petals, somewhat narrow, which suggests its affinity to the section alluded to. It is a most suitable variety for shallow water or for fountains.

N. Gladstoniana is, I believe, an American-raised variety. It has been cultivated for some few years now, but its exquisite beauty does not appear to have been fully recognised. It was finer last year than ever before at Gunnersbury. It is a most robust grower, one of the very strongest. Its foliage, when fully matured, is quite 18in. across. The flowers are of the largest size, often as much as 9in. in diameter. The colour is very pure, the outer petals being tinged with pale green; this rather adds to its beauty than otherwise.

### Pink and Rose-coloured Varieties.

In these shades of colour N. Mrs. Richmond stands out as being pre-eminently the best and finest pale pink variety that we possess. It is possessed also of most unusual vigour. I predict for this water-lily a much-extended culture in the near future. Those who are acquainted with the somewhat old N. Leydekeri rosea will see in N. Mrs. Richmond a very much finer flower of the same distinctive colouring and features.

N. Newton, a new lily, has in its flowers something of the character of N. stellata. In colour it is of a rosy-pink shade, and when seen upon the water could be easily recognised, being so very distinct. This, too, has a good future before it.

N. colossea is well described in its name as regards its size. It comes nearest to N. Marliacea rosea in other respects, and is quite a feature upon the water here. The flowers stand well above the foliage; hence they show to the best advantage. It continues a long time in flower, being one of the earliest and one of the latest to perfect its blossoms.

### Yellow Varieties.

In this colour the best novelty, in my opinion, is N. Mooreana; it is somewhat like N. Marliacea chromatella, but with an absence of the pink shading, while the yellow is distinctly deeper. In growth it resembles the variety just named.

### Red, Vermilion, or Carmine Varieties.

In this group we have a few remarkable novelties. There are already fine varieties in N. gloriosa, N. Ellisiana, and N. James Bryden, but we have another one that bids fair to rival these. One of the finest new kinds is Nymphæa Escarboucle; this, in colour, is different from those I have already named, being more brilliant than either, having a distinct shade of vermilion in its colouring. I do not know of any lily of the same colour as N. Escarboucle.

N. atropurpurea is now fairly well known. This also is one of M. Latour-Marliac's varieties. Here, again, the colour is most distinct, but not so brilliant as in the preceding variety. We find it flower freely all the summer. The late M. B. Latour-Marliac considered N. atropurpurea to be one of the best water-lilies he ever raised.

N. Meteor is fiery red, with occasional stripes (very narrow) of white. It is quite distinct, and can be easily recognised upon the water. Other kinds that come under this colour are N. Attraction, somewhat like N. atropurpurea; N. Conqueror, which has bright red flowers; and N. Sultan, a brighter red than many, and one with very brilliant stamens in addition.

## DISBUDDING PEACH TREES.

With regard to disbudding young trees, sufficient shoots should be retained, not only to furnish bearing wood, but for extension shoots. Such shoots as show great vigour must be stopped in order to realise the flow of sap, and if the resulting breaks are also vigorous, let them be also stopped. Usually lateral growths result from this second pinching, and if space permits, some of the best-placed ones may be laid in, and when attaining a length of 12 to 15 inches, pinch out the point of growth. On the first signs of aphides, dust the shoots with tobacco powder by means of a distributor, and continue to do so until such time as it will be safe to spray with a suitable insecticide. Quassia extract is a safe and reliable remedy for greenfly. To prevent panning down the soil during the operation of disbudding, lengths of trellis or boards should be used. Owing to the excessive rainfall the soil is in a saturated condition, and it will not be necessary to apply mulching material, particularly where the soil is heavy. — W. MESSENGER.

VIEW IN THE BOG AND WATER GARDEN AT WATERMOUTH CASTLE, NORTH DEVON.

## FORMING A WATER GARDEN.

Water gardening is becoming very popular with a large section of the garden-loving public, for there is a great fascination about it when carried out in quite an informal style, as it makes a pleasing relief from the more formal type of flower gardening.

One of the charms of a water garden is that it is of necessity unlike another of its kind, for it must depend very largely on the surroundings and the existing natural features for its formation and character. It is not everyone who can possess a water garden, for only certain positions can be utilised, and, of course, a fair supply of water is necessary. Where there is a pond adjoining the garden the work is greatly simplified, and even a hollow dell that is within reach of a supply of water can very readily be made use of with good effect.

To be really ornamental a water garden, or, at all events, the principal pool of water should be irregular in shape, and the outline of the water may be made as varied as possible by creating small inlets and bays wherever such a proceeding is practicable. The introduction of a moderate amount of rockwork in suitable positions is often an improvement. Where a water pool has to be formed entirely, it is necessary to thoroughly line the bottom and sides with concrete or clay to make it watertight, and it should be at least two or three feet in depth in places to accommodate the more vigorous of the water lilies.

One of the most charming kinds of water gardening is that formed with a stream, as this can frequently be widened into pools here and there, which greatly add to the effect. The banks of these pools form ideal places for numerous bog plants, and thereby create a pleasing feature. It is astonishing what a little water is required to keep such a garden replenished, for, provided there is a regular inflow, the pools are easily kept up to high-water mark; at the same time a large volume of water is always more imposing, especially when the pools are on distinctly different levels, and miniature cascades can be formed from one to the other.

In the pools themselves water lilies will be the principle adornments, and to grow these successfully they require a situation where they receive full sunshine. The more vigorous kinds, like Nymphæa alba, N. candidissima, with large white flowers; N. Marliacea, and its varieties, succeed well in deep water. But in dealing with young plants it is desirable to start them in fairly shallow water until they gain strength, when they can be located in their permanent positions. Nymphæa Leydeckeri, N. Seignoureti, and N. odorata are suitable for the shallow parts, and for growing in fountain basins. April is a good time to divide and replant these lilies. Place them in baskets filled with fairly heavy loam, and sink them in the positions where they are to grow. Where it is convenient to empty the pool mounds of loam can be made up on which to plant the nymphæas, and after planting the mounds should be finished off with a few rough shingles.

Various other water plants can be planted in the same way, including Orontium aquaticum (Golden Club); Pontederia cordata, with closely-set blue flowers; Nuphar luteum, the common yellow water lily; and Aponogeton distachyon, which is scented like hawthorn. Calla palustris (the Water Arum), Sagittaria gracilis, the common Arrowhead, and Menyanthes trifoliata (the Bog Bean), should also be included. Such plants as Caltha palustris (the Marsh Marigold), Caltha polypetala, C. palustris fl. pl., Typha angustifolia, T. latifolia, Phragmites communis, and Butomus umbellatus (the Flowering Rush), are very effective when planted near the water's edge.

The banks of the water and the surrounding marshy places are ideal positions for numerous bog plants, and if planted in masses they form objects of much beauty. Senecio clivorum, S. Veitchianus, and S. Wilsonianus are very bright and showy, and they look well associated with some of the fine-leaved bamboos, which are especially ornamental growing on the banks of the stream. For this purpose none are more suitable than Arundinaria japonica, A. anceps, A. nitida, Phyllostachys aurea, and P. Quilioi, as these are especially hardy. A few of the more ornamental Japanese maples form pleasing colour effects near the stream side, and of these Acer palmatum sanguineum, A. p. dissectum, A. p. septemlobum, and A. japonicum laciniatum might with advantage be chosen for planting in such positions.

The lovely Japanese Iris Kæmpferi, Acorus calamus (the Sweet Flag), and Iris sibirica, succeed well close to the water. Cypripedium pubescens and C. spectabile grow well in a shady and moist situation, and are especially charming when in flower during May and June. Rodgersia podophylla and R. æscalifolia, handsome plants with large peltate leaves, are very striking; while Saxifraga peltata should on no account be overlooked, as its erect flower spikes are produced early in the season, in advance of its handsome foliage, which is always effective near the water. Arundo donax, Carex japonica, and Elymus glaucifolius are very telling grasses. Epilobium angustifolium, with purple flower spikes; trollius in variety, Funkia Sieboldi, Hemerocallis flava, H. aurantiaca, Buphthalmum speciosum, astilbes and spiræas in variety, especially A. Davidi, S. palmata, and S. Aruncus, are very effective. Osmunda regalis (the Royal Fern) should on no account be overlooked; while Gunnera manicata and G. scabra are very handsome planted where their roots can easily reach the moisture.

J. Gardner.

Batsford Park Gardens.

---

**Propagation of Tuberous Begonias.**—These begonias are easily raised from seed, but should it be desirable to increase the stock of any particular variety, it can be done by dividing the tubers when they have started into growth, the tuber may be cut up like a potato, with a strong growth to each piece of tuber. Lime and powdered charcoal should be rubbed all over the cut side and the tuber placed in sand for a few days to heal before potting. The side shoots, if taken off as cuttings, inserted round the sides of a pot filled with a sandy compost, and put in a propagating frame, will readily root. These plants make nice tubers by the autumn. Seedlings raised in January will now be ready for pricking off into pans or boxes. As they are filled the pans or boxes should be placed in a house where a brisk temperature and moist atmosphere are maintained, and grown on for planting out in June. Seedling begonias are always best planted out the first year on a west border, and the best varieties labelled for pot culture the next season. This is an immense advantage, inasmuch as none but plants with flowers of good quality and effective in colour will be grown for conservatory decoration.—Lewis Smith.

## POPULAR PALMS.

Time was, and that well within the memory of many, when palms were not looked upon as general decorative plants, being, in fact, only regarded as choice occupants of the stove. The first to become popular in the market and to be employed for the decoration of the dwelling was that well-known Fan Palm, Latania borbonica, which botanists now tell us should be known as Livistonia sinensis. Present-day ideas favour plants of a less lumpy character than this, the result being that it is now not grown to anything like the same extent as it formerly was.

Kentias must be looked upon as the most popular of all palms, and in some nurseries they are grown literally by millions. They find a ready sale, from tiny little plants in thumb pots to large specimens a dozen feet or more in height. Large examples realise high prices, but small plants can be bought at a comparatively cheap rate. Clean, well-furnished palms, usually in 5in. or 6in. pots, may be frequently seen hawked about the streets of London. The Kentias that are generally grown are Kentia Belmoreana and Kentia Forsteriana, this last, from its looser habit, being preferred for growing as large specimens. Seeds of both are imported in large quantities during the season.

Cocos Weddeliana, with finely divided leaves, is a beautiful palm, but more exacting in its requirements than the Kentias. For table decoration and various select purposes it is much appreciated. With care it may be kept in health for a long time in the dwelling-house. Even in a quite small state this Cocos is very attractive, but another popular species only asserts itself when large. This is Cocos plumosa, or C. flexuosa, for the two names seem to be used indiscriminately. When young, the leaves of this are simple, or nearly so, but when mature they divide up into a number of narrow leaflets, and a specimen of this palm is then exceedingly light and graceful. The leaves are not of a spreading nature, and this fact, combined with their lightness, stands them in good stead for grouping purposes, as they do not occupy much lateral space in the background.

Phœnix dactylifera (Date Palm), though of great economic interest, is of little value as a decorative plant. Some members of the genus are, however, very ornamental, notably P. canariensis, among the larger growing kinds; P. rupicola, of medium size, and the pretty little P. Rœbellini. Compared with the others, the latter is of quite recent introduction, and for some years it realised a high price. Now, however, thanks to seed having been imported in quantity, well-furnished plants can be obtained at a cheap rate.

Other palms that may be specially referred to are Areca Bauerii and Areca sapida, two greenhouse species; Areca lutescens, which, before the introduction of the Kentias, was grown more than it now is; Chamærops excelsa, hardy in many districts; Chamærops humilis, a small-growing Fan Palm from Southern Europe; Corypha australis, that will stand draughts better than most palms; Rhapis flabelliformis, an exceedingly popular palm in Japan; and Seaforthia elegans, which, before Kentias were largely grown, was much more extensively cultivated. In some old conservatories very large specimens of this Seaforthia may be sometimes met with. Geonoma gracilis well merits its specific name, for in pots from four to six inches in diameter it forms an exceedingly graceful specimen, in this respect being superior to Cocos Weddeliana. The different kinds of Dæmonorops, too, are very pretty, but in their case the spiny leaf-stalks are a decided drawback.

With regard to the different names given above, it may be noted that the nomenclature of palms has undergone great changes within recent years. I have, however, referred to them by the names which are in common use.

Of the different palms enumerated above, Rhapis flabelliformis, from its habit of pushing up suckers, may be propagated by division; but for the increase of all the others it is necessary to depend upon imported seeds. These, as a rule, do not retain their germinating power for any great length of time, which accounts for the fact that they are not offered for sale to any great extent, the general practice in nurseries being to sow the seeds as soon as possible after arrival, and trust to selling the young plants afterwards. Seeds that have been kept out of the ground too long will, from their hard nut-like nature, appear to a superficial observer as sound as ever, but close inspection will reveal the fact that the embryo is shrivelled, and when this happens growth seldom takes place.

When sowing the seed, the bulk of the compost should consist of good loam, lightened by a little leaf-mould, peat, and sand. If the pans or pots in which they are sown can be plunged in a gentle hotbed, so much the better, as palms of all kinds are, during their earlier stages, greatly benefited by a little more heat than adult specimens require. Directly the first leaf is developed the young plants should be potted singly, putting them in as small pots as possible, as they very much resent too much soil around the roots. At the same time care must be taken not to injure the stout, fleshy roots. After potting they should, if possible, be again given bottom heat, in order to encourage quick growth. The after treatment will consist in shifting into larger pots when necessary and syringing freely, as palms are greatly benefited by atmospheric moisture.

For most palms a compost consisting to a great extent of good loam is very suitable, but it is most essential to guard against over-potting, for not only is the health often injuriously affected thereby, but plants in large pots are not convenient for jardinières, or for similar purposes. A stimulant in the shape of some of the concentrated manures now so much used will often prove better than re-potting. When potting becomes absolutely necessary an unexpected difficulty will often arise. In most palms the roots are of a deep descending nature, and consequently coil around the bottom of the pot, and lift the ball of earth out of its place. With these an ordinary flower pot of the required depth will be so wide as to be out of all proportion to the size of the plant. In some potteries, however, they make deep pots for palms, even among the larger sizes.

As seeds are frequently unobtainable, and seedling palms make slow progress during their earlier stages, many people prefer to buy them when they have attained an effective size. In purchasing palms one or two points should be especially borne in mind. In the first place, where palms are grown in quantity for sale, they are usually kept much warmer than is absolutely necessary, in order that they may attain a saleable size more quickly than they otherwise would do. Owing to this it will be as well to treat them to a course of hardening off, but if no conveniences exist for the purpose, the best time to purchase the plants is in June.

W. T.

## MOSS PINKS.

The pretty Alpine Moss Pink, as Phlox subulata is called, is one of the most charming and reliable subjects for rock garden planting. Of easy growth under little more than ordinary conditions, the prostrate stems form a moss-like carpet, and radiate in all directions; the leaves being evergreen, are attractive at all seasons, but specially when they provide an effective setting to the brightly-coloured blossoms that break from the stems in all directions.

It is a hardy plant, of free growth, and exceedingly free flowering, and this description applies without distinction to all its varieties, the majority of which are greatly in advance of the type, in having larger flowers; all are low-growing and rarely exceed six inches in height, whereas their spreading habit often enables them to cover over a yard in width. As carpet plants they have many uses in gardens; as edgings to borders or as groundwork for beds of early-flowering bulbs, they excel, and they are used most successfully in level planting, but their highest decorative beauty is, I think, only revealed when they are seen draping some weathered boulder on the rock garden, and in a lesser degree when suspended from the almost vertical face of a rough dry wall. In either of these positions the characteristic prostrate habit of the branches receives free expression, and the flowers likewise appear to the very best advantage; further, such positions are also most favourable to the thorough ripening of the stems, being exposed to reflected as well as direct sunlight.

Phlox subulata and its varieties succeed in any good garden soil, to which some fresh loam and a quantity of stone chips are added at the time of planting. Chalk is a valuable ingredient in the soil intended for Moss Pinks, and should be introduced wherever possible in a broken state. I have always experienced the highest results from plants grown on natural chalk formation, and this material as a soil constituent renders the plants to a great extent immune from winter damp.

Moss Pinks are propagated by cuttings or layers, the former taken in July and inserted in sandy soil in hand frames and kept close till rooted. Layering may be performed throughout the growing period, and consists of simply pressing the stems into the soil and covering them, when they emit roots freely.

Of the varieties of Phlox subulata that named G. F. Wilson is one of the most distinct, the flowers being a fine shade of mauve; the foliage is narrow and needle-like, the stems slender; old masses of this fine plant develop mounds about nine inches in height; being particularly hardy, it is one of the best for level planting. The variety lilacina, so finely illustrated here, produces flowers of a rich shade of lilac; it is not unlike G. F. Wilson in growth, but is dwarfer and rather more compact, and is altogether a spring-flowering subject most difficult to misplace. In Fairy the flowers are a near approach to lilac, of a most pleasing shade; the growth is neat and rarely exceeds six inches in height. Absolute purity is not found among the white forms, but the nearest approach occurs in Nivalis, a refined little subject of compact growth, and most free in flowering; it rarely exceeds a height of three or four inches. Nelsoni is of stronger growth, and, except for a pinkish centre, the flowers are white. The Bride is somewhat similarly coloured, the centre being a deeper red. A variety of outstanding merit is The Sprite; in this the flowers are bright rose colour, the centre being crimson. Other varieties of merit include Brightness, bright rose; Daisy Hill, a deeper shade than last; Little Dot, one of the dwarfest, having distinct flowers of white and blue; and Model, in which the flowers are pink.

The fact that Moss Pinks are in flower from April till June enables this fine class to be used in spring bedding arrangements, to which they add by their distinctiveness; they bear moving in June without any ill after-effects, so that by simply dividing them, the same plants will do for several years.

Thomas Smith.

PHLOX SUBULATA LILACINA.

A beautiful variety, with lilac-coloured flowers.

## AUBRIETIAS ON A WALL.

Nature has often a happy way of garlanding the face of a bare wall with flowering plants, and in the illustration on page 285 may be seen a high wall over the face of which numbers of self-sown aubrietias have spread into large breadths, and are very beautiful when in full flower. Every endeavour should be made to modify the original unattractiveness of bare walls by clothing them with plant life. Walls may be rendered objects of beauty, instead of eyesores. Nature gives us proof of this again and again. Here she faces a wall with countless upright, yellow-white spikes of navelwort rising from flat rosettes of rounded leaves; here she drapes the flat surface with lilac flower-trails of mother-of-thousands; here crimson-leaved herb, Robert and pimitory, paint the wall with red and yellow. Nature works wonders with her self-sown seedlings, perfecting her plants in the most unexpected and often apparently impossible spots. From the dry wall her chimney campanulas rise robustly with crowded stems, five feet or more in height; from the narrow chink between the country station wall and the paved platform, down which one can hardly pass a knife-blade, rise strong plants of valerian, a yard in height, and from mortar not five years old seedlings of shrubby veronicas push a few inches of growth. Man may often be discouraged in comparing his ill-fortune with Nature's apparently never-failing success. He has sown in carefully-prepared soil a packet of seed, out of which, perhaps, scarcely one has germinated. Nature's seed, thrown on a rock or into the midst of weeds, flourishes amazingly. But one only sees Nature's successes and knows nothing of her failures. Indeed of these latter she is heedless, "so careful of the type she seems, so careless of the single life," and man may well take heart of grace if his expectations be but half fulfilled.

Many simple cottage gardens are rendered charming in the springtide of the year by aubrietias, which are of the easiest culture, and succeed almost as well in heavy soil as in porous compost. On sloping banks and in retaining walls the aubrietia will flourish and produce its ever-enlarging mantle of flowers year by year. Although ornamental under such diverse circumstances, it is, perhaps, when planted in rockwork, where its roots can strike backward into the cool, moist soil behind the stones, while its foliage and flowers enjoy the fullest amount of sunshine possible, that the rock cress is seen at its best. Here it hangs, its dense mat of leafage hidden during the spring by a prodigal display of blossom, delightful in its shades of purple, lavender, or soft pink. Sometimes after a succession of hard frosts, alternating with sudden thaws, the aubrietia presents but a sorry appearance, but the plant has wonderful recuperative powers, and, with the advent of more genial weather, soon commences to furnish its leafless shoots with green, to be followed later on by a profuse, though somewhat retarded, flower display.

Wyndham Fitzherbert.

## FUCHSIAS.

When well grown there are but few, if any, greenhouse plants more useful than fuchsias, and certainly none that make a finer display when in bloom. Whether grown as standards, pyramids, bushes, trained up pillars, under the rafters, or in hanging baskets they are charming subjects. They are also most useful for outdoor decorations, for nothing has a more pleasing effect than a fine bed of fuchsias carpeted with some low-growing plant that harmonises with the colour of the flowers above. The cultivation of these plants is so simple that no one who has the convenience to grow them should be without a few.

Propagation is effected either by seeds or cuttings, but the latter is the most general method adopted, particularly where it is necessary to have a number of one variety. Cuttings of the young shoots may be inserted in a light sandy soil, and placed in heat, either in the autumn or spring, but those who are desirous of obtaining fine specimens in one season should take the points of the young shoots in September. If these are inserted in such numbers as are required in six-inch pots, which should be plunged in a slight hotbed, they will readily take root. Those, however, who only need small plants would do well to root the cuttings in spring. Seeds may also be sown at that time.

Autumn-rooted cuttings should be potted as soon as ready, and the plants ought to be grown in gentle heat through the winter. It is not advisable to have the temperature too high, or the growth made would be spindly; from 50 to 55 degrees is ample. By the middle of February the plants will require a shift into 48's, for if they have received proper attention, they should be about a foot high by this time; a hundred plants of this size do not take up much room, but after potting the space they will occupy will be much greater; therefore preparations must be made accordingly. When repotted return the plants to the same temperature as that they previously had that there may be no check. It should now be determined whether the plants are to be grown as standards, pyramids, bushes, as pillar plants, for growing up rafters, or for baskets. If the former, keep them to a single stem until the desired height is attained, then pinch out the points of the shoots to induce lateral growths, which operation should be repeated as fresh growth is made. Pyramids are formed by stopping the leading shoot so as to induce side growths to be made, and these, all but the leading one, should again be pinched until the desired shape is attained, when stopping should cease. Some varieties make much better pyramids than others, being more dense in their habit of growth, and such will require far less pinching to induce them to assume the desired form. Bush plants should be stopped when small, and then allowed to assume their natural habit, which will be that of a drooping nature.

When the plants have filled the 48's pots with roots they should be shifted into others two or three sizes larger, according to their strength and the variety grown. To produce specimen plants in one season from six to eight feet high, constant attention must be given; they must not receive a check from the time the cuttings are rooted until in bloom. We have often grown plants of this size from cuttings inserted in September, by the end of the following May, and had them in full bloom from June until the end of September. When potting do not ram the soil very firm, especially if the loam be of a heavy texture, for even though it is made light by the addition of leaf-soil and decayed manure, it has a tendency to become too solid when rammed hard. As the plants proceed in growth a neat stake should be put to the central shoot for support, and the side growth should be looped up to this to prevent them from being snapped off by their weight, and to assist in regulating the distance between them.

Fuchsias are gross feeders, and they will need artificial manure; we have found nothing better than dried blood. This is easily applied, either as liquid manure or in the powdered state; if the former, all one has to do is to put a handful into the watering-pot, fill, and then stir up with a stick. By the latter end of April or early in May the plants should be large enough for their final shift, and will require pots of the size of 8's or 6's. After the final potting they should be re-staked, using neat bamboo rods from six to seven feet or more in length, according to the height they will in all probability attain; at the same time care should be taken to loop up the side shoots to the main stem.

If the fuchsias are intended for furnishing flower beds, they should be stood out of doors towards the end of May, choosing a sheltered position so as to avoid their being broken by high winds, which are usually very prevalent about the first week in June. Such plants as these make a fine show in large beds when planted a sufficient distance apart to show themselves to advantage. The groundwork should be such as to harmonise with the colour of the flowers. If the fuchsias are self-coloured there is no difficulty. We have planted large beds of Blushing Bride carpeted with pink ivy-leaved geraniums, which had a charming effect; Merinka, with a groundwork of fibrous begonias; Lustre, with Royal Sovereign violas; and Charming with a groundwork of white heliotropes. The single varieties are most suitable for bedding, though some of the double forms such as Ballet Girl, Berliner Kind, and Frau Emma Topfer do well.

For specimens the plants should on no account be overcrowded even when in a young state, as their beauty would be spoiled if once they become drawn to one side. They ought to be turned round occasionally, so that all sides may receive a due share of light. Pinching should cease as soon as the plants have attained the desired proportions in order that the growth made afterwards may assume a natural habit, as the graceful drooping sprays will show themselves to advantage if allowed to extend freely. It is difficult to grow fine specimens of such varieties as Phenomenal, as this has a strong rampant growth, but the large showy flowers well repay the cultivator for the extra pains needed to grow it to perfection. Champion of the World is also another of this class.

For growing under the rafters of houses there is no variety that makes such a fine show as Olympia. When liberally treated this is a perfect mass of flowers hanging from the root in a most graceful manner. The long salmon-pink tubes and scarlet corolla produce a charming effect. Blushing Bride and General Grenfell are also useful for this purpose. Of course, there are many others, and each season we find new additions to the long list of varieties already in culture.

As basket plants fuchsias are most suitable, and when employed in this manner it is preferable to root the cuttings in spring. After growing them in pots until they are a foot or fifteen inches high transfer them to the baskets in which they are intended to bloom. The number of plants required to fill a basket must in a measure depend on the size of the basket; it is, however, well to plant sufficient to produce a good effect.

Though I have only dealt with young plants, there is no reason why older ones could not be grown with a like success, but as far as my experience goes young plants are far less trouble, and give a greater wealth of bloom for the labour bestowed on them, and, except in the case of pillar or roof plants, which are usually planted out, they retain their flowers much longer. Young plants take up but little room; one could put five hundred in a two-light pit or frame until potted a second time.

H. C. Prinsep.

## PROGRESS IN APPLE BREEDING.

A bulletin received from the Director of the Dominion Experimental Farms, Ottawa, Canada, is of much interest as showing what may be accomplished in the breeding of apples for a cold climate. When the experimental farms were established in Canada one was located in each of the then organised provinces of the Dominion. This resulted in one being established in Manitoba, and another in the North-west Territories. At that time no apples of merit were known to be sufficiently hardy to admit of their successful cultivation in the North-west plains country. On the suggestion of Messrs. Budd and Gibb, of Iowa and Quebec respectively, who had a short time previously made a journey through Russia, attention was turned to the steppe country of Russia for primary forms of the apple, with which to commence the work of raising varieties that, while of good quality, would be adapted to the climatic conditions that obtain in the North-west Territories. In the result the crab known as Pyrus baccata was imported, and seedlings raised from it, and as soon after as possible crosses were made with the hardiest apples and the cultivated crab. The crosses were numerous, and they were remarkably successful in securing hybrids. The trees came into bearing early, and some twenty varieties have been described and named, and distributed to settlers throughout the provinces of Alberta, Manitoba, and Saskatchewan. The fruits of P. baccata have a diameter of about half an inch, and many of the crossbreeds of the first generation have fruits that are twelve or fourteen times their weight. Crosses were made with Prunus prunifolia and cultivated apples, and some of these have borne fruits that were two inches in diameter. The flesh of this race of hybrids is mostly fine grained, juicy, with traces of astringency. No crossbreeds have as yet been produced that can be included with the dessert varieties, but it is hoped they will be evolved in due course.

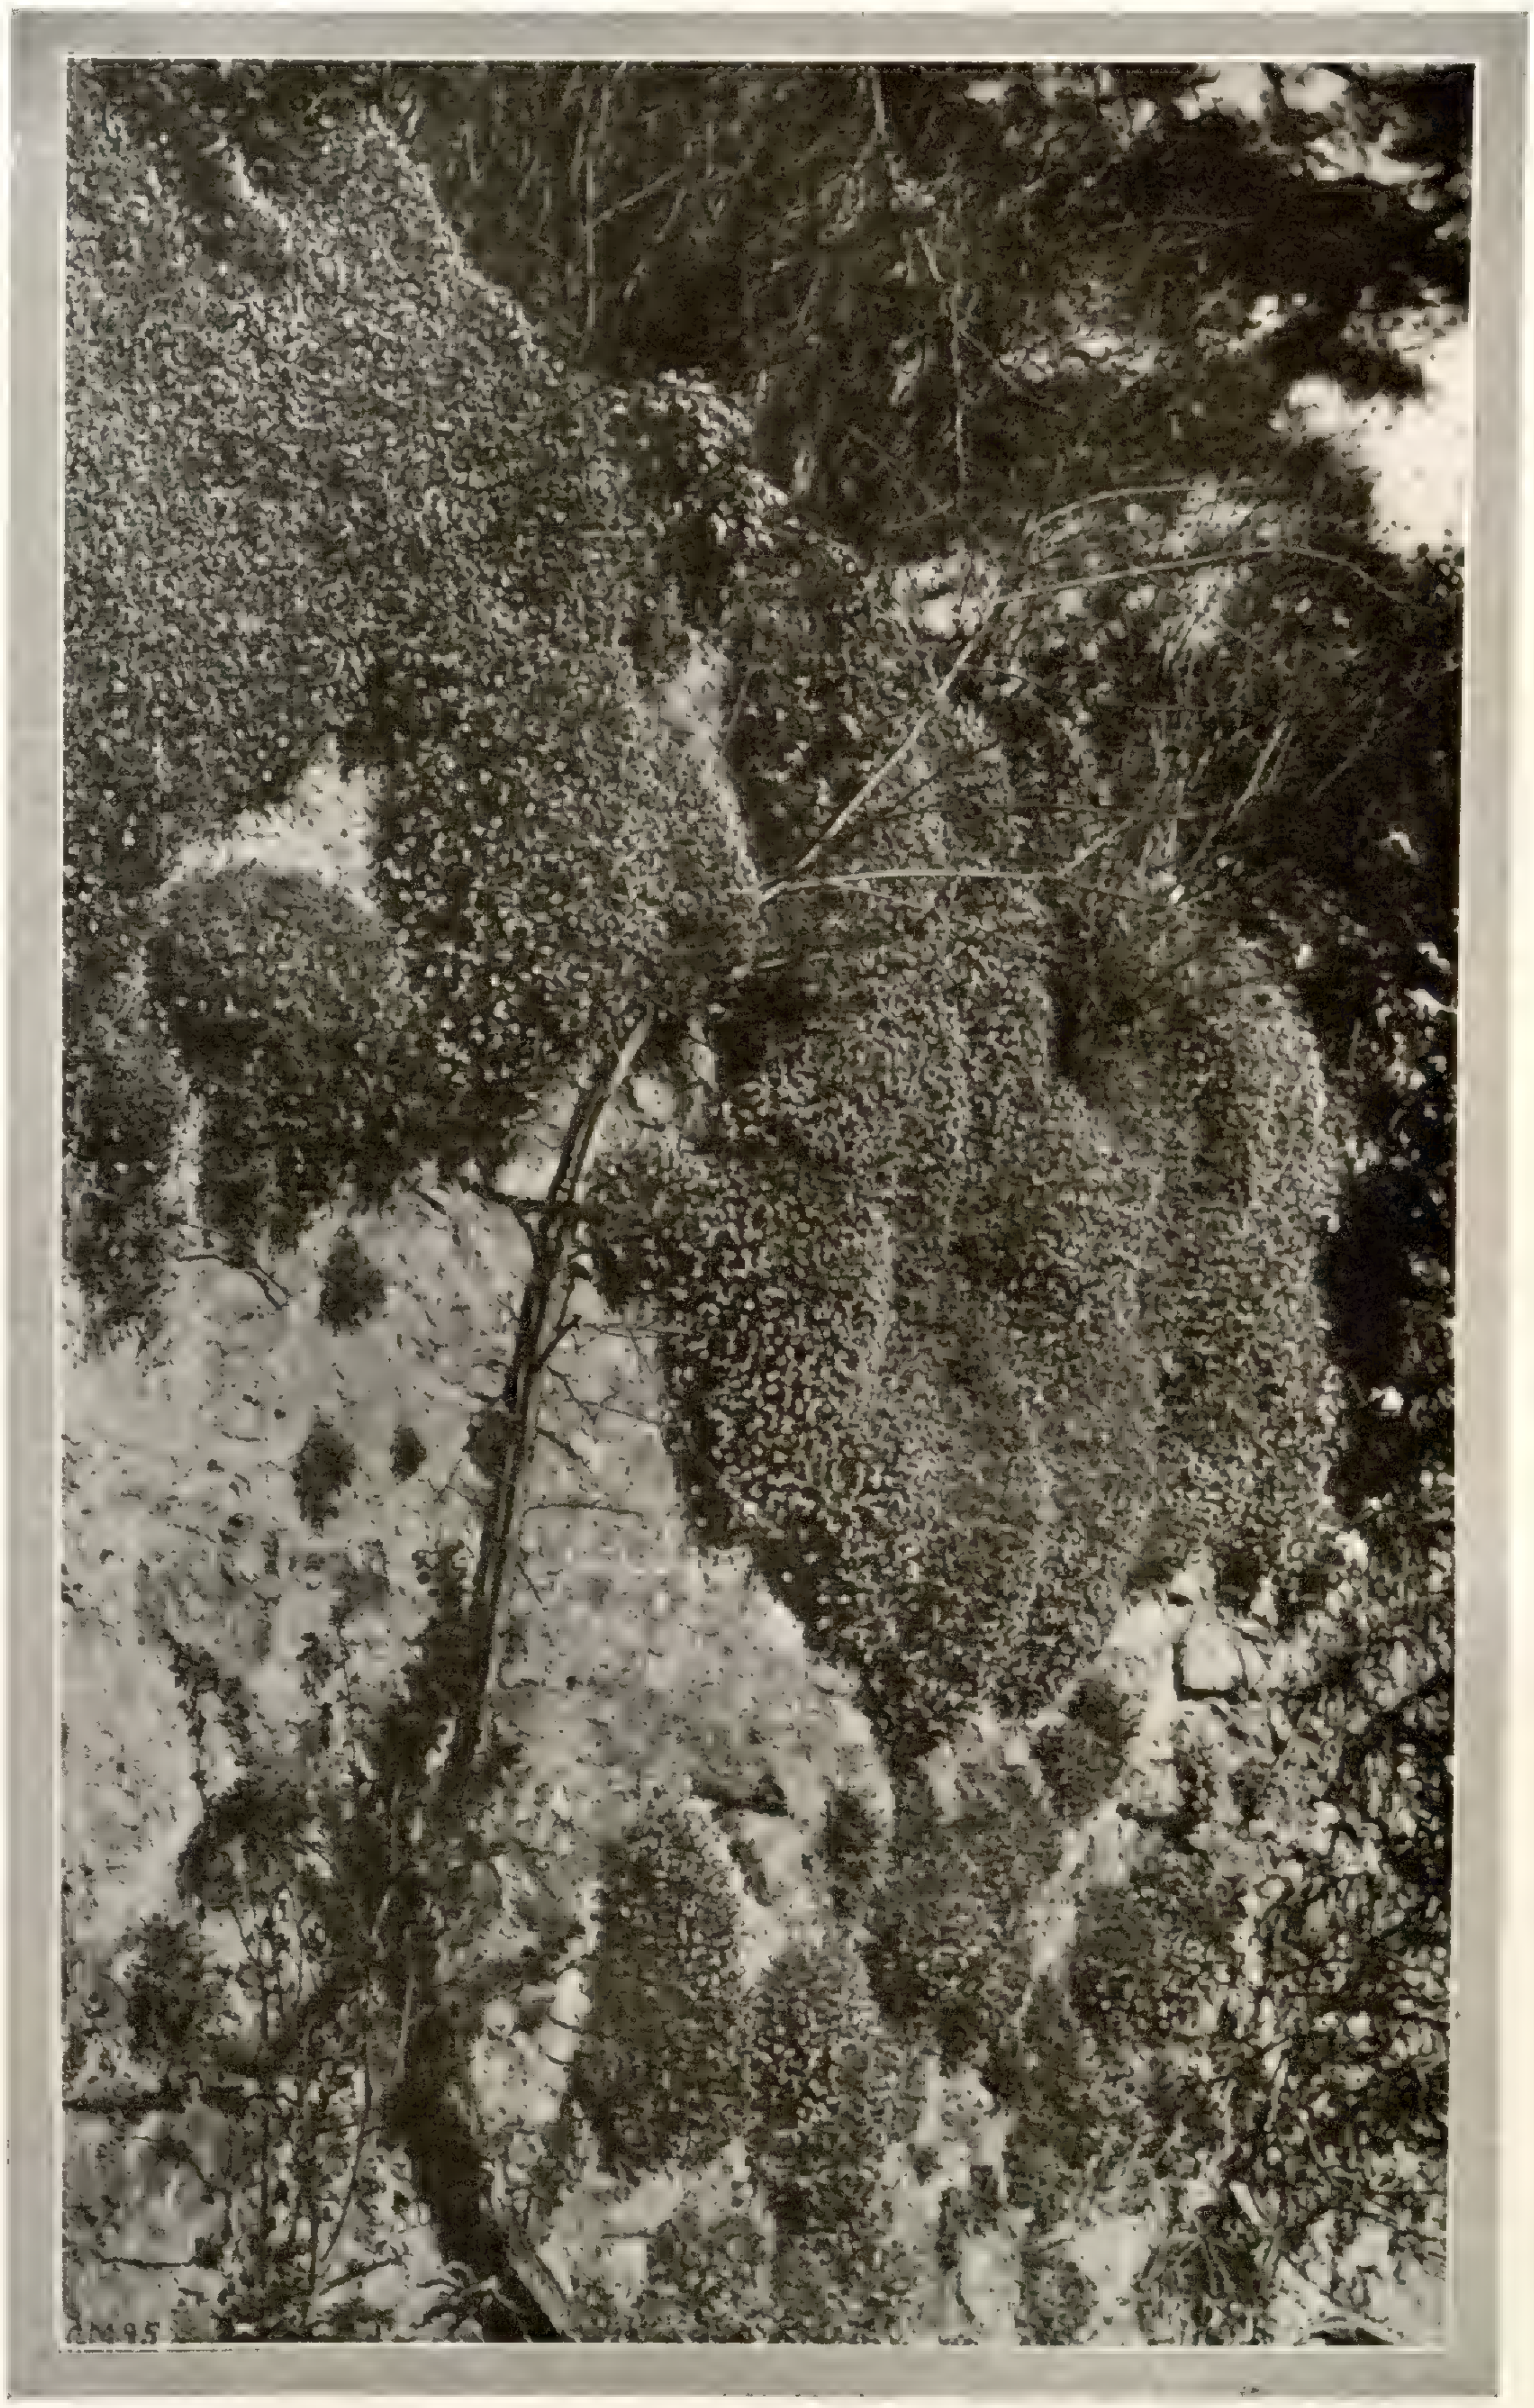
## SCOTTISH FORESTRY REPORT.

The report of the Scottish Committee on Forestry, recently issued, is a valuable document, and one that should mark a definite advance in the development of forestry in Scotland. It has been an open secret in forestry circles for some time that the committee had decided to recommend Aberdeen as the most suitable centre for the higher forestry teaching of Scotland, and the fact that Aberdeen has been suggested by the Commissioners for such has given much satisfaction in the north. It is felt that an opinion coming from such an influential committee cannot fail to carry weight, and to render it impossible for the powers that be to overlook or ignore the claim which was recently laid before them for the development of the Forestry School at Aberdeen. There are, broadly speaking, two crying needs in Scotland in connection with forestry—the necessity for an official survey of the area suitable for afforestation, and a model forest where forester apprentices can be trained and the science of sylviculture built up. This report brings us within the practical realisation of these two needs, and it points to Aberdeen as the centre best located in every way for the establishment of a university school of forestry, being nearest to the hub of the existing woodlands and largest afforestable area. The Commissioners add that "it would follow from this that the location of the demonstration forest area should be fixed mainly with reference to Aberdeen, though it would still be desirable that the forest should be, as far as possible, accessible from all parts of Scotland."

The quotation given prompts the query—Is there, then, within easy reach of Aberdeen such an area? As a matter of fact there is not one but several areas within the present jurisdiction of the Aberdeen Forestry Department. They are to be found in Kincardineshire, Morayshire (Speyside), and in Ross-shire. There are to be found in each of these districts—apart from Aberdeenshire—areas which would amply fulfil the requirements laid down in the report. The Kincardineshire area is within thirty miles of Aberdeen, and is, besides, much larger than that stipulated for by the committee. It could, besides, be taken over with comparatively little delay, and in other respects this area is easily adaptable for the early operation of a forestry school. Indeed, to find forests of any size in Britain the authorities must come to the north-east of Scotland. It is there, and there alone, that forestry as an industry can be said to exist in Scotland, and it is because of this that the committee has very properly recommended that the centre of forestry teaching should be placed at Aberdeen. Our chief woodlands are all in the north-east and north of Scotland, and it is there where the teaching centre should be placed, and not in the south where there is little or no timber grown. One has only to look at the map of Scotland accompanying the committee's report, and the important table given of the afforested and afforestable acreage in each county, to see how clearly this is brought out. In dealing with the subject of forestry, let us not forget that it is not a theoretical or purely scientific subject that can be carried on in the classroom and laboratory. It is an intensely practical subject, and it can only be efficiently taught in close contact with woodlands and forests. In devising a proper forestry course arrangements must be made for practical instruction in the State demonstration forest and in private forests. For this reason the Forestry Centre must be within easy reach of the great timber-growing areas of the country. The students must have access to the regions where sylviculture is carried on upon a commercial scale. They must be in touch with the industry so that the whole system of teaching may be practical and alive. It is considerations such as these which have very properly led the committee to recommend Aberdeen as the centre for forestry teaching in Scotland.

Keeping all these things in view, one need not be surprised to learn that the authorities in charge of the Forestry School at Aberdeen are to take immediate action. Their contention is to be pressed home, and pressed home at once. It is felt that there has been of late years far too much cry and little 'oo (wool), but with the issue of this valuable and practical report decisive action will now be taken. Now that the public interest is thoroughly aroused on the subject, and with the driving power of the committee's report behind it, one cannot but think that afforestation in Scotland should now be pushed forward to the stage of practical and definite work.

W. K.



AUBRIETIAS ON THE FACE OF A ROUGH WALL.

---

**Conifers..**—April is a good month in which to transplant conifers, as they are about to commence new growth. Lift them with a good ball of soil attached to the roots, and give them a good watering when they are placed in their new positions. Hollies can also be successfully transplanted now. Some of the variegated varieties make ideal specimens; while drooping standard hollies are very ornamental.—J. Gardner.

## WORK FOR THE WEEK.

### THE ORCHID HOUSES.

THE WARM HOUSE.—Dendrobiums comprise some of the most easily grown orchids in cultivation, and also some of the most difficult to manage. Because a plant is difficult to grow it should not be discarded, but rather persevered with, so that we may produce it year after year in perfection. It is to the difficult species I refer, such as D. Johnsoniæ, D. superbum, D. superbiens, D. Goldei, D. atroviolaceum, and D. Phalænopsis Schroderianum. I think I am quite right in assuming that a great many growers are not as successful with this latter orchid as they would wish, and it is to this that I am referring particularly this week.

DENDROBIUM PHALÆNOPSIS. — The chief points of culture to observe are as follows: Keep the plants in comparatively small receptacles, and grow all that will admit of it in pans, for they are usually more at home when suspended from the roof than when standing on the stages. Strong, erect-growing plants must of necessity stand on the stages. The roots will remain a long time in a sound and healthy condition if not over-watered. The resting season of most of these species is now about over, but at no time are they capable of withstanding such a low temperature as the deciduous dendrobiums. After they have completed their growths, they enjoy a long, dry rest, but must on no account be allowed to shrivel, and must be given just sufficient water to keep them plump and healthy. The whole of this section inhabit some of the hottest portions of the earth, and when in full growth they delight in an abundance of heat and light, and will succeed in a plant stove or a similarly-heated house, where they can be protected from the direct rays of the sun during the hottest part of the day. When the pans are full of roots these dendrobiums delight in copious supplies of moisture, both at the roots and in the atmosphere. During hot weather they should be syringed or sprayed at least two or three times a day.

COMPOST.—Dendrobiums, to my mind, are fastidious as regards compost, and whatever material is used it should be thoroughly prepared and have all the earthy particles removed. The fibre used should be of the best, and it should not have been cut for any length of time, so as to have lost its life. The compost should resemble, as near as possible, the live material in which the roots of these orchids revel in their native habitats. A suitable compost is made up of equal portions of peat, polypodium and osmunda fibre, and sphagnum moss, all thoroughly mixed together.

POTTING.—When potting plants that are grown in a high temperature it is essential that the compost be warmed to about the same temperature as the house in which the plants are cultivated. Dendrobiums should be potted moderately firm, and if the compost is prepared as advised there will be no danger of getting it too hard and solid. After repotting they should be kept rather dry, giving sufficient water only to prevent shrivelling and to slightly assist the new growths; they will then proceed steadily, but surely, and but few, if any, will be lost through damping off. Every encouragement should be given the plants to enable them to become established in the new compost.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

TUBEROUS-ROOTED BEGONIAS that have been stored and kept dry during the winter will by now have commenced to make new growth. The tubers are best brought on in batches, and the most forward tubers should be selected and placed in boxes in a light compost of loam, leaf-soil, and coarse silver sand, just covering them. The boxes may be put in a light house or frame, with a temperature of 55 degrees, and if the tubers are sprinkled with water through a fine rose the growth will be rapid. When the tubers have started, and the large leaves developing, they should be put into suitable sized pots, according to the size of the plant. The pots must be clean, and the compost should consist of two parts fibrous loam, one part each of leaf-soil and sand, and the pots be well drained. Begonias are best shifted on gradually, and not overpotted at any time. They like plenty of water when growing, and a stimulant when the pots are full of roots. A light position is necessary, otherwise they become drawn and spindly; and during their earlier growth, when not shaded, care must be taken in watering not to drop any water on the foliage, or the sun will scorch it.

SHOW PELARGONIUMS will be growing freely, and will need constant attention. Those requiring more root space should have their final shift. Old plants of last year will easily fill an eight-inch pot. When they are rooting freely in the new compost, the shoots should be pinched over for the last time. Keep them as near the glass as possible. Pelargoniums require light and air to keep them healthy, and are benefited by liquid manure when well rooted.

ZONAL PELARGONIUMS.—These will soon make a fine display. Plants that have been flowering throughout the winter and have become leggy should have the tops of the shoots taken off, and inserted in small pots. They soon become shapely again. Cuttings rooted last autumn and growing freely in 60's, will be ready to shift into 32's preparatory to standing out on the ash bed to be grown on for the autumn display. The flower spikes must be removed, and growths pinched frequently to encourage sturdy growth.

SHADING.—Owing to the very unsettled state of the weather, but little sunshine has been recorded; but the temperature has been high, and the growth under glass very rapid. Shading has not yet been required, but shading material should be in readiness for use when wanted. Fix all roller blinds in position, and where permanent shading, such as lime, summer cloud, etc., is used, have it ready to apply any day. A good permanent shade is made by mixing 1lb. of Paris green to two quarts of sour milk, and is readily applied with a whitning brush.—Lewis Smith, Shotesham Park Gardens.

## THE KITCHEN GARDEN.

MAINCROP POTATOES.—Weather permitting, it will be time to prepare for planting maincrop potatoes. Providing the site was treated as earlier advised, only surface stirring will now be necessary before planting the sets, but I fear many plots mapped out for potatoes on heavy lands have not even been touched, owing to the continuous rainfall experienced. Should this be the case, the ground must be very finely forked up and well broken, planting the sets as the work proceeds. A quantity of well-decayed manure, leaf-soil, and lime, with burnt garden refuse, should have been prepared under cover during wet weather, and this should be spread along the bottom of the trench when digging, immediately under each line of potatoes, and within easy reach of the sets. To place it in the proper position and distance, peg or stake the plot before commencing to dig, at two feet apart, and thirty inches for the stronger growing kinds. The potatoes should be properly sprouted, with two strong, sturdy shoots each; plant four to five inches deep, and eighteen inches apart in the rows; cover very carefully to avoid breaking the shoots. A little old leaf-soil and any old cucumber bed soil that may be available should be placed over the "sets" before adding the ordinary soil. This doubles the crop of potatoes. Excellent maincrop varieties are Superlative, Windsor Castle, Snowdrop, and Up-to-Date.

WINTER GREENS, BROCCOLI, AND CAULIFLOWERS.—The general sowing of all these will now need to be made. Choose an open position on ground that contains no fresh manure. Well beat and tread the surface, bringing it down to a nice firm and fine tilth; over this strew a heavy dressing of wood ashes and lime, and rake or fork it in. Sow in beds, or in drills, ten inches apart; the latter are perhaps preferable, as the Dutch hoe can then be readily brought into play. Should the turnip fly be troublesome, spray with a paraffin emulsion, or scatter equal parts of lime and sulphur over the seedlings early in the morning, when the leaves are damp with dew. Make a further sowing of the later varieties the first week in May. It is usual to make a sowing of leeks for use twelve months hence. When sowing is completed well net the whole bed as a protection against birds.

PARSLEY.—The early sown batch, which has been pricked off in boxes, etc., will need planting out on well-enriched ground; providing it is properly hardened off, plant at one foot apart, place a ring of cinder ashes around each plant to ward off slugs, and give occasional dustings of lime and soot alternately. Sow a good batch in the open.

ASPARAGUS.—After the heavy rains the beds should be carefully examined, slightly pricking the surface up to loosen and warm it, as on heavy land the beds will be very firm and wet. When the beds have had a good airing give a light dressing of salt, scattering over this some spent mushroom bed manure or similar material. A quick-acting artificial manure will also be very beneficial. Sow seeds on a warm border in a light soil for future beds. If tended with due care, good roots will be ready for new beds twelve months hence. Plant four inches deep on ridges. Three rows are usual on a bed, and the plants should be eighteen inches apart each way.—G. Ellwood.

SEAKALE.—The thongs treated as advised earlier are in excellent condition for planting out. Plant in lines at eighteen inches apart, and one foot from set to set; plant firmly, and place cinder ashes around the sets to prevent trouble from slugs. If lime is lacking in the soil, apply a dressing before planting. Soot and salt are great helps to seakale.—G. Ellwood, Swanmore Park Gardens.

## HARDY FRUITS.

DISBUDDING PEACHES AND NECTARINES.—This is one of the most important operations the hardy fruit grower has to perform. The future well-being of the tree is mainly dependent upon the manner in which the work is carried out, and it requires a considerable amount of forethought and discrimination on the part of the operator to select and retain those shoots which will preserve the balance and symmetry of the tree. This operation should be carried out so that no perceptible check is given. To avoid this danger it must be done by degrees, extending over a period of three to four weeks. The first thinning may consist of the removal of foreright and backright shoots—that is, shoots standing at right angles to the wall; also a slight thinning of the remainder, taking care to preserve the basal shoot. In about a week later a further reduction may be made. At the final thinning the basal and extension shoots only should be left, unless circumstances determine otherwise. There may be gaps to be filled, and where the previous season's growth has been allowed to extend for this purpose, select a well-placed shoot about 12 inches above the basal growth. In all cases have a shoot at the tip, which may be stopped later on should there not be space for training it in full length. By all means avoid overcrowding of the growths.

STRAWBERRIES.—All dead leaves should be removed from the plants. A dusting of equal parts of lime and soot round and about the crowns will make it unpleasant for slugs, and strengthen the young growths and flower spikes. For old plantations the pointing in of some well-decayed manure was advised in a previous calendar; it is not too late to make up arrears in this matter. If artificial manures are used, it should be with caution, otherwise an over-luxuriance of foliage may be induced. The surface soil of newly-planted beds should be kept well stirred with the hoe, and all weeds eradicated as far as possible prior to applying the mulching material, which usually consists of long stable litter freed from all the finer and shorter portions, and applied direct from the stables. If laid down in good time it will become sweetened by rain sometime before the fruit ripens; on light soils an application is desirable to prevent evaporation of moisture. In cold low-lying localities, where late frosts often occur and ruin the early blossoms, means should be afforded of protecting the opening flowers; thin strips of tiffany are most suitable for the purpose, or a temporary framework of splines and short posts erected to carry some kind of protecting material, which may be readily put on and off as required.—W. Messenger, Woolverstone Park Gardens.

"Carnations, Picotees, and Pinks" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## CULTIVATION OF PERPETUAL CARNATIONS BY AMATEURS.

The following is the text of the paper read by F. Fitch at the Conference held by the Perpetual Carnation Society at the Royal Horticultural Hall, March 21:—

The rapid increase in popularity of the perpetual flowering carnation, as well as the improvement in the flower itself, during the past few years, is little short of marvellous. Many of our friends would claim that the perpetual flowering carnation already competed with the rose for the first place in popular favour. It has become so indispensable as a decorative flower, especially during the dull, dark days of winter, that we might well wonder how we did without it before its introduction.

It is essentially a flower for the amateur, for besides its many other qualities, it is easy to grow, will flower practically the whole year round, will last longer when cut, and travel better than any flower I am acquainted with. During the past two months I have sent one or two hundred blooms every week to the South of France by parcels post, and I hear that they arrive in perfect condition. I know of no other flower that is so profitable to grow, for one can always go to the carnation house and be sure of finding some flowers fit to cut, and that, not for just two or three weeks, but in almost any week in the year.

If the amateur can devote a house to the culture of these flowers, I would advise him to do so; as the dry, buoyant, airy atmosphere essential to their well-being is more difficult to maintain if the house contains other plants requiring different treatment. The house should be placed so as to obtain all the sun possible during the dull days of winter. Ventilators should be arranged along the roof and at the sides of the house, which should be heated with pipes sufficient to maintain a temperature of 50 degrees while the top ventilators are open.

### Raising Young Plants.

Propagation should be effected between December and March; cuttings rooted in January, of course, making the best plants. There is no doubt that one of the chief essentials to the successful culture is the selection of the right kind of cuttings. They should be chosen from strong, healthy plants, for one cannot expect to have strong examples if the cuttings are taken from weaklings, or healthy ones if taken from diseased plants. This is a most important matter, and one that cannot be too strongly emphasised, and any little trouble taken in selecting cuttings for the future stock is well repaid. The best cuttings are those found half-way up the stem, and should be taken off when about three inches long, with a gentle downward pull, bringing with them a little of the old stem. This should be removed with a sharp knife.

Cuttings root in a temperature of 50 degrees to 55 degrees, and a bottom heat of about 60 degrees. The American, and our large market growers, make a bed of soft bricks placed over a pit with hot-water pipes enclosed about two feet below them. On the bricks is then placed some sharp sand about three inches deep, made firm, and watered with a fine rose. In this the cuttings are inserted in rows about two inches apart, and one inch from cutting to cutting. The whole being covered with a glass case.

The amateur, of course, could not carry out his operations on such an extensive scale as the market growers, but if he can produce the same essential conditions, although in a more limited way, as the man who grows for profit, he will not go far wrong. The soft brick bottom absorbs the moisture from the sand and returns it again when the sand becomes dry, so that the bottom of the cutting is always at a uniform moisture.

A good plan for the amateur is to place a case, a box with a sheet of glass over the top, or a handlight, in a corner of the house where it will have the requisite amount of bottom heat, and place in it cocoanut-fibre refuse, or some such material, and then take some seed pans or strawberry saucers, and fill them with sand, moisten with a fine rose, and insert the cuttings. Place the pans in the case where they will require very little more water until they are rooted, which should be from three to four weeks; but on no account should the sand be allowed to dry through. This mode is better for the amateur in several ways than pricking out in the bed, for it not only produces the effect of the soft bricks, as nearly as possible, but as some varieties are longer in rooting than others, each pan can be removed from the case as they become rooted, leaving the others to enjoy the closer atmosphere. Care should be taken that the cuttings do not lie about or get dry, but are inserted as soon as possible after being taken off the plants. After they are placed in the frame, put on the glass, shade from bright sun, and admit air for an hour or so each day, wiping the glass free from any moisture. If these directions are followed, the cuttings will be sturdy and strong, and no larger than when inserted. It is a great mistake to allow the cutting to begin growth until rooted.

Many other means would suggest themselves to the amateur under different circumstances; for instance, anyone only wanting a few plants might procure a 10 or 12-inch pot, put some good drainage in the bottom, and fill up to within five or six inches of the top with sand. Put in the cuttings, and place a piece of glass upon the top of the pot, stand it on the top of a hot-water pipe, and treat in the same manner as in the propagating case.

(To be Continued.)

## MANURING OF FRUIT TREES.

For the benefit of those interested in this question we have pleasure in reproducing here a few useful practical hints by Mr. C. Heine, head gardener in the Posen Botanical Gardens.

Fruit trees naturally require all the ingredients found in animal manure, such as nitrogen, potash, phosphate, and lime. Their requirements, however, in potash, phosphate, and lime are, on an average, much greater than has hitherto been supposed. The application of these various constituents will depend on the position of the tree, the nature of the soil, and likewise the development of the several parts of the tree, such as the wood, buds, etc., so that quite as much harm may be done by a one-sided manuring as by no manuring at all.

In kainit, which contains, besides the necessary potash for wood, leaf, and fruit formation, a corresponding amount of common salt, we have a means of strengthening the trees' resistance to disease, especially in the case of the stone fruits. For spring application the sulphate or muriate of potash should be used.

The application of phosphate in the form of basic slag or superphosphate promotes bud and fruit formation, at the same time producing a good flavour. The lime combined with the phosphate is necessary for the stone formation.

In the case of sour land, on which the trees suffer principally from disease and canker, an application of fresh ground lime will prove beneficial. This will purify the soil, and the trees will soon become healthy and fertile again. At the same time the lime will have the effect of decomposing the plant food in the soil and making it available for the trees.

According to experiments it is specially important, in order to obtain the best results, to apply the different manurial constituents at the proper time. This applies particularly to potash and phosphate. It is known that in dry soils both these ingredients will remain a long time undissolved and useless, for moisture is necessary to dissolve them, and to render them available as plant food. For this reason it is essential to distribute the manure as early as possible. In this connection it must also be remembered that in fruit plantations, where other crops are still grown between the trees, these require a large part of the manure, so that if the application is deferred too long, nothing or very little is left to the trees. It follows therefore that the potash and phosphate dressings will only show a favourable effect when they are given early.

## NORTH OF ENGLAND HORTICULTURAL SOCIETY'S MEDAL.

The medal for the North of England Horticultural Society, of which we give an illustration herewith, possesses considerable artistic merit. It has been designed by F. Ranson, Esq., from sketches submitted by the makers of the medal, Messrs. Fattorini and Sons, Lim., art medallists, Bradford.

The main feature of the design is the figure of Mother Earth, known in Latin as Ceres, and in Greek as Demeter, one of the great divinities in Greek mythology, the Goddess of the Earth. She is shown as bearing in her right hand a bunch of poppies, and in her left hand a basket of assorted fruit. She is standing in a field of wheat, and on one side the corn is shown in growth, and on the other in sheaves. Behind the field is the sun with its rays extending over the upper portion of the medal, amongst which are the letters N.E.H.S.

The treatment of the subject is happy, and the medal has been much admired by those who have had an opportunity of seeing it.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, April 9.—Weybridge Horticultural Society's Monthly Meeting.

WEDNESDAY, April 10.—Edinburgh Spring Show; two days.
Kingsbridge Daffodil Show.
East Anglian Horticultural Club.

THURSDAY, April 11.—Cornwall Daffodil Show, at Truro; two days.

FRIDAY, April 12.—Warninglid Gardeners' Society.

TUESDAY, April 16.—Royal Horticultural Society: Narcissus Committee meets at 11.30 a.m.; Fruit, Floral, and Orchid Committee meet at 12 o'clock; Lecture at 3 p.m. on "Darwin as Ecologist," by Rev. Prof. G. Henslow. Scientific Committee at 4 o'clock.
Royal Horticultural Society's Daffodil Show; two days.
Shrewsbury Spring Show.

WEDNESDAY, April 17.—Royal Horticultural Society's Examination for Teachers.
Royal Horticultural Society of Ireland, Spring Show.
Royal Meteorological Society.
Royal Society of Arts.

THURSDAY, April 18.—Ipswich Spring Show.
Linnean Society Meeting.
Manchester and North of England Orchid Society.
Hereford Spring Show.
Devon Daffodil and Spring Flower Show, at Plymouth; two days.

SATURDAY, April 20.—Chislehurst Spring Show.

TUESDAY, April 23.—Breconshire Daffodil Show.

WEDNESDAY, April 24.—Royal Botanic Society Meeting.
North of England Horticultural Society, at Leeds.

THURSDAY, April 25.—Midland Daffodil Show at Birmingham; two days.
Norwich Spring Show.
Falmouth Spring Show; two days.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Torquay Spring Show.

The Torquay District Gardeners' Association held its show at the Bath Saloons on March 28, a very early date, far in advance of any of the Cornish shows. The exhibition was a great success, the classes being well filled, and the entries so numerous that there was not room for all the plants in the large saloon, and an adjacent room had to be utilised. Amaryllis were the great feature of the exhibition, the richly-coloured flowers shown being superb, and the two groups of splendid plants staged were greatly admired. Cyclamen also were especially fine, the plants carrying enormous flowers borne in great profusion.

The chief prize winner was Colonel Cary, who was first for six foliage plants, three azaleas, a specimen azalea, group of palms and ferns, six primulas, three spiræas, six flowering table plants, six foliage table plants, six amaryllis, one specimen palm, three cinerarias, twelve pots of polyanthuses, a dozen carnation blooms, and a collection of vegetables. Mrs. Tottenham won the challenge cup for a group of orchids, and another cup for a group of greenhouse and stove plants; she was also first for six flowering plants, equal first with Mr. F. Pershore for a dozen hyacinths, and first for six pots of tulips. Mr. F. Pershore, the Hon. Helen Cubitt, Mrs. H. Greswolde Williams, Mr. H. E. Bowring, Mrs. Gordon Cumming, and Mrs. Cogan were other leading prize-winners, the Hon. Helen Cubitt winning the silver cup for a group of daffodil blooms.

The nurserymen's exhibits added much to the attractiveness of the show. The Devon Rosery, Torquay, showed pot roses in full flower, deutzias, Cytisus præcox, Acacia armata, Boronia heterophylla, Arctotis aureola, Lopezia miniata, Ribes sanguineum, Manettia bicolor, Clematis Fortunei, Erica lusitanica, Amygdalus persica flore pleno, Pyrus malus floribunda, Spiræa Thunbergi, S. prunifolia, Cydonia Maulei, C. Apple Blossom, C. nivalis, Forsythia suspensa, and a collection of rock plants, including Saxifraga Guildford Seedling, S. pylosa, S. caphilipis, S. Lindsayana, S. tenuifolia, S. Red Admiral, Arabis variegata, Sedum lydium, S. mauveanum, S. glaucum, Phlox setacea, and Thymus lanuginosa; while they also staged a fine collection of twenty apples in splendid condition. Messrs. Robert Veitch and Son, Exeter, had an interesting stand containing Correa bicolor, C. magnifica, C. cardinalis, Azalea obtusa (scarlet), Anemone pulsatilla, Eriostemon linearifolium, Primula malacoides, Jasminum primulinum, Chorizema Lowi, Hibbertia dentata, Cydonia japonica, Forsythia viridissima, Gerbera hybrida, Acacia Riceana, A. lineata, A. ovata, A. hybrida, A. Drummondi, A. diffusa, A. cordata, Cyrtomium Rochfordi, Eupatorium ionantha, Magnolia nigra, M. Alexandrina, a collection of winter-flowering carnations, and rock plants.

Mr. W. B. Smale, Torquay, showed Cineraria Pompadour, C. Antique Rose, C. Matador, C. stellata, C. Azure Blue, C. Boule de Neige, Clerodendron Balfouri, and Primula obconica, Queen of Roses. Messrs. Barr and Sons staged a superb collection of daffodils, including Vesuvius, Sir Galahad, Venus, Queen Sophia, Pedestal, Sunbeam, Van Waveren's Giant, Capax plenus, Isolde, Firebrand, Lycidas, Czarina, Hulda, Mascotte, Albatross, Michael Angelo, Macebearer, White Queen, and Torchlight. Messrs. Burridge and Sons staged azaleas in all colours, arranged with palms and ferns. Mr. H. Mayne, Torquay, showed hyacinths, tulips, carnations, hydrangeas, Lilium longiflorum, camellias, primulas, zonal pelargoniums, mignonette, narcissi, and orange trees in fruit. Miss Josephine Gundry, of Foot's Cray, Kent, exhibited a very beautiful selection of water-colour paintings of garden scenes.

## French Horticultural Society of London.

Under the genial presidency of Mr. N. N. Sherwood, V.M.H., the annual dinner of the above society was held on Saturday, March 30, at the Café Royal, Regent Street, London. There was a large attendance, and the British horticultural trade was well represented. Following an excellent repast, the Chairman proposed "The King and Queen and Royal Family," and "The President of the French Republic," the National Anthem and the Marseillaise being sung by the audience. "Success to the Society" was pleasantly proposed by Mr. Sherwood, who suggested further meetings than the annual one for bringing together British and Continental horticulturists. The great value of the society's work in looking after young French, Belgian, and Swiss gardeners who came over to England, and placing them in situations, was eulogised, as also was the educational work carried on by means of monthly meetings and lectures. Mr. Sherwood very kindly invited the members of the society to visit him at Kelvedon in the summer, promising them good cheer and a hearty welcome, as well as educational opportunities among the seed trials carried out by Messrs. Hurst and Sons. Mr. G. Schneider, the founder and president of the society, responded, and thanked the chairman for his presence, and for his kindly invitation. "The Officers and Committee" was proposed in French by Mr. F. Gaskill, and M. Caspari, who eloquently responded, also gave "The Horticultural Press," to which Mr. Chas. H. Curtis, of the GARDENERS' MAGAZINE, responded, and said that the society was strongly supported by British horticulturists from a rather selfish motive, and this was the hope that when the members returned home and entered business on their own account they would take as close an interest in young Britishers entering Continental nurseries and gardens as was shown to themselves while here.

Mr. W. A. Bilney proposed "The Chairman," and this toast was enthusiastically received, and accorded musical honours. Special thanks were accorded M. Ripard for decorating the tables, and to Mr. Hiehle for able assistance freely given in the conduct of the society and the arrangements for the dinner.

A lengthy and excellent programme of music, etc., was provided by the chairman, who, however, declared that Mr. Edward Sherwood was responsible. The speeches were all commendably short, and the proceedings concluded about 11 p.m.

Sir Albert Rollit, Mr. Harry J. Veitch, Mr. Gilbert Beale, and Mr. Stuart Low were unavoidably absent, but there were present: Messrs. H. B. May, Alfred Watkins, Harold Beale, W. Cox, E. White, T. Geoffrey Henslow, J. Bridgford, A. Dawkins, Tivey, G. H. Bard, C. Harman Payne, Murison, J. McKerchar, T. Bevan, J. Frogbrook, Prickett, E. F. Hawes, etc., among Britishers.

**Asparagus tenuissimus.**—The leafage of this asparagus is excessively slender, yet, at the same time, the plant is of a free branching habit of growth. What is more, unlike most of the now popular kinds, it will root readily from cuttings. Plants obtained in this way and kept in small pots are very useful for dropping into the small jardinières now so much in vogue, as they afford a pleasing variety to the ferns and small palms now frequently used. Beside this, A. tenuissimus may, like the better-known A. plumosus, be employed as a rafter or screen plant. Liberally treated it grows freely, and so fine is the foliage that when bedewed over with the syringe it presents at a little distance the appearance of a greenish mist. Spring and early summer is the best time in which to insert the cuttings.—S. W.

Robinsons' Guaranteed Gardenalities

have gained the praise of the greatest gardening authorities and experts. The reason why is because they always satisfy—are always reliable, and produce unequalled results. Professionals, amateurs, market-gardeners, and allotment-holders alike testify to their unexcelled superiority. What about fertilizers this year? Without fertilization time and labour is wasted.

"CARMONA" FERTILIZERS ARE THE CHAMPIONS.

This has been proved over and over again. They are scientific to a degree—pure, sure, and dependable. The plants assimilate their vital elements with avidity, and your products and crops bear testimony to this. A slight expense means a wonderfully increased profit. Made in many varieties to suit all needs. Special attention is drawn to the "Carmona" Sweet Pea Fertilizer. Bulks and prices are as follows:—1 cwt., 20s.; ½ cwt., 12s. 6d.; 28lbs., 7s. 6d.; 14lbs., 4s. 6d.; 7lbs., 2s. 6d. 1s and 6d. tins. Of all Seedsmen and Agents, or write direct.

CLIFT'S FLUID INSECTICIDE.

Messrs. Robinson Bros., Ltd., most strongly advise every gardener to write for a copy of the very convincing reports upon the extensive laboratory and outdoor experiments, conducted by an eminent expert, in relation to the efficacy of Clift's Fluid Insecticide. The facts and figures contained therein will at once demonstrate the absolute superiority of this standard insecticide. The prices are:—40 galls., per gall. 4s. 6d.; 20 galls., per gall. 5s.; 10 galls., per gall. 5s. 3d.; 5 gallons per gall. 5s. 6d.; 1 gall., 6s.; ½ gall., 3s. 6d.; 1 pint, 1s.

ROBINSON'S GRAND £350 SHOW.

This will be held on August 28th and 29th next at the Botanical Gardens, Edgbaston, Birmingham, and all may compete. Numerous cash prizes and many Championship Medals. Free entry to every buyer of "Carmona" Fertilizers—look out for the free entry "fee" coupon contained in each packet. Send now for the Show Schedules and make early entry.

HAVE YOU A LAWN?

To obtain perfect grass colouring, and to be rid of foreign plants, apply "Velvas" Lawn Sand. It transforms the worst lawn into the best. Of all Seedsmen and Agents, or write direct.

WEEDS ARE NOT WANTED, and are soon expelled if you apply "Eradiweed" (the guaranteed cent. per cent. weed-killer).

ROBINSON'S INVITATION.

Send for their two famous booklets, Robinson's Guaranteed Gardenalities Booklet, and Robinson's Garden Enemies Booklet. Full of hints, advice, and information. Gratis and post free on application to—

ROBINSON BROS., LTD., WEST BROMWICH, STAFFS.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

PANSIES AND VIOLAS FROM SEEDS.—A. P. P., Acton: Please let me know the best time and method of raising pansies and violas from seeds.—Pansy seeds should be sown at once in pans or boxes of light soil, and be placed in a warm frame or greenhouse until germination takes place; a cold frame will then suffice. Prick out the seedlings in the frame, and when they are sufficiently large and well rooted plant them out where they are to flower, watering and mulching them as necessary. If they are not needed to flower before next spring, then defer sowing until June, and sow in the open or in a cold frame, and plant out early in the autumn. Sow some of the viola seeds in pans in a cold frame at once, and the other part out of doors in rich light soil; prick out the seedlings into nursery beds, and subsequently plant in the permanent quarters when large and strong enough. Given good treatment, these should flower well in the autumn.

WIRE NETTING FOR PEAS.—J. G., Corbridge: Will you kindly let me know whether one row of 4-inch mesh wire netting will suffice for peas, or should there be two rows of netting to each run of peas?—We have seen sweet peas growing well against a single row of wide-meshed wire netting, but the plants were kept regularly tied to the support. In the case of culinary peas, two rows of netting should be provided or the plants will be severely damaged during winds and heavy rains.

SECATEURS VERSUS PRUNING KNIFE.—M. E. J., Ross: Do you consider secateurs are as suitable as a knife for pruning anything but a hedge?—In most secateurs we have handled there is but one cutting blade, and the other blade is very apt to cause a bruise on the side of the shoot pruned, opposite to the direction of the cut. If may happen that this bruise is so severe as to cause decay. Whenever and wherever practicable, the knife should be used in preference to the secateurs, but there are occasions when the work is so great, and the time so short, that one has to take the risks—and they are not really great—and use the secateurs.

IZAL POWDER IN SOIL.—W. H. F., Bristol: Some time ago I used a couple of kegs of Vaporite, and recently came across what appeared to be a part of a keg of this material. As I was making a new border across the end of a tennis court I used some of the material in the keg. This was a month ago, and now I am told that it was izal powder for disinfecting. Do you think I have spoiled our chances of growing half-hardy annuals in the border, and can you suggest anything to counteract the effects of the powder? I may say that the border was double dug, and the powder worked into the bottom spit. Eight rambling roses, for pillars, were planted in the site last autumn, and these so far do not appear to have suffered the least from the effects of the powder. Possibly the wet weather has washed the material further down.—We do not know the composition of izal, but we imagine it is not likely to do any harm. Work the soil frequently to aerate it until the annuals are planted, and then use the Dutch hoe regularly. Too much care cannot be taken in labelling and storing insecticides, artificial manures, fungicides, weed killers, disinfectants, and other preparations used in a garden, and particularly any that contain poison. Directly the materials are received they should have a stout and legibly written label attached unless there is a prominent one already on.

PEACH FRUITS DROPPING.—Peaches, Somerset: Late last autumn I took charge of a large number of peaches and nectarines in pots, and these I was instructed to force for fruiting in May. The trees had all been repotted, and so loosely that when moved they rocked in the pots. After every care and attention and an apparently good set, the little fruits have fallen wholesale, and there will be a very poor crop, even if all those remaining come to perfection. Do you think the failure is due to the loose potting?—Yes, certainly. Peaches and nectarines in pots must be potted firmly or they make few useful roots, and unless they are well rooted it is impossible to force them successfully. You must pay close attention to disbudding, so that light and air reach all parts of the trees; keep the foliage clean, duly harden off, and place outside and repot firmly directly the leaves begin to turn colour, instead of waiting for them to fall.

DISEASE ON VIOLET LEAVES.—W. E., Heathfield: Kindly tell me what is the cause of the disease that appears to be attacking the leaves of Admiral Avellan violet. The attack does not seem to affect the plants much as they are flowering quite freely.—The leaves show evidence of a very slight attack of violet mildew. Spray with a potassium sulphide solution, and afford abundance of fresh air, at the same time keeping the plants a little drier than usual.

FRUITING OF THE STEPHANOTIS.—S. W. writes: "With regard to the fruiting of Stephanotis floribunda, referred to by your correspondent, 'E. R. B.,' page 268, the following may be of interest: Some years ago I had a large pod form on a plant of stephanotis trained to the roof of the stove. I have no data of the time it took to ripen, but it was a long while before the pod split, and showed the seeds with their silky appendages. When ripe I sowed a number of the seeds, which germinated quickly, and the young plants grew away freely; in fact, too freely, as they covered a considerable space before I obtained any flowers, and when they did bloom they were not so free as those obtained from cuttings. None showed any improvement on the parent plant, and some did not flower at all. I got tired of my seedlings, and threw them away, and resolved for the future to follow the old-fashioned plan of propagating any I might require by means of cuttings."

### NAMES OF PLANTS.

G. S., Ryde.—Erica mediterranea.

W. E., Heathfield.—Iris Eucharica.

J. G., Potter's Bar.—1, Anemone pulsatilla; 2, A. acutiloba; 3, A. hepatica.

D. D., Rochester.—1, Erica carnea; 2, Forsythia suspensa; 3, Pieris japonica.

Y. C. W., Chesterfield.—1, Anemone apennina; 2, Pulmonaria angustifolia; 3, Primula viscosa; 4, P. malacoides.

L. R. J., Faringdon.—1, Erythronium citrinum; 2, Galax aphylla; 3, Cardamine pinnata; 4, Erica mediterranea.

F. E. R., Bletchley.—1, Magnolia stellata; 2, Prunus triloba; 3, probably Amelanchier canadensis, very poor specimen.

H. M., Wareham.—1, Spiræa Thunbergi; 2, probably a Ferula, send again when flowering; 3, probably Buddleia globosa, send when in flower; 4, Pieris floribunda; 5, Erica mediterranea; 6, Prunus Pissardi.

**Rose Claire Jacquier.**—I can assure "White Lady" she need have no qualms about this rose being sufficiently hardy to flourish in the open. I have grown it fully in the open, and with an eastern aspect, for many years, and have always found it a great success. The nankeen yellow blossoms harmonise well with the tinted wood and young leaves, and as for freedom of flower, I know of no rose more free. Plants of this rose do not require so long a period ere they flower freely, as in the case of Aglaia, for example.—E. M.

## COMING EVENTS.

Devon Daffodil and Spring Flower Show.—At Plymouth, on April 18 and 19, instead of April 16 and 17, as previously arranged.

Hereford Spring Flower Society.—Third Annual Exhibition on Thursday, April 18.

Chislehurst Horticultural Society: Spring Flower Show April 20; Summer Show, July 6, at Kemnal Warren.

Royal Counties Agricultural Society.—Flower Show at Guildford, June 11 to 14.

Penarth Rose Show, July 3.

Weybridge Horticultural Society, July 3, in the Old Palace Gardens.

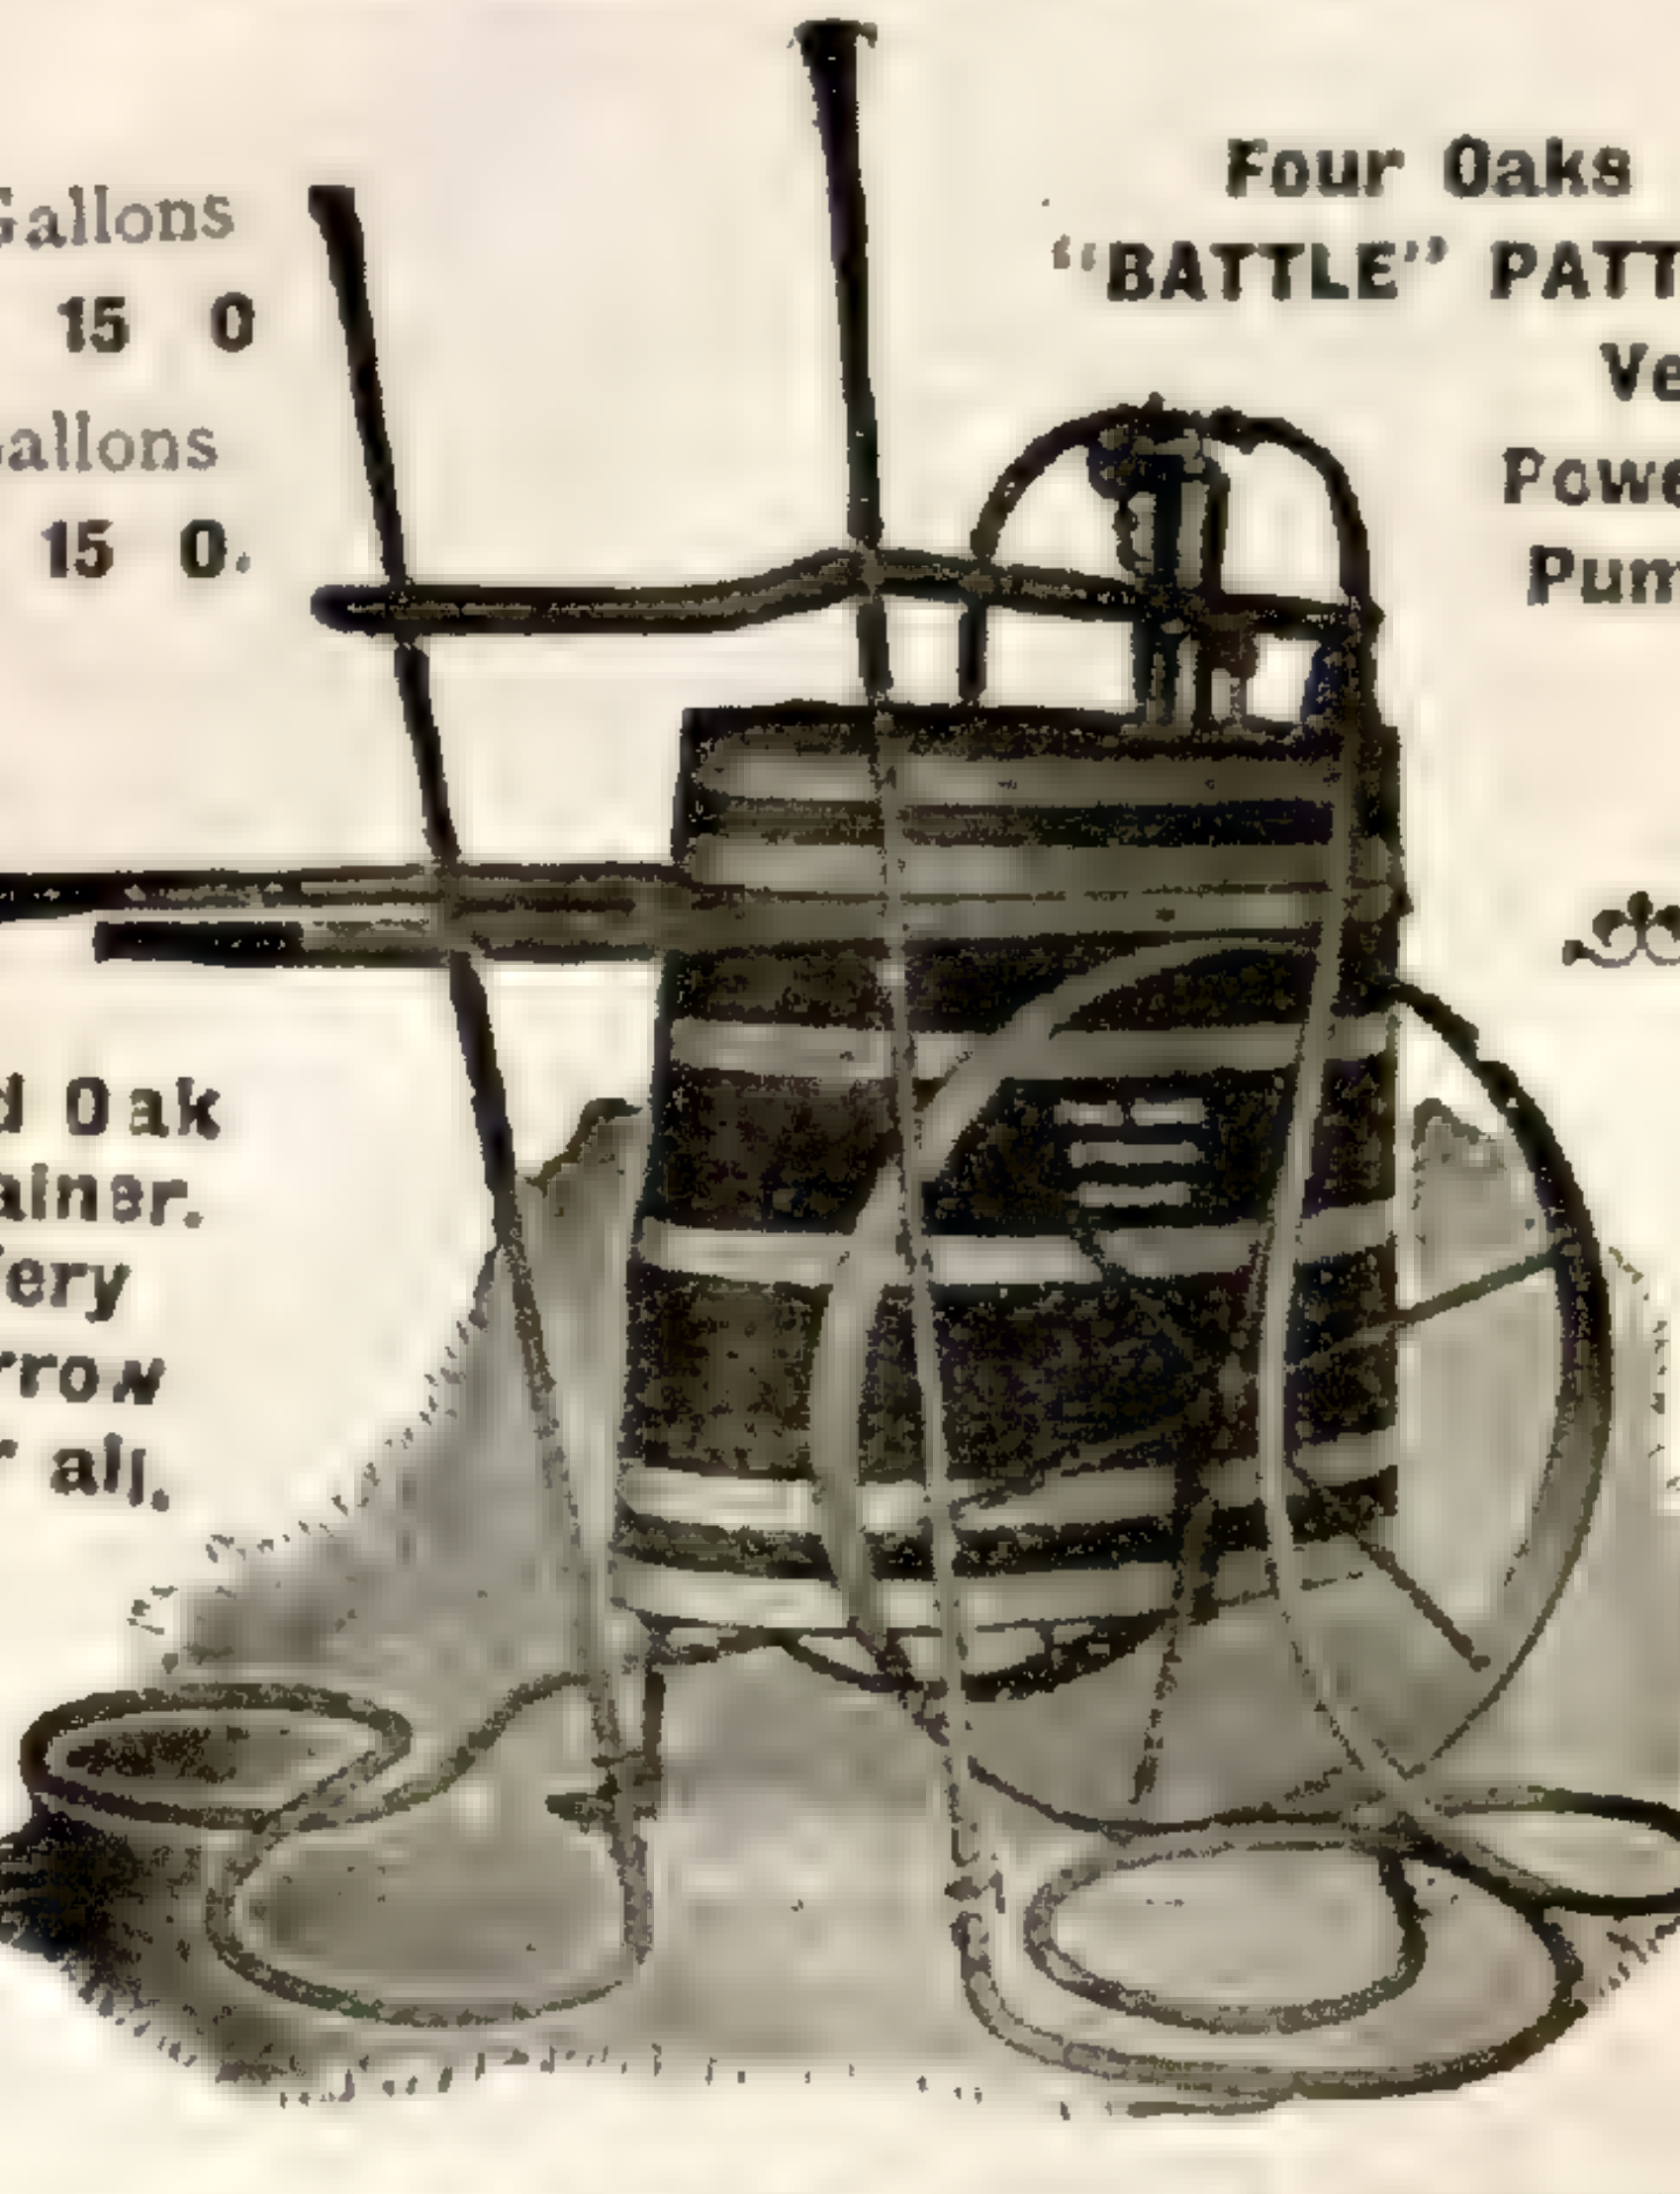
Wolverhampton Floral Fete.—In the West Park, on July 9, 10, and 11.

Bath Floral Fete.—In the Sydney Gardens, on July 10 and 11.

Sevenoaks Horticultural Society, July 10, in Knowle Park and Gardens.

Formby Horticultural Society, Summer Show, July 10; Autumn Show, November 9.

Ouseeliffe Rose and Sweet Pea Show.—Assembly Rooms, York, on Thursday, July 11.



→ Spraying. ←

One of England's leading Fruit Growers says: "I consider the 'Four Oaks' Spraying Machine, 'Battle' Pattern, to be the only practical machine on the market."

18 Gallons £13 15 0
25 Gallons £13 15 0.

Four Oaks "BATTLE" PATTERN Very Powerful Pump.

Solid Oak Container. Very narrow over all.

## CATALOGUES RECEIVED.

YOUNG AND CO., HATHERLEY.—These specialists in carnations issue a neat and handy catalogue of perpetual-flowering varieties, and have the courage to include a list of varieties they consider to be superseded by later introductions.

HARRISON AND SONS, LEICESTER.—A very interesting, useful, and capitally-arranged catalogue of select garden seeds. Sixteen pages of excellent illustrations occupy the centre of the catalogue.

THOMAS S. WARE, LIM., FELTHAM.—A very complete and freely illustrated catalogue of hardy plants suitable for various purposes. Dahlias and roses are also listed.

E. H. TAYLOR, WELWYN.—A large proportion of gardeners are bee keepers, and they will be interested in the new and illustrated catalogue of beekeepers' supplies issued by the Welwyn expert.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.
From Messrs. ———,
Grahamstown,
Cape Colony.
"The 'Manual' is unique, and is an exceedingly attractive book, and a most interesting work on Horticulture, and we are very pleased to possess this copy."

NOW is the time to plant KELWAY'S DELPHINIUMS—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.
———, Worcester, Mass.
"Your Delphiniums have proved to be the finest we ever grew, and for variety of beautiful shades they cannot be excelled."
Choice named collections, 15s., 24s., 34s., 50s. a dozen.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
———, Esq., ———, Exmouth.
"I have safely received the plants, which, owing to your excellent packing, arrived in perfect condition. For your exceptionally generous treatment in the matter of the Pyrethrums and Gaillardias, please accept the thanks of ———."

NOW IS THE TIME TO PLANT KELWAY'S NEWEST GLADIOLI.
These New Gladioli are a revelation. They have taken America by storm, and should be planted in this country by all who want glowing effect of colour in their beds and borders, and flowers for the house in July, August, and September. Kelway's large-flowered Gladioli have received more Medals and Certificates than any plant of modern times. We recommend trial of a selection of our "Cream of the World" Collection of named varieties, flowering bulbs; for instance, one dozen for 9s.
Full descriptive list of this Collection on application. Postage free for remittance with order.

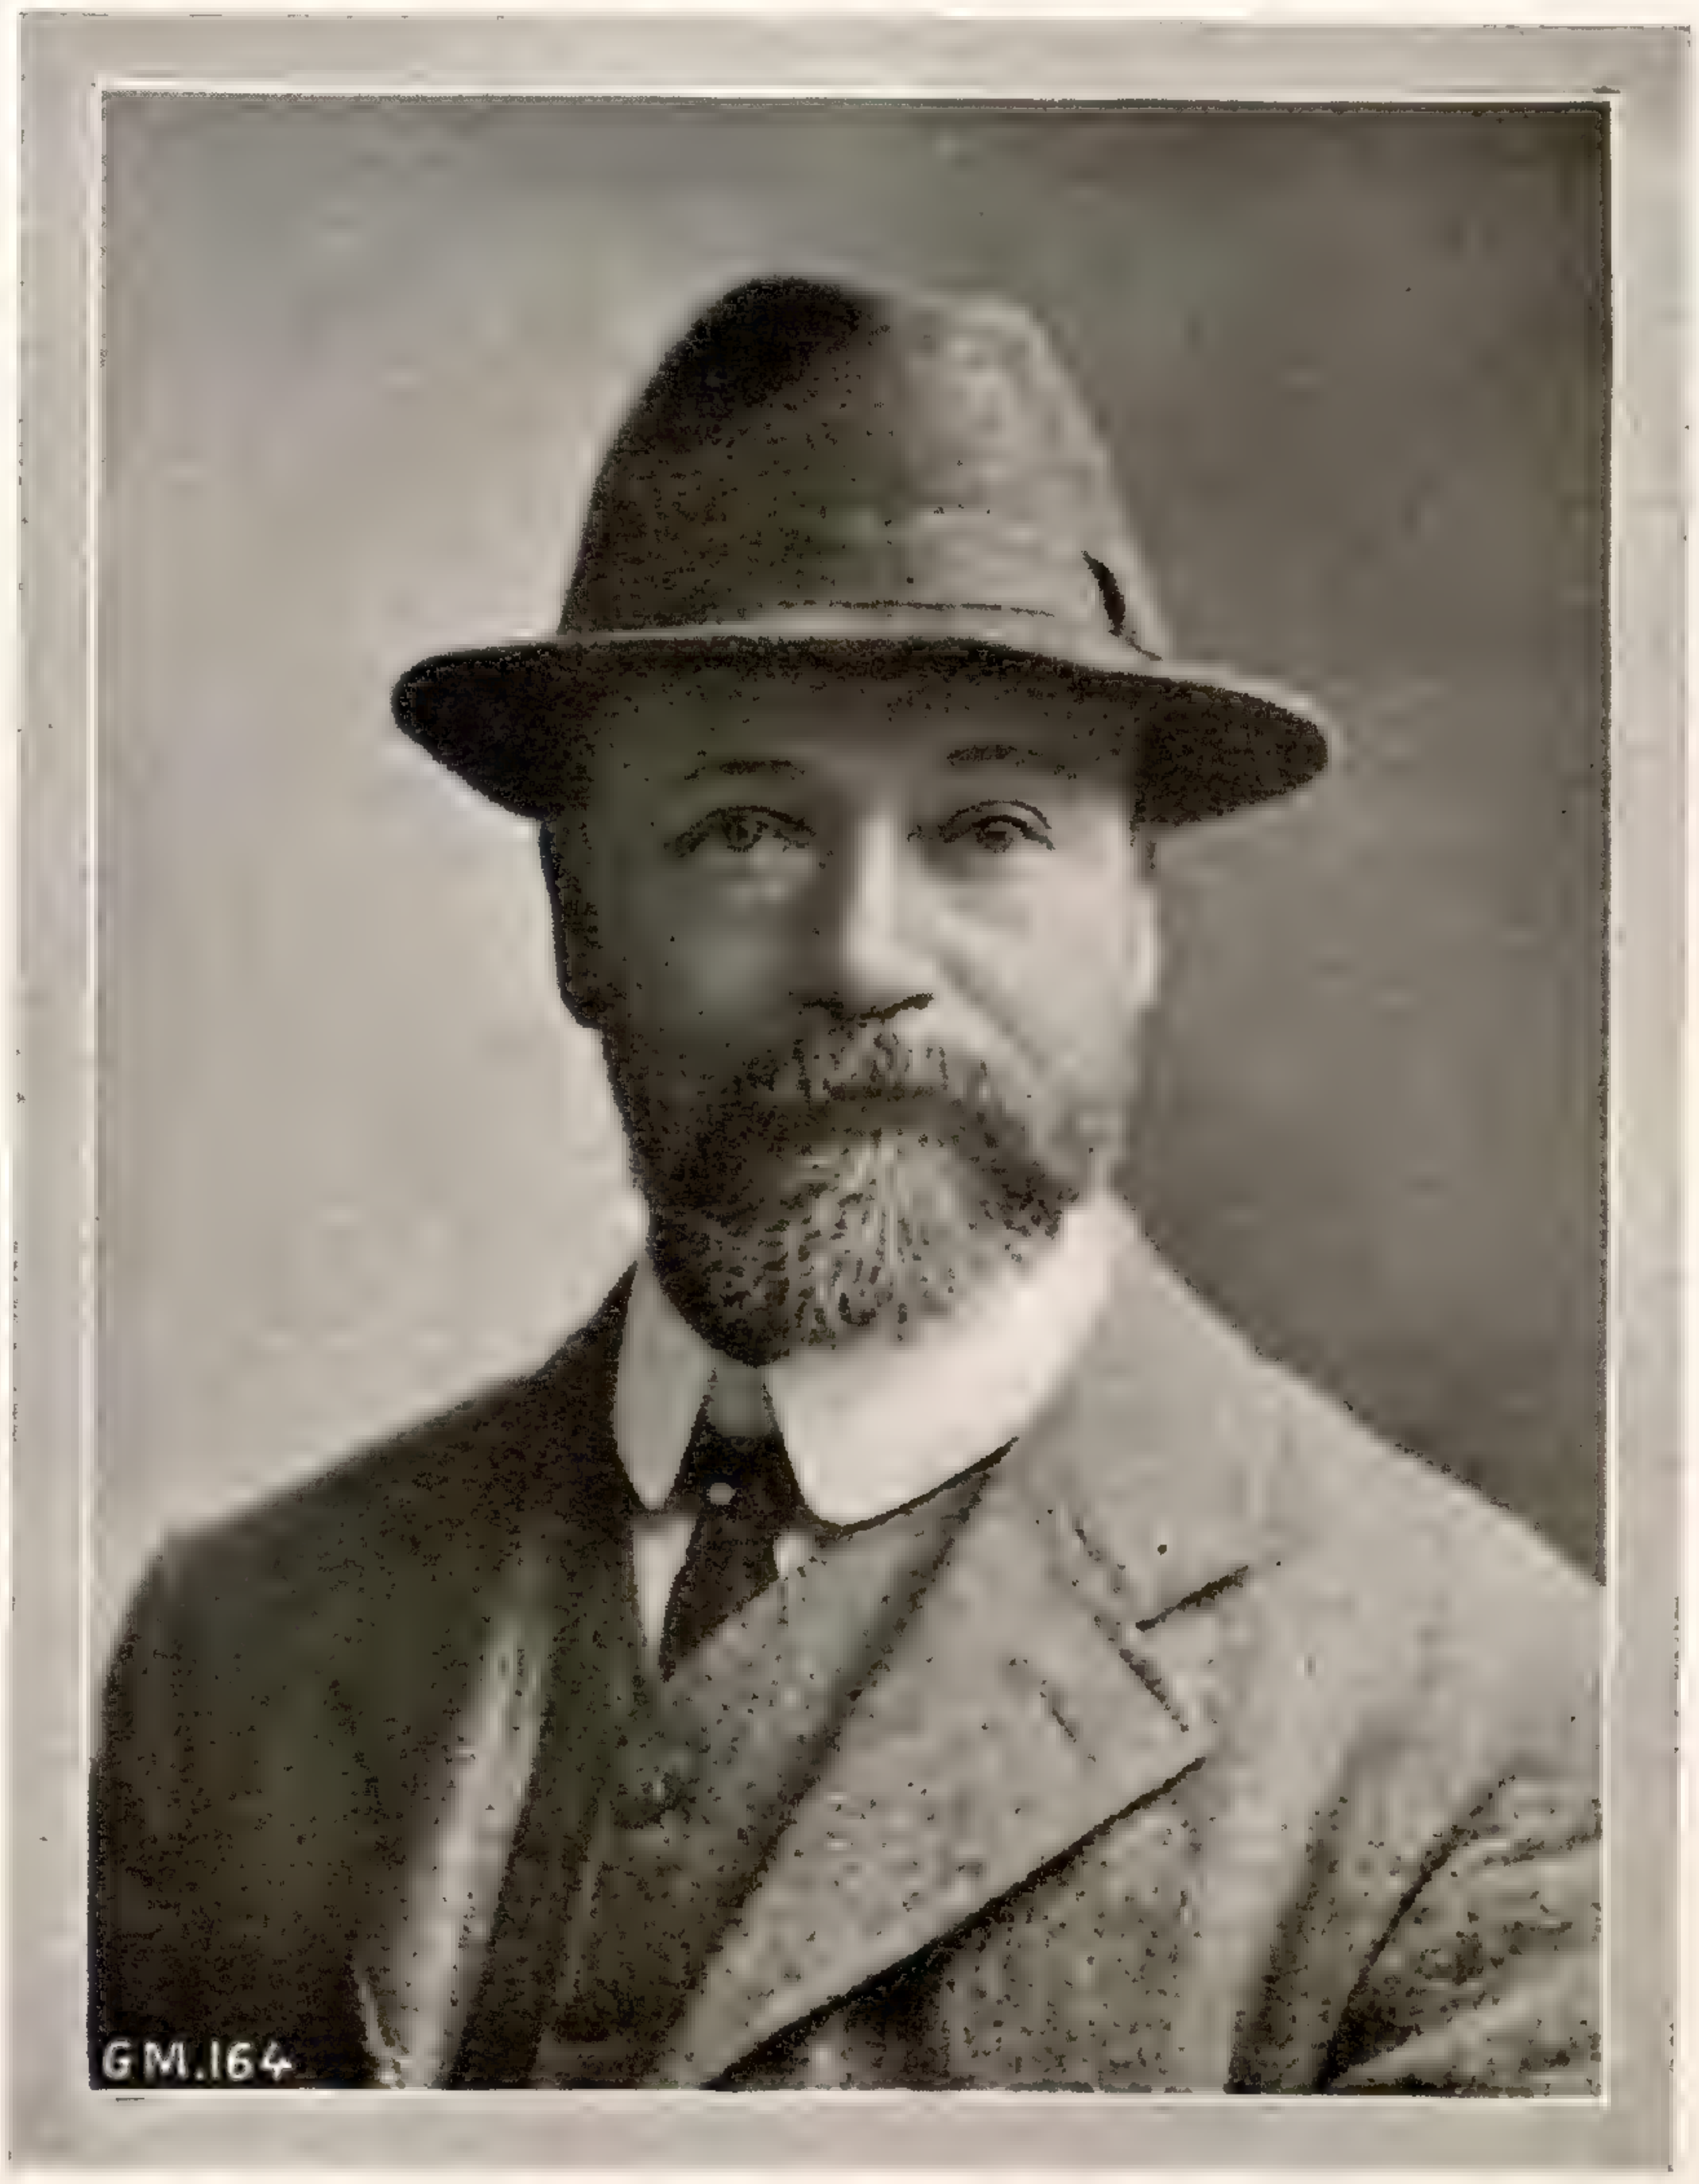
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Fertility of Fruit Trees.

Although there are many thousands of fruit trees in the gardens and orchards of this country, that have passed through their lives without having received assistance from the direct application of manurial matter to the soil in which they are growing, there is no occasion to refer in these pages to the fact that in the production of hardy and other fruits the judicious use of fertilisers is not less essential to success than in the cultivation of the various kinds of vegetables that have a place in the cropping of the kitchen garden. It is not necessary to do so because we, and our contributors, have constantly reminded our readers that while an apple or a plum tree will yield more or less fruit when wholly left to itself, the crops will be far inferior both in quantity and quality to what they would have been had the cultivator enriched the soil with suitable fertilisers in accordance with the requirements of the tree. Taking a still broader view of this question, there is not, in the present state of knowledge, so much a necessity for urging the importance of manuring as an essential factor in the cultivation of hardy fruits, as of calling attention to the desirability of adopting a strictly scientific method in maintaining the fertility of orchards and fruit plantations, such method, in fact, as would find favour with those who, by their work have established their claims to be regarded as authorities on fruit culture. Lest there may be any misapprehension upon the point, it may with advantage be stated that a scientific method is not necessarily one that is involved in complexity. So far from this being so in this case, it is characterised by extreme simplicity, and may be readily adopted by those who have had some experience in fruit production, and usually give full consideration to the matters they have in hand. Scientific method is frequently associated in the popular mind with experimental operations, but it need hardly be said that they are wholly different, for, in the one case, the details are carried out in strict accordance with the knowledge previously obtained, while in the other they are conducted for the purpose of obtaining definite information upon doubtful points. To state the case in the fewest words, the scientific method of manuring fruit trees is the enrichment of the soil with such constituents of plant food as will assist them to produce heavy crops of fruit of high quality, and to apply them at the most suitable times, and in such quantities as may appear desirable. The time of application is an important factor in the use of fertilisers in the fruit plantation and orchard, and while, in many instances, it may, in a general way, be advisable to dress the ground late in autumn or during the winter, manure may, in many cases, be applied at other seasons with still greater advantage. Should the trees have borne a good crop in the season previous, and are only moderately vigorous, a winter dressing will be beneficial, as, indeed, would be the case if they were unfruitful the previous season, and yet wanting in vigour. In cases well nigh innumerable there are trees that are sufficiently vigorous to suggest that unless they bear a full crop they will make so luxuriant a growth as to fail to produce well-developed fruit buds in the course of the summer, and a crop in the following year. Should, however, these trees set a good crop of fruit, they will require some manurial assistance to enable them to bring it to perfection, and this it cannot be too widely known, can be readily given when the fruits are beginning to swell freely, and a proper estimate made of the extent of the crop. By adopting this method all element of chance is eliminated, and the trees are supplied with food in accordance with their requirements, and the growth most favourable to fruit production ensured. With regard to the manures most suitable for fruit trees, it cannot be too distinctly understood that elaborate mixtures are wholly unnecessary. It is quite true that calcium, chlorine, iron, magnesia, nitrogen, phosphorus, potassium, and sulphur enter into the composition of fruit trees, as of many other forms of vegetation. But it does not follow, as some writers would have us believe, that we should apply them all to the soil when the trees are in need of additional supplies of plant food, because the soil usually, with the exception of nitrogen, phosphoric acid, and potash, contains them all in sufficient quantities for the requirements of the trees. Those who have an ample supply of stable or farmyard manure at their command will, in its use, add all the constituents of plant food to the soil, but the three last-named may not be in sufficient proportions, thus rendering it necessary to increase the percentage of those deficient as indicated by the growth of the trees. The only substances with which fruit growers need concern themselves with are the nitrogenous, phosphatic, and potassic manures, and lime in its various forms, and with these they should become well acquainted, with a view to using them to the best advantage. Nitrogen is of much importance for the aid it renders in the development of the wood and



MR. W. STRUGNELL.

leaf. If insufficient for the needs of the tree the growth is more or less stunted, and, when in excess in the soil, the leaf and stem undergoes rapid development, the tissues are soft, and the foliage is liable to fungoid attacks. Nitrate of soda and sulphate of ammonia are the two chief nitrogenous manures, both rapidly become available as plant food when applied to the soil, and unless taken up by the roots a considerable proportion of their fertilising properties will be carried away by the drainage water. Nitrate of soda should be used in preference to sulphate of ammonia in soils containing a large percentage of lime, and the soda base has the power of converting a small percentage of the potash contained in soils into a form available as plant food. Phosphatic manures promote early root development, and fruit production, and, therefore, of much value as aids in fruit culture. The more important of these to fruit growers are basic slag and superphosphate of lime. The first is rather the cheaper of the two, and, owing to its relatively slow action, is best applied during the winter, while the superphosphate of lime is the most suitable for use after growth has commenced. Potash is essential to the process of assimilation, and contributes liberally to the production of starch, sugar, and cellulose in the trees and their fruits. It also assists in the development of the tissues, and renders the plant better able to resist the attacks of fungoid and other diseases. Kainit is the cheapest of the potassic compounds, but the more expensive muriate of potash is more rapid in action, and, therefore, the best for use when growth has commenced. Applications of potassic manures are the most beneficial on light soils, in which potash is usually deficient, and, as a rule, should be made during the winter. Lime is useful in improving the physical condition of soils, in promoting the activity of the beneficial bacteria, and in converting potash in the soil into an available form; and it is essential to success in the cultivation of stone fruits. The fertilisers of special value for use when the fruit is set are superphosphate of lime and nitrate of soda, to be used at the rate of 3oz. and 1oz. respectively to the square yard. The effects should be closely watched, and if the growth is not so strong as could be desired a second dressing at about half the rate of sulphate of ammonia may be given a month later. But for the reason stated, it is important that nitrogenous manures be not used in excess of requirements.

---

**Mr. W. Strugnell,** who has for nearly twenty years been in charge of the charming and highly-kept gardens at Rood Ashton, Trowbridge, has long occupied a leading position among practical horticulturists in the West of England. During the period Mr. Strugnell has occupied his present position many alterations and improvements have been carried out in the Rood Ashton gardens. These have included the cutting down and clearing of overgrown timber and shrubs, and the introduction of new features, among the latter being the construction of pergolas for roses and other climbing plants, rock gardens, herbaceous borders, and shrubland extensions. Mr. Strugnell is well known in the western counties as an exhibitor of fruit and vegetables, where he has won many of the leading prizes in good company, and at the Royal Horticultural Society's exhibitions of fruits his name occasionally appears among those of other prize winners in the classes for hardy fruits. Specimen lawn trees are the special pleasure of his employer, the Right Hon. Walter Long, M.P., and these are frequently added to by the planting of commemorative specimens by Royal and other visitors. Prior to his engagement at Rood Ashton, Mr. Strugnell was for some time with the late A. R. Baily, Esq., Willow Vale, Frome, removing there from Benham Court, Newbury. At both places such excellent work was done as to establish his reputation. Foreman under Mr. W. Iggulden, at Marston, for two years, Mr. Strugnell became much interested in the production and exhibition of high-class fruit, vegetables, and plants. Mr. Strugnell occupied for some time a similar position in the extensive gardens of Buckland, Breconshire, South Wales, the residence of J. G. Gwynne-Holford, Esq., and, as at Marston, he had the advantage of being under one of the leading exponents of the gardening art. In the earlier days of his probation Mr. Strugnell occupied positions in the gardens of Brentry House, near Bristol, and Sneyd Park, Clifton, both places of note, and it is evident from the success achieved in the management of the gardens of which he has had full charge, and notably those of Rood Ashton, that full advantage was taken of the excellent opportunities he had for the acquisition of a knowledge of high-class gardening.

**The Bank Holiday.**—Although the weather was much colder on Monday than for several days previously the holiday makers took full advantage of the opportunities they had for enjoying the manifold attractions of public parks and gardens and other open spaces within a short distance of the metropolis. Those parks and gardens in which there are displays of early flowers attracted many thousands of visitors, but large numbers also went to Hampstead Heath and Epping Forest. The increasing popularity of the Royal Gardens, Kew, was evidenced by the fact that 127,000 visitors passed through the gates during the day. The immense specimen of Agave atrovirens, which is now coming into bloom, attracted much attention, and the crowds that thronged the arboretum showed the glorious displays of daffodils in the grass were highly appreciated.

**Accident to Miss G. F. Lindsell.**—The many friends of Mr. G. B. Lindsell will deeply regret to learn of the loss he has sustained by the death of Miss G. F. Lindsell from an accident which occurred at Hastings on the 2nd inst. Miss Lindsell, who was on a visit to her brother at Bexhill, was fond of climbing, and somewhat reckless in relation thereto, and when on her way to Hastings along the cliffs she appears to have slipped near Ecclesbourne, and fallen to the foot of the cliffs there, and to have been killed instantaneously.

**Peter Barr Memorial Fund.**—In 1910 numerous daffodil lovers expressed a desire to see a fund raised for the purpose of commemorating the life and work of the late Mr. Peter Barr, V.M.H. The members of the Royal Horticultural Society's Narcissus and Floral Committees considered the matter, and the proposals most favoured were the institution of a Peter Barr Memorial Medal and the provision of a fund for the maintenance of an orphan through the medium of the Royal Gardeners' Orphan Fund. To give effect to these proposals, Messrs. J. T. Bennett-Poë, M.A., V.M.H., William Cuthbertson, J.P., R. Hooper Pearson, William Poupart, Chas. E. Shea, Walter T. Ware, and the Rev. J. Jacob were elected to form an executive committee, with Mr. Wm. Marshall, V.M.H., as chairman; Mr. H. B. May, V.M.H., as treasurer; and Mr. Chas. H. Curtis as hon. secretary. Donations were invited, and have been received from all parts of the world where daffodils are grown, and for these the committee wish to tender their thanks. At a meeting held on Tuesday, April 2, the committee closed the fund, which, with £3 7s. 1d. interest, amounted to £309 15s. 5d. Receipt books, stationery, printing, and postage amounted to £3 1s. 7d., and the silver-gilt Peter Barr Memorial Cup (which does not involve the creation of a trust, as an annual medal would have done) cost £39 17s. 6d., leaving a balance of £266 16s. 4d., which has been handed over to the Royal Gardeners' Orphan Fund. The handsome cup, designed and made by Messrs. Elkington, will "be awarded annually in connection with work among daffodils," and the honour of holding it for the first year falls to the Rev. G. H. Engleheart, V.M.H., and it will be presented to him at 11.30 a.m. on April 16, in the No. 3 room at the Royal Horticultural Hall. Although the fund is closed, the committee does not dissolve at present, but will meet annually for the purpose of awarding the cup in accordance with the original suggestion.

**Ghent International Exhibition.**—An International Exhibition will be held next year at Ghent which, it is hoped, will rival in size and importance the exhibition that was held at Brussels in 1910. This exhibition will be organised in conjunction with the great quinquennial flower show of the Royal Society of Agriculture and Botany. The park of 250 acres in which the exhibition will be held will, in accordance with the announcement we were able to make some time since, contain the magnificent building which has been designed for the society mentioned.

**The Early Potato Crop.**—The planting of potatoes in Jersey during March was much delayed by the heavy rains, and some part of the early crop in the island may be rather later in coming to market than usual. Much, of course, will depend upon the weather that will be experienced during the next few weeks. Breadths that were planted early in February present a very promising appearance, for the growth is even, and much earthing up has been already done. The haulm is hardly so stout as usual at this period of growth, but with the brighter weather that has been experienced of late it will soon evince a material improvement in this respect. The planting of early potatoes in Ayrshire commenced, in the Girvan district, under favourable conditions about the middle of February, but owing to the wet weather that has been experienced it was not possible to proceed with the work so expeditiously as in most years. The early plantings have made an excellent growth, and are now pushing freely through the ground. In the districts in Cheshire and Lancashire, where early potatoes are largely grown, planting is fully a fortnight later than usual, and, owing to the wet state of the soil, it is feared that, excepting where the soil is light and sandy, the growths will not start away so freely as could be wished.

**South African Fruits in London.**—The supplies of grapes, pears, and plums from South Africa were received during the past fortnight in exceptionally large quantities, and as they were landed when the railway traffic was in a disorganised state owing to the coal strike, they realised at Covent Garden very low prices. The consignment brought by the Union Castle liner "Edinburgh Castle" consisted of 27,750 packages, and was the largest that has yet been received from South Africa. It consisted of grapes, pears, and plums. The grapes included Red and White Hanpoot, Raisin Blanc, Barbarossa, Gros Colmar, and Waltham Cross. The pears comprised Beurre Bosc, Beurre Hardy, Doyenne du Comice, and Winter Nelis. The plums consisted of the variety known as Kelsey. The grapes realised from 2s. to 8s. per box, Kelsey plums (28's to 32's) from 5s. to 6s. per box. Pears of ordinary quality realised from 3s. to 5s. per box of 10lb., while trays of Doyenne du Comice containing from 18 to 28 fruit, realised from 10s. to 14s. per tray. It was interesting to find among the grapes from South Africa the variety Waltham Cross, which was introduced by Mr. W. Paul, of Waltham Cross, and received a first-class certificate from the Royal Horticultural Society in 1871. Waltham Cross is a large and handsome grape, with long tapering bunches and large amber-coloured berries, and of excellent flavour. The variety has not of late years been regarded with much favour by cultivators in this country, but in South Africa it is evidently popular for culture for the British markets.

**American Gooseberry Mildew.**—The Board of Agriculture and Fisheries have issued an order dated March 30, entitled "The American Gooseberry Mildew (Fruit) Order of 1912," to England and Wales. Under the Order the sale or exposure for sale of diseased gooseberries is prohibited, and any person who knowingly sells or exposes for sale diseased gooseberries, or causes or permits any such sale or exposure, shall be liable on conviction to a penalty not exceeding £10. The landing in England or Wales of any gooseberries brought from any place outside Great Britain (except the Channel Islands) is prohibited, except where there is attached to the package in which the fruit is imported a label bearing the words "Imported gooseberries," and stating the name of the consignor and the country and district in which the fruit was produced. Other clauses of the Order deal with Information to be Given as to Imported Gooseberries, Cleansing of Packages containing Diseased Gooseberries, Powers of Inspectors to Enforce Cleansing of Packages, Powers of Entry, and Offences.

**Botany of a Hedgerow.**—Before the members of the Sheffield Naturalists' Club on the 23rd ult., Dr. T. W. Woodhead, of the Huddersfield Technical College, gave a highly interesting lecture on the botanical aspects of the hedgerow. Hedgerows, it was pointed out, are artificial structures which followed in the wake of man, and were quite unknown as natural features in the vegetation of the country. Although the dominant one, the hawthorn was by no means the only tree or shrub of the hedgerow. Large trees occupied an important place in the landscape, and their appearance in the hedgerow was largely due to the fact that frequently they had been introduced by man so as to afford shelter for cattle. Nearly all the British shrubs might also be found in the hedgerows, while another interesting group of plants were the climbers, among which all gradations and modifications of the climbing habit might be found. Referring to the biological aspect of the hedgerow flowers, Dr. Woodhead stated that insects and these flowers were intimately associated, and that there was much evidence in favour of the view that they had developed side by side, and that modifications of the one had been accompanied by parallel modifications of the other. Hedgerows and hedgebanks, he said, were doubtless used on a small scale near dwellings long before they extended to the more distant cultivated plots, but the custom of leaving a dividing line of unploughed turf, on which trees and shrubs often grew, would suggest and would long serve as the forerunners of the hedgerows which to-day added so much to the beauty of the country.

**Royal International Horticultural Exhibition.**—Through the courtesy of the executive we are able to give herewith an illustration of the handsome diploma that will be awarded at the Royal International Horticultural Exhibition to be held at Chelsea next month. A description of the diploma is unnecessary, but it may be mentioned with much satisfaction that the international character of the gathering is admirably shown in the design, which has the merit of combining boldness with elegance.

**Practical Instruction in Forestry.**—As an essential part of the first course in forestry at the Edinburgh University, the students have ten days' practical work at Raith, the finely-wooded estate of Mr. Munro Ferguson, M.P., who has kindly placed his woods at the disposal of the students. The first contingent of students numbered 26, and, leaving Edinburgh early in the morning of March 21, they reached Raith in the forenoon, and were soon at work in accordance with a well-devised plan. They commenced operations in the nursery under the supervision of Mr. Grant, the head forester, and his assistants, and throughout the ten days the whole of the manual work was done by the students except carrying out the trees when engaged in thinning. The programme of work comprised planting, thinning, nursery operations, measuring the volume of standing woods, testing the soil of an area to ascertain the most useful trees to plant therein, inspecting fences for the purpose of making estimates of cost, and becoming acquainted with the method of formation. Work commenced each day at 8.30 a.m., and concluded at 5 p.m., with an interval for lunch, and although much of it was decidedly arduous, the students applied themselves with energy to the operations, and proved to demonstration that they had been fully impressed with the importance of a thorough acquaintance with practical work. The woods and plantations of Raith have long had special attention given to them, as evidenced by the fact that records of them extending over nearly two centuries are in possession of Mr. Munro Ferguson.

**Influence of Magnesia on Roses.**—In a contribution to the issue of the "Journal des Roses" for February last M. Cochet-Cochets gives the results obtained from his experiments with magnesia as a manure for roses. He states that the experiments were carefully conducted with a large number of roses in pots, and some 1,800 plants of multiflora roses growing in the open ground, and that the magnesia exercised a distinct effect on the growth of the roses. Used in the form known as carbonate of magnesia as a dressing to the ground in which the multiflora roses were growing, it increased the development of the growth, which continued until late in the autumn, and caused the leaves to retain their freshness until a much later period than usual.

**Sewage Sickness in Soil.**—Dr. E. J. Russell and Mr. J. Golding, of the Rothamsted Experiment Station, Harpenden, have made an investigation of the state into which the soil of sewage farms arrives after the continued application of sewage, whereby it is so far injured both in its physical and biological conditions that it will no longer either let the sewage percolate or purify what passes through. In the course of their investigations they found that sewage-sick soil possessed a very limited bacterial activity, and was exceptionally rich in those protozoan organisms which Russell and Hutchinson have regarded as the limiting factor in the development of bacteria in soils. Partial sterilisation of the soil, either by treatment with antiseptics or by heating, was followed by a very large increase in the number of bacteria; in one case they rose from about 40 millions to over 400 millions per gram of the soil. Accompanying this increase in bacterial activity there was a renewal of the purifying effect of the soil upon the sewage, and it was found possible to restore the sewage-sick soil and make it become an even more effective filter than before, either by heating the soil sufficiently to char it slightly or by treating it with the vapour of toluene.

# ROYAL CALEDONIAN HORTICULTURAL. SOCIETY.

The spring show of this society was held in the Waverley Market, Edinburgh, on April 10 and 11, and, notwithstanding the difficulties of railway transport, the display was a very successful one. Several of the larger English trade exhibitors were not in evidence, which made this part of the show rather thin compared with what it is in normal circumstances, but in the competitive classes the entries were in excess of last year's, and the staging was very full. The show was also favoured with fine weather, and the atmosphere within the market was rendered quite genial and pleasant by means of the new heating installation, which was put in operation for the first time in connection with a flower show. The show was opened by the Marquis of Tullibardine, and there was a good attendance of the public all through the opening day.

## GROUPS AND PLANTS.

The leading class was for a group of orchids, arranged in a space not exceeding 12 feet by 6 feet, to be seen from one side only. Ferns and foliage plants were permitted in the arrangement, and variety, quality, and decorative effect were to be considered. There were two entrants in the class, and the first prize, consisting of the Sander Cup, value 25 guineas (which has to be won three times before it becomes the property of the exhibitor), and £3 3s., fell to R. Brooman White, Esq., of Arddarroch (gardener, Mr. J. Smith); while Jas. Wood, Esq., of Wallhouse, Bathgate (gardener, Mr. F. Henderson), was awarded the second prize. This is the second time in succession that Mr. Brooman White has carried off the cup. His collection contained a very choice selection of odontoglossums, hybrid cypripediums, and other kinds, among which were noted Odontioda Charlesworthi, fine varieties of Cattleya Schröderæ, Odontoglossum crispum Mercedes, Cymbidium Lowianum concolor, Cypripedium Euryades New Hall Hey variety, very fine hybrids from Odontoglossum Edwardi, and other fine things.

For four orchids, distinct, A. Dryburgh, Esq., Gogar, Midlothian (gardener, Mr. A. Findlay), was first; and R. Hindle, Esq., Edinburgh (gardener, Mr. A. Rae), was second. Chas. Cowan, Esq., Dalhousie Castle, Midlothian (gardener, Mr. W. G. Pirie), was first for one orchid; the Right Hon. R. C. Munro Ferguson, M.P., Raith, Kirkcaldy (gardener, Mr. D. McLean), was second; and A. Dryburgh, Esq., third.

For four stove or greenhouse plants, in flower, the first prize of £2 2s., presented by Messrs. Mackenzie and Moncur, Lim., Edinburgh, was awarded to Provost Ballantyne, Neuk, Peebles (gardener, Mr. A. Smith); the second to A. Dryburgh, Esq.; and the third to Sir Robt. Usher, Norton Park, Ratho (gardener, Mr. G. McKinna). Sir R. Usher was first for six plants in bloom; Sir John Murray, Challenger Lodge, Edinburgh (gardener, Mr. J. McIntyre), was second; and the Earl of Home, Douglas Castle, Lanark (gardener, Mr. A. McMillan), was third. For two greenhouse rhododendrons, Lord Elphinstone, Carberry Tower, Musselburgh (gardener, Mr. D. Kidd), was the only entrant, and was awarded the first prize. Sir John Murray was first for hardy rhododendrons in pots or tubs, and Sir Robt. Usher was second.

For four Azalea indica, in seven-inch pots, the first prize went to the Hon. Mrs. Baillie Hamilton, Langton, Duns (gardener, Mr. G. D. Kerr); the second to Sir John Gilmour, Montrane, Leven (gardener, Mr. I. Wilson); and the third to C. E. Green, Esq., Grace Mount, Liberton (gardener, Mr. P. MacLachlan). Colonel More Nisbet, The Drum, Midlothian, was first for two Azalea indica; Mrs. Bickmore, Beechwood, Murrayfield (gardener, Mr. J. Pearson), second; and Sir John Gilmour third. Mrs. Bickmore was first for six hardy azaleas, Lord Elphinstone second, and the Earl of Home third. In the fern classes the Earl of Home was first for three exotic ferns; R. A. Robertson, Esq., Kirklands, Gogar (gardener, Mr. T. Hermiston), first for three adiantums; and Miss Balfour Melville, Pilrig House, Edinburgh (gardener, Mr. W. Robertson), first for six dwarf hardy ferns.

The Earl of Home was first for four foliage plants (excluding palms), and also for six foliage plants in pots not exceeding 9in. diameter. The same exhibitor was also first for six table plants, three crotons, and six palms. Sir A. B. Milne, Inveresk Gate, Musselburgh (gardener, Mr. R. McAndie), was first for four palms, and J. McKelvie, Esq., Hatton House, Midlothian (gardener, Mr. J. R. Findlay), was first for a single palm. Mrs. Hutchison, Carlonerie, Kirkliston (gardener, Mr. J. Thom), was first for three dracænas.

In the rose classes, Mrs. Hutchison was first for a dozen roses in pots, for six H.P. roses, and for six H.T. roses; and Mrs. Dewar, Drylaw House, Midlothian (gardener, Mr. W. T. Galloway), was first for two climbing roses. Lord Elphinstone was first for four amaryllis; Mrs. Hog, Gogar Burn, Midlothian (gardener, Mr. W. Brow), for four ivy-leaved pelargoniums, and for four show pelargoniums; and Colonel More Nisbet for four zonal pelargoniums. The Right Hon. R. C. Munro Ferguson was first for four caladiums; the Earl of Home for six cinerarias (large-flowered); and Hon. Mrs. Baillie Hamilton for six Cineraria stellata.

Mrs. Bickmore was first for one deutzia, two deutzias in 7in. pots, three Guelder roses, and three lilacs; Provost Balantyne was first for two hydrangeas; Mrs. Dewar for three Viburnum plicatum; A. Geddes, Esq., Colinton (gardener, Mr. J. Todd), for two Dicentra spectabilis, and two pots of mignonette; Colonel More Nisbet for three pots lily of valley and four schizanthuses; Hon. Mrs. Baillie Hamilton led for six Primula japonica and six single Primula vulgaris varieties; Sir John Gilmour for six streptocarpus, six pots of polyanthus narcissus, and six pots of tulips; the Earl of Wemyss, Gosford (gardener, Mr. W. Galloway), scored for six calceolarias; Miss Balfour Melville for six pots of Primula japonica, six alpine auriculas, three auriculas, six auriculas, one auricula (grey-edged), and one auricula (self). C. E. Green, Esq., was first for six cyclamen; Charles Cowan, Esq., was first for two dozen alpine plants, for six alpine plants (excluding bulbs), and for one white-edged auricula. M. G. Thorburn, Esq., Glenormiston, Peebles (gardener, Mr. A. Dickson), was first for six plants of Primula Sieboldi; Dr. Scott, Musselburgh (gardener, Mr. W. Armstrong), for four astilbes; Miss Spott, Dunbar (gardener, Mr. J. Cossar), for one green-edged auricula; and Sir J. Gilmour for six pots of tulips.

## CUT FLOWERS.

In the rose classes, Mrs. Hutchison, Carlowrie, took first place for twenty-four blooms in not less than eight varieties, and for twelve blooms in not less than six varieties. Mrs. Bickmore was first for twelve blooms of Gloire de Dijon in vases, and for a dozen Marechal Niels in vases. Miss Wauchope, Manor House, Musselburgh (gardener, Mr. W. Hebdon), was first for twelve blooms of any other variety in vases. In the carnation classes the Earl of Home was first for three vases of Malmaisons; Sir John Gilmour for four and two vases exclusive of Malmaisons. Charles Cowan, Esq., was first for a dozen bunches of narcissi, three vases of daffodils arranged for effect, and three bowls of daffodils arranged for effect. M. G. Thorburn, Esq., was first for six vases of hardy spring flowers. In the tulip classes, Mrs. Dewar was first for three vases of parrot varieties; the Earl of Home for six vases any other kind; and the Right Hon. R. C. Munro Ferguson for three vases of any other kind. Sir John Murray was first for a dozen trusses of hardy rhododendrons, and Mr. A Johnstone, Hay Lodge, Edinburgh, for twelve trusses of greenhouse rhododendrons. Colonel Stewart Richardson, Ballathie, Perth (gardener, Mr. J. E. Davis), was first for a dozen bunches of stove or greenhouse flowers; and Charles Dickson, Esq., Viewbank, Lasswade (gardener, Mr. D. McKay), was first for six spikes of orchids.

In the section for floral arrangements, first honours went to T. G. Bishop, Esq., Dalmore, Helensburgh (gardener, Mr. J. Hood), for the white bouquet; to Sheriff Blair, Rockend, Helensburgh (gardener, Mr. W. Holmes), for a coloured bouquet; to Mr. W. Raeburn, Dalkeith, for button-hole bouquets and ladies' sprays; and to Sheriff Blair for any other floral design. There were four entries in the decorated dinner table class, and the awards were made in order to Sir John Gilmour, T. G. Bishop, Esq., and Lord Elphinstone.

## FRUIT.

The only fruit shown was a dish of strawberries, by Lord Elphinstone (first prize); pot vines, white and black grapes, from Colonel Stewart Richardson (first for black); and six bottles of preserved fruit, from Mrs. Hamilton Ogilvie, Archerfield, Dirleton (gardener, Mr. Thos. McPhail).

## NON-COMPETITIVE EXHIBITS.

Messrs. Young and Co., Hatherly, had a very fine exhibit of perpetual flowering carnations, including such varieties as Duchess of Devonshire, Cheltonia, A. S. Montgomery, Golden Glory, Queen, Rose Dore, Edith Waters, Hon. Lady Neeld, etc. (gold medal). Messrs. Hogg and Robertson, Dublin, had a very large exhibit of narcissi, including most of the best varieties, and several unnamed seedlings, and also a fine lot of tulips. The flowers were extremely fine (gold medal). Messrs. Stuart Low and Co., Enfield, showed perpetual-flowering carnations, orchids, and several other plants (silver-gilt medal).

Mr. H. N. Ellison, West Bromwich, showed a collection of ferns and hybrid gerberas (silver-gilt medal). Messrs. Cunningham, Fraser, and Co., Edinburgh, had a very neat exhibit of their alpine specialities, arranged on rockwork (silver-gilt medal). Messrs. Dobbie and Co. showed a fine lot of tulips, and some other bulbs (silver-gilt medal). Messrs. John Forbes (Hawick), Lim., had a nice exhibit of primulas and other alpine plants, tree pæonies, etc. (silver-gilt medal). Mr. G. Reuthe, Keston, Kent, exhibited an interesting lot of Indian and other rhododendron species, magnolias, and a variety of other hardy shrubby plants (silver medal).

Messrs. R. B. Laird and Sons, Lim., Edinburgh, had a large and artistically arranged group on the floor, the centre part of which consisted of large rhododendrons, with roses, azaleas, maples, etc. Mr. D. W. Thomson, Edinburgh, had an extensive exhibit of narcissi, hyacinths, and tulips, in fine condition. Mr. John Phillips showed a nice group of palms, dracænas, azaleas, clematis, roses, and ferns. Messrs. Bakers, Wolverhampton, set up a pretty exhibit of primulas, alpine, and other plants. Messrs. Sander and Sons, St. Albans, and Mr. McLeod, Chorlton-cum-Hardy, had each an exhibit of choice orchids. Messrs. Dickson and Co., Edinburgh, exhibited a fine lot of their new seedling hybrid amaryllis, and a collection of roses in vases, including My Maryland, Dean Hole, Franz Deegan, etc.

## AWARDS.

A First-Class Certificate was awarded to Carnation Duchess of Devonshire, exhibited by Messrs. Young and Co.; and an Award of Merit to Carnation Lady Alington, exhibited by Messrs. Stuart Low and Co.

## DRIFTS OF BLOSSOM.

If there is one thing about a rock garden that gives particular pleasure, it is certainly the use of informal drifts of blossom. The draping of crags, the carpeting of gentle slopes, and masses of foliage and blossom, finding their way from one level to another between the rocks, is ever a pleasurable feature from the garden-lover's point of view.

It is well, where space and a sufficiency of plants permit, to concentrate upon drifts or sweeps of blossoms, as being much more effective than clumps or dot plants of given subjects. Planting for effect is better than endeavouring to get a collection of, say, a thousand single specimens. Rather than forego my pleasurable "drifts of blossom," I would refuse the offer of countless rarities, and trust to one's own exertions in the raising of novelties from the stock in hand, to maintain the interest of the garden. It matters little what group of rock plants is taken, the majority can be made to yield a maximum of beauty if planted on the drift system. Even if one has but a few large plantings these will emphasise and accentuate the beauty and effect of the whole garden they are situated in.

DRIFTS OF BLOSSOM.
A charming scene in an East Anglian Rock Garden.

I enclose with these notes an illustration in the Holland House rock garden, here at Southcliff. It is one of several blossom drifts, and shows a group of Saxifraga umbrosa, continued by Aubriétia Rose Queen, culminating on a higher level with a mass of Nepeta Mussini and helianthemums. A pleasing combination, showing what can be done in the way of drift planting.

Bulbs can be utilised with rock plants in forming drifts, and one has in mind trails of Fritillaria meleagris winding through colonies of violas, primulas, and saxifrages, and giving one of the prettiest of spring effects. Muscari azureum, M. botyroides, M. botyroides alba, and M. conicum Heavenly Blue are fine when rising en masse above close-growing alpines, and are charming with miniature daffodils, such as N. moschatus, N. Queen of Spain, etc. Crocuses gemming masses of Thymus coccineus, chionodoxas running riot with saxifrages like S. apiculata, S. sancta, etc., and the soft blues of the puschkinias mingling with miniature yellow-flowered alpines, are each and all productive of delightful results.

Rock plants, which are capable of exquisite drifts of colour, naturally include the aubrietias, especially the fine varieties (of which Dr. Mules is so splendidly decorative); the alyssums, particularly the saxatile forms, and a few of the smaller species; violas of the gracilis character, rich, illuminative, and profuse; Zauschneria californica, a blaze of scarlet in late summer; helianthemums, particularly those with the silvery foliage, and golden or rosy colourings; the taller saxifrages and their kindred, the heucheras, which give such light misty masses of pinkish and scarlet blossoms must also be noted. Snowy cerastiums are invaluable for draping otherwise bare and steep places; the ethereal beauty of the phloxes of the setacea and subulata groups, and many of the dianthuses, sedums, and irises, all deserve the closest attention in this connection.

And these are but a few. There are veronicas, gentians, and the primulas and linarias. Ridges gay with alpine poppies, slopes, and crevices thick with campanulas of many species, and bold masses of nepetas and iberis, are all effective.

One might go further, and denote many other subjects, but the idea given may assist the reader to the effective planting of the slopes of the rock garden. Rock garden steps also may be brought into the scheme by running colonies of low-growing plants between the stones, and so linking up groupings of similar plants on either side of the pathway. In itself the idea of growing plants in the crevices between the stones of the footway is a commendable one, and if these self-same plants appear to be roving colonists, which have come from one side of the garden to the other, the thought of natural effects and simple plant groupings is brought before one at every turn.

P. S. Hayward.

## STANDARD AZALEAS.

Within the last few years standard plants of many different subjects have been extensively grown, and the Indian azalea is one of them. I do not mean plants with a clear stem of about a foot, such as we have always been familiar with, but standards with stems from 3ft. to 5ft. high or thereabouts. These tall plants are very useful for grouping, as they serve to relieve the monotony of the more lowly specimens. A characteristic specimen was illustrated in the Gardeners' Magazine of March 18, 1911. The varieties so grown form a good representative selection of this beautiful class of plants, but one cannot fail to notice the disappearance among Indian azaleas of many of those varieties whose flowers are of some shade of magenta, even Madame Van der Cruyssen, which has been a favourite as long as I can remember, being now little grown. On the other hand, semi-double flowers of a rose or salmon-rose tint, with a white or light-coloured border, of which Imperatrice des Indes was one of the earliest examples, are now largely grown. Standards of Azalea mollis in several forms are often met with; in fact, as above stated, a great many plants are now grown in this way. Of summer subjects, Salvia splendens, Plumbago capensis, abutilons, heliotropes, and, of course, fuchsias, may be mentioned, as their habit eminently fits them for growing as standards.—W. T.

## VIOLET CULTURE.

At the present time violet plants in frames that have provided a supply of flowers throughout the winter will have, in this respect, very nearly completed their period of usefulness; consequently arrangements for the propagation and after-culture of a stock for another season can very soon be carried out. The past year, in most parts, was far from being an ideal one for the growth of violets during the summer months, the abnormal heat and drought, combined in very many instances with an inadequate water supply, or owing to the press of work in other directions, the impracticability of applying it when it would have been most beneficial, found the plants in autumn much below their usual standard of size and vigour; while the foliage presented that sickly hue denoting an attack of red spider in an aggravated form. So much was this in evidence that most of the older leaves retained upon the plants when transferred to frames were soon after cleared off as rubbish, leaving the crowns almost bare, and very unpromising for supplying flowers in quantity during the dark days of winter. This forecast proved correct, for the flowering capacities showed considerable diminution for a time compared with previous years; but, with gradually lengthening days and an increase of sunlight, the plants responded to the improved conditions, and for some weeks past flowers in abundance and of good size and quality have been available.

### Propagation.

It is now obvious that the supply of rooted rhizomes, or runners, usually depended upon for increase of stock for the ensuing season will not be so readily obtained as formerly, for the simple reason that, owing to poverty of growth last year, such were very sparingly produced. Hence recourse must be had to the division of the plants now flowering. With the double varieties there is no difficulty in doing this, as usually a number of crowns, or offsets, are clustered about each root-stock, and these, pulled apart and divested of the older leaves, and having any lengthy roots reduced, answer the purpose well. The single-flowered varieties are not quite so prolific in this respect, as growth with them is more inclined to concentrate in a main stem, but generally a good number of offsets may be detached therefrom with a few roots formed, or in process of formation, that will speedily accommodate themselves in genial surroundings.

### Summer Quarters.

In southern districts the practice often followed of selecting a north border or other partly-shaded position for growing violets is best; but further north considerable modification of this course, according to soil, site, and latitude of the situation, would probably give better results. Here it has been found that the single-flowered varieties thrive best, and give better returns by way of flowers when grown fully exposed in the open garden; while those having double flowers make better progress upon a border having a western aspect, in this case having a wall at the back, which, of course, affords good protection from scathing winds, which are apt to prevail in this part in the spring months. If not already done, the intended site or sites should at once be prepared by receiving, if thought necessary, a liberal supply of short, well-rotted dung or leaf-mould, and be deeply turned over with a spade. After lying in the rough state for a few days, or until it becomes dry and workable, a dressing of soot might with considerable after-benefit be given, and the whole surface be reduced to a fine tilth by means of a rake, at the same time making it uniformly firm and level. Soil that has been well enriched for a previous crop, or that is known to be of good sustaining power, would be better without any fresh manure; deep digging and the soot-dressing alone would suffice. Soil over-rich is not desirable, as such is likely to cause a too-luxuriant growth, with the attendant evils of coarse blooms and excessive damping and dying-off of the foliage in the winter season.

### Planting.

One foot apart every way is ample space for the double violets, and it also allows room for such necessary work as the removal of runners and occasional stirring of the surface. The single kinds require from three to six inches more space, owing to their longer leaf-stalks and more robust character. In planting, a little fresh, well-prepared soil should, if possible, be used wherein to insert the roots, thus giving the plants a kindly start. Disused chrysanthemum soil, well pulverised and sifted to remove any crocks or roots, is excellent for this; but a suitable mixture is easily composed of loam and leaf-mould. Planting is best done with a trowel, making a cavity that will hold a handful of soil as stated; in this insert the roots, and press firmly all around. Watering may be necessary, according to the weather; and, if means are at hand for shading for a few days should drying winds prevail, a light shade will prove of material benefit, and represent time well spent.

After-cultivation consists principally of keeping the surface soil in a loose, friable condition by means of the hoe, and removing all small, slender shoots as they form, to concentrate the energies of the plant as far as possible on the central crown. By allowing more space, three or five of the strongest runners may be allowed to remain, and be secured in the soil at equal distances around the parent plant, where they will become rooted and self-supporting; but, as more space must be allowed both in the open and when removed to frames, the system, though very adaptable, has not much to recommend it.

### Good Varieties to Cultivate.

Formerly the double varieties, as Neapolitan and Marie Louise, were almost exclusively grown for frame culture, and answered the purpose well. The introduction, however, of several single violets with longer flower-stems, rendering their arrangement into various forms of decoration an easy matter, and having richer colours, and perfume quite equal to the older kinds, has resulted in these having been ousted from the position they once held; though for pot culture, and flowering late in the season, they are yet of great value.

Marie Louise, lavender-blue; Neapolitan, lavender; Lady Hume Campbell, an improved form of the latter; and Comte de Brazza, white, are four variously-coloured and reliable double varieties. Among the singles Princess of Wales, light blue, is one of the best, being large and very long-stemmed; Italia, deep blue; Wellsiana, purple; Baroness Rothschild, purple, very large; and Admiral Avellan, rosy-violet, having smaller flowers, but considered by many to be the sweetest-scented of any, and one that thrives and flowers freely in the open, are sufficient to provide variety, though there are several others that nearly equal them, and that might with advantage be added to any comprehensive collection. JAMES DAY.

Galloway House, Wigtonshire.

## PATHS AND EDGINGS.

Gardens are constantly being made out of new land, and old gardens are always being altered, but few gardeners realise that it is the paths which so largely determine the success or failure of the whole. If walks are cut where they intercept beautiful views a great deal is sacrificed. A noble broad border of roses, or a magnificent sweep of turf, must be ruined by being cut in two or more portions by a gravel or tiled strip. No matter how desirable it may be to obtain sufficient methods for traversing the grounds, a beautiful feature should not be injured. By giving winds and turns to a walk it is always possible to leave certain portions of land intact, and the more paths meander the more charming a garden becomes.

One noteworthy plan for making a large garden original is to form it on the zigzag principle after the chief lawn has been passed. The walks may describe the curves followed by a tired horse dragging a load uphill. When shrubbery groups have been set in place here and there against the slanted walks there will be nooks formed, different aspects created, and the eye will no longer tire of a monotonous expanse that can be surveyed from all sides. In small gardens it is seldom that the walks are of sufficient breadth to be pleasant to walk along. This can be obviated by having fewer paths, and turning those about so that the ground for planting is at no point too wide to be easily tended.

Another method is to have only one extra-broad walk running down the middle of the garden. This looks best when the edges are curved, either regularly or unevenly, either so as to make opposite bays or so as to form a walk that winds. When there is no lawn in a small garden this centre path may well be of turf, since the green grass has a value all its own, as a contrast to blossom colour. If it is objected that the turf will not be fit always to walk upon—a contention that need not be granted, however—the difficulty can be met by letting a narrow gravel path encircle the whole garden, leaving narrow borders against the walls, but wide borders flanking the grass. By the sufficient use of lawn mower, roller, and broom, grass can be kept in a condition that incites one at all seasons. After a frost or heavy dew a sweeping will soon dissipate the surface moisture, and the earth below will be level and hard still.

The beauty of rockery edgings to paths is undoubted. Their disadvantages are the manner in which they harbour insects, and the way in which they conduct rain down upon the gravel. If the spaces between the rocks are sometimes dusted with lime, and catch-drains are made at the sides of the walk, these evils disappear. Behind the rockery edging plants of from nine inches to a foot in height can be freely indulged in; behind a row of tiles, box, or a belt of turf, these would appear too tall. The more taller plants can be located the greater will be the supplies of cut blossom.

An altogether novel edging for a wide border, or a plot of low-lying land, consists of a trench, puddled with clay, fed with water from the tap of a rainwater butt, and simply planted on each side with perennials that love moisture. There will be no washed-down soil, because the little canal will lie between the main portion of the ground and the walk; the row of plants against the walk should be evergreen, and close-habited species, such as London pride and other saxifrages, mimulas, Bellis perennis, woodruff, and primroses. Coloured burrs are sadly out of place in what may be called romantic gardens, those, namely, in which beautiful natural effects are imitated, but in prim villa gardens they have their uses, especially to edge borders beside the tiled walks from gate to front door. They do not harbour insects as do old grey stones, and their dark shades show off the hues of polyanthuses, violas, aubrietias, arabises, and alyssums.

Pinks can edge walks alone, their foliage soon gaining a sufficient solidity to hold in the soil, especially if the young shoots are pegged down twice yearly. The beauty of a long edging in which numerous varieties of pinks are alternated must be seen when in perfection to be correctly appreciated. Mossy saxifrages, pink, white, and crimson, are equally suitable, the vivid green of the foliage giving a winter splendour of immense worth, being apparently uninjured by any kind of insect pest. When tiles have to be employed, and their inartistic aspect is a subject of annoyance, dwarf close-growing perennials should be planted closely behind them, and the material will soon be hidden in leaf and bloom.

M. H.

## THE FORSYTHIAS.

Although attention has often been directed to the various species of forsythia, they are of such general use and of such a showy character that their virtues still bear discussion. Thriving in all except the very coldest parts of the country, they may be used in the largest and smallest gardens, for, whether massed in large groups or grown as single plants, they grow and flower equally well. They are not very particular regarding soil, although that of a loamy character is best suited to their requirements. Propagation is easily effected, providing care is taken to obtain cuttings from quite young wood, say, in June or early July, for at that time, if inserted in sandy soil in a close frame roots are formed in about three weeks, but if the wood is allowed to become hard before the cuttings are made, a much longer time is required for the formation of roots, and the subsequent growth is very weak in comparison to that formed by cuttings taken at an earlier date. It is a good practice to plant the cuttings out as soon as well rooted, for they thus become well established before winter, and form strong buds for the ensuing season's growth. By cutting the branches back once or twice during the first summer, nice bushy plants are formed the first year.

Subsequent pruning must be done after flowering is over, but the amount depends entirely on the object for which the plants are grown. F. viridissima and F. intermedia do not require pruning annually and what pruning is done is for the object of thinning the branches and reducing the bushes when out-growing their positions. By doing this as soon as the flowers fade, a long growing season is obtained for the production of wood for the following year.

With F. suspensa the pruning is done on different lines. Left unpruned, it forms a loose-habited bush, 10 to 15ft. high, with long, slender, pendant secondary branches, and in this form it is useful for many purposes. It may, however, be pruned hard each year to form a denser bush with more upright shoots. To obtain the desired result, the younger branches are pruned hard back each year as soon as the flowers are over. A foundation of strong branches is necessary in the first place. These branches are allowed to grow about 2½ft. high. They are then cut over, and from them vigorous upright shoots, 3½ to 4½ft. long, are formed during summer, which bloom from nearly every bud, from base to summit, the following spring. After the flowers are over the shoots are cut back to within two or three eyes of the base, and another set of flowering branches is produced for the following year. This system of culture is an exhaustive one; therefore steps must be taken by top-dressing the bushes with well-rotted manure to keep them in a healthy and vigorous condition. When, however, plants show serious signs of enfeebled health, it is as well to destroy them and start again with young plants in fresh soil.

Forsythias are useful plants for forcing, especially F. suspensa, and useful specimens may be grown in large pots or tubs and used several years in succession by feeding them during the growing period. Large plants lifted from the open in October also afford plenty of flowers in January by gentle forcing.

F. suspensa is a Chinese species which may be easily recognised by its bright brown branches, and by some of the leaves being ternate and others two-lobed; the majority, however, are single. An examination of the yellow bell-shaped flowers will reveal the fact that some have styles which protrude beyond the stamens; whilst in other cases the styles are hidden by the anthers. The varying character of the species has given rise to more than one name being adopted for the plant, a fairly common one being F. Fortunei. It is, however, as F. suspensa that the species is correctly named. Its time of flowering varies considerably according to the weather experienced during the early months of the year, for sometimes, as in the present year, the blossoms were as far advanced by the end of the first week in March as they are in some other years by the end of the month.

F. viridissima is a second Chinese species, which differs rather widely in habit from the last-named. The branches are stiff, green, and upright, attaining a height of 4 or 5ft. The leaves are distinct in shade, and show none of the variable form peculiar to F. suspensa. Flowering is a week or more later than in the case of the last-named species. The yellow flowers are, however, borne freely.

F. intermedia is a hybrid between the two species referred to. Of vigorous constitution, it grows quite 8ft. high, and branches freely, the habit being intermediate between that of the parents. Flowers are borne profusely most years, although now and then a lean year is experienced. Two very floriferous forms have been selected for varietal names. These are densiflora and spectabilis. Both are superior to the type, and ought to be selected for preference where a few plants only are required.

F. europæa was introduced from Albania a few years ago. Of rather stiff, upright habit, it grows into a somewhat spare shrub 5 or 6ft. high. Yellow flowers are borne a week or two later than in the case of the Chinese kinds, and they are rarely in sufficient quantity to make a good show. Altogether, it is a disappointing shrub, and is not worth introducing for decorative effect, although it may be included in scientific collections of shrubs.

W. Dallimore.

PRIMULA MRS. JAMES DOUGLAS.
A beautiful little plant with a neat habit, and flowers of a rich purplish blue shade.
A.M., R.H.S., April 2. Mr. James Douglas, Great Bookham. (See page 305.)

# POLLINATION OF HARDY FRUITS.

The following notes from the "Journal" of the Royal Horticultural Society on the experiments conducted by Mr. C. H. Hooper, M.R.A.C., on the pollination of hardy fruits, are of special interest at the present season:

The experiments recorded were designed to gain information upon the following points:—(1) To what extent can our ordinary fruits set without the visits of insects to the blossoms? (2) To what extent fruit flowers set when pollinated with their own pollen, whether from the same flower, the same tree, or another tree of the same variety? (3) Do fruit blossoms, when pollinated with pollen from another variety, set fruit more plentifully and of better quality than when pollinated with pollen of the same variety?

Mr. W. E. S. Erle Drax most kindly gave me permission to carry out my trials in his garden at Olantigh, his gardener, Mr. Bond, kindly giving me information as to varieties, etc.

## The Trials.

1. To test the effect of excluding insects, fine muslin paper bags were placed over unopened flower buds; where any flowers had already opened they were picked off. The bags were tied at the mouth with twine, with label giving date, variety, and number. After about three weeks, when the fruits outside had set, the truss inside the bag was examined and notes taken as to results, the bag was taken off, leaving label with notes, etc.

2. To test whether fruit blossoms set fruit when pollinated with their own pollen or pollen of the same variety, muslin or paper bags were placed over unopened blossoms, which were tied up and labelled. When the flowers opened the stigmas were dusted with pollen of the same variety either with a camel's hair brush or by the use of a pair of forceps, taking the stamens from another flower, the anthers of which were shedding their pollen, and touching the stigmas with these anthers. In order to avoid mixing pollen, the brush was after use dipped in methylated spirit and dried before using again for other pollen, so four or five brushes were needed for the work. After pollination the flowers were again bagged, the date of pollination added to the label, and in some cases a note of the number of flowers taken, with any note of injury by caterpillars, or other point influencing results. Where the blossoms were not all open at once, as in gooseberries, currants, and cherries, pollination was repeated; in some cases there were three separate pollinations. The bags were kept on for a fortnight or more after pollination; when the bags were removed, the labels saying what had been done were left on.

3. To test whether foreign pollen—i.e., pollen of another variety—gave better results than pollen of the same variety, unopened blossoms were bagged. Accepting the fact shown by experiments in the U.S.A. and by Mr. F. J. Chittenden, that most varieties will not set fruit with their own pollen, when the flowers opened I took pollen from other varieties, either by brush or by carrying the stamens with forceps, and dusted it on the stigmas of the bagged flowers without emasculation. The only variety that had all the flowers experimented upon emasculated before the anthers shed their pollen was a Cox's Orange tree, on which I tried pollen of nine different varieties of apple; but in two trials of Cox's Orange Pippin pollinated with its own pollen, in neither case did fruit mature, and in five trials bagged and not touched none set any fruit. Emasculation would therefore seem unnecessary.

For these trials I used some 200 muslin bags, most of them of green colour and fine mesh, and about 100 paper bags, as used by bakers and grocers. The season being dry, the latter answered quite well, and did not come ungummed. Green muslin bags were used for the sake of the appearance of the garden. The only insects I found in any of the bags, to the best of my remembrance, were caterpillars, apple sucker, and aphis, and sawfly in the young apples, the eggs of which must apparently have been on the flower buds when bagged. The results seemed similar whether in paper bag or muslin bag. With the fruits experimented on I think very little pollen was blown about, and none came through the muslin bags to affect results. Glazed, transparent paper bags may be the very best of all to use, and if I make further trials I propose using them to try and avoid possibility of error.

## Gooseberries, Red and White Currants.

Bags were placed over small boughs of unopened blossoms, with the result that very few fruits set, and those chiefly at the tip and at the base, where rubbed by the bags. The pollen of gooseberries and currants is sticky, and cannot be transferred from the anthers to the stigmas without mechanical means, and these plants are therefore dependent on insects to do this office for them in order to set fruit. They are self-fertile—i.e., set fruit perfectly when pollinated with pollen of the same flower or same variety.

## Cherries.

On some ten varieties of cherries on which unopened blossoms were bagged and left untouched, not a single fruit set; when pollinated with their own pollen several set, but none matured except on Morello cherries, whilst in the five cases in which I bagged and afterwards pollinated with pollen of another variety all set fruit. It appears necessary when growing cherries to have several varieties for cross-pollination, and to have plenty of bees to carry the pollen.

## Plums.

I made trials on eleven varieties of plums —viz.: Victoria, Czar, Rivers' Early Prolific, Early Orleans, Bittern, Cox's Emperor, Jefferson, Denniston's Superb, Pond's Seedling, Greengage, and July Greengage. Of those bagged and left untouched, four varieties set fruit out of eleven, but only fruits of two varieties came to maturity—namely, Victoria and Czar—and these were not as large as others in the open.

Of those bagged and afterwards pollinated with their own pollen, seven of the eleven varieties started by setting fruit, but only five matured—viz., Victoria, Czar, Denniston's Superb, Bittern, and Rivers' Early Prolific.

Out of ten cross-pollination trials, I had good fruit mature on five (the pollen coming from the second named)—namely, Victoria × Czar; Victoria × Denniston's Superb; Rivers' Early Prolific × Victoria; Rivers' Early Prolific × Denniston's Superb; and Pond's Seedling × Czar; the fruit produced by the cross being generally larger than that where self-pollinated. All the varieties, except perhaps Victoria, seem to set finer fruit more plentifully when pollinated with another variety.

With plums also it appears advantageous to grow several varieties for cross-pollination, and have bees in the neighbourhood.

## Pears.

Whilst the pears were in flower in 1911 in Kent, although the weather was sunny and warm, the wind during most of the time was boisterous and too rough for hive and humble bees to work in, which accounts, I think, for the short crop of pears this year.

Out of twenty-two varieties of which I bagged blossoms and left them afterwards untouched, only Duchesse d'Angoulême, Colmar d'Eté, General Todleben, Dr. Jules Guyot, Joséphine de Malines, and Durondeau set fruit; all the fruits, however, fell before maturity.

Of those blossoms bagged and pollinated with pollen of the same variety, about the same number proportionately set, but only two kinds thus treated—viz., Duchesse d'Angoulême and Colmar d'Eté—matured their fruit. I thought to have been able to include General Todleben also as self-fertile, but the fruit withered after July 7. I did not make many cross-pollinations in pears, but apparently the pollen of Duchesse d'Angoulême sets the fruit of Williams' Bon Chrêtien well, the pollen of Conference that of General Todleben, and vice versa.

In the case of Vicar of Winkfield, I bagged four buds, and afterwards pollinated them with Winter Crasanne, and had two fine pears, some of the best on a large tree, there being only about ten fruits, though plenty of blossom. This, I think, exemplifies the importance and value of pollination with another variety.

The twenty-two varieties of pears of which flower buds were bagged and then left untouched were: Joséphine de Malines, Duchesse d'Angoulême, Beurré Alexandre Lucas, Durondeau, Conference, Clapp's Favourite, Doyenné du Comice, General Todleben, Winter Crasanne, Marie Louise, Colmar d'Eté, Dr. Jules Guyot, Margaret Marillat, Beurré Diel, Catillac, Citron des Carmes, Uvedale's St. Germain, St. Luke, Louise Bonne of Jersey, Souvenir du Congrès, Beurré Superfin, and Pitmaston Duchess.

## Apples.

Out of sixty-three varieties of apples on which unopened blossoms were bagged and left untouched, the only fruit that set and matured was on Irish Peach, and this was very good; of those bagged and pollinated with their own pollen by brush or anthers the following set and matured their fruit: Irish Peach, White Transparent, Newton Wonder, Ecklinville, Summer Golden Pippin, Baumann's Red Winter Reinette, Peasgood's Nonesuch (very fine), Christmas Pearmain, King of the Pippins (damaged by sawfly, eventually fell); Washington and Adams' Pearmain fell in June. I believe American Mother and James Grieve set with their own pollen, but am not quite certain.

In nearly all the crosses made, good fruits resulted; out of the sixty-four varieties crossed forty-eight were successful. Among the best may be mentioned: Brabant Bellefleur with pollen of Beauty of Bath, Gladstone with Beauty of Bath, Alfriston with Beauty of Bath, Allington Pippin with Summer Golden Pippin (the finest on tree), Grenadier with Seaton House, Hoary Morning with Seaton House and vice versa, Christmas Pearmain with Cox's Pomona, Mère de Ménage with Lady Sudeley, Sandringham with Hormead Pearmain, Beauty of Bath with Summer Golden Pippin, High Cannons with Grenadier, The Queen with Baumann's Red Winter Reinette, Lane's Prince Albert with The Queen, Golden Spire with Hollandbury and Bismarck, and Cellini with Graham's Royal Jubilee.

These crosses were made without removing the stamens from the flowers, which were pollinated by brush or anthers; if the brush was used it was dipped in methylated spirits and allowed to dry before using with another pollen; but in the case of a tree of Cox's Orange Pippin, nine bunches of unopened blossoms had their stamens taken out with forceps, and were pollinated by camel's hair brush or anthers with the pollen of nine different varieties of apple to try to find out which would give the best result. Fruit set with pollen of the eight following varieties: Bramley's Seedling, High Cannons, Grenadier, Lady Henniker, Golden Spire, Duchess's Favourite, The Queen, and with its own pollen; only with Peasgood's Nonesuch did fruit not set; however, all gradually fell before maturity except those pollinated with Bramley's Seedling and High Cannons.

The following is a list of apples experimented on.—Self-fertile: Irish Peach, White Transparent, Newton Wonder, Ecklinville, Summer Golden Pippin, Baumann's Red Reinette, Peasgood's Nonesuch, Christmas Pearmain, King of the Pippins, Adams' Pearmain, Washington, American Mother (?), James Grieve (?). Self-sterile, or, perhaps better, those that did not set or mature fruit with their own pollen in these trials: Allington Pippin, Annie Elizabeth, Alfriston, Astrachan, Beauty of Bath, Belle de Pontoise, Beauty of Kent, Ben's Red, Bismarck, Blenheim Orange, Brabant Bellefleur, Cellini, Cox's Orange Pippin, Cockle Pippin, Cox's Pomona, Duchess's Favourite, Egremont Russet, Fearn's Pippin, Gladstone, Golden Noble, Golden Spire, Graham's Royal Jubilee, Grenadier, Hambling's Seedling, High Cannons, Hoary Morning, Hollandbury, King of Tompkins' County, Lane's Prince Albert, Lady Henniker, Lady Sudeley, Loddington, Lord Derby, Lord Suffield, Mère de Ménage, Old Hawthornden, Old Nonpareil, The Queen, Ribston Pippin, Rival, Graham's Royal Jubilee, Sandringham, Seaton House, Stirling Castle, Striped Beefing, Sturmer Pippin, Waltham Abbey Seedling, Warner's King, William's Favourite, and Worcester Pearmain.

### Strawberries

seem to be less dependent on insect pollination than any other of our hardy fruits, though to these bees are probably beneficial, especially when during a dull, rainy season there are intervals when these insects can work.

To test the effect of excluding bees and other insects from strawberry blossoms, the frame of a hand-light was placed over a strawberry plant, muslin was tied over this by a string round the upper rim of the frame. The weather during blossoming time was fine, with a good deal of wind. The fruit set and matured on the enclosed plant practically as well as on those around in the open; muslin bags were also placed over unopened blossoms of plants of several varieties, but in general these set their fruit as well, or nearly as well, as those not enclosed. Apparently the movement of the wind carries the pollen from the anthers to the stigma of the strawberry flower in the open field or garden.

### Raspberries and Loganberries.

Where these flowers were bagged in muslin the fruits set, but were not generally so large and well developed as those in the open.

### General Conclusions.

Fruit blossoms generally are dependent on the visits of insects, and from want of these many fruit plantations do not yield their best; bees are absolutely essential to gooseberries, black and red currants, and very largely so to pear, apple, plum, and cherry, and where there are not hive bees near and but few wild bees, one or more hives of bees should be placed in the plantation.

In the case of most varieties of apples, pears, plums, and cherries, it is advantageous to have a different variety flowering at approximately the same time in every third or fourth row for better cross-pollination and consequent setting of fruit.

## A BEAUTIFUL WATER LILY.

In the list of water lilies contributed to our issue of the 6th inst., Mr. J. Hudson, V.M.H., mentions the beautiful Nymphæa Attraction, which is unquestionably one of the finest of the brilliant red-crimson varieties. It is free in growth and profuse in flowering, and the large brilliantly-coloured flowers present so attractive an appearance as to at once attract the attention of those who have had an opportunity of seeing the fine collection of water lilies in the Gunnersbury House gardens. Some finely-developed blooms of this variety and Mrs. Richmond, which received an Award of Merit, were shown by Mr. Hudson at one of the meetings held by the Royal Horticultural Society in August last, and both varieties attracted much attention, more especially from those who are interested in the water lilies and appreciate their value in enhancing the attractions and interest of the garden.

NYMPHÆA ATTRACTION.

A recently introduced water lily, remarkable for the fine form and rich colour of its flowers. The bloom illustrated is one of several shown by Mr. J. Hudson, V.M.H., at one of the R.H.S. meetings in August last.

## PLANT VEINS.

The venation, or vein system, of all plants is extremely interesting. It differs from that of animals in one important respect. In animals, speaking generally, there is a double system, one which conveys the blood, revitalised by contact with oxygen in the lungs, to the system of arteries and minor channels which pervade the body, and by means of this supply do all the work of repair and growth. The other system gathers up the now-exhausted blood and carries it to the lungs for revivification, the waste of the system which it has collected in its course being practically burnt up there, with the consequent production of the carbonic acid which is always present in our expired breath. In plants, on the other hand, there is only one system, which, commencing in the roots, gathers up there the requisite water and earthy salts, and transmits it upwards to the leaves, wherein the materials it contains are utilised under the influence of the light, and combine with the carbonic acid which the leaves have absorbed from the air to form the materials of growth, and the fruits, and the myriads of products, boons and banes, which, as we know, vegetation provides.

There is thus in plants no obvious return venous system, but, nevertheless, it is quite obvious that a return flow exists, since from the leaves all the materials are derived for the growth of supporting stems or trunks, or the fabrication of flowers, seeds, and fruits, which do little or none of the manufacturing aforesaid, the green cells alone being the active agency. Thus in the potato, for example, we see large masses of nutritious starchy material store up in the tuber, all of which has been transmitted thither from the foliage above. Neither do we find in plants, as in animals, the same clearly defined tubular channels for the conveyance even of the main supply of sap. A section of a tree trunk, or branch, or twig, shows merely a core of wood and a cover of bark or skin, and between the two, by the aid of a lens, we will find an arrangement of cells whose province it is to convey sap in one direction to the leaves, and in the other direction to receive, and, in part, to transmit, the material for building up the annual ring of wood upon the central core.

If, as in the grasses, we find a hollow centre, this plays no part as a vein, but merely means an economy of material plus an increase of strength, since, curiously enough, a tube of fair thickness is stronger than a solid of same diameter in many ways, as we may see by the relative resistance against bending or breaking of a bamboo and a cane. The transmission of sap and return material must take place largely through the permeability of the walls of the cells, which cells are, however, often transformed into minute spiral ducts to facilitate the passage. It is in the leaves themselves that we best may see the vein systems proper.

In the dicotyledons, to which most of our trees belong, i.e., plants with seeds that produce two primary leaves on germination, we see the greatest diversity, so great indeed that it would be difficult to match exactly in plan the vein systems of the leaves of any two species, or even varieties. We have only to select leaves from any of the shrubs or trees in our gardens to note the wonderful differences in the delicate networks which their leaves present, while most certainly we could never match any two in detail even from the same plant. In each we can note how, commencing with a main vein, really a continuation of the stalk itself, lateral veins branch off, and divide and ramify, and form interconnections, until eventually they constitute a continuous network, the meshes of which are filled with the tiny green cells that form the leaf proper.

In the monocotyledons, or plants with only one primary seed leaf, the diversity is much less, since in these plants, whether they be humble grasses or stately palms, the veins run longitudinally from end to end of each leaf, or subdivision, and are easily torn into strips, which it is impossible to do in the case of a netted venation. Apart from the mere question of transport of the sap of plants, or blood of animals, there is also, between the two, the immense difference involved in the presence in the latter of a definite impelling force, viz., the heart, which acts as a force-pump by its incessant muscular contractions, and thus keeps the blood in active circulation throughout the venous and arterial systems.

In the plant there is nothing analogous to this, and the circulation is entirely induced by the fact that water is being constantly evaporated through the pores of the leaves, or used up in them as building material, which water is replaced by absorption from cell to cell, in the first place, and, in the second, a draft upon the nearest veinlet, such draft being transmitted then to the larger and larger ones, until finally, no matter how large the tree or plant may be, it reaches the root system, which collects it from the soil through a myriad absorbent points, and it is the province of that system to extend in precise proportion to the foliar demands above the ground.

CHAS. T. DRUERY, V.M.H., F.L.S.

# DOUBLE ROCKETS.

Double Rockets are among those flowers to which the term "old-fashioned" is applied—a word which to the multitude conveys the idea of something superseded, on account of lack of merit, by new-comers of more brilliant attractions. To the select few, however, old-fashioned things have the charm of association, independent of their intrinsic worth, connected, as they are, with the less ostentatious beauties of the past, and fraught with the fragrant memories of old times. The Rocket, however, although somewhat neglected, is quite able to stand on its own merits, and with its white spires of bloom, and the perfume that on still, dewy evenings of early summer fills the soft air with exquisite fragrance, it possesses charms which are certainly not inferior to those of the gaudy, scentless pelargonium, by which it and other lovely old plants have been ousted.

A GROUP OF DOUBLE ROCKETS.
Sweetly-scented, old-fashioned flowers of great beauty.

Of yore, despite bars and bolts, the hidden daughters of Araby revealed to their chosen the secrets of their hearts, and oftentimes, in like manner, the unseen occupants of sequestered gardens waft, by the aid of their accomplice, the wandering zephyr, sweet messages to the passer-by and to one who loves flowers and can rightly interpret their language, rockets, clove carnations, and clustering roses, silently, by their ambrosial breath, disclose their presence within the secluded walls of their sanctuary as surely as if their loveliness were visible to the eye.

Although grown to some extent in herbaceous borders, it is rarely, save in cottage gardens, that double rockets are seen at their best. It is often in the humblest plot that one finds the sweet old-fashioned flowers growing in the greatest luxuriance. At such times one is tempted to wonder if the possibility exists of plants being swayed by sentiment; if it is the desire to brighten the lowly lives that prompts such bounteous blossoming, for, surely, in many cases, the surroundings do not appear especially adapted to induce vigorous growth. A cottage garden is now in my mind's eye. It is but a small space of ground, yet it is filled with sweet old flowers. There the rockets grow in masses; from the glaucous cushions of the white pinks arises the delicate essence from the countless fringed blooms. Madonna lilies lift their snowy, scented spires; the moss rose and sweet brier exhale from flower and leaf their mingled fragrances; the jasmine above the porch distils its sweetness from a thousand snowy stars, and the passing breeze is odorous with the scent of the blossoms that crown the great lilac bush with a veil of rosy-lavender.

The pleasures of the garden are manifold, but there are none that transcend that of fragrance, not even the delight of the eye in suave colour harmonies, effective contrasts or breadths of lovely tints. At the almshouse the border between the cobbled path and the building is but a narrow strip, raised above the path by an edging of stones. It does not suffer, indeed, from lack of solicitude, but its attendants are women, and "women's knees are weak;" and these women are old—very old, and past work, but the flowers repay the necessarily limited labour with lavish prodigality, seemingly taking the will for the deed, for there is no conscious neglect of their wants. Here the old double white rockets throw up great spires of flower, well nigh three feet high, and their scent floats gently down the quiet valley to the corner hard by the thatched forge, where cluster roses wreathe cottage walls and chimneys.

The double white rocket (Hesperis matronalis alba plena), though, strictly speaking, a perennial, does best, if divided every autumn, and given fresh soil. Treated in this manner, strong, flowering plants are secured, and the stock is also rapidly increased. It is not necessary to replant each year in a different spot, removal of a portion of the soil and the substitution of some fresh compost being quite sufficient to encourage strong and healthy growth. The flowering season is a prolonged one if the precaution of removing the central spike as soon as faded be taken, the plants thus relieved producing a good show of bloom from the secondary shoots.

There is, besides the white form, a purple variety of the double rocket, which is, however, far less ornamental. Such fragrant flowers as these should be in every garden, for perfume is almost as valuable an accessory to a blossom as are beauty of form and colour. Wyndham Fitzherbert.

---

**Cordyline australis lentiginosa.**—This is a very distinct variety of Cordyline australis, which last, by the way, is often known in gardens as Dracæna indivisa. In lentiginosa the leaves are of a reddish-brown or bronzy-red tint, quite different from the normal green of the type, to which, for decorative purposes, it forms a marked contrast.—W.

## MARSH MARIGOLDS.

MARSH MARIGOLDS BY THE WATERSIDE.

There are but few plants flowering during the spring months that in their season contribute more liberally to the charms of the environment of running stream and silent pool than the

> "Brave marsh marybuds, rich and yellow,"

and there are certainly none capable of producing a richer display of colour in the bog garden, provided it is sufficiently open to enable them to enjoy to the full the advantages of exposure to sunshine and a free circulation of air. There is no occasion to remind my readers of the fact that the common marsh marigold (Caltha palustris) is a member of the British flora, and that many are the districts in which it may be seen growing so abundantly in swampy places as, in the season of flowering, to produce surprisingly rich colour effects. This species is not, however, peculiar to the British Isles, nor is it limited to the lowlands, as may be assumed from the frequency with which it is met with alongside streams and on the margins of lakes and ponds in the valley. The plant is as much at home on a mountain of a considerable height as in a deep valley, provided its roots have access to soil that is saturated with moisture, and one of the finest displays—and I have seen many that have been good—that has yet come under my notice was on the Wengen Alp, at an altitude of over 7,000 feet. Growing in the boggy soil were several large breadths, the largest probably extending over half an acre, and the effect produced by the myriads of glistening yellow flowers as seen under the influence of sunshine of intense brilliancy was such as is not likely to be soon forgotten.

At the present time we are only concerned with the marsh marigolds in their relation to the garden, and in the first place it may be suggested that in the planting of the bog garden and moist places in the pleasure grounds they should be judiciously utilised. The common form is worthy of a place in the garden, but with the other fine forms now available, it should be sparingly planted. There are two double forms, both effective, which are known as C. palustris plena and C. p. monstrosa plena respectively. They are both deserving of attention, and it is somewhat of a matter of taste as to which is the best. I prefer the first-named, as the flowers have a lighter appearance, but others who appreciate the charms of moisture-loving plants may have a preference for the large double blooms of the second of the two varieties mentioned, and I suggest that the selection be left to individual taste. The rare C. palustris Tyermani is distinct from, and superior to, all the other varieties, but it is yet too costly to admit of it being planted otherwise than sparingly. It is of robust, yet dwarf, growth, and bears in great profusion large rich yellow single flowers of fine form. In addition to the foregoing there is the large-growing C. polypetala. The flowers are single and of large size, and the glossy green leaves measure ten or more inches across. For planting on the margin of large lakes or in open spaces in the bog garden, where bold effects are desired, this species has much to recommend it. G.

---

**Japanese Maples.**—In many districts these are of greater value for the embellishment of the greenhouse or conservatory than for the open ground, where their tender unfolding foliage is often scarred by spring frosts and cutting winds. Under glass this does not occur, and they there form a delightful spring feature.—S. W.

## POINTS ABOUT PERRY PEARS.

One hardly ever picks up a horticultural paper without reading something about pears, but the pears that claim the attention of the average writer on fruit culture are the dessert and culinary varieties that are so familiar to gardeners all over the country. There is another family of pears, however, that is very little written about, perhaps because it is unknown outside the few counties in which it flourishes, and perhaps also because it belongs to the orchard on the farm rather than to the garden and commercial fruit plantation. I refer, of course, to the perry pears, which possess none of those qualities that are needed on the dessert table, but which nevertheless serve a useful purpose in providing the juice to make the beverage which most West Country men know and appreciate.

In various parts of these islands fine pear trees are to be seen, but for size of limb and girth of stem, there is nothing equal to the perry pears, and as you travel through the orchard lands of Gloucestershire you may observe specimens that are more like great forest trees than anything else. Many of them look as if they were about half as old as Time itself, and centuries must have rolled away since they were first planted. A few interested persons have endeavoured to trace the history of some of the old perry pears in the West, and most notable amongst them was the late Mr. Radcliffe Cook, who did more than anyone in his time to popularise the West Country beverages cider and perry, and as a consequence, when he sat for a Parliamentary division of Herefordshire, was often referred to as the honourable member for Cider. I have no data before me of Mr. Radcliffe Cook's investigations, but he obtained abundant evidence to prove the great age of many of the perry pear trees that are still alive and fruitful, and they flourished in West Country orchards centuries before fruit culture was treated seriously as a commercial industry.

Hundreds of the old trees have, of course, dropped out, every year a few more are laid flat by winter gales, and the last purpose the old veterans serve is to provide firewood for the farmer, but many still remain, and one wonders where the perry will come from when they are gone. One is led to this thought by the fact that most of the perry that is made comes from old trees, and in recent years there has been a tendency to plant market varieties at the expense of vintage fruit. This is a pity, because there is room for both, and happily, during the past few seasons, more attention has again been turned to the planting of perry pears. It is only in the farm orchards where the perry pears grow, and they were first planted to feed the old stone cider mill in the barn. The latter simple and cumbersome apparatus has for the most part given way to the modern cider mill, which chews and grinds up the fruit in its cruel teeth, but the same old perry pears feed it, and the farmer values each specimen by the number of gallons of juice he gets from it and the edible quality of the same. There is not so much perry made as cider because pears are not so plentiful as apples, and on some farms both fruits are mixed and ground up together, but the best of perry is a beverage for the gods, and when bottled and matured it is not far below the standard of champagne.

It would appear as if Nature had selected the districts best suited to perry pears, and though trees in these parts are numerous, the varieties are few. So far as I am aware, no one has introduced a new perry pear for generations past, and the name of a variety in most cases indicates its origin. Doubtless they were all natural seedlings, and one can fancy a farmer generations ago picking out a promising looking seedling that sprang up from a seed thrown out with the pulp from the mill. He grew his seedling into a tree which eventually bore fruit, and, as this made good perry, he gave it a name of his own, enlarged on its good qualities at market and elsewhere, and presented grafts to his neighbours, who in turn worked it, and established trees of their own. With variation in detail, perhaps, this is the history of most of the West Country perry pears, and apparently they suffice, as no one troubles to introduce any more.

Amongst the varieties, the names of which are local household words, there is a big towering tree, which is grown in the vale of the Severn, and is known as the Blakeney Red from the fact that it originated somewhere in the vicinity of the old Severn-side village of Blakeney. Some of the trees of this variety are really grand specimens, and the fruit, though not the best for perry making, is brightly coloured, and has a pleasing appearance. For this reason, it does not all go to the mill; for in some seasons tons of Blakeney Reds are sent to Covent Garden and other great fruit markets, where they fetch a price that is more lucrative to growers than making perry. It is their appearance that sells the fruit, and I have heard them referred to as "one bites," from the contention that the buyer who is attracted by the pleasing look of the fruit takes one bite and consigns the remainder to the gutter.

Taynton Squash is another variety that owes its name to a little village near to Gloucester, though there do not appear to be many trees now in the place of its origin. Among connoisseurs there are few who have not a good word to say for Oldfield perry. Trees of the Oldfield variety are to be found in many a Gloucestershire orchard, and it is not unusual for the farmer to keep this fruit separate, and the juice goes into a special cask, and later into special bottles, and the fact that this is for his own particular consumption speaks volumes for its quality. In another part Barland perry is the particular brand that is most favoured, and this is made from the Barland pear, a popular variety that grows into a big spreading tree. In his "Fruit Manual," Dr. Hogg mentioned the Barland pear, and it is there stated that the original tree grew in a field called Bare Lands, in the parish of Bosbury, also that the Barland pear was grown in Herefordshire prior to the publication of Evelyn's "Pomona" in 1674. It is quite possible that some of the trees then described are still standing. The Bull pear is another variety for perry, and so also is the Moorcroft, but there are not very many more that are generally met with in West Country orchards.

Last year was not what is called a good season for perry pears, but when the crop is good, an old orchard tree will produce an enormous quantity of fruit. These perry pears are possessed of a characteristic native hardiness, and they suffer but little through insect pests, and the scab which plays such havoc amongst dessert varieties is almost unknown amongst them. If appearances go for anything, there should be plenty of perry fruit this year, as the trees are thickly studded with blossom, and I know of nothing more beautiful in Nature than a big old Gloucestershire perry pear in April, when every branch and twig is wreathed with pearly-white blossom. These veteran perry pears seem to have little in common with table varieties and modern fruit culture, but they stand like great sentinels, keeping watch over other trees in the orchards, remaining fruitful so long as a spark of life is left or the gale spares them, and they serve as a kind of connecting-link between the present generation of farmers and their forebears, who quaffed the perry which the old trees produced in days gone by, when manners and customs in other respects were different to what they are now.

## OVERCROWDING.

Overcrowding is a fault with which almost all gardeners may be charged at some time or other, but it is the inexperienced who most often—it might almost be said always—fall into the error. We need imagination and knowledge to keep us from erring in this respect—imagination which, coupled with experience, will enable us to picture to ourselves the plants or trees after months or years of growth; and, at the same time, knowledge principally of the functions of the leaves—how they breathe, how by means of the chlorophyll in their tissues, they break up the carbonic acid of the air into carbon and oxygen (carbon forming, next to water, the principal constituent of vegetable matter), and how, finally, they produce the elaborated sap to be distributed to all parts of the plant for building up its tissues.

Thus we see how important it is that sunshine, direct or diffused, should fall upon as much leaf surface as possible, the ideal condition being that in which the maximum amount of sunlight falls upon every leaf of the plant. But, even when we know all this, our desire to obtain all we can out of the earth is often the cause of our getting less than we should do otherwise. That it is the insufficiency of sunlight as well as of nutriment which is a prime factor in the poor development of crowded plants is proved by the fact of large plants growing in comparatively small flower pots, and by the difference in character among the leaves on the same plant according as they are fully exposed to the light, or more or less smothered by other leaves. If we bear this in mind we shall give plants more space in shady, or partially shaded, positions, than in sunny ones. To the observant gardener the wonderful summer of 1911 was an object-lesson in the thick leaves, well-developed fruit and leaf buds, and the vigour and healthy promise of the crowns and root stocks of herbaceous plants as autumn came on, indications of the strengthening of the plants and trees which became even more marked during the winter.

One of the commonest forms of overcrowding is in the sowing of annuals. Many have little idea of the size annuals will attain if they have a fair chance. When they are grown too closely together we have little more than one thin stem, branching a little near the top, and thus capable of keeping up no succession of blossom, whereas, when given sufficient room, many of them make bushes instead of slender plants, and the succession of blossom is prolonged for several weeks. The contrast between Shirley poppies grown on the two systems is especially striking, as they are one of the briefest of joys in the first case, whereas, when allowed sufficient space, they make fine plants three or four feet in height and two feet through, with correspondingly fine blossoms. Many instances showing scarcely less contrast might be given, and some will occur to every reader. However good our intentions may be in the matter of thinning, and however well we may carry them out, seedlings often suffer irremediable injury through being too thick in the seed-bed before they are big enough to thin out.

Even the greediest of hardy perennials suffer quite as much from being grown too closely together, or, what is the same in principle, from the shoots not being thinned out in the spring (e.g., varieties of Helianthus rigidus), especially if there is insufficient rainfall during the summer. Many which make such handsome specimen plants or groups when given enough space are not worth growing when starved by being grown too closely together, or too near other strong-growing plants, the flowers being small, their duration short (both as regards the individual blossoms and the whole display of the plant), and the appearance of the plants after flowering more ragged than they would be if able to use their foliage for recuperation.

Rudbeckia Golden Glow, for instance, when well managed, will produce a succession of large double flowers, resembling African marigolds, for a period of six weeks or more, and after flowering is finished, and the plant begins to become untidy, the stems may be cut down to give full development to the handsome basal leaves which follow. When crowded and starved, the blossoms are half the size, and do not last very long, the whole plant suffering from drought, and presenting a deplorable appearance, the new root leaves being thin and straggling. We have all seen plants of many perennials suffering no less from bad cultivation, of which insufficient space is a prominent feature. If perennials are given plenty of space for their summer development the intervening spaces can be used for spring bulbs and such early-flowering plants as primroses, forget-me-nots, alyssums, silenes, limnanthes, Leopard's bane, honesty, wallflowers, etc., all of which can be pulled up later, care being taken that the young growths of the perennials are not too much shaded by them.

Less obvious, but none the less real, are the evils of overcrowding in fruit trees. Careful inspection, however, will show the harm done to the trees, which is mainly in the form of the poor development of what should be fruit buds, owing to the insufficient nutriment supplied to them by their leaves; the amount of sunlight they receive does not enable them to elaborate enough sap for their needs. This becomes patent in the lessened amount of blossom on all parts of the tree which suffer in this way, whether it is on the inner branches of an apple tree or a gooseberry bush, or even on the outer branches if the trees are growing too closely together. It may also be seen in the failure of unfavourably placed blossom to produce fruit, while in the course of a few years many fruit spurs and small twiggy branches with have been becoming weaker and weaker owing to mal-nutrition will die away altogether. Alger Petts.

---

**Rhododendron racemosum.**—This charming little rhododendron cannot now be looked upon as a novelty, and neat little flowering plants may be purchased at a comparatively cheap rate. This is to a great extent owing to the fact that it can be readily raised from seed. This was by a long way the first of what may be regarded as the recent introductions from China, yet in my opinion at least it far surpasses any that have been sent out since. Planted as at Kew, in breadths or masses, it is remarkably effective in the open ground, while brought on gently under glass it is an exceedingly pleasing object in the greenhouse.—W.

## IVY-LEAVED PELARGONIUMS.

Sufficient use is not made of ivy-leaved pelargoniums for garden decoration in the summertime, although there is a distinct improvement in this direction. Isolated pyramidal specimens are splendid on the lawn, while smaller examples in beds, with an undergrowth of dwarfer subjects, look well. For window boxes hardly any plant is superior to the ivy-leaved pelargonium, especially if the position is a sunny one, and such varieties as Madame Crousse, Galilee, Souv. de Charles Turner, Achievement, and Rycroft Surprise are used. The old pink Madame Crousse is by no means to be despised, as probably there is no variety to surpass it for extreme freedom of flowering. In the sheltered parts of the south-west of England and the warm parts of Wales, this old variety is sometimes found filling a large wall space on a house front, and providing a most elegant and effective display during a long season. An example of this method of employing Pelargonium Madame Crousse is illustrated in the present issue. In this instance an old plant occupies a position between the window and the front door, and this site it has occupied without removal or protection for many years. But the house and plant are at Beaumaris.

IVY-LEAVED PELARGONIUM MDME. CROUSSE, ON A HOUSE FRONT AT BEAUMARIS, ANGLESEY.

## VARIETIES OF GRAPES.

New varieties of grapes are but sparingly introduced, and it takes a long time to establish a new one in public favour, even if it possesses merits above the ordinary. For instance, Prince of Wales, a sport from Mrs. Pince, was introduced many years ago, but has not made much headway, although in many ways desirable. I think, however, that gardeners have tired of including so many varieties, especially during the last ten years. Some twenty or thirty years ago prizes were offered for ten or twelve varieties at some of the leading shows, and experience proved that many of the dozen sorts were quite worthless, or inferior to others of the same colour. In my own case, I planted a dozen sorts over thirty years ago. The number is now under eight, and probably that leaves too many.

At the present time there is a tendency among gardeners to raise their own vines from eyes in January, grow the plants rapidly, and plant them in May or June. Whether this is real economy or not I do not profess to say, but I doubt it. My experience has been the opposite, and thus I advise planting year-old canes

Black Hamburgh was imported during the early part of the seventeenth century, and still ranks as the finest black grape we have for all general purposes. It will ripen quite early in April if required, and equally so in September; none can equal it for ease of growth and adaptability to site, and for quality it stands quite in the forefront. Madresfield Court is a seedling from Muscat of Alexandria and Black Morocco, and was sent out about 1870. This is very popular, more so now than formerly, when its splitting propensities were not understood. Nothing but praise can be given this grape, as it grows well in a warm house, and equally well in a peach house or greenhouse, and it is quite first class.

Mrs. Pince is a chance seedling, raised some fifty years ago. To those requiring a late-keeping grape with a Muscat flavour this is a desirable variety. Though somewhat capricious in its behaviour, when it succeeds it is excellent. Lady Downes is quite the best of late black grapes; it does not give a showy bunch, but more from a utilitarian standpoint it is first rate. It is a Yorkshire-raised grape, and appeared about 1835. I do not know of a grape that will keep longer and retain its pleasant flavour. Muscat Hamburgh was raised about fifty years ago, and where high flavour is required no grape can equal it; apart from that I do not advise its inclusion in a limited collection. Appley Towers is a desirable grape where large bunches and better flavour is required than obtained from Lady Downes, and for this reason it is desirable, while its good keeping qualities enhance its reputation.

Alicante is supposed to be of Spanish origin, and is quite the easiest of all grapes to grow; indeed, it is a capital amateur's grape, succeeding under cool conditions, and it will carry a heavier crop without injury to the vines than any other sort. In point of quality it is exceedingly poor. The above varieties include all that are necessary for any purpose among black grapes, except, perhaps, for market culture, and then I should add Gros Colmar, but my notes are not written from a commercial point of view. There are several other black grapes which some exhibitors admire, because they have a fine appearance, but the less said about their quality the better. I allude to such sorts as Gros Maroc, Alnwick Seedling, Gros Guillaume, Diamond Jubilee, and Directeur Tisserand.

White grapes are fewer in number. The best early white variety is Buckland Sweetwater. This is an English-raised variety from Continental seed, and appeared prior to 1860. Foster's Seedling was raised about the year 1835, and it is more free fruiting than Buckland Sweetwater, but not so good in quality, though for its hardiness and heavier cropping qualities it is sometimes preferred. Muscat of Alexandria is by far the finest of white grapes; how and when it was raised it is difficult to say. It has many synonyms, but I do not consider any variety distinct save Canon Hall Muscat. With the exception of an early variety, and the late-keeping Lady Hutt, I do not think it necessary to grow another white grape, except, perhaps, on account of requiring an early bunch along with such sorts as Black Hamburgh. Muscat of Alexandria, does not succeed with the latter; indeed, it is best grown alone.

Although there are several other white grapes, such as Duke of Buccleuch, White Tokay, Frontignan, White Lady Downes Seedling, White Nice, Trebbiano, Royal Muscadine, Raisin de Calabre, Mrs. Pearson, Golden Queen, Golden Hamburgh, Chasselas Musque, and Duchess of Buccleuch. I do not consider any one is required except under special circumstances.

E. Molyneux.

## ORNAMENTAL ASPARAGUS.

Since the introduction from South Africa of the various ornamental asparagus, much has been said and written in their favour, and deservedly so, for but few plants, from a florist's point of view, have been more useful. Some of the species have almost ousted the once-popular Adiantum cuneatum, and where houses were occupied with this latter for furnishing supplies of the fronds for market, we find them filled up with the various forms of asparagus. Although these latter are so generally grown, it is not always one sees them in that state of perfection so desirable, for not infrequently the foliage is so disfigured with red spider and other pests as to render it quite useless for any purpose, and the plants, instead of being an ornament, are an annoyance and trouble. Now, when we consider that most of the species of asparagus grow very rapidly, there can be little wonder that they become starved when their roots are confined in a limited space, and where this limitation of root room is considerable the plants soon begin to suffer unless recourse be had to extra feeding.

With due care and attention there is no reason why the foliage of these useful plants should not always be fresh and green. The old foliage is sure to become somewhat shabby, but this ought to be removed so that the young growths may have more room to develop. One of the greatest mistakes the cultivator makes is in keeping them too long. Young plants grow away far more rapidly, and give infinitely better results than old worn-out ones. Therefore, a batch of fresh plants should be raised each season to take the place of those that have become exhausted.

There are several species and varieties of ornamental asparagus. Some have been known to cultivators for a considerable time; others are of more recent introduction. Take A. falcatus, for instance; this was introduced from the East Indies far more than a hundred years ago. It grows much after the manner of A. Sprengeri, but is more loose in habit, and when well looked after and liberally treated will produce shoots in one season from fifteen to twenty feet in length. This species, like A. tenuissimus, has the habit of making a quantity of laterals from the joints below where a piece has been removed, and these growths are most useful, as they make fine sprays from eighteen inches to two feet long, which may be used for decorative purposes. Unfortunately, this plant grows too large for the ordinary stove, therefore is not so well adapted for small places. To grow it to perfection ample room should be given, and when planted out against the back wall of a large stove and allowed to ramble at will it grows away rapidly.

For baskets A. Sprengeri certainly has but few equals. Its bright green glossy foliage is always cheering, whether the plants are large or small. For cutting it is in great request, as the stems are stiff, and, therefore, well suited for decorative purposes. When plants become old they will fruit most freely. We have had them in fruit through the winter months, when their bright red berries, interspersed amongst the bright green foliage, produce a charming effect, especially when the plants are well grown, having growths from five to six feet in length.

A. plumosus scandens is a rambling kind, and when in a robust state of health will make growths from fifteen to twenty feet long. It is more suited for training under rafters than for growing in pots, as its loose nature renders it necessary to have supports of some kind. The foliage is produced in flat sprays, which makes it most useful for arranging with cut flowers, etc. There are several varieties of A. plumosus. One called nanus I have not seen in fruit, though I have grown some thousands of plants. We always propagate this by dividing the plants. It has pale green foliage, and does not grow more than a foot or fifteen inches high. There is a variety of plumosus that has a very slender habit, and instead of the foliage being produced in flat sprays they are of a more feathery nature. This is one of the most useful for cutting, as it is so well adapted for making shower bouquets, etc. It is, indeed, the most useful of all the asparagus, as it makes such nice plants in small pots, thousands of plants being raised for this purpose.

A. tenuissimus is a peculiar asparagus, having light feathery foliage, and is most valuable for cutting. When grown against the back wall of a house, where ample moisture can be provided, it will send out abundance of roots from the joints, therefore there is no difficulty in working up a stock in a short time. It should be grown by all who have large quantities of cut flowers to arrange, as its light pale green foliage is very telling with choice flowers.

A. deflexus is admirably adapted for baskets. Its drooping growths, which are thickly clothed with heavy foliage of a dark green hue, renders it a most useful plant for baskets, or for like purposes, but it does not make a good pot plant.

A. myriocladus is a most useful kind, of neat habit, and is worthy of a place in all gardens.

Asparagus are gross feeders, therefore soon exhaust the soil in which they are planted, and unless the nutrient matter is replenished from time to time by liberal supplies of artificial manures, the plants will soon show signs of poverty.

Most of the kinds make thick fleshy roots; in fact, some of them have roots quite tuberous, and as these soon fill the limited space of a pot, there is but little room for the soil, unless those of extra size are employed, which is not always convenient.

Where plants are grown in pots specially for house or conservatory decorations a batch or two should be raised each year. Seeds of most of the kinds are very cheap, therefore there should be no difficulty in working up a stock, but as some of the species root so freely either from layers or cuttings, propagation may be effected in this manner. The stock may also be increased by dividing the roots, but it is not well to let the plants attain a considerable age before this is effected. The asparagus delight in ample moisture both at the roots and over the foliage, but they will not grow in stagnant water. Given a good rich soil and ample moisture, with a suitable atmosphere, they will grow most luxuriantly, whereas in a dry atmosphere and high temperature they soon become shabby, and when once this happens it is far better to work up a young stock than to try to bring the old plants into health again.

H. C. Prinsep.

---

**Azara integrifolia variegata.**—In the milder parts of the country the azaras form valuable outdoor shrubs, but in other districts the protection of a wall or glass is necessary. That above mentioned forms a very pretty greenhouse shrub, the small, roundish, dark green, shining leaves being heavily margined with cream, and often suffused with red.—T.

## NEW PLANTS, ETC.

### NARCISSUS.

Crœsus.—One of the finest and most brilliant of the flat-crowned varieties. It has a fine cream-white perianth, and a broad, frilled, flattened crown of brilliant orange-yellow shade. F.C.C., R.H.S., April 2. Mr. A. M. Wilson, Shovel, Bridgwater.

Pedestal. — A handsome trumpet variety with a shapely and regular white perianth, and a rather straight-cut golden trumpet of deep shade. A.M., R.H.S., April 2. Mr. A. M. Wilson.

Killiecrankie.—A beautiful trumpet daffodil with soft creamy perianth and yellow, frilled trumpet. A.M., R.H.S., April 2. Mr. A. M. Wilson, Shovel, Bridgwater.

### PRIMULA MRS. JAMES DOUGLAS.

This handsome primula is of quite auricula-like character, the stout leaves having a little mealiness. The flower stem is stout and erect, and carries a cluster of bright purplish-blue flowers of about the same size as a good alpine auricula. A.M., R.H.S., April 2. Mr. Jas. Douglas, Great Bookham.

### ROSES.

Mrs. E. Alford.—A beautiful new H.T. rose of good size and shape; the colour is rich pink. The outer petals have their margins rolled back a little after the fashion of La France. A.M., R.H.S., April 2. Messrs. Lowe and Shawyer, Uxbridge.

Mrs. C. Reed.—A large, full, and finely-formed H.T. rose of soft cream colour, the cream being faintly and exquisitely suffused with the merest suggestion of pink. A lovely H.T. variety. A.M., R.H.S., April 2. Messrs. Lowe and Shawyer, Uxbridge.

### PRIMULA JULIÆ.

A new hardy primula found in the Caucasus. It has smooth, crenate leaves, and produces its purple-mauve flowers after the fashion of the common primrose. A.M., R.H.S., April 2. Mr. Baker, Oxford Botanic Gardens.

### PELARGONIUM AMBROSIA.

A very effective zonal pelargonium, and of excellent habit for summer bedding. The neat leaves have a well-marked dark zone; the flowers are large, borne in good trusses on stout stems, and their colour is a pleasing shade of pink. A.M., R.H.S., April 2. Mr. Phillip Ladds, Swanley Junction.

### CYMBIDIUM PAUWELSI, THE DELL VARIETY.

A splendid plant of this fine orchid was shown, carrying a long arching spike of twenty large flowers. The parents were C. Lowianum and C. insigne. The flowers are creamy-buff, dotted and lined with rich brown, and with heavier bright brown markings on the lip. F.C.C., R.H.S., April 2. Baron Bruno Schröder (grower, Mr. Shill), The Dell, Egham.

### LÆLIO-CATTLEYA McBEANIANA.

This charming hybrid was obtained by crossing Lælia anceps Schröderiana with Cattleya Schröderæ. The flowers are of good cattleya size, with broad white sepals and petals, boldly marked with deep purple. F.C.C., R.H.S., April 2. Messrs. J. and A. McBean, Cooksbridge.

### LÆLIO-CATTLEYA ORAMA.

This is a splendid orchid derived from L.-c. Dominiana and L.-c. Bletchleyensis. It is much like the former, but of finer size and rich colouring. The sepals and petals are rich purple, while the large lip is dark crimson-purple. A.M., R.H.S., April 2. Messrs. Jas. Veitch and Sons, Chelsea.

### CYPRIPEDIUM ROGER SANDER.

A small, neat, and interesting flower that has resulted from crossing C. Godefroyæ and C. glaucophyllum. The ground colour is whitish, and this is freely veined and shaded with deep red-purple. A.M., R.H.S., April 2. Messrs. Sander and Sons, St. Albans.

### ODONTIODA COOKSONIÆ, COBB'S VARIETY.

A very fine and showy variety with flowers of good size. The colouring is intense crimson-scarlet, flushed with rose towards the edges of sepals and petals, and with a few light whitish marks. The apex of the lip is pure white. A.M., R.H.S., April 2. Walter Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper, Horsham.

### ODONTOGLOSSUM HIS MAJESTY.

A bold and handsome odontoglossum of unrecorded parentage. The flowers are of excellent size and shape, and disposed with wonderful regularity on the spike. The bright and rich purplish-brown colouring has almost obliterated the creamy ground colour. A.M., R.H.S., April 2. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### VIBURNUM DAVIDI.

As shown, this is a low-growing evergreen shrub with glossy leaves that are fairly large for an evergreen species. The flowers are white and borne in neat terminal clusters. This newcomer was figured on page 273 of our issue of April 6. A.M., R.H.S., April 2; Messrs. Jas. Veitch and Sons, Chelsea.

NARCISSUS KILLIECRANKIE.
A fine daffodil with creamy perianth and yellow, frilled trumpet. A.M., R.H.S., April 2. Mr. A. M. Wilson, Bridgwater.

### LÆLIO-CATTLEYA TRIMYRA.

A particularly beautiful hybrid obtained by crossing Cattleya Trianæ with L.c. Myra. The spike shown carried three flowers, each as large as a good C. Trianæ bloom. The colour is a lovely shade of rich, yet soft orange-apricot, with a little deeper orange shading in the wavy lip. F.C.C., R.H.S., April 2. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

### LÆLIO-CATTLEYA FREDERIC BOYLE, VEITCH'S VAR.

This is one of the few hybrids having Lælia anceps as one parent. It is finer than the original hybrid, being larger and with a bright golden-yellow throat to the purple-tipped lip. A.M., R.H.S., April 2. Messrs. James Veitch and Sons, Chelsea.

### PRIMULA WARLEYENSIS.

A tiny little plant, as shown, but a very free-flowering one; even when in bloom it is only about two inches high, but its purplish lilac flowers are of quite good size, and they are freely produced. This should be a good rock garden plant if it proves amenable to cultivation. A.M., R.H.S., April 2. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley.

# WORK FOR THE WEEK.

## STOVE PLANTS.

ERANTHEMUM PULCHELLUM.—Blue flowers are not plentiful in the winter and early spring months, and a good batch of this eranthemum is well worth a place. It is very free flowering, and is easily propagated now from cuttings taken from old plants, and inserted in sandy soil. Place in the propagating frame, and when rooted pot singly into 3-inch pots and grow them freely on a shelf in the stove. When well-established repot into 6-inch or 7-inch pots, and grow them during the summer in an intermediate house or pit. Keep the points pinched out as growth proceeds, to induce a bushy habit, and when the pots are well filled with roots give weekly applications of diluted liquid cow manure with a little soot added. Where large specimens are in demand the old plants may be shaken out and repotted into larger pots. A suitable compost consists of two parts fibrous loam to one each of leaf-soil and peat, adding plenty of sharp sand. The compost should be used in a lumpy state, and made firm.

WINTER-FLOWERING BEGONIAS.—Pay special attention to the propagation of sufficient numbers of these indispensable plants at this time. As advised in a previous calendar, early propagation is essential, and the best material for cuttings is to be had from the earliest flowered plants that were cut down some time back. These will have produced new shoots, and some of them may be repotted and again grown as specimens for early flowering. The large-flowered varieties, such as Winter Cheer, Julius, and the like, are not usually so ready to produce cuttings, and every encouragement should be given the old plants to induce them to break into growth. Take the cuttings when an inch or two in length, and insert them in sandy soil, and place in the propagating frame. Immediately they are rooted place on a light shelf and pot off into thumb pots.

CISSUS DISCOLOR.—As an ornamental climbing foliage plant for rafters, or walls in the stove, this plant is unique. It is of free growth, and, although good results may be obtained by keeping the plants in large pots, the growth will be more luxuriant when the plant is in a restricted border. A compost of two parts loam to one each of peat and leaf-soil, with sand and broken charcoal added, will suit the plants, using it in a rough condition. Cuttings will readily emit roots if taken when three or four inches long and plunged in heat.

OTHER CLIMBERS.—All climbers need close attention now that growth is active; regulate the shoots or they will quickly become entangled and damaged. Watch must be kept for insect pests. All climbers should be kept scrupulously clean or the insects will fall upon plants growing beneath them.—H. T. Martin, Warren Wood Gardens.

## THE ORCHID HOUSES.

THE INTERMEDIATE HOUSE.—Odontoglossum citrosmum having been well rested throughout the winter, will now be pushing flower spikes from the centre of the new growths, and the plants so doing may be given more water at the roots. They should be suspended from the rafters of the house, a position in which the pendant flower-scapes show to advantage, and where the increased light is beneficial. The best time to afford fresh rooting material is directly the flowers are over, and as it is not a very strong-rooting subject the receptacles should only be just large enough to accommodate the plants and allow for their development for two seasons. They succeed either in pots, pans, or teakwood baskets, but in whichever receptacle they are grown, the drainage must be ample, but only a thin layer of compost is necessary. The rooting materials should be pressed moderately firm about the roots, and water should be sparingly applied until new roots begin to develop freely, but afterwards a liberal supply of moisture is needed. In the autumn, when the pseudo-bulbs are fully matured, watering at long intervals will suffice to keep the growths plump and the roots healthy. O. citrosmum enjoys more heat than O. crispum, and others of that class, and therefore should be grown at the cool end of the intermediate house. Direct sunshine is not advisable, but the less the plants are shaded, provided the foliage is uninjured by scorching, the better. It is surprising the quantity of sunlight the plants will withstand without evil effects, provided the atmosphere is kept moist, and ventilation is free. After being disturbed at the roots, the plants often shrivel, therefore every care is necessary, after potting, not to expose the plants to too much light until they are re-established.

EPIPHRONITIS VEITCHI. — This delightful bigeneric hybrid is now passing out of bloom, and should have attention. Many growers fail to grow it satisfactorily through leaving it too long in the same compost. Like some of the epidendrums, it has a habit of growing itself out of the compost, and should therefore be cut down, and the stems made up again into neat little specimens. As soon as it has finished flowering is the best time to perform this operation. Many grow it too cool; I find it succeeds admirably, at the cool end of the intermediate house, grown in shallow pans, in the kind of compost used for cattleyas. Water must be administered with great care after the plants have been disturbed, but this holds good in every case, and too much care cannot be bestowed upon watering newly-potted plants, to whatsoever genus they belong.

EPIDENDRUMS. — The long-stemmed species, such as E. Wallisi, E. Endresi, E. xanthinum, E. radicans, and the hybrids from them, are now becoming active and pushing out new roots, and the present time is, therefore, favourable for repotting them, should it be a necessity. They will all succeed in the intermediate house, and should be grown in ordinary flower pots, using a compost as for cattleyas. E. radicans and others of rambling habit, which emit roots throughout the whole length of their stems, should have stout stakes placed in the pots for support, and the plants should, as far as possible, be trained into a presentable shape. Being subject to attacks of red-spider they should be syringed or sprayed, especially on the under sides of their leaves.

INSECT PESTS.—Should an attack of any insect pest develop, we may conclude that the plant is not in its proper place as regards moisture, temperature, or even shade and light. A sickly plant is subject to every kind of attack.—J. T. Barker, The West Hill Gardens.

## FRUITS UNDER GLASS.

FRUITING POT VINES.—The berries will (if they have not already) soon commence to colour where the cultural details have been properly attended to; strict attention must be paid to watering, as vines must not become dry at any time. Syringing should be discontinued, and the damping down of the house reduced to a minimum; admit air freely when possible, both by the top and side ventilators, allowing a little ventilation to remain on at night. Endeavour to maintain a brisk, buoyant atmosphere, not overcharged with moisture. Weak applications of liquid manure and chemical stimulants should be administered three or four times a week until the berries have nearly finished ripening, when they should be discontinued. It may be necessary, and it is also very beneficial at the present time, to give the plants a slight top-dressing, with good rich loam, with a little old mortar rubbish added. The laterals may be allowed to grow more freely before being stopped during the ripening period, but not in such a manner as to cause the foliage to become dense and confused. Keep a sharp look out for red spider, and, should it make its appearance, thoroughly syringe the affected leaves with soapy water. Maintain a steady bottom heat, with a night temperature in the house of from 65 deg. to 68 deg.

POT FIGS.—The fruits will be swelling away freely now, and the day and night temperature should be slightly increased. Create plenty of atmospheric moisture by frequently damping down the house and syringing the plants; copious supplies of water will be necessary, and the soil in the pots should not approach dryness at any time. Give stimulating liquids occasionally, to accelerate the swelling and full development of good-sized fruits. If red spider is troublesome, syringe the plants several times with a solution of sulphur, or dust the affected parts with dry flowers of sulphur. When the fruits commence to ripen, drier atmospheric conditions must prevail; but, at the same time, it should be borne in mind that the roots of the plants should not be allowed to suffer for want of water under any circumstances.

STRAWBERRIES.—Continue to introduce batches of plants into heat, to maintain a succession; give clear liquid manure alternately with pure water, unless the plants are disposed to make too much foliage, when stimulants of any kind must be moderated. Thin out the fruits to the required number as soon as set. Gather fruits which are ripe daily, laying them carefully in single layers, in shallow trays or baskets.

PINEAPPLES.—Plants that have been recently potted should be watered carefully until the roots have permeated the new compost; lightly spray the plants daily, and, as the season advances, admit air more liberally as weather permits. Maintain a dry atmosphere where the plants are ripening off their fruits, with a temperature of 85 deg., allowing a rise of 10 deg., with sun heat.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

EARLY-FLOWERING SHRUBS.—These have burst into blossom unusually early this spring, and various subjects are quite gay, and especially full of flower. The flowering currants form picturesque objects on the outskirts of the shrubberies. Nuttallia cerasiformis is producing its racemes of greenish-white flowers with great profusion. The magnolias are a mass of bloom, a large group of Magnolia stellata forming an especially fine picture. The forsythias are flowering abundantly, and a huge bed of F. suspensa against a background of dwarf pines is a very picturesque sight. Shrubs like the forsythias and Chimonanthus fragrans should be pruned back closely immediately after flowering.

ANNUALS.—Those that have been reserved for outdoor sowing should be sown now that the surface soil can be raked down finely for their reception. It is advisable to sow where the plants are to flower, and afterwards to thin them out to a suitable distance apart. Bare spaces in the front of the flower borders and shrubberies are suitable for many annuals, while those intended to produce blooms to use in a cut state should be given a border to themselves. Clarkias, godetias, nigellas, coreopsis, and mignonette are suitable for sowing outdoors at the present time.

SUMMER BEDDING PLANTS.—Fuchsias, pelargoniums, swainsonias, heliotropes, and calceolarias that are established in pots from which they will be planted out, can now be removed to cold frames so as to harden them off slowly. As soon as they are accustomed to the change, give plenty of air, and remove the lights entirely during mild weather; attend to the pinching of the long shoots so as to produce neat, bushy specimens. Hardy annuals in boxes, in cold frames, can be placed outside, provided that adequate means of protection can be afforded in case of frosty nights. Lobelias and pyrethrums that are grown for edging purposes can either be grown in shallow boxes or pricked off in cold frames near the glass, where they will make sturdy plants, and can gradually be hardened off.—J. Gardner, Batsford Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE, April 2.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir John Llewelyn, Messrs. J. O'Brien, J. Fraser, W. Hales, G. Gordon, E. M. Holmes, A. W. Hill, and C. E. Shea.

SCHOMBURGKIA LUDDEMANNI. — Sir Frederick Moore sent a flowering spike of this uncommon species, figured in the "Bot. Mag.," t. 8427. Some discussion arose regarding its distinctness from S. undulata, but the Director of the Royal Botanic Gardens, Kew, to whom it was referred, says it is distinguished from that species by a bright yellow crest to the lip and other differences. It appears to have been lost sight of since 1862, and even now its habitat is unknown. S. undulata has been figured several times (see Lindl. "Bot. Reg., xxxi., t. 53; Will. "Orch. Alb.," v., t. 335; Warn. "Sel. Orch., ii., t. 21; Cogn. "Dict. Orch. Draw," xlix., t. 33), and always without the yellow disc.

DRABA RUPESTRIS. — Mr. J. Fraser showed a specimen of Draba rupestris in a pot, under which condition the plant grows much more dwarf and compact than when in a rock garden in free soil, attaining under the latter conditions to about six inches in height, and under the former to only about three inches, though flowering quite as freely.

CLIVIA MINIATA. — Mr. J. W. Odell showed an inflorescence of Clivia miniata with one of the bracts foliose and about seven inches in length.

NARCISSUS SPORTING.—Mr. C. E. Shea showed a variety of daffodil which had appeared among Empress, but which had a much flatter perianth and no green colouration at the back; the mouth of the corona was wider and the colour somewhat paler. The evidence as to its origin did not appear conclusive, and the committee were inclined to regard it as probably a seedling from Empress.

NARCISSUS MALFORMED. — Mr. Jacob sent a flower of narcissus having the perianth pieces three-lobed instead of entire as is usually the case.

ELÆAGNUS SP. FRUITING.—Mr. F. R. Durham sent from Salcombe, S. Devon, Elæagnus macrophylla, E. Frederici Anna, and E. pungens variegata, each bearing ripe fruits. The pink berries of the first-named with their silver scales are particularly beautiful.

### MEDAL AWARDS, APRIL 2.

Silver-gilt Flora.—To Mr. A. M. Wilson, Bridgwater, for new daffodils; to Rev. G. H. Engleheart, V.M.H., Dinton, for new daffodils; to Messrs. Barr and Sons, Covent Garden, for daffodils; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver-gilt Banksian.—To Messrs. W. Cutbush and Son, Highgate, for tulips; to Messrs. R. and G. Cuthbert, Southgate, for flowering shrubs and lachenalias.

Silver Flora.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. W. Cutbush and Son, Highgate, for carnations, shrubs, etc.; to Messrs. R. Gill and Sons, Falmouth, for rhododendrons; to Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. A. Piper and Sons, Bayswater, for shrubs and hardy flowers; to Mr. L. R. Russell, Richmond, for clematises, etc.; to Messrs. Jas. Veitch and Sons, Chelsea, for cinerarias and primulas; to Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; to Messrs. R. H. Bath, Wisbech, for tulips and daffodils; to Miss F. W. Currey, Lismore, Ireland, for daffodils; to Mr. C. Bourne, Simpson, Bletchley, for daffodils.

Silver Banksian.—To R. G. Thwaites, Esq., Streatham, for orchids; to Messrs. Hassall and Co., Southgate, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. J. R. Pearson and Sons, Lowdham, for daffodils; to Mr. F. H. Chapman, Rotherside Gardens, Rye, for daffodils; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. H. Cannell and Sons, Swanley, for zonal pelargoniums; to Messrs. F. Cant and Co., Colchester, for roses; to Messrs. G. Jackman and Son, Woking, for hardy plants; to Mr. H. J. Jones, Lewisham, for zonal pelargoniums; to Messrs. Wm. Paul and Son, Waltham Cross, for flowering shrubs; to Mr. M. Prichard, Christchurch, for hardy flowers; to Mr. G. Prince, Longworth, for roses; to Mr. G. Reuthe, Keston, for hardy plants and flowering shrubs; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; to Messrs. Young and Co., Cheltenham, for carnations.

Bronze Flora.—To Messrs. Whitelegg and Page, Chislehurst, for saxifrages, etc.; to Messrs. R. Felton and Sons, Hanover Square, W., for cut lilac.

## The Nurserymen, Market Gardeners', and General Hailstorm Insurance Corporation, Lim.

The seventeenth annual meeting of this company was held at 41 and 42, King Street, Covent Garden, on the 29th ult.

Mr. Harry J. Veitch, who presided, congratulated the shareholders on the growth of the company, and the strength to which it had attained. The company had been of great service to nurserymen, and the directors had recently seen their way to grant a bonus of 15 per cent. to policy-holders in reduction of their annual premiums. A strong reserve fund had been accumulated out of revenue account. Six claims had been paid during the past year, and since the books had been closed four other claims had been received.

To illustrate the prompt way in which claims were met, he read the following letter from Mr. Ladds, of Swanley:

"Dear Sir,—In consideration of the generous and prompt manner in which you settled with me, following on my claim on your company for glass broken by the severe storm of March 4th, I wish to convey my best thanks to you personally for the courtesy and fairness shown me when here on the following day, and to the company for their unquestionably fair method of business. I do not desire a repetition of the storm, but in these untoward occurrences it is very gratifying to know that "The Hailstorm Insurance Company" are always ready to extend every advantage of their company to the glass-house owner.—Yours faithfully,

FRANK W. LADDS, Manager.

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 2nd inst. Mr. Massie, the president, was in the chair, and there was an attendance of 125 members.

Mr. Wm. Cuthbertson, J.P., of Messrs. Dobbie and Co., Edinburgh, delivered a lecture entitled "Sweet Peas Up-to-date," illustrated by a series of beautiful lantern slides, many of them in natural colours, of the leading varieties. He dealt with the great development of the sweet pea during the last ten years. In 1901 the first waved flower was exhibited in London by Mr. Silas Cole, gardener to Earl Spencer, at Althorpe Park, Nottinghamshire. This variety was named Countess Spencer, and it is still largely grown, and deservedly popular. Mr. Cole claimed that it was the result of crossing two of the older unwaved varieties, but within the last few days unmistakable evidence had come into his (the lecturer's) hands that an exactly similar flower had appeared in Somersetshire in the same year in the form of a variation from Prima Donna, one of the varieties which, according to Mr. Cole, entered into the parentage of Countess Spencer. This fact, along with Mr. Unwin's statement that Gladys Unwin was also a variation from Prima Donna, leads to the conclusion that the waved sweet pea arose as a mutation, and was not the result of crossing. It appeared in several different parts of the country, as many sports or variations in other plants have done. Very many of the beautiful varieties now in commerce arose as simple variations from Countess Spencer, including John Ingman, Helen Lewis, Nubian, Elfrida Pearson, Mrs. Cuthbertson, Princess Victoria, The Marquis, and others.

After Countess Spencer was distributed for sale in 1904, crossing with it began, and in the course of the last few years varieties have been introduced which are the direct results of such crossing. These include such varieties as Evelyn Hemus, Elsie Herbert, Etta Dyke, Red Star, The King, and May Campbell.

On the motion of Mr. Greene, Mr. Cuthbertson received a very cordial vote of thanks.

The exhibits were: Richardia africana flowers from Miss Burton, Polton; apples Mere de Menage and Lane's Prince Albert, from Mr. A. C. Scott, Riccarton, Midlothian; Narcissus King Alfred, from Messrs. James Grieve and Sons, Edinburgh.

At a meeting on May 7 Mr. James Whytock, Dalkeith Palace Gardens, will give a lecture entitled "Some Impressions of America and its Horticulture," illustrated by limelight views.

## Bournemouth Gardeners' Association.

There was a very good show of flowering and foliage plants staged at the fortnightly meeting held on April 2. The cinerarias exhibited by Mr. Charles Pearce, gardener to Mrs. Ormond, and Mr. Pavey, respectively, were fine specimens. They belonged to the stellata type, and the largest measured 3ft. across the head of blossoms, and was 3ft. in height. Mr. Heath, gardener to G. G. Russel, Esq., had a very fine specimen of Azalea indica, and Mr. Evans, gardener to G. J. Fenwick, Esq., Crag Head, staged good table plants. The points awarded to the exhibits were the highest given to any during this session, so far.

Mr. J. B. Stevenson presided at the meeting, the evening being devoted to questions. Usually, the questions are written on slips of paper, the latter being placed in a box,

→ Spraying ←
And Limewashing Machines.

In every garden and on every estate one of these 'Four Oaks' machines are indispensable.

Will spray the Fruit Trees, Limewash the Stables Kennels, Outbuildings, &c., in a fraction of the time taken by brushes.

Complete Catalogues of Spraying and Limewashing Machines & Syringes free on application to Sole Manfactrs.: The

'Four Oaks' Limewashing Machine, "Royal Pattern" £3 18s. 6d.

FOUR OAKS SPRAYING MACHINE CO.,
No. 3C, Sutton Coldfield, Birmingham.

taken out, one at a time, by the chairman, and read; the members reply, and a discussion follows. But at this meeting a change was made—a slip of paper containing a question being taken from the box by all the members present, and then in due order each member read the query he had drawn out and answered it, other members joining in a discussion. The innovation was a popular one, and it had the merit of inducing new and younger members to take a part in the discussion.

The following were a few of the principal queries: "When is the best time to sow seeds of Primula sinensis for general purposes?" "What is the best remedy for the grub which attacks the roots of primulas?" "Are cyclamen plants better the second year than the first?" "How should zonal pelargoniums be treated to flower well in spring?" "Are arum lilies better dried off or planted out?" "What is the best treatment of aubrietias after flowering?" A few questions were not dealt with owing to lack of time, and a hearty vote of thanks to the chairman closed a very interesting meeting.

### Bristol Gardeners' Association.

The usual fortnightly meeting was held at St. John's Parish Rooms. Mr. Thoday presided over a good attendance. Mr. Harvey, of Cricket St. Thomas, read an interesting paper on "Annuals." The lecturer emphasised the usefulness of annuals grown in pots for indoor purposes, and gave schizanthus, godetias, clarkias, mignonette, nemesias, alonsias, and petunias, as a good selection; and for sowing outdoors in April, hemp, centaureas, godetias, clarkias, lavateras, mignonette, and poppies. In giving a description of borders, Mr. Harvey said a few years ago he made several large borders sixty yards in length, where rock had to be quarried out to a depth of four feet, and this was utilised for road-making on the estate. The top spit from a meadow was then requisitioned for the borders, and this, with a good dressing of cow manure added, had given most satisfactory results.

For two Cineraria stellata, Messrs. Young, Shelton, and Mawditt won in the order given. Mr. Ayres was awarded a Certificate for two plants of Tom Thumb cineraria, and Mr. Thoday a special for six amaryllis seedlings.

### Reading Gardeners' Association.

There was an excellent attendance at the fortnightly meeting which took place on Monday week in the Abbey Hall, Mr. F. G. Drew (chairman of committee) presiding. It has been customary for several years past for the Reading Association to exchange lecturers with the flourishing kindred society at Redhill and Reigate. Recently, Mr. T. J. Powell visited Redhill as representative of the Reading Association, and for the evening under notice Mr. W. Wells, jun., journeyed to Reading as delegate from the Redhill and Reigate Society. Mr. Wells's subject was "Early Flowering Chrysanthemums," and the lecturer is one of the best authorities in the country on the culture of these popular favourites. Mr. Wells gave a comprehensive selection of the best varieties to grow, the names being eagerly noted by the appreciative audience. A beautiful group of Star cinerarias, staged by Mr. H. C. Loader, head gardener to Mr. M. H. F. Sutton, Erlegh Park, was awarded the association's certificate of cultural merit. The Chairman exhibited two boxes of Newton Wonder apple in splendid condition, exemplifying the ideal system of packing in vogue at the Reading University College Gardens.

**Grape Culture.**—An illustrated guide to the culture and management of vines in greenhouses and in the open air is published at Gardeners' Magazine Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.). Full particulars are also given as to renovating old vines, and the best varieties to grow.

## ANSWERS TO CORRESPONDENTS.

APPLE BESS POOL.—J. M., Southampton: I enclose a few samples of a very fine late-keeping apple, and should be glad if you could give me its name and any particulars concerning it. I had a splendid crop last season, and every one who has seen the fruits has greatly admired them. Whatever the variety is, I feel sure it ought to be more widely known and grown.—The very fine clean fruits sent represent the apple named Bess Pool at its best. This is unquestionably a fine variety, but unfortunately it does not fruit freely or regularly until the trees have attained some age. The flowers open late, and so escape frosts as a rule. Dr. Hogg stated that in a communication he received from the late Mr. J. R. Pearson, of Chilwell, the latter wrote: "My father became so in love with the Bess Pool that he planted it largely. He used to tell how a girl named Bess Pool found in a wood the seedling tree full of ripe fruit; how, showing the apples in her father's house—he kept a village inn—the tree became known, and my grandfather procured grafts. He would then show the seven first-planted trees of the kind in one of our nurseries; tell how Loudon had been to see them, and given an account of them in his Gardeners' Magazine; make his visitors try to clasp round their boles, and measure the space covered by their branches. He would then boast how, one season, when apples were very scarce, the fruit of these trees was sold at 7s. 6d. a peck, and made £70, or an average of £10 a tree. So far from thinking the Bess Pool a regular bearer, I believe it to be a very uncertain one, and anything but a profitable one to plant." Mr. S. T. Wright, the superintendent of the Royal Horticultural Society's Gardens, at Wisley, tells us that when living at Ross he found Bess Pool a most useful apple, and in May he could sell every fruit without difficulty, and at top prices.

CHRYSANTHEMUMS. — E. W., Orpington: My first crown varieties of chrysanthemums, like Master David, are just beginning to break. They are strong and healthy, but I hardly know what to do with them.—Master David is one of the varieties best managed if allowed to break naturally, and the first crown bud is taken. Keep the plants as sturdy as possible by admitting abundance of air to the frame, except during bitter winds and frosts, when the ventilation must be reduced. During the recent fine weather the lights might well have been removed entirely during the day from well-rooted plants.

STOPPING PERPETUAL CARNATIONS.—H., York: How many times should perpetual carnations be stopped in the case of cuttings rooted in January for flowering from early November onward through the winter? I have a good batch of plants from layers made last autumn; these are in five-inch pots, have been stopped once, and are making healthy growths. How many times should they be stopped for winter flowering? Which are preferable—autumn layers or January struck cuttings—for winter flowering?—Where continuity of the flowering season, rather than a burst of bloom at one time, is desired, and this is the best method for private gardens, young plants should be stopped at the sixth joint from the base, and the subsequent growths also stopped at the fifth or sixth joint. The batches of plants should be examined every week as growth develops, and all new growths that are of sufficient size should then be stopped. For flowering in early November, such varieties as Britannia, Carola, Mikado, and Mrs. Burnett should not be stopped after the middle of June; Lady Alington, Lady Bountiful, Mrs. R. F. Felton, and Pink Delight should not be stopped later than the first week in July; while the last stopping for Enchantress, Mrs. T. W. Lawson, May Day, Rose Pink Enchantress, Scarlet Glow, White Enchantress, White Perfection, and Winsor should take place at mid-July. The layered

plants will probably give more flowers than the cuttings, but they will need larger pots, and in other ways take up more time and room. Most growers put their faith entirely in cuttings.

SALVIA HORMINUM.—B. M., Swindon: Is Salvia Horminum hardy, and, if so, how is it propagated? I saw some plants last year, and much admired them.—Salvia Horminum is hardy in the southern part of England in light warm soils. It is easily propagated from seeds sown in heat in February or March, or sown in the open in April. Plant the seedlings in groups when strong enough, setting them about nine inches apart each way.

ORCHID SEEDLINGS.—J. H., Plumstead: About the middle of February, 1911, a small quantity of orchid seed was sown on a small piece of peat placed in a thumb pot, and placed in a temperature of from 65 to 70 degrees. These are now sturdy seedlings about a quarter of an inch long, and fairly close together. Will you kindly inform me what the next proceeding should be? At present I have only a warm greenhouse.—Prepare a compost of finely-cut peat-fibre and sphagnum, the latter predominating, and use this as a compost for the seedlings, putting it into little pots or pans over ample drainage. Press it firmly, water with tepid water, and transfer the seedlings one by one with the utmost care, gently pressing the loosened compost up to them. Set them about an inch apart, and keep those of about one size together. Keep the pots in a warm, moist corner, and shade from bright light and sunshine. This is, of course, a general instruction, and we cannot be more particular, as you do not tell us what kind of orchid seeds were sown.

### NAMES OF PLANTS.

J. W. B., Oxford.—Clematis cirrhosa.

A. J. G., Calne.—We do not recognise the hyacinth; the little creeping plant is Helxine Solieroli.

C. H., Fotheringham.—1, Odontoglossum cirrhosum; 2, Sophronitis grandiflora; 3, Cattleva Schroderæ; 4, Goethea Wiotti.

M. E. B., Ipswich.—1, Cydonia Maulei; 2, Arabis albida flora plena; 3, Forsythia suspensa; 4, Deutzia crenata; 5, Prunus Pissardi; 6, Berberis Darwini.

## GARDENING ENGAGEMENTS.

Mr. A. Brown, who has occupied the position of foreman during the past three years in the gardens of Melchet Court, has succeeded Mr. G. Hall as gardener there.

Mr. Thos. Crosswell, for twenty-five years head gardener at Homewood, Eden Park, Beckenham, has entered upon his new duties as head gardener to Mrs. English, Pickhurst Manor, Hayes, Kent. Mr. Crosswell's late employer left him a legacy of £100, free of duty.

Mr. J. Hepburn, in charge of the Hardy Plant Department, Glasgow Botanic Garden, has been appointed gardener to the Marquis of Ailsa, Culzean Castle, Ayr.

Mr. W. H. Johns, of Kilmarnock, N.B., has been appointed horticultural instructor to the Belfast Corporation.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, April 16.—Royal Horticultural Society: Narcissus Committee meets at 11.30 a.m.; Fruit, Floral, and Orchid Committee meet at 12 o'clock; Lecture at 3 p.m. on "Darwin as Ecologist," by Rev. Prof. G. Henslow. Scientific Committee at 4 o'clock.
Royal Horticultural Society's Daffodil Show; two days.
Shrewsbury Spring Show.

WEDNESDAY, April 17.—Royal Horticultural Society's Examination for Teachers.
Royal Horticultural Society of Ireland, Spring Show.
Royal Meteorological Society.
Royal Society of Arts.

THURSDAY, April 18.—Ipswich Spring Show.
Linnean Society Meeting.
Manchester and North of England Orchid Society.
Hereford Spring Show.
Devon Daffodil and Spring Flower Show, at Plymouth; two days.

SATURDAY, April 20.—Chislehurst Spring Show.

TUESDAY, April 23.—Breconshire Daffodil Show.

WEDNESDAY, April 24.—Royal Botanic Society Meeting.
North of England Horticultural Society, at Leeds.

THURSDAY, April 25.—Midland Daffodil Show at Birmingham; two days.
Norwich Spring Show.
Falmouth Spring Show; two days.

## TRADE NOTE.

The disorganisation of railway traffic consequent on the coal strike placed so many difficulties in the way of firms whose business extends over a wide area, that it is of much interest to learn that Messrs. Richard Sankey and Son, Lim., of the Bulwell Potteries, Nottingham, were able to execute all orders for their garden pots with their customary promptness throughout the period over which the strike extended.

Robinsons' Guaranteed Gardenalities

Every one is the best of its kind, for the Robinson reputation guarantees this. They make your gardens bright, beautiful, and profitable, and realise your highest ambitions.

Be up-to-date—be practical, and see to it that your soil is thoroughly fertilised. Let the plants have the utmost vitality; let them draw their essential elements from a soil rich in such requisites. The wise gardener knows what to do, and therefore applies

"CARMONA" FERTILIZERS.

There's all the difference in the world between the inferior and the superior. "Carmona" Fertilizers have no equal, for test, analysis, and results manifest their unrivalled excellence.

If you want THE Fertilizer, then get "Carmona."

Many varieties, and of special interest, is the "Carmona" Sweet Pea Fertilizers.

Made in bulks to suit all gardeners. See below:

1 cwt., 20s.; ½ cwt., 12s. 6d.; 28 lbs., 7s. 6d.; 14 lbs., 4s. 6d.; 7 lbs., 2s. 6d. 1s. and 6d. tins.

Of all Seedsmen and Agents, or write direct.

WAGE EFFECTUAL WAR ON INSECTS

and destroy all these pests by means of Clift's Fluid Insecticide.

Here you have a guaranteed insecticide. Wireworms, millipedes, leather-jackets, eelworms, maggots, and the like are always exterminated when Clift's Fluid Insecticide is sprinkled on the soil.

You should use Clift's Fluid Insecticide in both flower and kitchen garden for frames, conservatories, greenhouses, and fruit trees. A little goes a long way. Prices below:—

40 galls., 4s. 6d. per gall.; 20 galls., 5s. per gall.; 10 galls., 5s. 3d. per gall.; 5 galls., 5s. 6d. per gall.; 1 gall., 6s. Of all Seedsmen and Agents, or write direct.

A FREE ENTRY FOR ROBINSON'S Great £350 SHOW IS AWAITING YOU.

A splendid chance to secure one of the many cash prizes and championship medals awaits you, for a free entry "fee" coupon is enclosed in every packet of "Carmona" Fertilisers. This great Show will be held on August 28th and 29th next, at the Royal Botanical Gardens, Edgbaston, Birmingham. Robinson's have the Show Schedules ready, and will send them post free upon request. Don't fail to enter, for you have as good a chance as anyone.

Note these Gardenalities.

1. "Velvas" Lawn Sand— absolutely the finest dressing known. It kills the weeds, intensifies the colour, and improves the grass. If you want an ideal lawn, use "Velvas." Sold in convenient quantities. 14lbs., 3s. 6d.; 56lbs., 11s.; 112lbs., 20s. Tins at 6d., 1s., and 2s. Of all Seedsmen and Agents, or write direct.

2. "Eradiweed"—the guaranteed cent. per cent. weed-killer. Keep your paths, drives, and roads clear and clean. One application in 12 months is all that is necessary. The "Standard" weed-killer. Tins, 1s., 2s., and 3s. 6d.

Of all Seedsmen and Agents, or write direct.

Guaranteed: Gardenalities

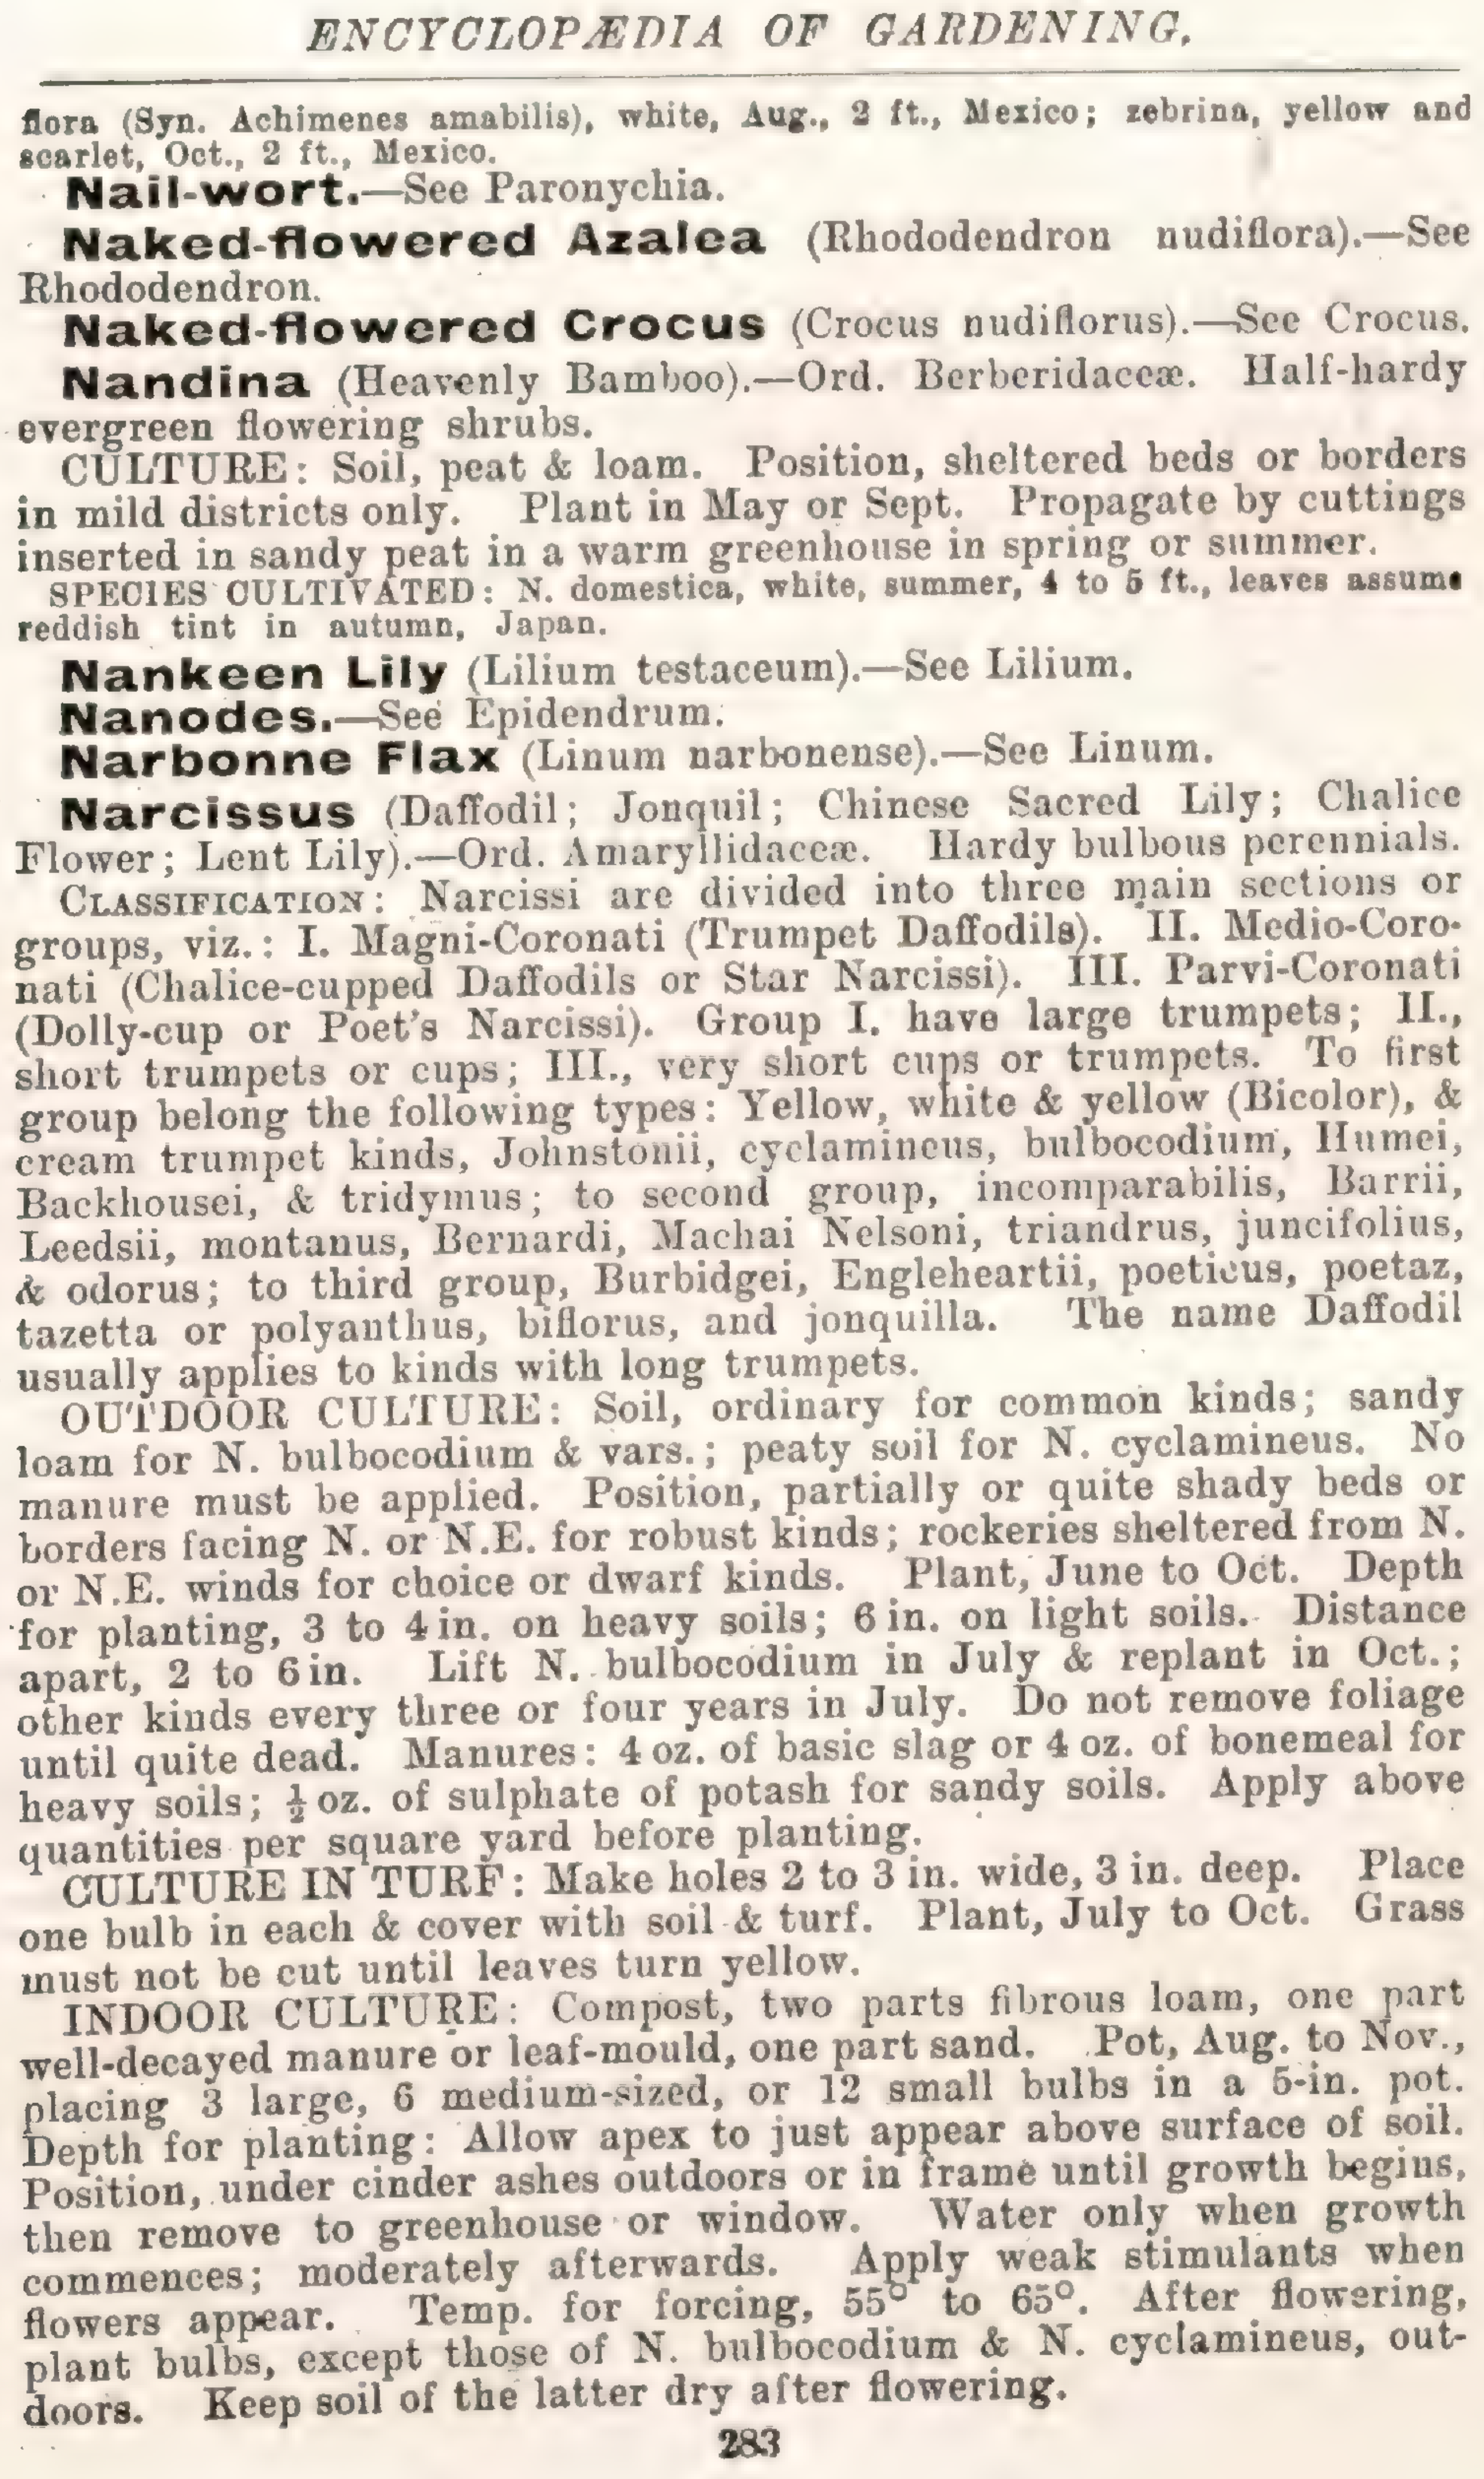
E.C

## *SPECIMEN PAGE.*



*ENCYCLOPÆDIA OF GARDENING.*

flora (Syn. Achimenes amabilis), white, Aug., 2 ft., Mexico; zebrina, yellow and scarlet, Oct., 2 ft., Mexico.

**Nail-wort.**—See Paronychia.

**Naked-flowered Azalea** (Rhododendron nudiflora).—See Rhododendron.

**Naked-flowered Crocus** (Crocus nudiflorus).—See Crocus.

**Nandina** (Heavenly Bamboo).—Ord. Berberidaceæ. Half-hardy evergreen flowering shrubs.

CULTURE: Soil, peat & loam. Position, sheltered beds or borders in mild districts only. Plant in May or Sept. Propagate by cuttings inserted in sandy peat in a warm greenhouse in spring or summer.

SPECIES CULTIVATED: N. domestica, white, summer, 4 to 5 ft., leaves assume reddish tint in autumn, Japan.

**Nankeen Lily** (Lilium testaceum).—See Lilium.

**Nanodes.**—See Epidendrum.

**Narbonne Flax** (Linum narbonense).—See Linum.

**Narcissus** (Daffodil; Jonquil; Chinese Sacred Lily; Chalice Flower; Lent Lily).—Ord. Amaryllidaceæ. Hardy bulbous perennials.

CLASSIFICATION: Narcissi are divided into three main sections or groups, viz.: I. Magni-Coronati (Trumpet Daffodils). II. Medio-Coronati (Chalice-cupped Daffodils or Star Narcissi). III. Parvi-Coronati (Dolly-cup or Poet's Narcissi). Group I. have large trumpets; II., short trumpets or cups; III., very short cups or trumpets. To first group belong the following types: Yellow, white & yellow (Bicolor), & cream trumpet kinds, Johnstonii, cyclamineus, bulbocodium, Humei, Backhousei, & tridymus; to second group, incomparabilis, Barrii, Leedsii, montanus, Bernardi, Machai Nelsoni, triandrus, juncifolius, & odorus; to third group, Burbidgei, Engleheartii, poeticus, poetaz, tazetta or polyanthus, biflorus, and jonquilla. The name Daffodil usually applies to kinds with long trumpets.

OUTDOOR CULTURE: Soil, ordinary for common kinds; sandy loam for N. bulbocodium & vars.; peaty soil for N. cyclamineus. No manure must be applied. Position, partially or quite shady beds or borders facing N. or N.E. for robust kinds; rockeries sheltered from N. or N.E. winds for choice or dwarf kinds. Plant, June to Oct. Depth for planting, 3 to 4 in. on heavy soils; 6 in. on light soils. Distance apart, 2 to 6 in. Lift N. bulbocodium in July & replant in Oct.; other kinds every three or four years in July. Do not remove foliage until quite dead. Manures: 4 oz. of basic slag or 4 oz. of bonemeal for heavy soils; ½ oz. of sulphate of potash for sandy soils. Apply above quantities per square yard before planting.

CULTURE IN TURF: Make holes 2 to 3 in. wide, 3 in. deep. Place one bulb in each & cover with soil & turf. Plant, July to Oct. Grass must not be cut until leaves turn yellow.

INDOOR CULTURE: Compost, two parts fibrous loam, one part well-decayed manure or leaf-mould, one part sand. Pot, Aug. to Nov., placing 3 large, 6 medium-sized, or 12 small bulbs in a 5-in. pot. Depth for planting: Allow apex to just appear above surface of soil. Position, under cinder ashes outdoors or in frame until growth begins, then remove to greenhouse or window. Water only when growth commences; moderately afterwards. Apply weak stimulants when flowers appear. Temp. for forcing, 55° to 65°. After flowering, plant bulbs, except those of N. bulbocodium & N. cyclamineus, outdoors. Keep soil of the latter dry after flowering.

READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.
From ———, Esq.,
Northwood,
Middlesex.
28 September, 1911.
"I find that I have never forwarded 2s. for your lovely Catalogue you sent me some weeks since. It would be cheap at five times the price, and I sincerely regret the oversight."

NOW is the time to plant KELWAY'S DELPHINIUMS—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.
———, Esq., ———, Bolton Percy.
"I wish to say how pleased I am with the Delphiniums I got off you two years ago. They are really splendid. I have never seen anything to touch them."
Choice named collections, 15s., 24s., 34s., 56s. a dozen,
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
———, Esq., Twynholm, N.B.
"I am very much obliged to you for forwarding my order so promptly, and am very pleased with the plants which you have sent. They are quite strong plants, better than I have been in the habit of getting from any other firm."

NOW IS THE TIME TO PLANT
KELWAY'S NEWEST GLADIOLI.
These New Gladioli are a revelation. They have taken America by storm, and should be planted in this country by all who want glowing effect of colour in their beds and borders, and flowers for the house in July, August, and September. Kelway's large-flowered Gladioli have received more Medals and Certificates than any plant of modern times. We recommend trial of a selection of our "Cream of the World" Collection of named varieties, flowering bulbs; for instance, one dozen for 9s.
Full descriptive list of this Collection on application. Postage free for remittance with order.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.
XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.
XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

**ALPHA, No. 3.**
Capacity, about 3 quarts.
Price **17/6.**

**Most Seedsmen stock Alpha Sprayers, and those who don't can get one for you by return.**

Now is the time to investigate the merits of Alpha Sprayers. Even now the roses and greenhouse plants want spraying—in a few weeks spraying will be a duty to be regularly discharged—then it is that the Alpha No. 3 will serve you as no other machine can. It holds about three quarts of fluid which it sprays in the form of a fine mist—it is quite free from complicated parts, and reliable to a degree. Once charged with liquid and air it empties itself to the last drop, while the spray is under perfect control at all times.

**Alphas are Endorsed by the Royal Horticultural Society, and have won 18 Gold and Silver Medals.**

**ALPHA SPRAYERS** (PATENT).

**TO LOVERS OF HERBACEOUS AND ALPINE PLANTS.**

Keen Amateurs should raise their new and rare plants from Seeds, not only because this method is the most interesting phase of gardening, but because it is the cheapest and best. From a dozen to fifty plants of the dearer sorts may be raised from a sixpenny packet, and we find in practice that home-raised plants are the easiest to establish in the borders and rockery.

OUR SEED CATALOGUE will be found quite an educational work, giving English and scientific names, natural orders, and hints on cultivation and seed raising, and should be in the hands of all enthusiastic gardeners; free on application.

THE GARDENERS' MAGAZINE

# NOTE OF THE WEEK.

## Progress with Daffodils.

The exhibition of daffodils which the Fellows of the Royal Horticultural Society and other visitors had the opportunity of enjoying on Tuesday and Wednesday, if not quite so extensive or of so high a degree of excellence as could have been desired, was highly interesting, and, as a whole, remarkably good, considering the somewhat unfavourable character of the season. This year the period of flowering was fully a fortnight in advance of the average dates, and, owing to the brilliant sunlight and the dry easterly winds to which the flowers were exposed within a short time of their full development, they retained their freshness for so short a time that cultivators might well have been excused had they cried, with Herrick:

> "Fair daffodils, we weep to see
> You haste away so soon."

The great heat and drought that were experienced during the summer and early in the autumn of last year, had, there can be no doubt, a material influence upon the flowering of daffodils this season. The bulbs matured quickly and thoroughly, and owing to the dryness of the soil until moistened by the October rains, the roots were late in resuming activity. When new growth commenced it was, favoured by the mild winter, very rapid, and the development of the flowers completed in a shorter time than in an average season. As evidenced by bulbs that are planted late in the autumn, a short season of growth is invariably followed by flowers more or less wanting in substance, and, therefore, unable to resist to an appreciable extent the effect of brilliant sunshine and drying winds. This was, generally speaking, the case in the present season, and, having regard to the conditions that have obtained, it is somewhat surprising the daffodils should have attained to so high a state of development, and contributed such glorious floral pictures to gardens in which their merits are fully appreciated, and their cultural requirements understood.

MR. FRANK W. WRIGHT.

Notwithstanding the fact that a large proportion of the flowers grown by some of the exhibitors were past their best before the dates of the show, there were more than sufficient to interest the visitors, and large numbers were represented in a manner that indicated cultural skill of a high order. To us the interest of the exhibition largely consisted in its forming, metaphorically speaking, a new landmark in the history of a flower that is now doing so much to render our gardens bright and attractive at a season of the year, when in the distant past it was dull and uninteresting, because of the absence of flowers in any considerable numbers. We have had exhibitions of daffodils in London, and some of them memorable ones, and there have been competitive gatherings in the provinces, but not until now has there been an exhibition in the Metropolis at which growers could meet and enter into competition for the cups and other prizes offered for their favourite flower. We were specially interested in the exhibition because it reminded us of the Daffodil Conference that was held under the auspices of the Royal Horticultural Society at Kensington twenty-eight years ago, and also afforded an excellent opportunity for forming an estimate of the progress that has been made during the intervening period. On that occasion there was a large and attractive exhibition, possessing educational value of a high order, and at the conference of cultivators and others, work of far-reaching importance was accomplished. The proceedings were commenced by a comprehensive paper on daffodils, and the discussion which followed was almost wholly devoted to questions of nomenclature. A large number of the beautiful varieties that during the first half of the last century had been raised by the late Mr. Leeds and Mr. W. Backhouse were being distributed, and following the usual custom were given Latin names. Some of the leading cultivators of daffodils had evidently become impressed with the fact, as John Parkinson had been more than two centuries previously, that "There hath been great confusion among many of our modern writers of plants in not distinguishing the manifold varieties of daffodils." Hence it was that much attention was devoted to the question of the naming of varieties. At the close of the discussion a resolution was passed unanimously to the effect that uniformity of nomenclature was desirable, and that garden varieties of narcissi, whether known hybrids or natural seedlings, should be given English names in accordance with the practice that obtained among florists. A committee was appointed to give practical effect to the resolution, and as the result of their labours the number of species was reduced to thirteen, and popular names were adopted for the varieties. For the splendid work that was accomplished as the result of the conference, all who are in any way concerned with daffodils have good cause for being thankful, for not only are popular names more easy to remember and pronounce, but they do not, as in the case of Latin ones, present a barrier to those who may be attracted by the beauty of daffodils, engaging in their cultivation. This change in the naming of daffodils has unquestionably contributed to the high degree of popularity which these flowers now enjoy, and the advantage of simplicity of naming has not at any time been more marked than now. Since 1884, the year in which the Daffodil Conference was held, there has been rapid and continuous progress. All the finest of the varieties of the period that have good constitutions have been propagated in such immense numbers as to have been for some years past within the reach of all who possess a garden, and to have rendered it possible to develop an industry of considerable importance in the production of flowers for market. While commercial cultivators have been busily engaged in the growth of bulbs of standard varieties to meet the requirements of private gardens and market establishments, raisers have increased and achieved a degree of success that renders it difficult to place a proper estimate on their work without suggesting some amount of flattery. We have only to glance through one of the principal trade catalogues to see how many are the varieties of outstanding merit that have been placed at the command of cultivators, and to visit an exhibition to obtain a good idea of the large number of beautiful forms that will be at their disposal within a comparatively short time. It would give us much pleasure to refer to the work of the principal raisers did space permit of their having justice done them. That, however, is impossible, and it must suffice to mention that the presentation of the Peter Barr Memorial Cup to the Rev. G. H. Engleheart, V.M.H., formed a pleasant episode in the first day's proceedings. Mr. Engleheart was one of the first of the amateurs belonging to the present generation to engage in the systematic raising of seedlings, and the persistence and judgment with which he has carried on the work for so long a period fully justifies the committee in presenting him with the handsome cup, which will for all time remind daffodil lovers of the pioneer of the cult of the daffodil, and the splendid work he accomplished during his long and active life.

---

**Mr. Frank W. Wright,** the able superintendent of Finsbury Park, affords an excellent proof of the great value of a thorough training early in life, and thoroughness and perseverance after the probationary stage has been passed, as aids to obtaining a high position in avocations involving the exercise of both hands and head. His training extended over about nine years, and during this period he occupied positions of nearly equal length in such important gardens as those of Norris Green, Liverpool; The Firs, Lewisham; Abberley Hall, Worcester; and Croxteth Park, Liverpool; in all of which he would be engaged in practice of them both. On the completion of his training he was appointed gardener to Sir G. Wyatt Truscott, and achieved much success during the occupancy of that position. Being much interested in the horticultural features of public parks, he entered the service of the London County Council, starting work in the ranks at Battersea Park, under Mr. Coppin. About a year later he was appointed as foreman at Peckham Rye Park, and the success achieved obtained for him, at the end of the second year, the position of foreman-in-charge at Bethnal Green Gardens. After a further two years' service Mr. Wright was transferred as foreman to Victoria Park, and after a two years' stay was appointed superintendent of the Victoria and Albert Embankment Gardens. The next step upwards was the charge of Myatt's Fields, and on the Embankment Gardens being raised to a higher grade Mr. Wright returned to them, and remained in charge five years. He was then promoted to the position of superintendent of Southwark Park, and later succeeded the late Mr. J. Melville at Finsbury, one of the first-class parks under the control of the London County Council. We mention these details as showing that by those possessing the necessary degree of ability and perseverance, it is possible, in the case of the London parks, to rise from the ranks to one of the highest appointments at the disposal of the Council. We have during the past ten years or so had opportunities for seeing Mr. Wright's work in the various open spaces of which he has had charge, and have been much impressed by the taste and skill displayed in carrying out the multiferous details involved in park management. We remember with pleasure the splendid work that was accomplished by Mr. Wright's predecessors in the provision of beautiful displays of spring and summer flowers and exhibitions of chrysanthemums, and in the interest of the residents in the north of London, and of park management generally, we are much gratified that they should have had a successor possessing so high a degree of ability.

**Entries for the Royal International Horticultural Exhibition.**—Exhibitors are reminded that Wednesday, May 1, is the latest date for the making of any alterations or withdrawals which may be occasioned by exigencies of weather, season, or other causes.

**Sale of Rejected Seedling Daffodils.**—In connection with the raising of new daffodils, it appears to us that the time has come when the question of a change in the method of dealing with bulbs of rejected seedlings might be considered with advantage to all concerned. As so well known, the percentage of seedlings of sufficient merit to introduce to cultivation is small, and, this being so, an immense number of bulbs have to be destroyed. This represents much waste, and we suggest that this might be avoided with advantage both to raisers and cultivators by placing the bulbs at the disposal of the latter at a moderate price. These seedlings, if selected according to their class, would prove of interest to amateurs who are not able to purchase named varieties until several years after they have left the hands of the raisers, and be useful for naturalising. The evidence that may be derived from the tuberous begonias is sufficient to show that the question is worth considering. From the first much success was achieved in the hybridisation of the several species that were utilised in the creation of the new race, and there was a brisk demand for the novelties, but there was but little profit associated with their production until tubers that were left after the varieties for naming had been selected were, instead of being destroyed, sold at prices proportionate to their quality. The case of the begonias and daffodils may not be on all fours, but the question is well worth discussing, as an interchange of opinion may result in avoiding the difficulties likely to arise.

**Presentation of the Peter Barr Memorial Cup.**—In accordance with the arrangements already notified, Mr. H. B. May, V.M.H., treasurer of the Peter Barr Memorial Fund, presented the handsome silver-gilt cup (figured in the present issue) to the Rev. G. H. Engleheart, V.M.H., on Tuesday morning last, at the meeting of the Royal Horticultural Society's Daffodil Committee. There was a large attendance, when, in a few graceful words, Mr. May referred to the great work of the late Mr. Peter Barr among daffodils, the desire to perpetuate his memory, and the great skill of Mr. Engleheart as a raiser, skill that had enriched British gardens in a remarkable degree. Mr. May said that the Memorial Committee were unanimous in conferring this award for the first year upon the Rev. G. H. Engleheart. The famous raiser expressed his appreciation of the honour conferred upon him, but it was obvious that the memories stirred by such a presentation were almost overwhelming, and he concluded with the hope that the younger raisers would continue their excellent work on behalf of daffodils, so that in due course the honour of holding the Peter Barr Memorial Cup would fall upon more worthy shoulders than his own. Meanwhile, he was proud to be the first holder of the handsome memorial to one whose pioneer work had enabled others to produce the results now so apparent each springtime.

**Rothamsted Experimental Station.**—At a recent meeting of the Lawes Agricultural Trust, Mr. A. D. Hall, director of this important station, tendered his resignation, which was accepted with regret. Mr. Hall's resignation takes effect in September next, after which he will devote his whole time to the work of the Development Commission. The committee of the Trust will proceed to the election of a new director in June. Mr. Hall has rendered splendid work in connection with agricultural science and education. He was the first principal of the South-Eastern Agricultural College, Wye, when it was opened in 1894, and during the eight years he occupied that position, he laid down the lines on which the work of the college has developed. In 1902 he was appointed director of the Rothamsted Experimental Station, and in this position he has also done excellent work. The old features of the station have been maintained, and new investigations have been developed in other directions, more especially those connected with the solution of various soil problems. Mr. Hall has been a member of the Development Commission since its formation two years since, and his appointment to a permanent position under the Development Act is giving general satisfaction.

**Flower Shows at Birmingham.**—The Birmingham Botanical and Horticultural Society have again decided to hold two flower shows during the present summer at the Botanical Gardens, Edgbaston. The first will be held on June 12 (orchids and early summer flowers), and the second on July 17 (roses and midsummer flowers). Honorary exhibits of flowers, fruits, and vegetables will be welcomed. Particulars may be obtained from the Hon. Secretaries, Botanical Gardens, Edgbaston.

**Extension of Wimbledon Common.**—The committee of the Wimbledon and Putney Commons Extension Fund has issued a report on the work which has been done both in securing options on land in Kingston Vale and in raising the necessary funds for the purchase of the land. The original scheme was for the acquisition of 172 acres, at a cost of £52,500. A portion of the land has already been secured, but 110 acres still remain to be purchased at a cost of £36,150. Votes of different amounts have been made by various public bodies in the district, and the sum of £19,270 has yet to be raised. The report points out that the burden of private subscription has fallen largely on Wimbledon residents, who already maintain the Common, and it is felt that the cause is a general belief that Wimbledon Common is maintained by public funds, as is the case with Hampstead Heath and Epping Forest. It is also stated that the contributions have come rather from residents of modest incomes than from those who are in a position to give large sums.

**Horticulture at Sandringham.**—The King has given permission for the Sandringham Estate Horticultural Show to be held in Sandringham Park on Wednesday, July 24. His Majesty and the Queen are offering prizes for the best-kept cottages and the best-cultured gardens.

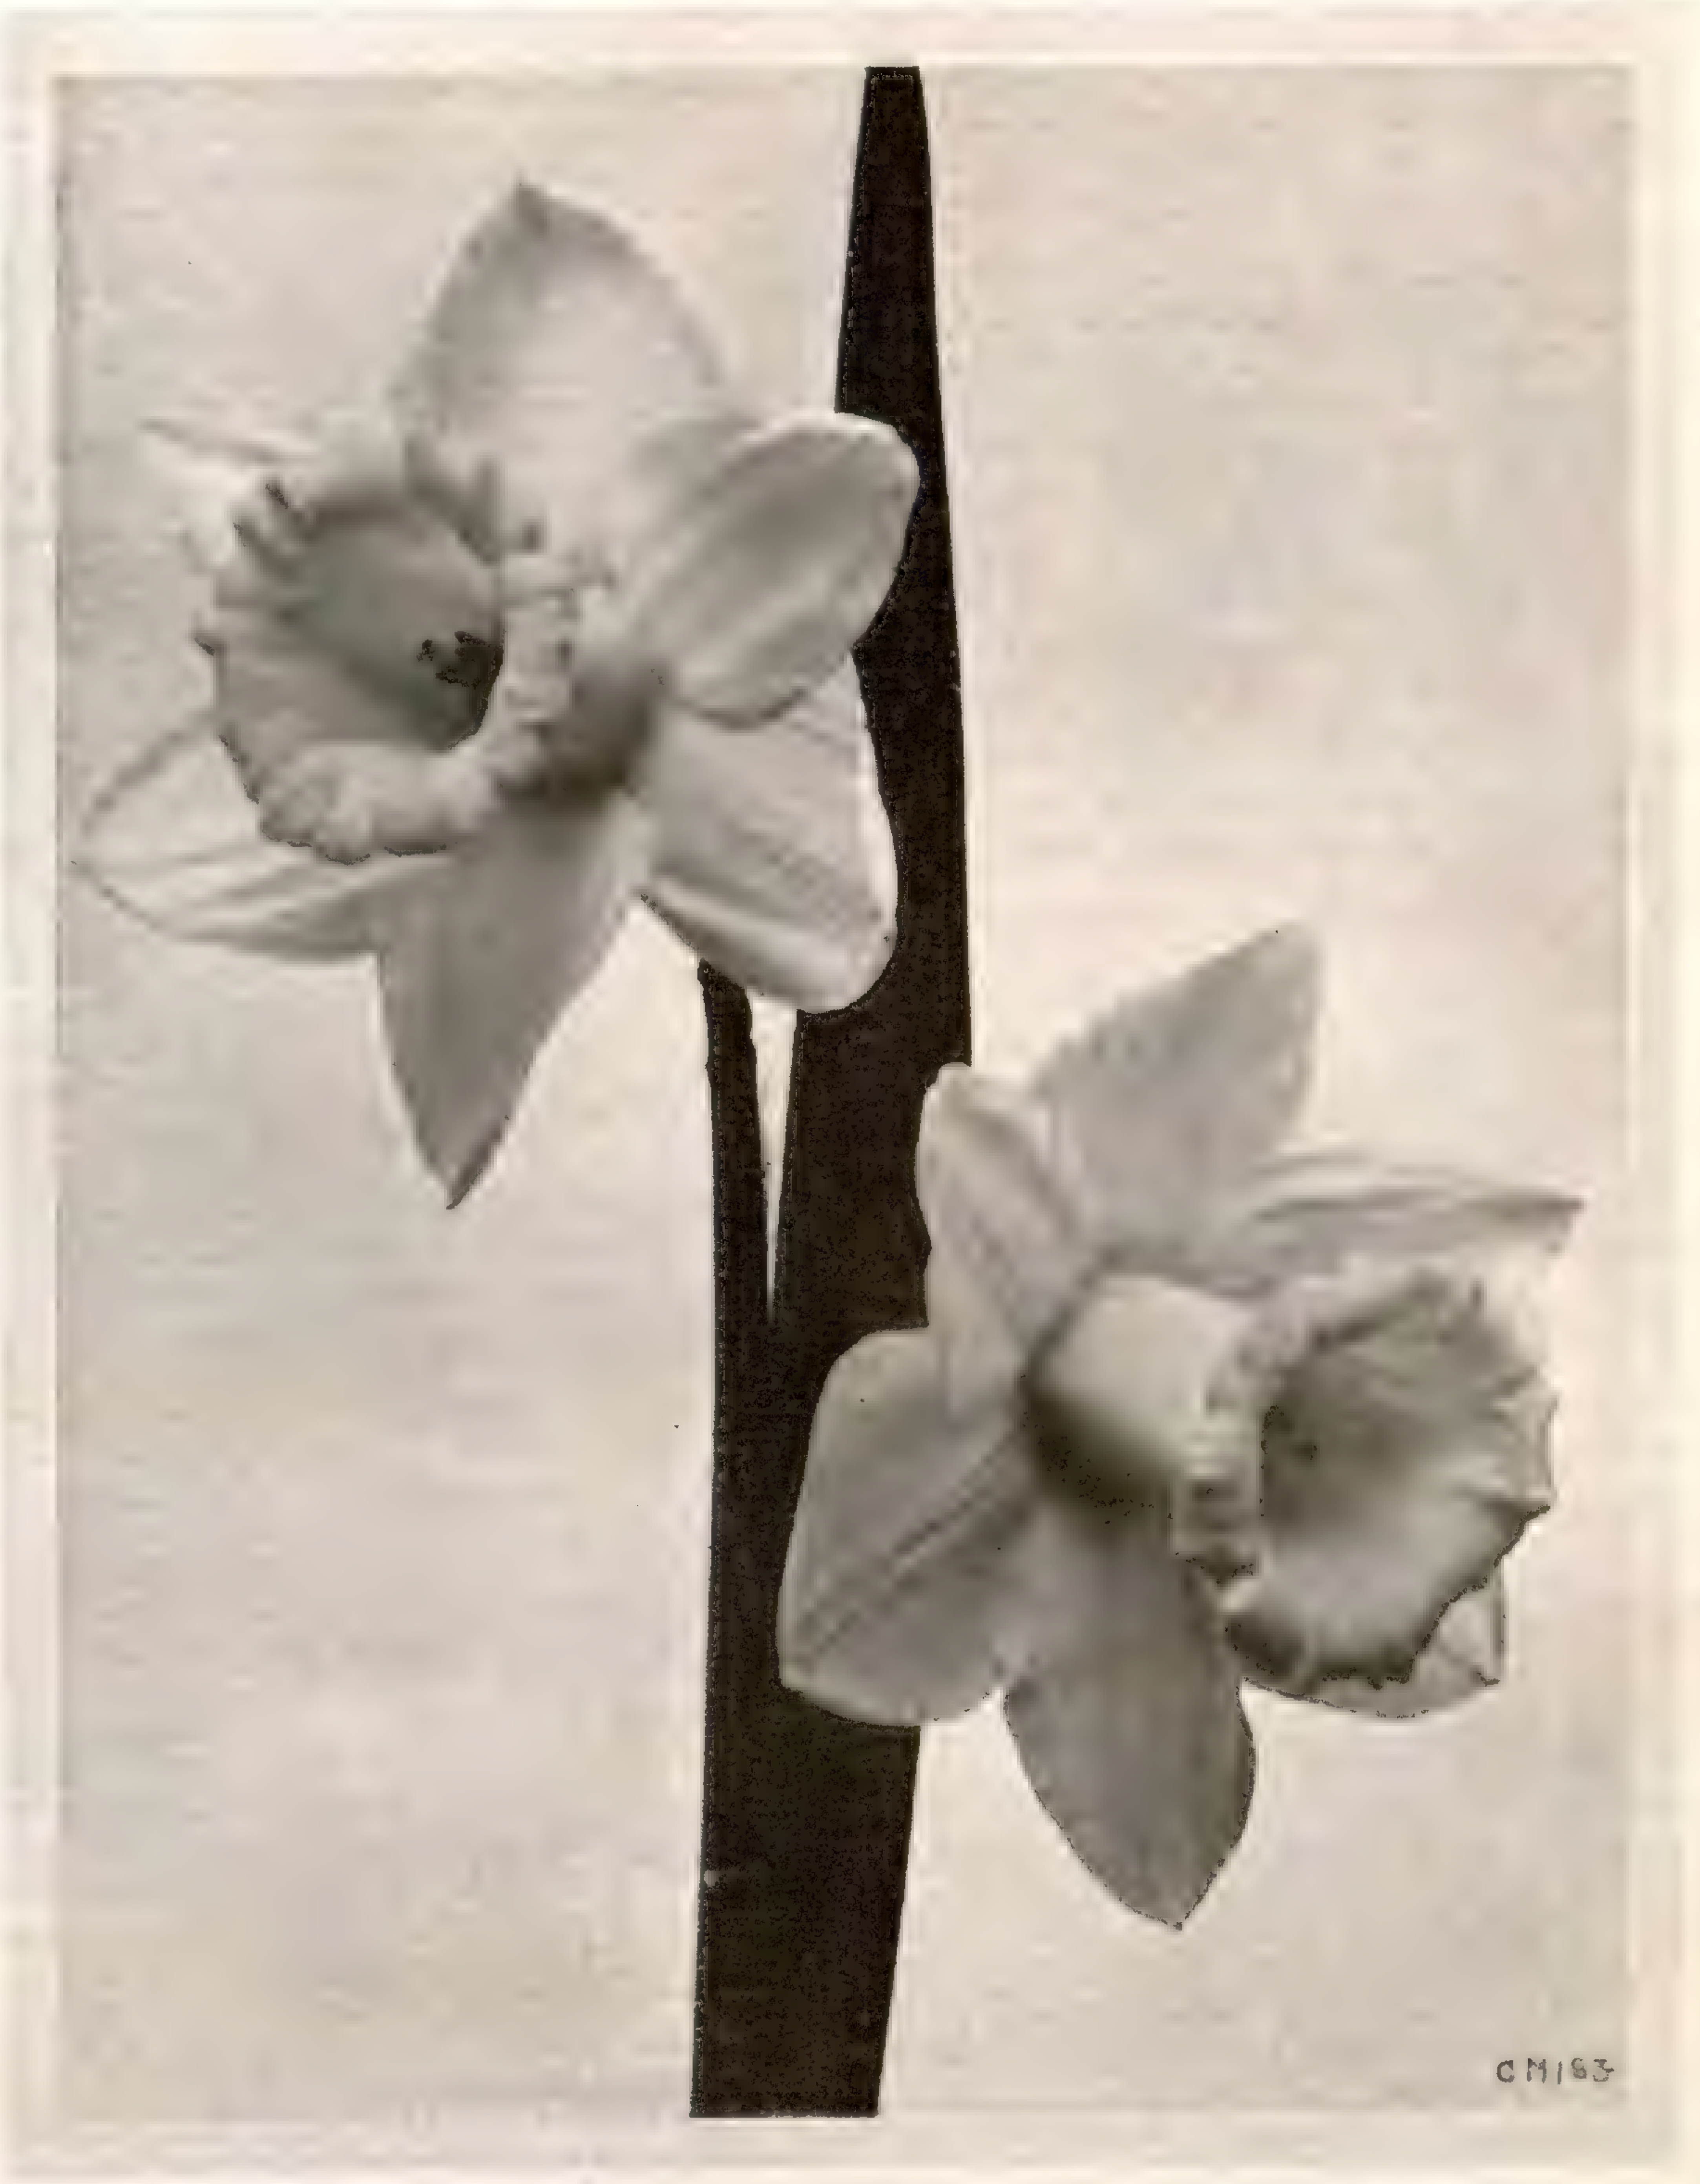
**Gloucestershire Orchards.**—With reference to the present appearance of the Gloucestershire orchards, Mr. H. C. Prinsep writes: "I have never seen the bloom of pears and plums so fine as it is this year. I have within the past few weeks driven through miles of orchards, and find it the same everywhere. When you ascend one of the hills and look across the valleys, the great masses of snowy blossom present an appearance that is exceedingly beautiful. We had a sharp frost the other night, but I do not think much harm has been done."

**Birmingham Daffodil Show.**—The extreme earliness of the daffodil season suggests that the Birmingham Show, to be held at the Edgbaston Botanic Gardens on April 25 and 26, may not be so extensive as usual, but we feel sure that if everyone who has daffodils, and appreciates the efforts made over so many years by Mr. Robert Sydenham and his friends on behalf of daffodils and daffodil lovers, will take the best of their remaining blooms to the Midland show, then the extent of the exhibition will not suffer, and probably the quality will be finer than most expect. Our friends in the North of England ought to turn up in large numbers, so that "Uncle Robert" may not be disappointed.

**Old Garden Furniture.**—"La Vie à la Campagne," the fortnightly French publication, has a department, so to speak, that deals with horticulture. Several special issues have been of great interest to the gardener. The last issue to hand (March 15) is devoted entirely to the subject of old garden decorations, and with such authorities as MM. Maumené, Gibault, and Lambert, our readers may well imagine the way in which such an interesting subject is treated. The illustrations to the text are profuse, and comprise views of old gardens, and all kinds of garden ornaments and accessories, such as sundials, terraces, fountains, seats, balustrades steps, and staircases, vases, and the like. Of these there are close on 200, a varied and interesting collection made from many sources.

**Loss of a Fine Pine.**—Mr. W. Graysmark writes from Bury Hill Gardens, Dorking: "I am very sorry to tell you that we lost our fine Pinus cembra during the great gale on March 4. It was sixty-one feet high, and clothed to the ground, and between six and seven feet in circumference at the base. Do any of your readers know of any specimen larger than this in England? It is a great loss to us, and there is now a great opening in our flower garden where it used to stand."

**Potash Manure.**—It is well known to cultivators that both garden and farm crops have to be supplied with manures in some form that contain nitrogen or ammonia, phosphate, and potash; and that, if any one of these is deficient, the results will be more or less unsatisfactory. It is also generally known that there are various sources of nitrogen and phosphate, but that in the case of potash the only sources of importance are the deposits at Stassfurt, in Germany. Notwithstanding the last-named fact, potash is a common and widely-distributed substance, and it has been estimated that it forms about 2.8 per cent. of the crust of the earth. The whole of the potash can be traced back to the original rocks—granite and others of a similar composition—and to the more recent rocks of volcanic origin. Usually the minerals containing potash are associated with such large proportions of quartz that the percentage of potash is very small. There are, however, in various parts of the world large deposits of rocks and minerals containing much higher percentages. It is essential, in forming an estimate of the value of a material as a potassic manure, to know not only the percentage of potash, but the condition in which it exists. The importance of this will be understood when it is stated that potash in a soil or manure may be in an available state in which the plant can take it up at once, or in such condition that some years' exposure is necessary to convert it into an available state. The availability of the potash is an important factor, as shown by the fact that a clay soil may contain 2 per cent. of potash, and that, owing to it not being in a condition for the plant to utilise it, a dressing of soluble potash manure may be necessary to ensure a satisfactory crop. Potassic manures usually employed are kainit, sulphate, and muriate of potash, and these are so readily soluble in water that the plants can make use of them at once. It is of some practical importance to know that, notwithstanding their solubility, there is, owing to the absorbent properties of the soil, very little risk of loss through drainage.



NEW TRUMPET DAFFODIL, MRS. ERNST H. KRELAGE.

Flowers cream-white. A.M., R.H.S., April 16. Messrs. Krelage and Son, Haarlem.

**Effect of Lime-Sulphur Wash on Scale Insects.**—In the investigations conducted at the Michigan Agricultural College with a view to ascertain the effects of lime-sulphur wash on scale insects, no proof could be obtained that the wash had penetrated into the tissues of the insects. It appeared to have very little effect on large insects having heavy chitinous walls. Various theories were tested, and the results were such as to suggest that its action on scale insects was due partly to the fact that it takes up oxygen in comparatively large quantities, thus indirectly suffocating the insect which it covers, and partly to the effect on the wax at the margin of the scale, which results in the insects being absolutely sealed in under the scale covering.

## LETTUCE CULTURE.

In a lecture recently delivered at Bradford, Mr. W. F. Giles dealt with various salad plants, but paid special attention to lettuce culture.

He pointed out that among salad plants the lettuce is usually considered the most important. In its many varieties the cos type proves itself to be extremely useful, and under various conditions of culture can be had practically all the year round.

Generally speaking, lettuces may be divided into three groups:

(1) Winter lettuces—that is to say, those which when sown in the autumn in a fairly sheltered position will stand through the winter, and heart up in spring and early summer.

(2) Spring, or forcing lettuces—that is, those which when sown in gentle heat early in the year, and either grown entirely under glass, or planted out on a hotbed, heart up very quickly, but, generally speaking, do not remain in condition long before running to seed.

(3) Summer lettuces—that is, those usually sown in the spring and summer and grown in the open to provide a supply all through the summer and autumn.

It is, however, difficult to draw any hard and fast line between these sections, because with so large a number of varieties, there are some which do not perfectly fit into either section, but it may be taken that broadly speaking, varieties that do well in one class are not of much use in another. There are, of course, exceptions, especially with the cabbage varieties, but, although the cos type is useful for sowing in autumn or spring, it is not of so much value in the forcing section.

If these so-called winter varieties are sown towards the latter part of August and in September, and planted out in October and onwards on some well-drained ground, they will usually go through most of the winters experienced in England, although in exceptional weather it is as well to give them a little protection.

The deep English pattern frames are usually planted with the forcing type of cabbage lettuce. This is the style of culture which may be seen in many English gardens early in the spring, and differs from the French method, chiefly in the type of the frame, the hotbed, and the fact that the lettuces are grown by themselves instead of with other crops as in France. This being the class of culture in which the French gardener excels, Mr. Giles gave a few notes on his methods.

About October he forks over an old border or spent hotbed and sows his lettuce seeds under the cloches or bell jars. These cloches are really very useful articles. They are made in various sizes and shapes, and admit light on all sides. Some are made with a knob at top, others not. The form without the knob is that mostly in use around Paris; the others are more generally used in the South of France.

As soon as the seedlings are large enough, they are pricked out under other cloches, about two dozen under a glass. This is to encourage root action, and the plants remain here until they are wanted for their final quarters in January or February. If the weather is at all severe, mats made of rye straw are rolled over the cloches, or dry litter is placed around for protection. Then about January or February the French gardener commences to make up his hotbeds. He does not make them as many do in England, entirely above ground, but digs out his soil, where the bed or beds will be, to a depth of nine or twelve inches. Then he places in the trench manure made of old and new in about equal parts to a depth of one, two, or three feet, according to the season and to whether he requires the bed for vegetables and salads, or melons. When the manure is well trodden down, about four or five inches of good soil is placed on the top and the whole is then ready for sowing or planting.

The advantage, of course, is that being below the level of the ground it retains its heat much longer than would otherwise be the case. The bed having been made ready, it is then sown broadcast thinly, with carrot and radish seed, and planted with lettuces. Usually under a cloche one cos and three or four cabbage type are put, and cos are also planted between the cloches.

The beds are made in the same way and of the same size, whether they are to be fitted with cloches or frames. The French frames are made much more shallow than the usual English patterns, so that the plants may be grown near to the glass, and thereby not become drawn. In the frame four crops may be growing together, radishes, cabbage lettuces, cos lettuces, and carrots. The radishes come off first, then the cabbage lettuce, after this the cos, which then gives the carrots plenty of room to develop; and whilst they are growing plants of cauliflower are put out amongst them, so as to occupy the ground after the other crops are cleared. These shallow frames are really very useful and quite cheap, and if they are required for taller growing plants, they can be raised at the corners with flower pots or bricks, and manure put round at the bottom to keep out the cold. The gentle warmth from the hotbeds, combined with copious waterings, causes the crops to grow very quickly, and it is this quick growth which makes them so tender. It does not do to have much heat for salads, otherwise the lettuces become flabby and the radishes run to foliage. The French gardener finds about 55 to 60 degrees is quite enough.

There is no doubt whatever that a few of these cloches, or a shallow French frame, are useful things in any garden, as by their means salads can be grown very quickly, and therefore very tender; besides which, they can be produced at seasons of the year which would be almost impossible without them, or unless one had house room; but I should be one of the last to advise everyone to take up French gardening on commercial lines, for, although a large number of crops can be produced from a small area of ground, there is a good deal of work and anxiety, besides expense, attached to it. The system, however, is good, and, attempted on a small scale, would enable one to obtain a good deal out of a small space.

Whilst on the subject of frames, I should like to refer to the kind of light that is used in Holland. It is made of a single sheet of glass which slides in a groove, and is kept in position by two blocks of wood at the bottom. The lights are about 60 inches by 32, and are used on shallow frames similar to those used in France. The great advantage is that there is no obstruction to the light, and no drip caused by glass overlapping.

The disadvantage is that if you have an accident you have broken rather a large pane of glass, but in Holland, although the men wear sabots, or wooden shoes, it is not often the lights get broken. They can, as will be gathered, be made very cheaply. Thousands are sometimes to be seen in one place, and they are almost exclusively used for small salads and cucumbers.

The next class of lettuce is probably the one most generally grown—the summer kind. Of these the number of varieties is very large, sufficient to satisfy all tastes. In addition to the cos and cabbage types of lettuce, there is a class which is not often seen in this country. It is the "cutting" lettuce, and is much grown in some parts of America, and also on the Continent. It does not make a head, but produces a considerable quantity of tender salading. It is very useful for spring or autumn sowing.

---

**Helenium Riverton Gem.** — Under the dry burning conditions experienced last summer, this proved so satisfactory that it can be well recommended for its floral display. It reaches a height of about four feet, and continues to bloom from the latter part of July till the autumn is well advanced. When the flowers first open they are of a warm terra-cotta tint, but after a time they change considerably to more of a wallflower-like hue.—W.

## SUNSHINE AND FOG.

At a recent meeting of the Royal Society of Edinburgh, an interesting communication on "The Sun as a Fog Producer" was read by Mr. A. Watt, on behalf of Dr. John Aitken, F.R.S., who was unable to be present. Some years ago, Dr. Aitken said, it was noticed by him that at Falkirk fogs frequently began to form in the mornings just at sunrise, and observations of all the meteorological conditions were begun to see if their appearance was in accordance with any laws in nature, or were what are generally called fortuitous. Observations were therefore made of the humidity of the air at the time, as it always plays an important part in the formation of fogs. As the fogs were probably produced by some impurities in the air, the direction of the wind was noted, so as to ascertain whether the air came from polluted areas or not; the velocity of the wind was also observed, as it would determine the degree of concentration of the impurities. The transparency of the air, that is, the amount of haze or fog, was also observed before and after sunrise, also the amount of sunshine in the morning. These observations have been made during the last four winters. The result of the observations shows that when the wind was light and blew from an impure direction—that is, brought air from densely inhabited areas and was damp—a fog invariably formed if the sun shone; whilst it did not form if there was no sunshine; also that if the wind was from a pure direction the sun had no effect on it. The rest of the investigation deals with the way in which the sun acts on the impurities in the atmosphere and causes haze and fog, and with some suggestions as to their prevention.

As these fogs were thus shown to be caused by some impurities in the air coming from the densely inhabited areas, an investigation of the impurities in the atmosphere coming from these areas was begun to try to find out how the sun acted on them and caused fogging. As the air coming from the polluted areas contains a large amount of the products of the combustion of coal, attention was directed to them, and from the well-known products of combustion of sulphur, attention was first directed to it, as all coal contains a large amount of sulphur which is burned with the coal, and gets mixed and carried along with the passing air.

Among the gases in the air produced by the combustion of coal which change the sulphur products to the solid or liquid condition, it was found that ammonia, hydrogen peroxide, and ozone all acted powerfully. Their action, however, plays no part in the morning fogs, because the sun has no action on them, and they can act on the sulphur products in the dark. The products from a clear coal fire and also from a coke fire were tested and found to act exactly like the products of burning sulphur. If the products from the fire are filtered, so as to remove all particles, and then exposed to the action of light, radium, etc., they give a very dense condensation, due to the particles formed by the light out of the sulphur products from the fire. When, however, the products of combustion of ordinary household gas were tested in the same way, it was found that neither light nor any of the other influences had any effect on them, and they remained free from all particles which cause haze or fog.

It is pointed out that these sunshine fogs are probably caused by the sun acting directly in the manner shown on the products of the sulphur in the coal, and also to the sunshine forming hydrogen peroxide in the air. This gas, as shown, combines with the products of the sulphur and forms particles which can condense vapour in unsaturated air, which accounts for these sun fogs forming in air that is not saturated, while in pure air fogs only form when it is saturated. One conclusion pointed out is that though we may have smokeless fires and furnaces, yet we will be subjected to these fogs, and in order to be rid of them we must prevent the escape of the invisible products of the sulphur.

# SPRING-FLOWERING HEATHS.

A great deal of attention has been given during recent years to the various kinds of Erica suitable for outdoor planting, and in places where they thrive there are few groups of shrubs which are more worthy. Their flowering period is a long one, for it is rare in those gardens where a full collection is grown that one or more cannot be found in bloom from the earliest days of the year to the latest.

BANK OF ERICA MEDITERRANEA AND OTHER SPRING-FLOWERING HEATHS AT KEW.

The spring-flowering set alone blossom over a period of six months, for it is usual for the earliest one to open some of its flowers in November, while the later ones are scarcely over before the end of May. The best time is from early March to the middle of May, and during that period the majority of the kinds are perfect masses of bloom.

Heaths, as a class, cannot tolerate lime, for although one or two kinds are occasionally found growing in soil where lime is rather plentiful, they are rarely so well developed as plants growing in other positions where lime is not much in evidence. Rather light soil, either peat or loam, suits them, and there is no necessity to go to any great trouble or expense in the preparation of ground, providing it is free from coarse weeds. If dug over to a depth of twelve or fifteen inches that is quite sufficient, while by digging a few inches of decayed leaves or peat into the surface of loamy soil, a much better rooting medium is formed than would be the case if a bed were excavated to a depth of twelve inches or so and filled up entirely with peat.

Numerous methods may be adopted for the disposal of heaths throughout the garden, but the most satisfactory results are usually obtained by grouping, the groups either being formed of one sort, or of a number of kinds. If it is desired to add height to the groups, this may easily be done by using dot plants of some taller-growing subject.

A few of the spring-flowering heaths are not very hardy, therefore those kinds ought not to be planted in places where severe frosts are common. In most gardens in the Midlands, South, and West, however, they may be expected to thrive satisfactorily, though there may come a severe frost now and then to injure them. With this in view, it is as well to root a pot of cuttings of each of the Southern European kinds every autumn. These, kept in a cold frame for the winter, will ensure a stock should anything happen to the old plants.

### Erica arborea.

This is a tall-growing species, widely distributed in the region of the Mediterranean. At its best it may attain a height of from twelve to eighteen feet, with a considerable diameter. In this country, however, we are more familiar with it as a bush from three to six feet in height, and from three to five feet through. Its tiny leaves are of a very dark shade of green, and against them the small white bell-shaped flowers are well set off. The presence of this plant in a garden is soon detected by the fragrance of the blossoms. Unfortunately it is rather tender. The variety alpina is hardier than the type, and it may be distinguished by its more fastigiate habit and rather brighter leaves. From burrs formed on the roots of E. arborea the famous briar-root pipes of commerce are manufactured.

### E. australis.

Although this is the most tender of the various species, it is one of the most distinct and beautiful. Of loose, straggling habit, it grows three to five feet high, with dark green leaves. The flowers are larger than those of any other species in the section, and they are bright red in colour. A native of Portugal and parts of Spain, it was introduced many years ago, but was rarely seen until about fifteen years ago.

### E. carnea.

This is one of the hardiest of all the heaths. Of low-growing habit, it scarcely reaches nine inches in height, but spreads widely, and forms a carpet of greenery throughout the summer and winter, and a mass of reddish flowers from the middle of February until the middle of May. A native of the Alpine regions of Europe, it is perhaps the most widely grown of all the spring-flowering heaths. E. c. alba is a duplicate of the type in all except the colour of the flowers, which is white.

### E. lusitanica.

A native of Spain and Portugal, this is better known in some gardens under the name of E. codonodes. It is very popular in the south-west counties, where it may sometimes be met with up to ten or twelve feet in height. Sometimes confused with E. arborea, it may be easily distinguished from that species by its more plumose habit, brighter green leaves, and longer, tubular, scentless flowers, which are pink in the bud stage and white when expanded. It often commences to open its flowers during winter, but is at its best during March and April.

### E. mediterranea.

This is a native of Spain and South-west France. Under normal conditions it grows into a shapely bush, four to six feet high, though plants have been known to attain a height of twelve feet in the vicinity of London. Blossoms appear with great freedom; they are reddish-purple in colour, and at their best in March and April. There are numerous varieties, nana, of dwarf habit, and alba, with white flowers, being very distinct. The variety hibernica is found wild in Ireland.

### Hybrids.

E. mediterranea hybrida is doubtless a hybrid between E. mediterranea and E. carnea. It is very hardy, grows twelve to sixteen inches high, spreads freely, and bears reddish-purple flowers, usually from November to May. It was later than usual during the past winter in commencing to flower.

E. Veitchi is another hybrid, the parents in its case being E. arborea and E. lusitanica. Intermediate between the two species, it is exceptionally floriferous, and a great acquisition. W. Dallimore.

Kew.

## SPRING-SOWN LAWNS.

Where ground has been levelled for a lawn, and the soil is free from the seeds of coarse grasses and other undesirable forms of plant life, the best time in spring to sow it with lawn grass seeds is from the middle to the end of April. The heavier soils are colder than the lighter ones. Consequently, the more tenacious mediums are better left until the later date. In either case, advantage should be taken of a dry spell to work the surface into a fine tilth, make good any "slacks," and secure uniformity in solidity throughout. This is best attained by forking over the ground to a depth of about three inches, then carefully treading with the heels, to find out the weak parts, filling these up, retreading, and raking till the desired level and fineness of mould is secured. In some instances, a roller will be useful for breaking up lumps in the preparation of the soil, even although it is useless for levelling or solidifying purposes, as only the high and hard parts are affected by it.

Ordinary hay rakes are excellent implements for drawing over the ground, with the teeth one inch deep in the soil, in preparation for the seed, and when this is sown then drawing cross-ways to cover it. A heavy roller should be used on light soils, and a light roller on heavy soils to fasten the seed, and then a dusting of slaked lime at the rate of about 4oz. to the square yard should be given to the surface to protect the seeds from birds. Besides being a good protection for the seed, it also acts most beneficially on the young plants by breaking up both organic and inorganic compounds in the soil, neutralising acidity, and providing a liberal supply of available food to the seedling grasses. I always use 1lb. of seeds to 30 square yards of ground, but there will be no harm in allowing more than this, as the quality of a lawn is often the result of the amount of seed employed.

Hibernia.

---

**Alonsoa incisifolia.**—Some of the alonsoas are justly appreciated annuals, and make a goodly show out of doors during the summer months. The species under notice is, however, of a more shrubby character, and it is really a very valuable plant for the decoration of the greenhouse during the spring and summer months. It is naturally of a freely-branched habit of growth, and the flowers, which are borne in great profusion, are disposed in dense spikes, and the colour, a kind of orange-vermilion, is very effective. Alonsoas are quite distinct from any other occupants of the greenhouse. With an occasional stimulant the plants of this alonsoa will flower for months together. It is as easily struck from cuttings as a fuchsia.—W. T.

## SPRING FLOWERS AT HAMPTON COURT.

In the Gardeners' Magazine for September 9 last year a portrait was given of Mr. W. J. Marlow, the Superintendent of Hampton Court Park and Gardens. The accompanying letterpress dealt with the great and successful work that he has carried out during his tenure of office, particular reference being made to the high class of both the spring and summer bedding, examples of which are often taken as a model for other establishments.

This season the spring bedding is again splendid, and during Easter time it was the admiration of thousands. All tastes and ideas are provided for, as numerous examples occur of bold masses of colour, as well as most pleasing and harmonious combinations.

Taking first the long border, which stretches from the Palace to the limit of the gardens in the direction of Bushey Park, a magnificent display is provided. The principle there adopted is much the same as that followed in the summer, namely, the different flowering subjects are arranged in masses or clumps, a sufficient number of each being employed to form, as it were, an object on which the eye can rest. The following flowers are all very freely represented—hyacinths in various colours, tulips just as numerous, wallflowers of sorts, narcissi, polyanthuses, Aubrietia Dr. Mules, very rich in its colouring, muscaris, forget-me-nots, double daisies of different sorts, etc., the whole being edged with the double arabis, which, at Hampton Court, does not seem to be attacked by pigeons as I have sometimes seen it. A notable feature in this border is a group of numerous plants of the double Japanese cherry, which in height forms quite a break away from its associates. One more feature in this border must on no account be passed over, namely, a charming group of the slender-growing Lady Tulip (Tulipa Clusiana), whose flowers, though small compared with those of the florists' varieties, are much admired. In colour they are white, with a central stripe of red.

Hampton Court Gardens have long been famous for their strain of polyanthus, and though probably owing to the excessively hot and dry weather of last summer they are, I think, not quite up to the standard of some years, they are very beautiful, and play an important part in some pleasing combinations. Among the most prominent of these are yellow polyanthuses associated with white and pink tulips, dark polyanthuses dotted over with Joost Van Vondel crimson, and Joost Van Vondel white tulips, yellow polyanthuses plentifully sprinkled over with Lady Palmerston tulip, a semi-double satiny-rose flower.

A particularly striking bed, in fact, looked upon by some as the most attractive of all, has a groundwork of bright yellow Alyssum saxatile overtopped by the blush Hyacinth Van der Hoop, above which stand numerous well-flowered and brightly-coloured examples of Dielytra spectabilis. Another bed, lowly in stature, but very pretty and uncommon, is planted with Auricula King of the Yellows and Primula Sieboldi, the whole being sprinkled over with Tulip Cottage Maid. Wallflowers are freely represented, and, in some instances, are very fine, but personally I do not care for those of dull undecided tints. One bed is, however, at a distance very quaint, being planted with Wallflower Eastern Queen and the orange-coloured Tulip Thomas Moore, though when closely inspected the effect is not so striking. Dark wallflowers are also associated with this tulip, while a bed of the pale yellow Primrose Dame has as a companion the orange-scarlet Tulip Grace Darling. Other combinations worthy of especial mention are Hyacinth Grand Maitre, blue, and pink Tulip Cottage Maid, over a carpet of double white arabis; Hyacinths, Fabiola, rosy-red, and La Franchise, blush, with single white arabis; Hyacinths, Leonides, blue, and La Grandesse, white, springing from a bed of double arabis; a carpet of Aubrietia Dr. Mules and large white daisies, with an overgrowth of Narcissus Madame de Graaff, very uncommon and pretty; single arabis and forget-me-not, and above that Hyacinth Gertrude, red, and white tulips; double arabis and Hyacinth King of the Blues; the same arabis with Fabiola and Gigantea, blush hyacinths, with Tulip Cottage Maid. Beside these there are some very fine beds of tulips, including such well-known kinds as Artus, Chrysolora, Cottage Maid, Keiserskroon, Thomas Moore, Joost Van Vondel, and others.

With so much to admire it may perhaps be looked upon as out of place to criticise, but in the naming of the flowers in the beds some improvement is desirable, for scarcely any of the tulips are labelled. This is a most important omission in a public garden, where so many come to admire and seek inspiration. I noted, however, that every bed of polyanthuses bore a conspicuous label.

In the case of the flower beds at Hampton Court the beauty of their occupants is enhanced by the splendid condition of the turf which surrounds them, and the numerous yews which form, in many instances, a very suitable background for the brilliantly coloured blossoms. W. T.

## FRUIT PROSPECTS.

In the southern part of Hampshire and in Dorsetshire the prospects of a good fruit year are encouraging, as far as the show of blossom goes. Pears are exceptionally well laden, plums and cherries are promising, and apples have an abundance of flower buds. I notice that Allington Pippin, Lane's Prince Albert, and Warner's King have blossoms above the average. Pear Doyenne du Comice even bears blooms at the extreme ends of the shoots in many instances. Of course, this is a result of the maturing of the wood last year. The young shoots of black currants were not as gross as in many previous years, and, as they are so well ripened, the crop may be a grand one.

In one garden I visited recently I saw a number of pear trees confined to one main stem, but having side shoots 1ft. to 18in. in length, and they were bristling with fruit buds. These trees are not trained as cordons proper, but on that principle, and it is really wonderful the number of trees that can be accommodated in a small garden. I have been able to watch the trees in question for several years past, and they never fail to crop satisfactorily. Peaches and nectarines, also apricots on outside walls, are very promising. Gooseberries, red and white currants, and raspberries, also look well.

In a few instances trees of a somewhat stunted character are carrying too many flowers, and it is quite possible that most of the latter will fall off. But generally the trees are well laden with flowers without being overcrowded. So very much depends on the weather conditions. Last year a severe frost on April 5 blackened the pear blossom wholesale. I am preparing to lightly protect a number of small bushes, and thus avoid running any risk of injury.

Geo. Garner.

TRADE MARK.
(Registered.)

# Plants Plantoids, Ltd.,

Hopetoun House,
Lloyd's Avenue,
London, E.C.

## An Important Announcement.

***It is our pleasure to announce that the difficulties hitherto associated with the use of artificial fertilisers are now overcome, and that, by the aid of Plants Plantoids, the very finest of prize flowers and plants can be grown without the least uncertainty as to the plant food or method of application necessary for their successful culture.***

**Plantoids combine all Nature's fertilising materials in convenient tablet form.**

The use and application of Plantoids is as simple as A.B.C., and their results an improvement on all hitherto known artificial fertilisers. Plantoids contain, in a highly concentrated form, the natural food of all evergreen and deciduous plants, whether in pot, bed, or border.

Plantoids are little green tablets which are odourless and as clean as the flowers themselves. You merely place two or more—according to the size of the plant—once a week just under the surface of the soil, and water as usual. The Plantoids slowly dissolve and provide the root with a continuous supply of the nourishment it requires for perfect development. None of the plant food is washed away, as is the case with ordinary fertilisers. The Plantoids being placed under the surface of the soil there is no possibility of harming the foliage.

**Within a very few weeks of the first application of Plantoids the leaves assume a richer and more luxuriant colour. The Plant grows as if bursting with vitality; the buds spring forth in greater profusion, and develop into glorious blossoms.**

***Rose Trees,*** fed with Plantoids, produce prize blossoms in profusion.

***Ferns,*** nourished with Plantoids, put forth new fronds, and, in a few weeks, almost double in size.

***Borders,*** when Plantoids are placed every three inches or so, become, in the course of a very few weeks, a glorious blaze of colour.

***Sweet Peas,*** nourished with Plantoids, bear larger flowers with richer colouring. The growth is ever so much more robust, and the plants remain in flower for a considerably longer period.

*The Real Test.* **Exhaustive tests of Plantoids have been made at one of the leading horticultural establishments in England. Mr. Hollands, the proprietor, writing from Tunbridge Wells, under date 12th February, 1912, states:—**

> ***"I have used Plants Plantoids in my nursery to my great satisfaction. The rapid growth was surprising, even in this dormant winter season."***

*The Final Proof.* These things you can verify for yourself. A 6d. tin contains an ample supply of Plantoids for a thorough trial. When you have seen what astonishing results Plantoids effect, then order a large tin—they are more economical.

**Plantoids are sold—or can be obtained for you—by all Grocers, Ironmongers, Chemists, Stores, Florists, Seedsmen, etc., in *3d., *6d., *1s., 5s., and 10s. tins.**

**When ordering direct add postage, thus:—3d. size 1d., 6d. size 2d., 1s. size 3d., and please use coupon.*

## ANCHUSA ITALICA, DROPMORE VARIETY.

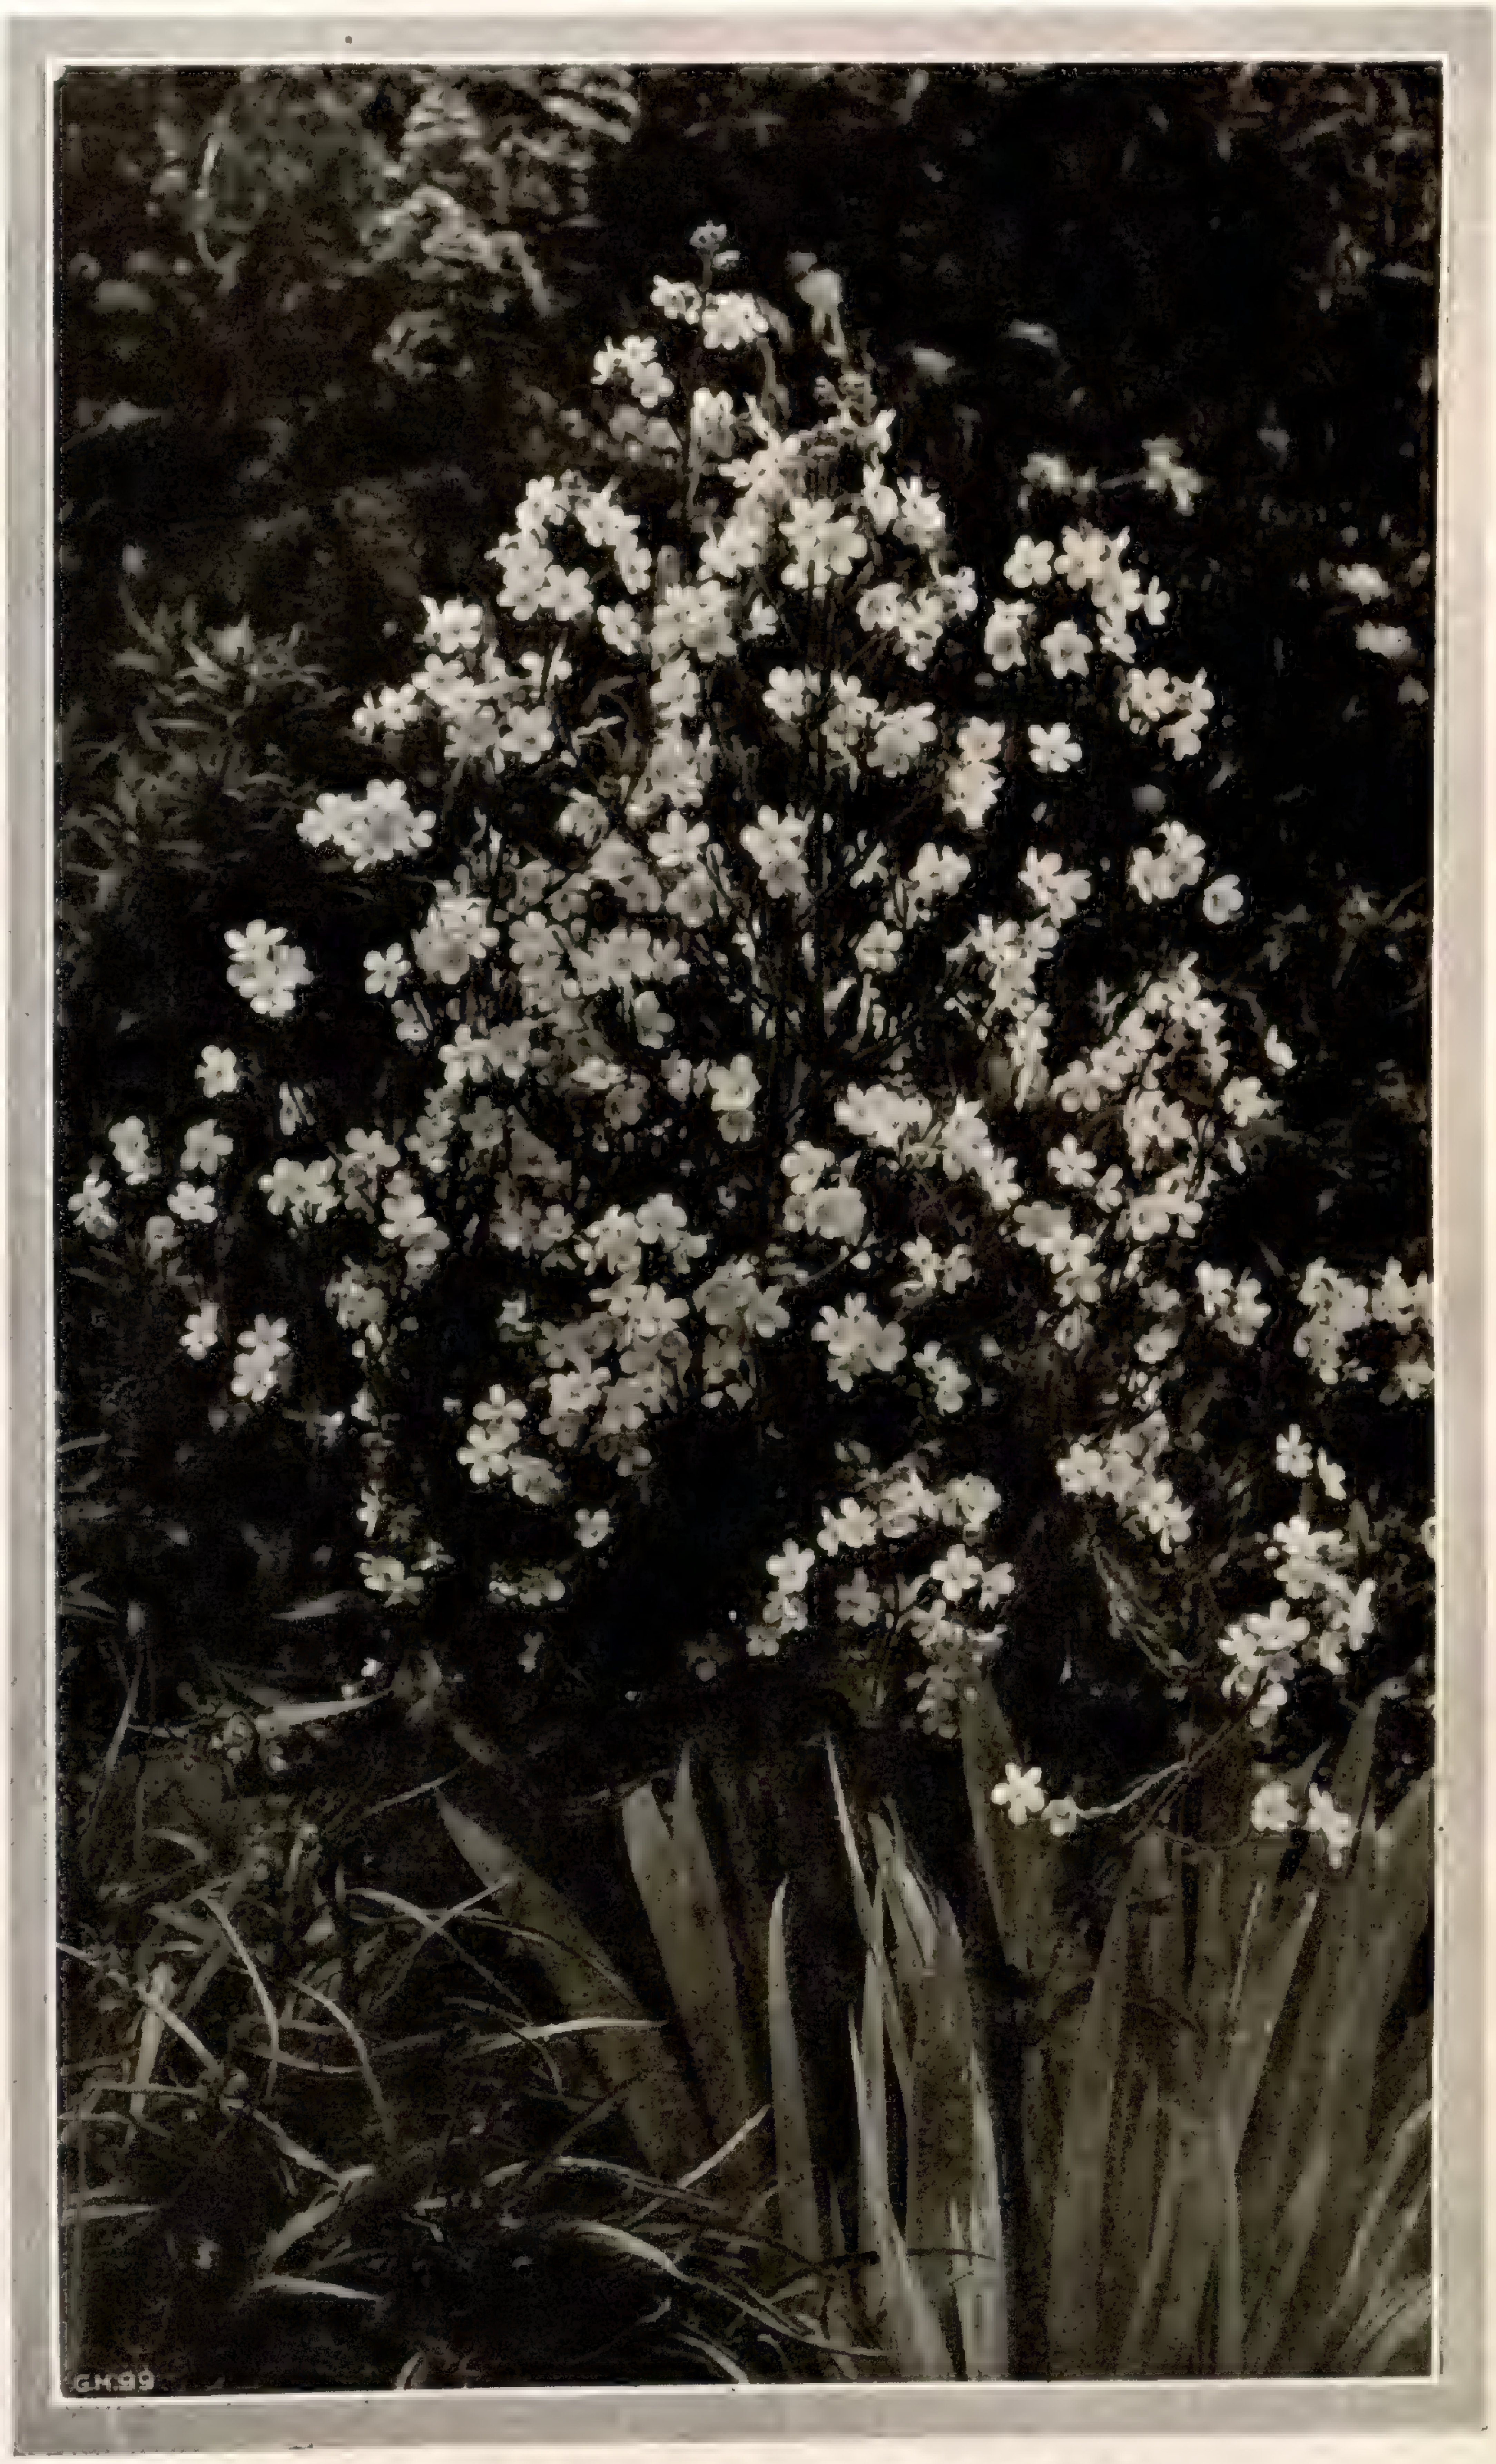
Unsurpassed for effect in the herbaceous border is this splendid introduction, being, indeed, the finest of all the larger blue-flowered perennial plants. This, in the face of the handsome family of the larkspurs or delphiniums, with its countless fine named varieties, may appear a rash statement, but anyone who has seen this Alkanet at its best will admit that it possesses attractive qualities of the very highest order. It is so far superior to the type that it might well pass for a distinct species, but the fact that it does not come true from seed, and that the seedlings have a tendency to produce flowers as small, or nearly as small, as those of the common type, tend to prove that this is its parent.

The flowers of the type are so small that it is not a sufficiently effective plant for the herbaceous border, but the blossoms of the Dropmore variety are rather over an inch across, and are borne in such profusion that the whole plant becomes a sheet of deepest blue. A vigorous example will attain a height of from 6ft. to 7ft., with a diameter nearly as great; and, if not shut in and shaded by other plants, a specimen will be, from the ground level to the topmost shoot, a cloud of blue that invariably attracts universal admiration. Were its flowers short-lived its beauty is so great that it would be welcomed in the border, but it has the additional merit of lasting in bloom for a very lengthened period.

The plants generally commence to flower towards the end of May, and at the close of July still hold sufficient blossom to be attractive. If the shoots that have flowered are cut off the plants will throw up side shoots and bloom again in the autumn. This plant was raised by Mr. Charles Herrin, late head gardener at Dropmore. Curiously enough the Dropmore variety has not proved as hardy as the type. In the South-west the type never dies in the winter, even though totally unprotected, but in many cases, the Dropmore variety has failed to appear again in the spring after dying down. It is therefore advisable to raise a pyramid of leaf-mould over the plants when they die down as a protection during the winter months. In open spaces in the wild garden this anchusa produces a beautiful picture when in full flower, and a group of plants on a sloping lawn are also most effective. For indoor decoration the flower shoots are very valuable, and when cut at a length of four feet or so, they form delightful arrangements in tall glass and other vases.

As has already been mentioned, seedlings of this variety are generally very inferior to their parent. Propagation must therefore be necessarily effected in some other manner, and root cuttings have been proved a successful method. The plants must be lifted in the winter and the roots cut into pieces one inch to two inches in length, and inserted in boxes or pans of very sandy soil. In a few weeks growth will appear, and the little plants may be grown on until ready for planting out. There are many varieties of Anchusa italica superior to the type. Many years ago a fine variety, with larger and brighter flowers of a good blue appeared. This was called amœna. Then came the Dropmore variety, with flowers half as large again, since when other forms named superba and grandiflora have been raised. Opal is lighter in colour than the Dropmore variety, with flowers of the same size, and azurea, a pale blue, owes its introduction to Mr. E. Molyneux.

Wyndham Fitzherbert.



ANCHUSA ITALICA, DROPMORE VARIETY.
A beautiful blue-flowered perennial plant.

## RUBUS SPECTABILIS.

This is the earliest of the many hardy brambles to open its flowers, and it is usual for it to be at its best before the end of April. Belonging to the raspberry section of the genus, it is seen as a clump five to six feet high, made up of numerous bright brown upright stems, which bear green raspberry-like leaves, and showy rosy-purple flowers, the latter appearing from axillary buds. The flowers are followed by golden-coloured fruits, which ripen in early summer. They are medium sized and juicy, and although not put to any use, Loudon recommends them for culinary purposes. A native of Western North America, it is found from the Columbia River southwards to California, from whence it was introduced about eighty years ago.

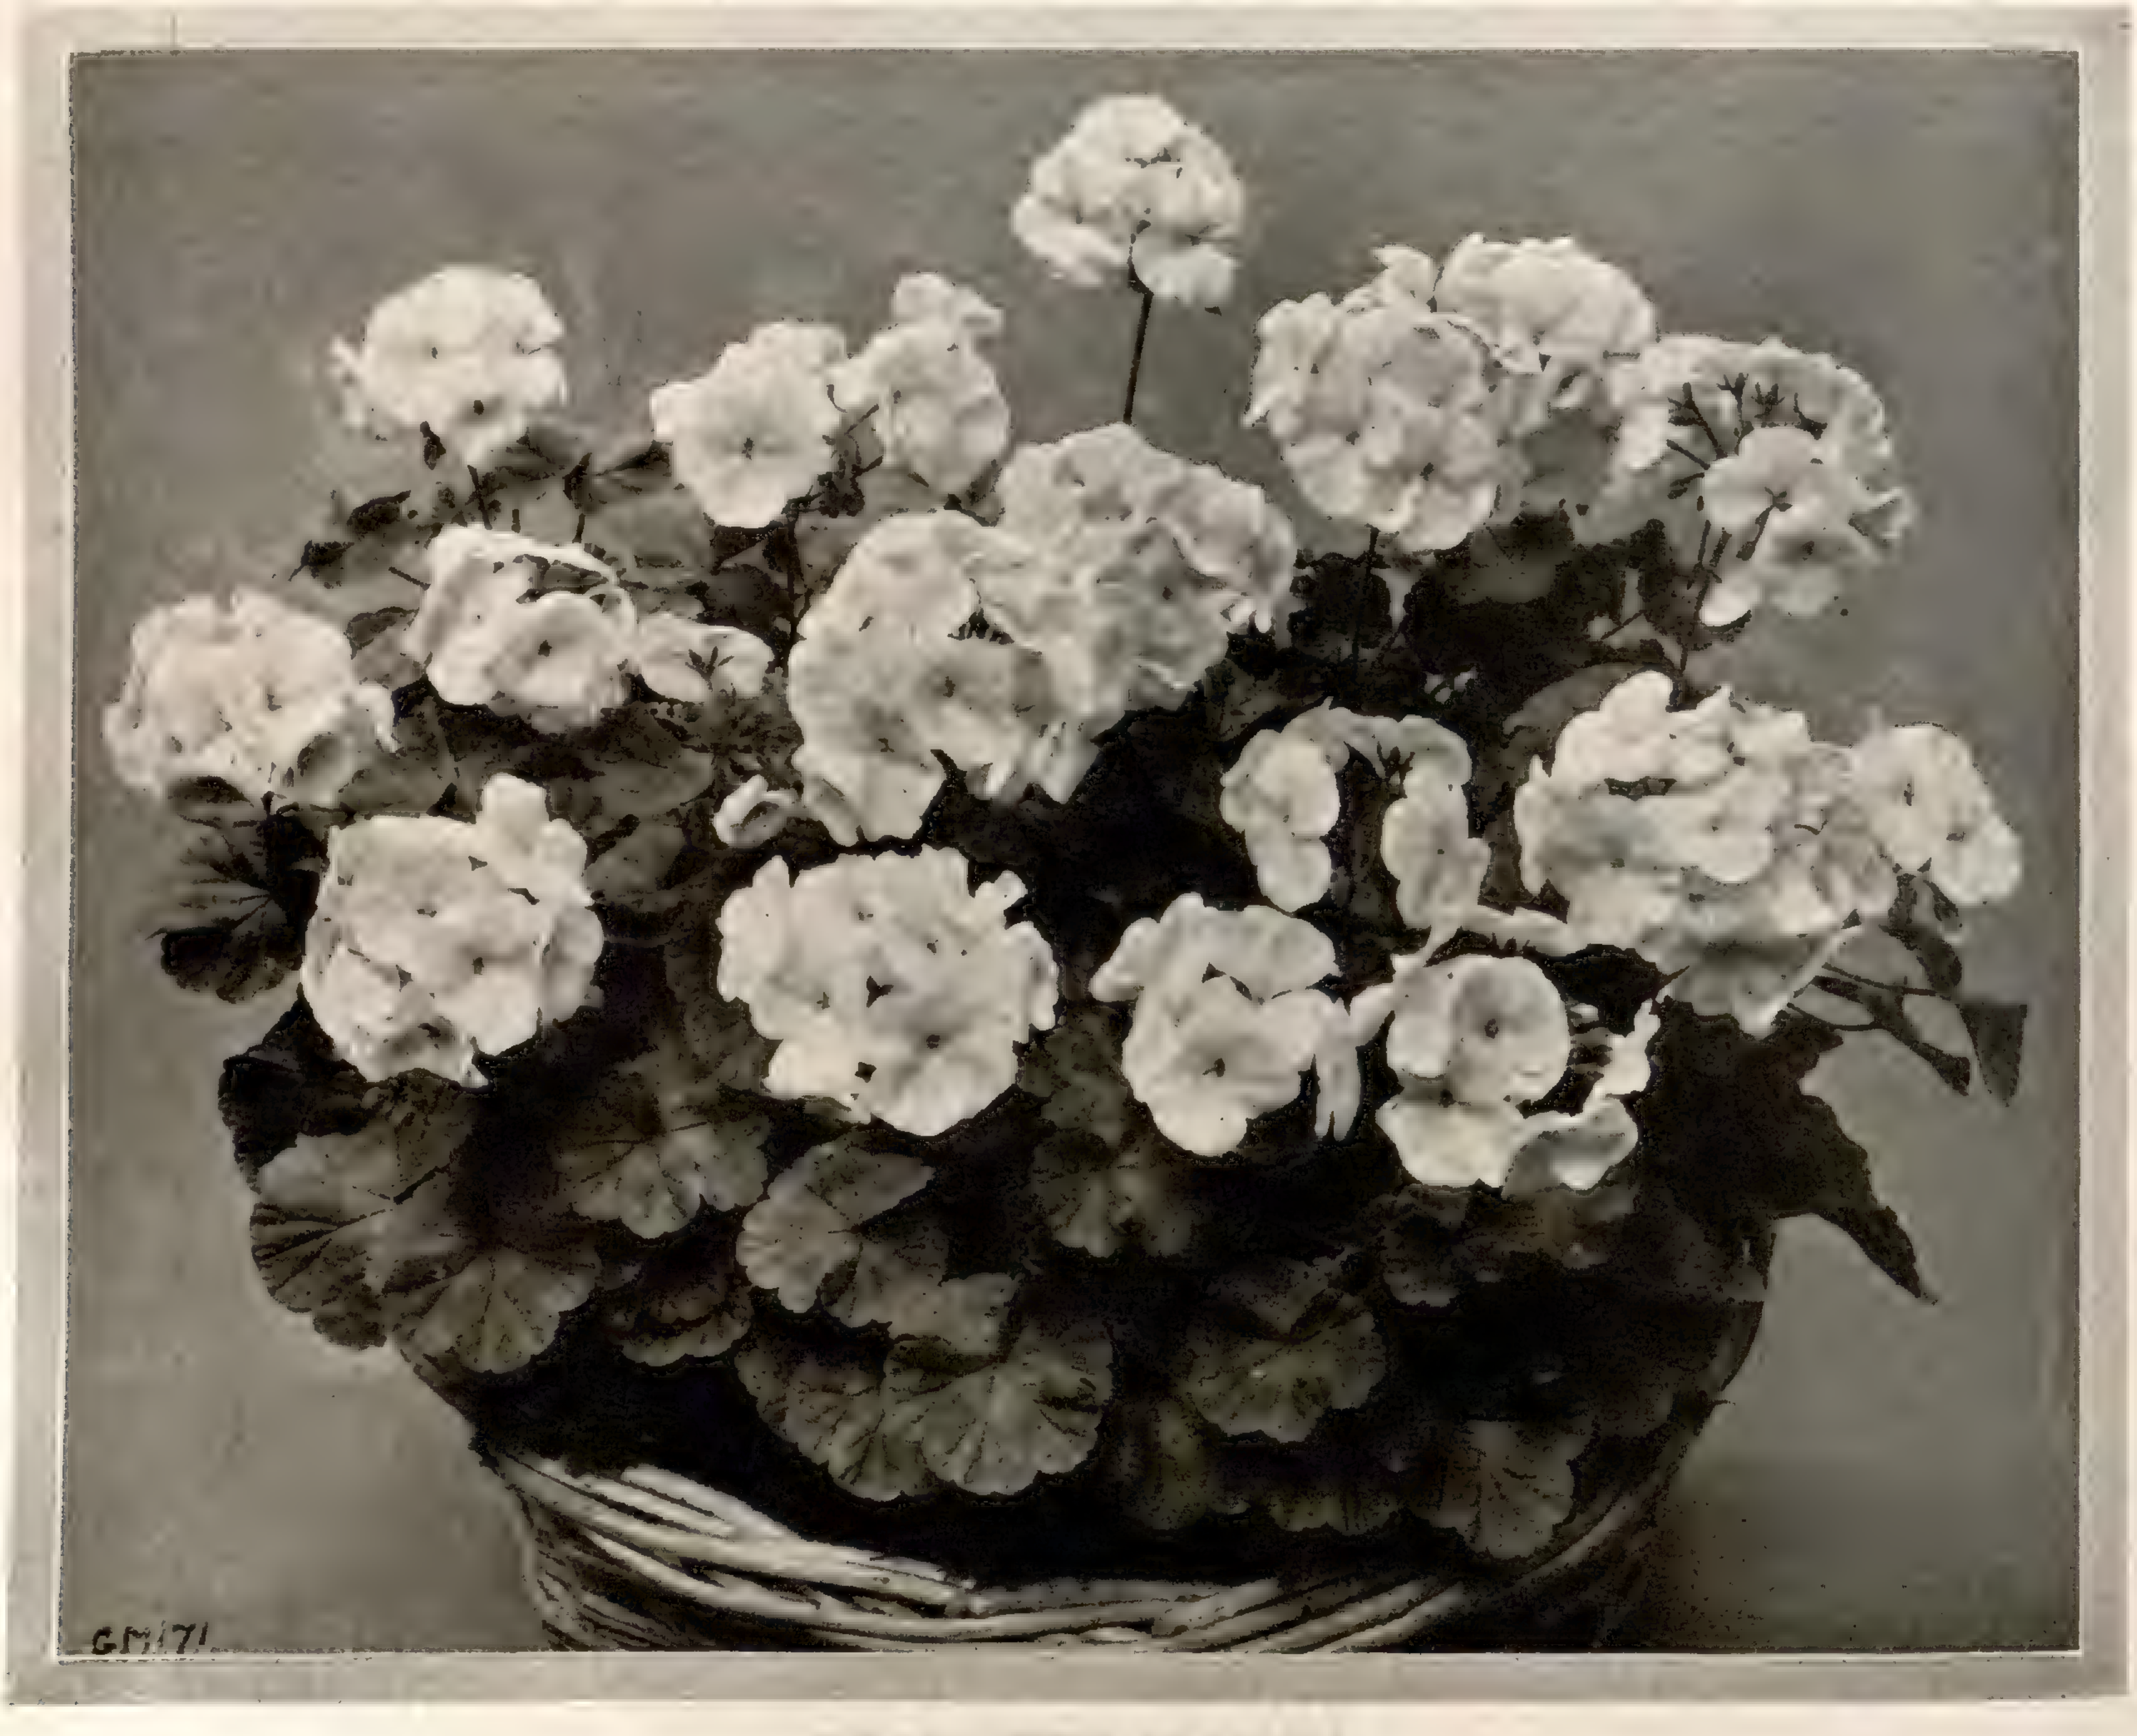
Planted in good soil it gives little trouble other than an annual cutting over in summer to remove the old canes, therefore it is well suited for planting in a shrubbery where the plants have to look after themselves to a large extent. Its free habit of producing suckers fits it for a place in the wild garden, where it can be given ample room for development, whilst it may also be planted, in places where the shade is not very dense, for cover. Propagation is readily effected by division of the clumps during autumn or winter.

W. D.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of Chrysanthemums for Garden and Greenhouse, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## PELARGONIUM AMBROSIA.

New pelargoniums of special merit for summer bedding, are not raised so frequently now as in former years, when it was more the fashion to provide the summer display of flowers by means of tender subjects than at present. The lack of special demand for new bedding varieties has doubtless been largely responsible for the scarcity of the supply, but there is always room for a first-rate plant, and when the variety Paul Crampel was introduced for bedding it rapidly became popular because of its good habit, fine flowers, large trusses, and rich colouring. A variety that promises to have a long run of popularity is figured in the present issue. It is named Ambrosia, and gained an Award of Merit from the Royal Horticultural Society on April 2, when exhibited by Mr. Philip Ladds, of Swanley Junction. As already indicated in these pages, Ambrosia bears large shapely flowers in good trusses, carrying these well above the deep green, dark-zoned leaves. A basket of plants was exhibited by Mr. Ladds, who is one of the largest growers for market, and every one was short jointed, freely branched, and in every way perfect for the purpose proposed for it. The colour is a distinct and beautiful shade of rose-pink, at once pleasing and effective.



PELARGONIUM AMBROSIA.
A fine new, pink-flowered bedding variety. A.M., R.H.S., April 2. Mr. Philip Ladds, Swanley Junction.

## CARPETING PLANTS.

A number of plants that have a dwarf, prostrate, and spreading habit are of great utility in the garden. Such plants are naturally identified with the rock garden, where they form delightful mounds of greenery and coloured foliage, to say nothing of the wealth of florescence that is produced in many instances in due season. Then they may be utilised to furnish banks and spaces underneath large trees, it being a difficult and laborious task to maintain grass in good condition under such circumstances. A few at least may find a home in the front of the herbaceous border, and thus contribute life and greenery in the dull season.

Further, at this season we are reminded of their value for covering mother earth in the beds and borders devoted to spring-flowering bulbs, and it is no longer necessary to gaze upon bare soil in this part of the garden during the winter, while the carpet plants do much to enhance the beauty of the whole when in blossom. It is superfluous to dwell upon the merits of such well-known and popular plants as the arabises and aubrietias, the saxifrages, sedums, and stonecrops, which are well represented in most gardens.

The New Zealand Burrs, or Acænas, supply us with first-rate material as carpeting plants, and a very attractive species is A. microphylla, with bright red burrs and distinctly pretty foliage. Scarcely less desirable is A. argentea, and both are of wide-spreading habit. The grey foliage of Thymus serpyllum lanuginosus is soft and pleasing, and it is advisable to cultivate the plants in pots, and plunge them in the beds in autumn, returning them to the reserve garden in late spring. Among the alpine pinks, perhaps Dianthus cæsius and D. deltoides are the best for this purpose, and with regard to arenarias, A. montana and A. balearica must be written down as first-rate. That useful old plant, the Creeping Jenny (Lysimachia nummularia) cannot be ignored, while its variety aurea is a brilliant subject, and I noted 5ft. high banks of it on either side of a carriage drive, which presented a solid golden mass, in a western garden last season, and was much impressed with the effect created and the capabilities of the plant in this direction. It is employed in some of the London parks to form a very wide belt around large flower beds, and is, I think, unsurpassed for brilliance. There are many gardens from which at present wholly absent where both the green and golden leaved forms might be used with advantage.

Alyssum serpyllifolius gives us sheets of hairy foliage, while Mentha Requini is responsible for delicate greenery that is very pleasing to the eye. Herniaria glabra and its variety aurea, Linaria hepaticæfolia and pallida extend the list, not forgetting Galax aphylla, with leathery green leaves which assume a crimson shade when placed in the direct sunshine, or Geum montanum, Phlox procumbens, and Megaseas in nearly a score of kinds. Primroses, polyanthuses, daisies, and myosotis also play an important part in the decorative scheme in relation to spring bedding, especially when representing good strains.

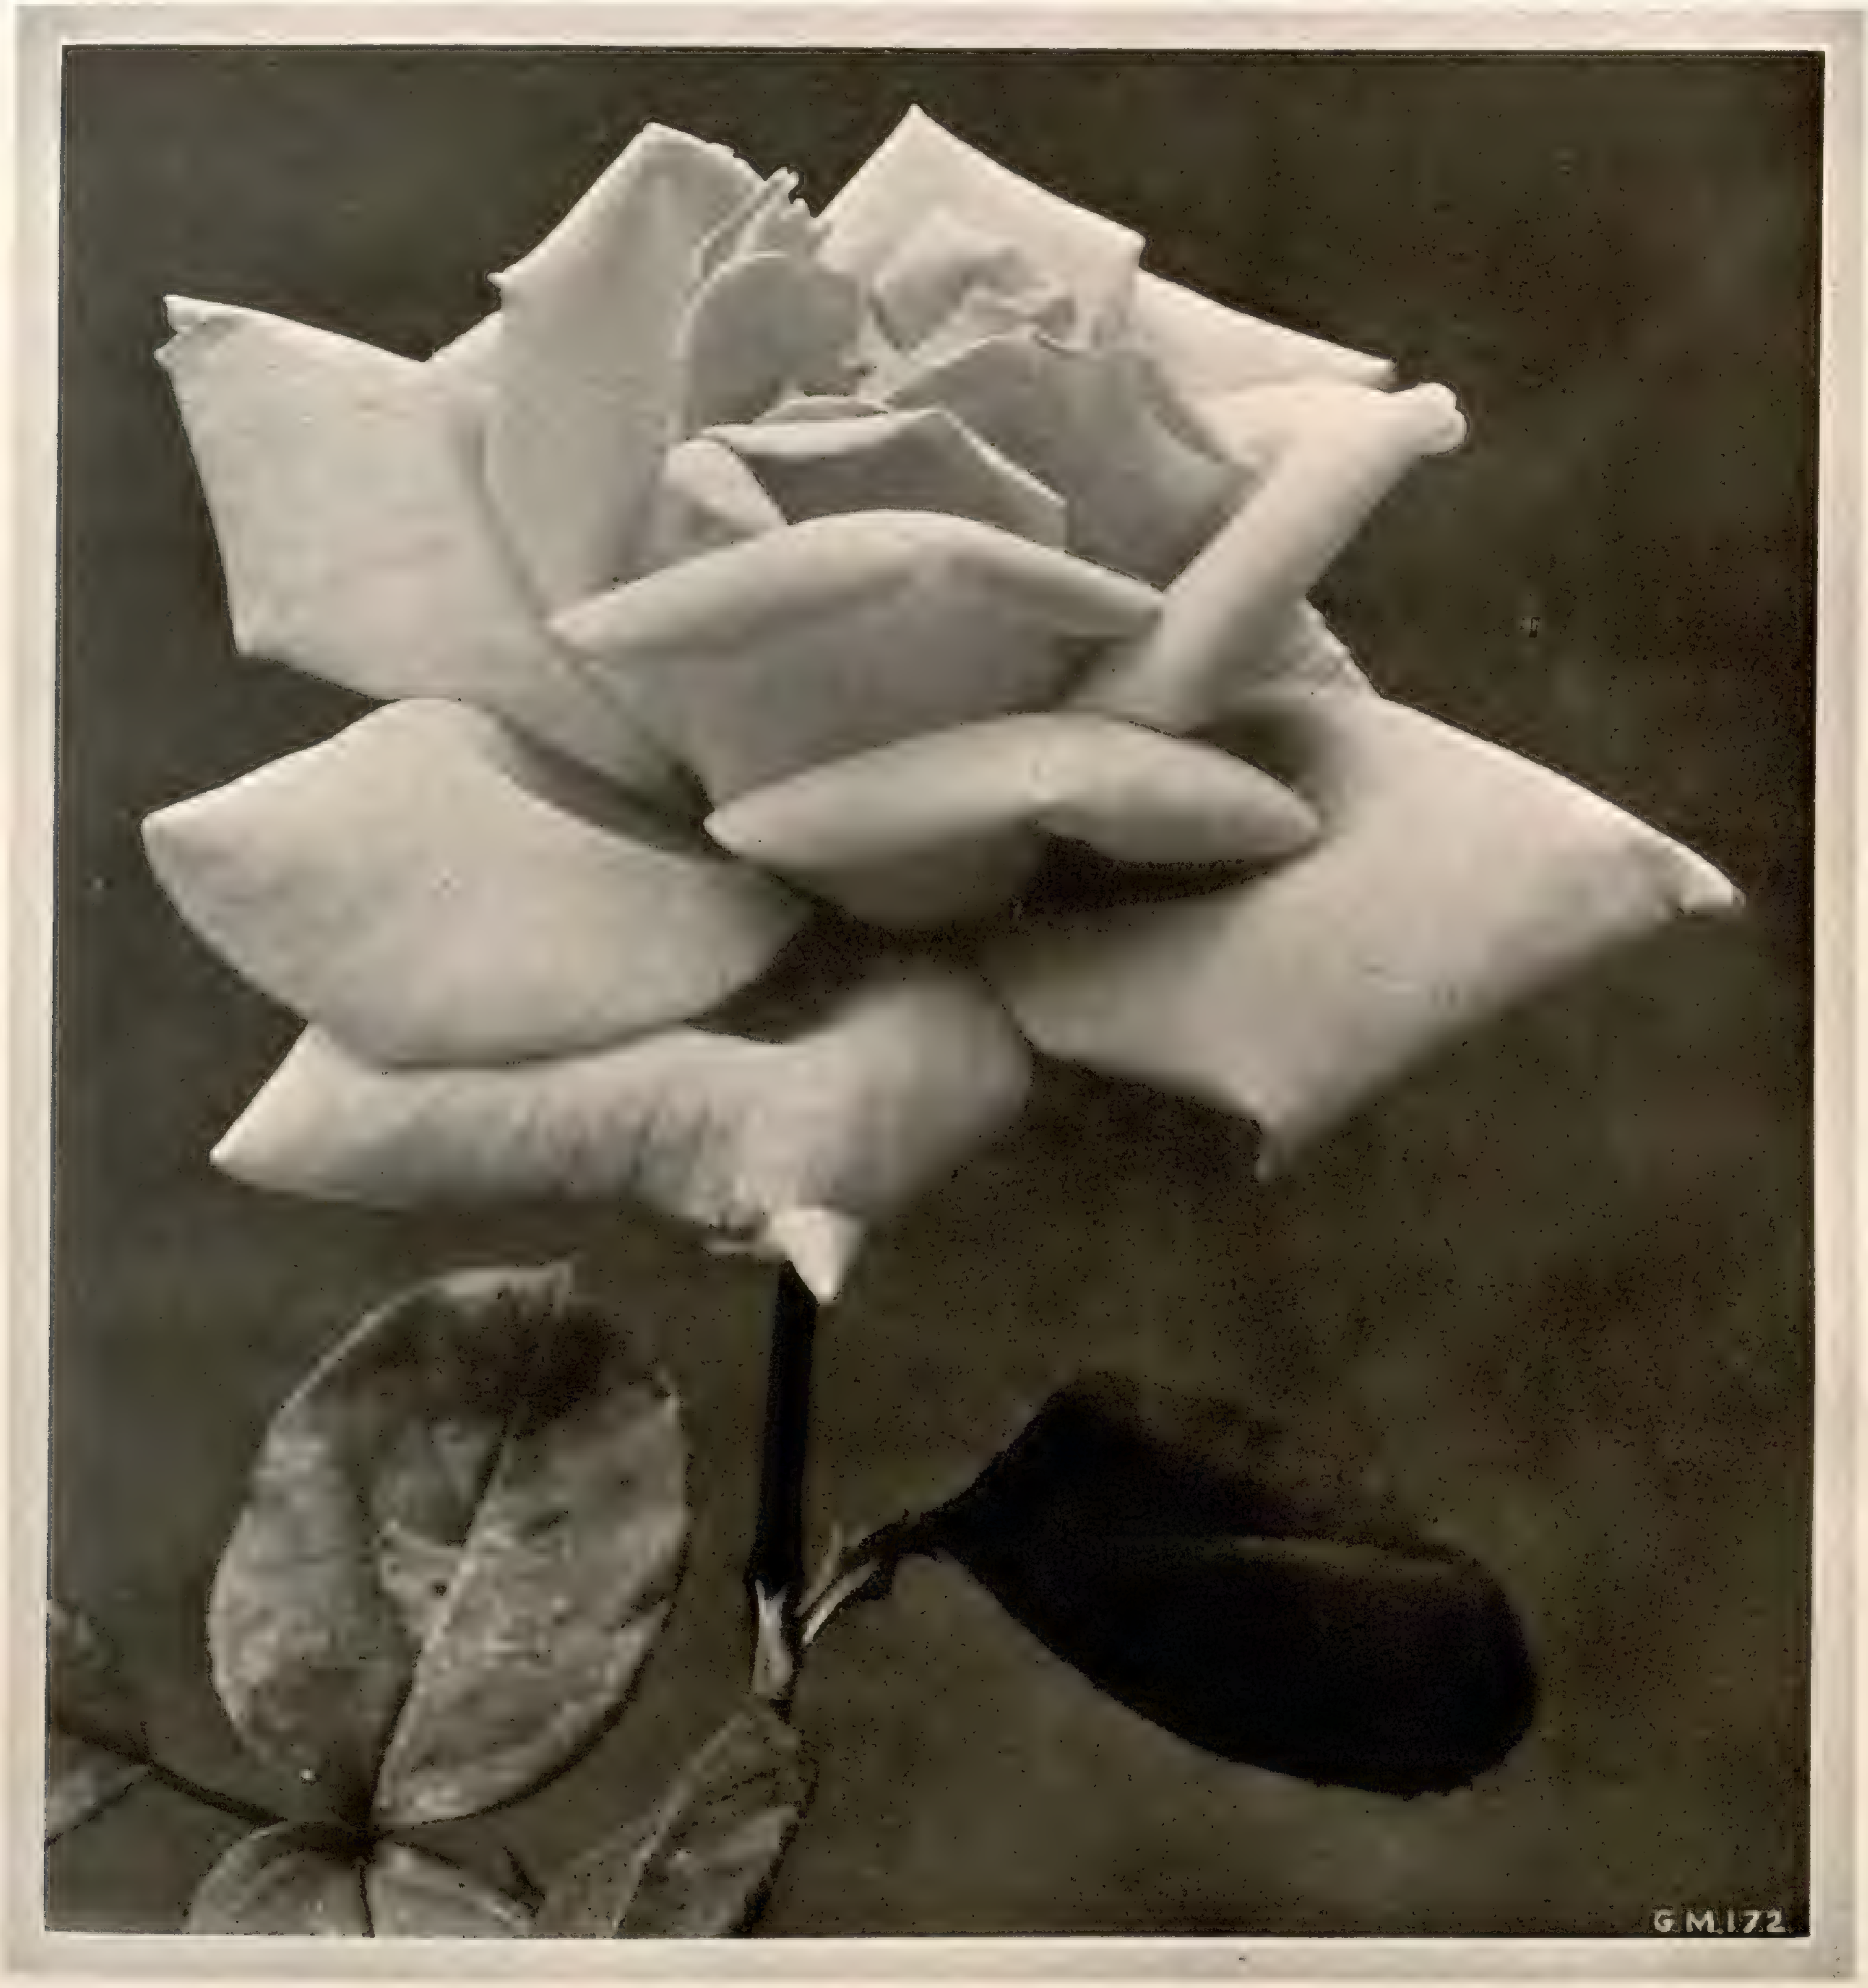
Walter H. Aggett.

---

An edition of "SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis, has been issued for 1912, and consequently this is an up-to-date work on the subject. The price, by post, is 1s. 2d. (cloth, 1s. 9d.) from the Publishers, 148-9, Aldersgate Street, London, E.C.

## NEW ROSE, MRS. C. REED.

This appears to be a most promising new hybrid tea rose, and certainly it is a fine one for forcing. The flowers are of large size, and fine form, full, broad petalled, and extremely beautiful. The colour is creamy-buff, exquisitely suffused with pink, forming an art shade that costumiers are sure to imitate quickly. The flowers are borne on long stout stems, and the foliage suggests that the rose has a good constitution.



NEW H.T. ROSE, MRS. C. REED.
Flowers cream-buff, suffused with pink. A.M., R.H.S., April 2. Messrs. Lowe and Shawyer.

The variety was capitally shown by Messrs. Lowe and Shawyer, Uxbridge, at the Royal Horticultural Hall, on April 2, and was then granted an Award of Merit.

---

**Franciscea calycina floribunda.** — This exceedingly floriferous variety of a well-known and popular plant has been shown at several of the Horticultural Society's meetings this year, and has gained many admirers. For the warm greenhouse or stove it is a useful subject, and its lilac-purple flowers are most attractive.—K.

## HARDY PINKS.

These popular old favourites provide a class of plants which are excellent for edging purposes in flower borders. Coming into blossom before the carnations, they are highly appreciated for cutting, as the blooms last well and are deliciously fragrant. They thrive best in a free, open soil, made fairly rich with well-decayed manure. Where soil is heavy, a liberal quantity of old mortar rubble and sand should be added. Although quite hardy, pinks frequently succumb to excessive moisture when planted in heavy, retentive soils.

Undoubtedly the best results are obtained from two years' old plants, as after this age pinks have a tendency to become weak and straggly, and the natural outcome of this is a poor crop of flowers. To maintain a good stock of healthy plants, propagation must be carried out annually, and the best time to accomplish this is immediately the flowers are past. Material suitable for propagation, pipings, or slips is produced by the side growths, which are found growing from the stem below the old flower spike. These should be carefully drawn off, with a downward pull. All the preparation necessary is to trim off the ragged ends caused by removal, and a few of the lower leaves. A bed of sand should be placed in a cold frame, or, if only a few plants are required, a hand-light will suffice, and the cuttings inserted in it. When the cuttings are put in the bed give them a good watering to settle the sand firmly round them. Shading will be necessary for a short time during bright days. Keep the frame close, and damp the cuttings overhead once or twice daily.

Providing the cuttings are in good condition when they are put in, there will be very few failures under this method of propagation. Pure sand is an excellent material for rooting pinks in, but close attention must be afforded to prevent it becoming dry. Should this occur, it will mean a great drawback to the rooting of the cuttings, and many losses will result from the neglect. Of course, slips will root when inserted in the open border, but not so freely as they will under the foregoing method of propagation.

An excellent white for general purposes is Her Majesty, with large and fragrant flowers freely borne; others are Snowflake, Albino, and Mrs. Simkins. The newer Progress, with rosy mauve flowers, is an exceptionally fine variety of vigorous habit, and with strong flower stems. Evelyn, white ground, with pink lacing; Ernest Ladhams, blush, darker centre; Empress of India, dark-red; Lady Craven, red; Marion, rose pink; George White, purple; and Minerva, dark-red, are all good and free-flowering pinks.

## EARLY FLOWERING MAGNOLIAS ON WALLS.

With the exception of Magnolia grandiflora no great prominence is given the members of this genus for the purpose of clothing walls, yet in the colder parts of these islands, at least, no choicer subjects can be conceived for such a purpose, while even in favoured districts they attain a degree of beauty under these conditions that warrants much greater use being made of these than heretofore. Although hardy in most parts of the country, even when planted in the open, it is always necessary to plant in sheltered places, as, owing to the wax-like texture of the petals, the flowers are exceedingly liable to damage from sun scorch following upon frost, or from chafing against the branches during rough winds. It is against accidents such as these that the advantage of wall protection becomes apparent.

Of early-flowering kinds, Magnolia stellata is first to unfold, the flowers opening toward the end of February or early in March, according to the season; the flowers are white, and the strap-like petals reflex at the points, and give the expanded flowers a star-like appearance. It forms a well-rounded bush when grown in the open, and although not quite the best type of wall shrub, it readily adapts itself to these conditions; once well-established, growth becomes fairly rapid, the plant fills up well, and flowers with a freedom that marks it as one of the best of our deciduous flowering shrubs. Like other members of this genus, it resents lime in the soil, succeeding best in a cool deep sandy loam.

Magnolia conspicua (the Yulan) blooms early in April, producing large white scented cup-shaped flowers, that are borne erect on the points of the branches. It is a fast-growing shrub, and flowers so freely as to appear clad in white, and a good specimen constitutes quite a floral triumph in the garden in spring. Magnolia Soulangeana is only a few days later in opening than conspicua; it is regarded as a natural hybrid between the last-named species and obovata, resembling conspicua in the large size of the flowers, but differing in colour, the flowers being heavily suffused with purple externally.

Magnolias succeed best in a fairly rich loamy soil, and in a warm sheltered spot open to the sun. For the early-flowering section a south-west or west aspect is much to be preferred, as there the early frosts are dispelled from the blossoms before the morning sun falls upon them. Magnolias resent disturbance at the roots, so that planting should be regarded as permanent in character, and ample space be provided for lateral development at the time of planting.

## CULTIVATION OF PERPETUAL CARNATIONS BY AMATEURS.

(Continued from page 287.)

### Newly-rooted Plants.

When the cuttings become rooted, gradually harden them off, and put them into two-inch pots, using a compost of equal parts of loam, leaf-soil, and sand, with a few wood ashes added, then place in a light position in a temperature of 50 to 55 deg. Shade them from bright sun for a few days until established, and water carefully, remembering that for the first few days the plants have few roots, and so will not be taking up a quantity of moisture from the soil, which, if kept wet soon becomes sour. A slight spraying overhead might be given with advantage on bright days, but this should always be done early in the morning, so that the foliage will become dry before night. A word of caution might be given as to the manner of removing the cuttings from the sand. Do not pull them up, or most of the lower roots will be broken and left behind in the sand, but take a label or flat piece of wood, and push under the cuttings so as to break the sand, and lift up the cutting with the roots entire. Keep them growing, and as soon as the roots show round the sides of the pots, they should be shifted into 3½in. or 4in. size. For this shift use a compost of three parts of good loam that has been stacked for some time, one of good flaky leaf-soil, and one of old mortar rubble or screenings from a clay or smother fire, and sand with a good sprinkling of wood ashes. Pass the whole through a quarter-inch sieve. Take care at each potting that the stem of the plant is not buried lower than previously, or stem-rot is likely to set in.

Continue to grow on in light, airy position in a house with a temperature of 48 to 55 deg., and in a few weeks they will require another move into their flowering pots, the larger into seven-inch, and the smaller into six-inch pots. Use the same mixture of soil as before, except that it should be coarser, not requiring sifting, and adding a six-inch pot of bone-meal to every barrowful of soil.

In potting it is essential that both the soil and plant should be in the right condition. The soil should be moist, but not so wet that it will stick to the hands. The plant also should not be too wet or too dry. If wet, the ball of the plant is liable to break and injure the roots, and it is impossible to make the new soil properly firm, while, if dry, it is difficult for the water to percolate through the new soil, and so reach the roots, which consequently suffer.

### Stopping the Growths.

Stopping is an important item in the culture of perpetual-flowering carnations, and is performed in the first place to insure a compact bushy habit, and also to increase the size of the plant, and the number of the flowering growths. The first stopping should take place just after the young plants have received their second potting (i.e., into 3½ or 4in. pots), and are about six inches high, and have perhaps six or eight fully-developed leaves. The points of the plants should be pinched out, so as to leave about four joints.

It may appear to the novice to be waste of time to grow a plant for some time and then take away what looks like the best part of it, and he would probably say, "Why not stop earlier," but it is best to exercise patience. The plant has been building up and becoming stronger and more active in root growth, and, what is more important, the whole of the four joints are matured and more likely to break into growth at one time, and so lay the foundation for a larger and better plant than if stopped earlier, when it would probably break into two growths instead of four. It will be seen that the correct method of this first stopping makes all the difference between large and shapely plants and leggy weak specimens. In the same way, if they have been allowed to become pot bound, and then stopped instead of being kept growing and potted as soon as required, and stopped while the roots are in active growth, one could hardly expect such clean growths from the former plants as the latter. From this time, the plants should be attended to once or twice a week, and those growths stopped which are just beginning to run, or are six to eight inches long. Stop back to the matured wood, leaving four to six joints. If not more than one or two growths on the same plant be stopped at the same time, it will help to keep up the perpetual flowering character of the plant, for naturally, if all the shoots were stopped at the same time they would flower at very nearly the same time. The stopping of most of the varieties should be discontinued at the beginning of July, a few of the more freer growing a fortnight or so later.

### Summer Management.

About the beginning of April the plants may be removed into unheated frames and gradually hardened off as the season advances. About a month later they may be stood outdoors on an ash bed, but means should be taken by which they may be easily covered with glass lights, should a rainy period occur.

Nothing will cause carnations to become unhealthy quicker than being continually wet at the roots, and especially is this the case with plants that are not well rooted, which, of course, the carnations would not be at this early stage of their growth. During the summer, watering must be carefully attended to, and when they are well rooted, weak applications of soot water may be given. During warm weather they are much benefited by spraying over with the syringe in the late afternoon, wetting the ashes around them to cause a moist atmosphere. If the amateur cannot attend to his carnations by looking round them two or three times a day during hot weather, it is a good plan to plunge the pots in ashes, so that they will not dry out so quickly. But otherwise I prefer not to plunge, because in our capricious climate we are just as likely to have a dull time, and I think the plants benefit by the air playing around the pots.

Staking and tying should be attended to as soon as becomes necessary. This operation should be begun early, not delayed until the growths begin to bend or they will not make shapely plants. On windy days, the grower will be much happier to know his carnations are safe from being blown about, and some of the best shoots broken. Place a stake in the pots long enough so that it will not want replacing during the plant's growth, for strong-growing varieties this should be 2½ to 3ft. long. There are some patent wire rings on the market, which can be used as substitutes, for tying later, and these if carefully placed, will keep the plants in good shape, and save much labour in tying as well as when cutting the flowers.

(To be continued.)

---

**Escallonia Langleyensis.**—One seldom sees this recommended as a wall or screen plant, yet I know of nothing more beautiful for the purpose. If the main branches are secured to a wall, fence, or other support and the minor shoots are allowed to dispose themselves at will, they assume a more or less semi-pendulous habit of growth, and a charming effect is thereby produced. More than this, the clusters of reddish rose flowers are borne in great profusion, and a succession is kept up for some time. Beautiful as many of the escallonias are, I look upon this as one of the best. It is surprising that it has not gained the First Class Certificate of the Royal Horticultural Society, though it was given an Award of Merit some years ago. Escallonia Langleyensis was raised in Messrs. Veitch's nursery at Langley, the parents being E. macrantha and E. philippiana. This last-named is deciduous, while the other parent is evergreen, and as might be expected, the progeny is sub-evergreen in character. There is a particularly fine specimen of this escallonia at Coombe Wood.—S. W.

## AMONG THE ALPINE FLOWERS.

"I have found Violets. April hath come on,
And the cool winds feel softer, and the rain
Falls in the beaded drops of summer time.
You may hear birds at morning."

So sung Nathaniel Willis, the American poet, in speaking of April, and though we have long had violets, we can yet, I think, enter into the spirit of his joyous notes as we wander among the flowers of the time. April is, indeed, one of our most delightful months among the alpine flowers, even though we are as yet but on the threshold of our temple of pleasure. There may yet be hard times in store for our flowers. Winter is not so readily defeated by the approaches of spring. Despite her soft wooing, he is reluctant to yield, and so we enjoy our floral treasures with some slight shadow of fear upon us, lest they may be cut off in the midst of their beauty. Happily, however, our alpine flowers are not so tender or so frail as to be unable to withstand the usual weather of the season, and so we delight in their loveliness, even though the rockeries are white with late hoar frosts on some mornings. These beauties of ours can brave the changes of the seasons wonderfully, and so we take pleasure in their "pleasant delites," as an old writer said. Wherever we turn there are bright flowers, and not only those which usually open at this season are in bloom, but I think there are still a larger number than are wont to remain of the more courageous blossoms which have dared the winter months, and abide with us until the spring flowers call upon us to admire their charms in preference to those of their forerunners. There are many claimants upon our notice, and so we feel at a loss which to select for our appreciation. Many of our finest flowers have been praised before, but we may yet find a number of gems which call for our notice at this time.

### Primula The General.

We have of late been endowed with a wonderful number of new primulas, either novel species or hybrids recently raised. Some of these are lovely things, revealing to us a wide field of beauty, and promising to us and to our successors in gardening many vistas of loveliness. Yet some of the older hybrids and varieties deserve more than a passing notice. The one, called The General, raised, I think, by the late Dr. Stuart, of Chirnside, though I say this subject to correction, is one which I have proved to be a more reliable plant under comparatively simple treatment than almost any other primula that I have cultivated. It is derived from P. ciliata, and is an excellent grower, standing well on the rockery without calling for any special treatment, flowering freely, and giving a goodly number of its deep scarlet flowers. All it requires appear to be a rather open, yet firm soil, with plenty of stones about it, top-dressing in spring, and an occasional division. I am a little surprised that it is still so scarce, and can only say that it deserves the love and admiration of many cultivators of rock plants. These ciliata primulas all like a cool place, and my best plant of The General is well shaded from the forenoon and afternoon sun.

### Primula Bulleyana.

Mr. A. K. Bulley's primula is showing for bloom already, and it seems strange that we shall probably see it in perfection at the great International Horticultural Exhibition, just as we have admired it at the Temple Shows. One has been a little doubtful of some of these Chinese primulas, so far as regards their perennial habit, and hardiness under average conditions. But we need not, I think, have any lingering fear even respecting Primula Bulleyana. It has passed through more than one winter, and is quite at home in a low, damp spot in the rock garden. Unlike the ciliata varieties, it is not a saxatile species, and takes pleasure in moisture, being thus a plant for those who have places in which they can plant this and other moisture-loving primulas. It is truly handsome and vigorous, sending up tall stems of flowers in whorls, and of a fine orange and apricot colour. It is delightful in itself, and it holds in prospect treasures as yet untold, in the shape of its progeny, for the lover of the primula. We may doff our hats to the finder of this fine plant, and thank him for the benison he has bestowed on all lovers of the race.

### Waldsteinia geoides.

Time was when the writer despised the plant known as Waldsteinia geoides, and accounted it as much less worthy than its sister flowers, W. fragarioides and W. trifoliata. But that was ere it was seen in specimen form, and now he has been delighting in one which is of considerable dimensions. It is delightful indeed this April, with its little geum-like leaves and its crowds of small yellow flowers, spangled thickly over the foliage. It conveys a lesson, i.e., not to be too hasty in condemning a plant, seeing that it has been known to the writer for a goodly number of years, has been cultivated in his garden for a considerable time, and has been frequently seen elsewhere. It is certainly not a flower for the worshipper of size and beauty in the individual bloom, but as a rock garden plant, trailing over a low stone in a moist place, it is not by any means to be despised. But it must not be a plant with a dozen or so of flowers, but a specimen which can boast of a hundred or more together. It is a lover of moisture, and, at least, partial shade.

### Other Flowers.

But now we must draw to a close amid a galaxy of beauties which would claim our notice. There are, for example, anemones galore, from the dainty A. vernalis to the many varieties of our wood anemone, Anemone nemorosa, which have found their way here. A. blanda has not yet gone to rest, and Mr. Ingram's dark blue one is still resplendent. A. apennina is yet in full glory; A. ranunculoides, in three varieties, is very bright, with its little starry flowers. As for the nemorosa varieties, who can do justice to them? Snow white, palest blue, opal, purple, deepest blue, with intermediate shades, they are lovely, and fascinate us as we stand and stoop to admire. Their allies, the hepaticas of gardens, still give us a few flowers. Saxifrages are delightful, and the later ones bristle with blooms over their sheets of moss-like verdure, or send from their silvery rosettes little spikes or towering plumes which are rising fast into bloom.

Other primulas than those mentioned are in bloom, or fast making progress. Arabises are sheets of snowy white, and aubrietias, not yet at the zenith of their loveliness, give us masses of colour.

The moss pinks are bristling with buds, and a page almost would be necessary were we to enter fully on the flowers now in flower. In bulbous plants alone there are narcissi, frittilarias, ornithogalums, scillas—italica being now in bloom, with two or three more. Tulips, muscaris, and others with bulbous or tuberous roots bear company with the many beauties of the time.

Truly "the winter of our discontent" is past, and we are in the glorious, yet sweet and attractive, spring—the Elysian period of the lover of the alpine flowers.

S. Arnott.

## THYMES IN GARDEN DECORATION.

The use of old flag-stone paths and dry walls in gardens, so much in favour at present, brings into prominence certain plants that otherwise would have but a limited use. Of the highest utility in this direction are the various species and varieties of thymes, many of which have the merit of being exceedingly profuse and beautiful when in flower, and the majority are among the most delectable of scented plants, the fragrance of Thymus Serpyllum lanuginosus being remarkable for its elusive character, as it is difficult to inhale by direct contact, yet when diffused in the surrounding air, it is both powerful, and one of the most exclusive of perfumes, appealing to every taste.

Among thymes we recognise two distinct types of growths. The stems of T. Serpyllum assume a decumbent habit, while those of T. vulgaris grow erect; the former has an extended use for planting in the joints of paved walks as the prostrate stems are not materially damaged by being trodden upon, while an occasional plant of the erect type, by giving contrast, will increase the general effect.

The best known creeping thyme is T. Serpyllum, a native plant that grows wild in chalk districts, on sunny banks and similar places; of this species there are several distinct varieties worthy of a place in the garden scheme, such as I have suggested, or for arid sunny spots on the rock garden. T. S. albus is a pure white flowered form, and is easily distinguished in winter and spring by the vivid, bright green tint of stems and leaves. T. S. carnosus is slightly hirsute on the leaves, which have a slight grey tint, while the flowers are a bright shade of pale magenta. T. S. coccineus is a rich crimson flowered variety, and is readily recognised in winter by the dark purple tint of the leaves. There is also a form sold as grandiflora, much larger in its parts than any of these, but equally profuse in flowering, the colour approaching that of T. S. carnosus. T. S. lanuginosus is grown entirely for the sake of its leaves, which are densely hoary, the plant forming a luxuriant mat of grey leafage that is most delicately scented. T. S. citriodorus is the Lemon-scented thyme, of which there is a golden-leaved form, and also a form in which the leaves are variegated white and green; the latter retains its colour at all seasons, being very bright in positions where it obtains plenty of sun; all the varieties of citriodorus grow erect.

Thymus Chamædrys is a distinct species that gives several desirable varieties of prostrate growth; T. C. nummularius is one of the freest growth, with flowers of a light purple; T. C. montanus is a refined variety, with much smaller foliage than the last-named; this variety succeeds best in a dry stone wall, with the interstices filled with soil; otherwise, in flat planting it is liable to die off from damp in winter; the habit of growth and rich shade of green render it very distinct.

Thymus villosus, regarded as a species, is a dense woolly-leaved plant, much in the way of T. S. lanuginosus, but lacking the refined perfume of the last-named; the stems are quite prostrate, and the plant is vigorous and a reliable grower in any position. All the varieties of thymes are propagated by division or cuttings; the latter root readily at any season if placed in a close frame, while division is best carried out in spring or autumn.

Thomas Smith.

Coombe Court Gardens.

## THE OLD-FASHIONED GARDEN.

A garden of old-fashioned flowers may be made either according to a regular or an informal plan, but probably the first method gives most pleasure if it can be carried out on a fairly large scale, the second being better suited to the small plot that can be overseen at a glance. A round lawn is an attractive centrepiece for the formal garden; it should be surrounded by borders that would make the whole into a square if continued on all sides; the necessary exits and entrances from the lawn may be four in number, one at each side, and had better be also of turf, leading to a wide gravel walk, that, in its turn, is flanked by a four-feet to six-feet border. If there is space another gravel path may follow this border, flanked by a border ending in a trim hedge of evergreens.

Here we have the foundation for a successful regular old-fashioned garden; by the time a sundial is stationed in the centre of the lawn, and the four grass paths are each spanned by a rose and jasmine-covered arch, the scene will be already attractive. In the wide gravel walk, opposite each grass path, may stand a round or square green-painted tub containing a variety of subjects, according to choice. Heliotropes and chrysanthemums, rhododendrons, Madonna lilies, moss roses, Michaelmas daisies, snapdragons, phloxes, clove carnations, all may be successfully cultivated in sufficiently deep and well-drained receptacles.

The border between the two paths should contain a massing of all kinds of plants. A Maiden's Blush rose bush can spring out of a group of polyanthuses, lavender may be surrounded by giant pansies, and the old Cabbage rose with Lilium candidum by its side and hen-and-chicken daisies in front will always please. Here should be tree lupins, as well as others, congregations of rich-tinted sweet williams, some of the older kinds of dahlias, striped carnations, wallflowers and stocks in abundance, with asters of the ancient types, not the modern Comet and Ostrich Plume varieties. French honeysuckle should not be forgotten, nor lychnises and pentstemons, while pinks must be in great evidence.

Where a shady bit of border exists violets can blossom in profusion, with St. John's wort, honesty, Solomon's seal, woodruff, London pride, and ferns. Occupants for the border by the hedge should include day lilies, the cottager's orange lily, monkshood, single hollyhocks, and phloxes.

The informal old-fashioned garden ought to be so planted that the special trees and shrubs make obstacles to the view, and create "spots of mystery" beyond them. A thicket of briar roses, a bit of hedge formed of everlasting peas, a bower of honeysuckle and sweet briar mingled, will effect this, so, too, will avenues of hollyhocks, and a hedge of lavender.

A paved walk, with a wide border, hedge-backed on either side, will make a charming old-fashioned garden within the garden proper. It should lead to an arbour and seat at the end, and may be spanned by an archway or two. A round arch of ivy is a fitting entrance to it. The borders should be edged with double daisies, pansies, pinks, polyanthuses, etc. All the tall plants ought to be kept well to the back, as the grouping of high perennials or annuals in a foreground is of distinctly modern origin.

The gardener who makes a feature of an old-world rose garden will be helping to preserve among us the dear ancient varieties that are in danger of being discarded.

M. H.

## A QUEER FERN.

In all classes of vegetation there are very queer or curious forms to be found, some specific and others varietal; but it is fairly certain that the queer forms assumed by some of our native hardy ferns entitle them to rank amongst the most curious of all. A recent find near Woody Bay, in North Devon, suggests these notes.

I visited that paradise of ferns which exists under the shelter of the umbrageous woods which clothe the slopes leading downward to the sea in that beautiful locality. On one of the more exposed declivities, covered by oak trees stunted somewhat by their direct exposure to the wind, I found the soil composed of largish fragments of stone, more or less buried in deposits of oakleaf-mould, the accumulated result of centuries of autumnal sheddings. The trees affording shade of not too dense a nature, this soil had become the home of innumerable large plants of the hart's-tongue fern, which extended in all directions as far as the eye could penetrate the recesses of the wood. The large majority of these, owing to the stony character of the soil, were isolated plants, and consequently well developed and of large size.

For a long time, though examination was so easy, I could not find the slightest abnormality, every frond was of perfectly normal outline, varying only to the extent of small differences in width or a tendency to slight waviness or frilling of the usually flat, strap-like fronds. Suddenly, however, my eye caught sight of a frond with divided ends, on the lines of the common lobatum, or forked type. I noticed, however, that, instead of tapering to the usual blunt point, each division was quite round, and on nearer examination I found all the frond tips so characterised, some fronds dividing into two near the top, and others being simple. I found this to be due to the fact that in every case the midrib, which normally continues to the very point, suddenly stopped short, the veins then radiating from it, and carrying the leaf-tissue with them in such a way as to form a perfectly semicircular finial; while the long sausage-shaped dual spore heaps, hitherto arranged herring-bone fashion on each side of the midrib, radiated at regular intervals in conformity, exactly like the figures of the upper half of a clock dial.

As an undivided, but otherwise similar, form is already in collections named by me "radiosorum," in allusion to this peculiarity, I have named this new find "S. v. radiosorum lobatum," to indicate also the secondary character. It is, of course, impossible to imagine the cause of such a singular and thorough alteration of structure. The plant was, as I have indicated, one of many thousands, all growing under identical environmental conditions; there was nothing to check development; it was perfectly healthy and robust; and yet, in each and every frond, the unrolling midrib altered its mind, as it were, when nearing the end of its task, and, instead of forming a normal tip to the frond, finished it up in this symmetrical and neat fashion.

This type must be allocated to what is known as the truncate section of the hart's-tongue variants, which embraces a number of distinct forms, all characterised by a sudden stoppage of the midrib development. Usually, however, it continues externally to the frond for a short distance, forming a thorn-like projection, constituting the "cornutum" or horned section, this horn protruding either from the front or the back of the abbreviated frond tip. Or it may spring from the centre or elsewhere of a sort of pocket (peraferens); and, if conjoined, as has been done, by crossing with branching forms, such pockets and thorns may be produced at the terminals of each division, the midribs obeying, as it were, the law of the varietal section concerned, and invariably stopping short of forming a normal tip. Where the normally round basal lobes of the frond are extended so as to show independent midribs, these, too, will stop and form basal pockets (triperaferens).

This trick, if we may so term it, curious as it is, since it cannot possibly be imputed to any environmental check upon growth, is by no means peculiar to the hart's-tongue, though in that species it assumes many forms. It is also seen in Lastrea filix mas, L. montana (quite frequently in the wild state), Polypodium vulgare (in irregular lines), P. hexagonopterum, Athyricum filix foemina (excurrens), Polystichum angulare, and Osmunda regalis; and, outside the ferns, we see it in the leaves of the tulip tree.

Chas. T. Druery, V.M.H., F.L.S.

## POND-WEED AND COPPER SULPHATE.

A frequent application for advice made to Kew is from correspondents whose ponds or lakes are infested during summer by the various forms of algæ or "weed," found in British waters. Everyone, writes "W. J. B.," in the "Kew Bulletin," knows the unpleasant nature of the scum-like and other growths that are nearly always seen at that season on still, or nearly still, water. They not only frequently destroy the beauty of ponds entirely for a time, but are offensive to the nostrils as well. A good deal of this annoyance may be avoided by the use of copper sulphate. Owing to the water of the Lake at Kew being pumped for garden purposes (including the watering of ferns and other low types of vegetation) it is considered inadvisable to use copper sulphate there, but it is employed with advantage in the smaller ponds. The proportion used is one part copper sulphate to anywhere from 750,000 to 1,000,000 parts of water. It is first necessary to ascertain, approximately at least, the cubic contents of the water to be treated. The sulphate of copper should be obtained in a pulverised state, placed in a porous bag, and dragged through the water until dissolved. It does not matter how the sulphate is distributed so long as it is done thoroughly. It may be dissolved previously and sprayed evenly over the surface, provided no water-lilies or other aquatic phanerogams are in growth. It may be mentioned that a cubic foot of water weighs about 62¼lb.

During the last two summers a striking example of the effective use of copper sulphate has been provided in St. James's Park. Previously, it had been a costly and troublesome matter to keep the water there presentable in hot weather by employing men in boats to remove the weed with rakes, etc. The copper sulphate treatment was adopted, with the result, we learn, that at a much less expenditure in money and labour it can now be kept practically free from weed.

A fact of considerable interest has also been reported by the Superintendent. The ponds are cleaned out triennially and the surplus fish disposed of. In recent years it has been found that many of the fish were badly attacked by fungus, so much so that it became doubtful whether it was advisable to transfer them to other waters. We learn that at the last cleaning out the fish were quite free from fungoid disease and remarkably clean and silvery. This is of especial interest because one of the doubtful matters about the use of copper sulphate in water was its effect on fish. It has been found in America that certain delicate species were affected, but usually when a considerably stronger application was used than that mentioned above.

## LEEKS.

The leek (Allium porrum) is said to have been cultivated in this country prior to 1562. It is a hardy biennial plant, thought to be a native of Switzerland, and introduced into this country about the middle of the sixteenth century. There is no doubt that one would have some difficulty in naming many more useful vegetables than the leek. The utility of this esculent, boiled, stewed, or in soup, is not at all under-estimated by the Welsh and Scotch; but in the South it is not so highly esteemed. If leeks are boiled, and the first water thrown away just before they are quite cooked, they are rendered as mild as a Spanish onion. Boiled in salt and water until they are tender, and eaten with melted butter, like asparagus or seakale, the water being changed when the leeks are half-cooked, the leek is a most excellent vegetable. When used in soup, leeks should be boiled, cut into two-inch lengths, and used plentifully by stewing them afterwards with the soup itself.

In the districts around Edinburgh the leek is cultivated on a comparatively large scale. It is said that, of all vegetables grown for market, leeks have the principal claim on the Edinburgh market gardener's attention, as the season commences at the end of August, and continues until May—eight clear months without intermission. There is no need to wonder, therefore, why every effort is put forth to keep up a continuous supply. In fact, it was once remarked by a Scottish writer that leeks are the only vegetable that the foreigners—Englishmen and Irishmen as well—left them to have the pleasure to supply, as none came from beyond their own country to their markets.

To the shopkeeper leeks are useful, for they present an admirable appearance for shop display, especially when extra fine, long, even, and well-blanched stems can be secured. For market purposes leeks are almost invariably bunched, the size of the bundle varying according to the demand. It is also customary to make up large bunches of second-grade produce, somewhat after the style of the large carrot bunch, with a slightly spreading base; these bunches are tied with soft willows. Leeks are decidedly one of the most profitable crops that the market gardener can turn his attention to. When grown under an intensive system of culture, they usually average from between 1½ to 2 or 3lb. per root, and are of excellent quality. Such leeks as these find a ready sale, wholesale, at about 6d. per dozen, and would probably fetch more if sent to distant markets.

To cultivate leeks successfully, a light, rich soil and an open situation are preferable. Where it is desired to secure first-class specimens, such as would be worthy of a prize if exhibited, the plan usually adopted is to take out a trench, after the fashion of preparing the ground for celery. This trench need not be more than two feet deep and about 18in. wide for a single row of leeks, and sufficient nourishment can be provided by forking in a liberal supply of well-decomposed farmyard manure with the bottom spit. Of course, exhibition culture will entail a certain amount of extra care and attention, but the ordinary cultivation of the leek is most simple.

Leeks are sown during the first or second week in March for ordinary purposes, and the seed-bed should be well enriched with plant food, and fully exposed in a warm, open situation. Further, care must be taken not to make the sowings too thick, for the plants will grow much better and stronger if they are given plenty of room during their early stages of growth. Where plants are required for exhibition purposes sowings should be made from the middle to the end of January, and before planting out the bottom of the trench should be forked up, and a portion of the better soil removed in making the trench spread over it, the whole being trodden down firm when dry. To secure the best individual specimens, some growers prefer to excavate square-bottomed trenches; while another plan is to bore large holes in the ground with a dibble, inserting the plants therein, and filling up the whole with some specially prepared compost.

For exhibition purposes leeks are generally blanched by means of stout brown-paper collars placed around each stem. These can be purchased, or a useful substitute can be found in the cardboard tubes used for despatching plans, etc., through the post. The latter can be cut to any length required, and allow the stem and upper leaves of the plant to remain free. As the plant increases in length, the soil should be carefully drawn up around the base, and the paper collar raised. Leeks will usually be fully blanched by the middle of July, but the stems will subsequently continue to increase in diameter.

PETER BARR MEMORIAL CUP.
Presented to the Rev. G. H. Engleheart, V.M.H., at the R.H.S. Daffodil Show on Tuesday.

Liquid manure is largely used in the production of exhibition leeks, but if this is not available its place can well be taken by any of the well-known fertilising compounds on the market. If ordinary liquid manure from a stable or farmyard is used, it must be diluted with at least five parts of water, and should not be given more than twice a week during the growing period. Where intended for marketing purposes, the stems cannot very well be too long or too thick, for the gross bulk of blanched portion is the most edible part of the vegetable.

J. C. Newsham.

Old Basing.

## WORK FOR THE WEEK.

### CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Plants intended for the production of big blooms will now be ready for a shift into 6-inch pots. The compost for chrysanthemums should be at all times of the very best quality, and should consist at this potting of two parts fibrous loam, one part decayed farmyard manure, a sprinkling of soot, a 32-pot full of wood ashes to each barrow-load of compost, and plenty of coarse sand, the whole being passed through a coarse sieve. The plants should be watered a couple of hours before they are repotted to ensure the soil being moist. After potting they should be placed in a cold frame on an ash base, and when they begin to root freely they must have plenty of air, eventually pulling the lights off on all favourable occasions. In some establishments large blooms are no longer favoured, and attention is devoted to producing large quantities of flowers for cutting. For house and table decoration nothing can be more useful and give a better effect than the single varieties grown naturally. These need good culture, and it is best to pinch the tops out about a fortnight before each potting to ensure a bushy growth. Where large quantities of bloom have to be produced throughout the winter it will, perhaps, be as well to give the method we practise here. We rely on a few of the best, and grow a quantity of each. The cuttings are rooted in boxes, about 200 cuttings in each, and placed in cold frames. The first week in May they are planted out on a long border, two feet from row to row, and 18 inches from plant to plant. They are pinched frequently until the middle of August. Early in October they are lifted with a little soil, if possible, but this does not matter much, and planted thickly in a long row of slightly heated pits that have been sunk so that the growths are a foot from the glass. If they are thoroughly sprayed over for a few days they will be nothing the worse for the shift. The varieties we grow like this are Edith Pagram, Shasta, Mary Richardson, Mary Anderson, Western King, Niveus, Source d'Or, F. S. Vallis, and Church Brothers' White.

WINTER-FLOWERING CARNATIONS.—With the increased light the growths have strengthened, and the flower stems will be self-supporting. The flowers are now of much better quality than those opening earlier in this year. Young plants rooted in December or early in the new year, and potted into 60's when rooted, will have filled their pots, and are ready for another shift. These have been pinched, and are breaking freely. They should be shifted into 5-inch pots and shaded slightly for a few days. The temperature of the carnation houses should be kept about 60 deg. by day and 50 to 55 deg. at night; give abundance of air at all times.

PROPAGATION. — There will be abundance of work in this direction, and almost anything will root freely now. A propagating frame in a warm house is absolutely necessary. Salvia splendens, S. Pitcheri, S. rutilans, Coleus thyrsoideus, fuchsias, brugmansias, bougainvilleas, eupatoriums, Begonia Gloire de Lorraine, Streptosolon Jamesoni, bouvardias, and many more subjects will all require to be rooted now. Place four cuttings in a three-inch pot, and when the cuttings are ready for potting the ball of soil can be broken equally in four parts, thus keeping the roots of the four plants intact. A sandy compost will suit most cuttings.

GENERAL REMARKS. — Lilies of the speciosum section, such as L. rubrum, L. album, and L. Melpomene, with L. auratum, will now need top-dressing as they are emitting roots freely from the stems. Arum lilies as they pass out of flower should be stood outside in a sheltered spot preparatory to planting out. Crinum Moorei and C.

Powelli have commenced to grow, and should have plenty of water. Keep all dead flower spikes and leaves removed, and tidy up and rearrange the flowering plants frequently.—Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

APRICOTS.—The young fruits are rapidly swelling, and a preliminary thinning is advisable where a good set has occurred. As there is a considerable difference in the size of the fruits of various varieties, some special knowledge is necessary to carry out the operation of thinning with satisfactory results. With such a small-fruited variety as Breda, the fruits may be left more closely together than would be advisable for the larger fruiting Large Early Montgamet, Hemskirk, and Grosse Peche. Thinning should be carried out by degrees, first removing those fruits which are found growing between the wall and the branches, and where they have set in pairs take away the smaller fruit. A weekly examination will enable the operator to note those fruits likely to take the lead, and a further reduction of the smaller fruits can be made. Rather more fruits should be left than will be required for a full crop until stoning is finished, when the final thinning should take place. The usual distance apart allowed for the larger fruits is eight inches, small fruits (as Breda) five inches apart. The strength and vigour of the tree should be considered; vigorous trees may be cropped more heavily than those which are not so robust, but it is far better to have a medium crop of fine fruits than a heavy crop of small, tasteless fruits.

DISBUDDING.—The extension branches of young trees and those of older trees laid in to fill gaps should have all growths at the back removed, also all foreright shoots not required to form spurs, laying in only sufficient of the young growths required to fill the allotted spaces. Frequently it will be found that old-established spurs have more growths than are necessary, and these, if allowed to grow, crowd each other, and consequently air and sunlight are excluded, preventing proper development of fruit buds for the ensuing season. It is, therefore, advisable to thin out the extra growths, so that each one left will have space to develop its leaves and permit air and light to have access for the ripening of the young wood. Stop all shoots left for spurs at the third or fourth leaf, and any subsequent growth to one leaf. The thinning of the fruits and disbudding may be done at one and the same time. In laying in young branches avoid overcrowding. Sufficient space must be allowed for the future development of fruit-bearing spurs. Fortunately, the apricot is not troubled with many insect pests; at times, however, the apricot moth attacks the young foliage, and this becomes apparent by the leaves curling up; by pressing the curled-up leaves between the finger and thumb, the caterpillar is destroyed. All exposed portions of main branches and the stem should be covered with sacking as a protection from sun-heat.

GRAFTED TREES.—As we are experiencing a period of drying winds, take care that the clay does not become dry, crack, and fall off; a little moss tied over the clay and moistened occasionally will prevent damage.

PLANTING-OUT FORCED STRAWBERRY PLANTS.—By planting these at the earliest suitable opportunity, it is possible to obtain a fair crop of fruits quite late in the season. Plants of Royal Sovereign, carefully hardened off and attended to in the way of watering and syringing will usually throw up flower spikes during the late summer months, and by affording a slight protection it is possible to have ripe fruits during October and even into November. Later batches of forced plants are most suitable to plant out for next season's supply. During the hardening-off process, the plants should have careful attention for too often, after fruiting is over, they are removed to some out-of-the-way corner and neglected.—W. Messenger, Woolverstone Park Gardens.

## THE ORCHID HOUSES.

ONCIDIUMS.—The oncidiums constitute one of the largest families of orchids, and the genus is also an important one from a garden point of view; for there are no other inexpensive orchids that surpass them in beauty. Oncidiums are represented among warm, intermediate, and cool orchids, but by far the largest portion can be cultivated in a cool intermediate house without any great difficulty, though some require great care to maintain them in a robust condition, as the large, branching, many-flowered inflorescences often enfeeble the plants to such an extent that it seems almost useless to try to revive them. With the commoner kinds this is not of much consequence, as plants are imported annually in such quantities that fresh specimens can be purchased at a very small cost. In the case of special sorts it is not advisable to overtax them, therefore the flower-spikes should be removed before they develop each alternate year. The spring and early summer-flowering oncidiums, such as O. Marshallianum, O. concolor, O. cucutatum, and O. microchilum, are developing their flower-spikes in the cool intermediate house. All these require a moderate supply of moisture at the roots. O. varicosum and other late summer and autumn-flowering species, such as O. Forbesi, O. crispum, O. dasytyle, O. tigrinum, O. Gardneri, and O. Mantini, are now starting into growth after their long rest since flowering last season. New roots soon push forth from the base of the young growths, and this is the best possible time to afford new rooting material to any that may require it. For dwarf-habited and compact growing oncidiums, shallow pans are the most suitable receptables, and these should be provided with a fair amount of drainage. Use the same kind of compost as for odontoglossums, but add a more liberal supply of half-decayed oak leaves. Potting should be moderately firm. These oncidiums are best grown close up to the roof glass in a cool intermediate house where they can receive plenty of fresh air. During the early stages of growth water must be applied with care, as an excess would cause the new growths to damp off, but when the young roots have established themselves in the new compost they must have an abundant supply both at the roots and in the atmosphere. Spraying and syringing should be practised on fine days, as a dry atmosphere favours the spread of thrips and red spider, both serious pests.

MILTONIA VEXILLARIA is now pushing up its spikes, and the young pseudo-bulbs should be making roots from their base. They must not be allowed to suffer for want of water at the roots. The present is a favourable time to remove the plants from the quarters they have occupied all the winter, into a cool intermediate house, or the warm end of the cool house, where the flowers will develop with much more substance and a finer colour than they would do in a higher temperature. Removing them also gives one the opportunity of thoroughly cleansing them, and at the same time liberating any leaves that may adhere together, as they often do at this season. Woodlice are very fond of the young roots, and if not diligently sought after and killed, they will destroy every root immediately it becomes visible. These pests may be trapped by laying some pieces of vegetable, such as potato, turnip, or carrot, with the centre scooped out, on the surface of the compost. M. vexillaria delights in an even temperature the whole year round, and, when in full growth, an abundant supply of moisture, both at the roots and in the atmosphere. Yellow thrip is very persistent in attacking this orchid, especially in a high temperature, and every means must be taken to keep it in subjection.—J. T. Barker, The West Hill Gardens.

## THE KITCHEN GARDEN.

ONIONS.—Those that were raised early in the year should now be sufficiently hardened to plant in the beds which have been prepared for their reception. The surface should be pricked over to create a fine tilth; over this scatter a dressing of soot and burnt garden refuse, then tread the plot over level, and plant the onions in lines eighteen inches apart, and fifteen inches from plant to plant. Lift the onions carefully from the boxes, and plant firmly. If dry weather prevails water the plants at the time of planting, and give regular sprinklings of water each afternoon should hot weather continue. Regular hoeings and occasional dustings of soot will be found very beneficial.

LEEKS.—Seedlings that are nicely established in boxes, and pots, must now be planted in well prepared trenches, providing the plants are well hardened off. If there is any doubt about this, delay the operation for ten days. Prepare trenches as for celery, eighteen inches in depth; add a good layer of decayed farmyard manure, and place thereon old marrow bed soil or old light potting soil, with some burnt garden refuse, especially if the soil is retentive. Plant very carefully in single lines at one foot apart, water in, and spray during favourable weather. Good varieties are Prizetaker, Lyon, and International.

PEAS.—The various sowings made in boxes will now need transplanting to their permanent lines. Prepare drills one foot in width, finishing the surface two inches below the surrounding level, to allow for watering during dry weather, and afford shelter from cold, cutting winds. Yew or spruce boughs are also very helpful to ward off frosts and cold winds if placed on the north and east sides. Plant in double lines as for broad beans, and water in if dry. To maintain a constant supply, sow quantities according to the demands at intervals of ten days, in prepared drills. Duke of Albany, Criterion, Quite Content, Senator, and Superlative are excellent varieties for main-crop.

SALSAFY AND SCORZONERA.—These two vegetables are becoming more popular each year, and are much sought after during the early spring months. Well-prepared light soil suits their needs best. If sown now very few will run to flower as earlier sowings are apt to do. Sow the seeds in drills eighteen inches apart, and scatter a quantity of old potting soil over the seeds before filling in the drill.

CAULIFLOWERS.—Plant further batches of later sown plants on well-tilled ground, water in, and ward off slugs with finely-sifted cinder ashes. Make another sowing of the fine autumn varieties, and prick off immediately they are large enough to handle.

CARDOONS.—Sow seeds singly in small pots in gentle heat, and transfer the plants to trenches prepared as for celery during May, or sow the seeds in drills at the end of April, and thin out the seedlings to eighteen inches apart when large enough.

VEGETABLE MARROWS.—Sow a good batch of the favourite varieties, putting one seed in each large 60-sized pot; place in gentle heat, duly harden off, and transplant when all danger of frost is past. Attend to those now growing in frames. Keep them well supplied with water, and ply the syringe regularly about them to promote quick growth. Fertilise the flowers and stop leading growths.

CUCUMBERS.—Sow a good strain of the old Telegraph for placing in frames and pits as room becomes available by the removal of bedding plants. Make sowings of various herbs, turnip, spinach, lettuces, and a few French beans.—Geo. Elwood, Swanmore Park Gardens.

---

**Allium neapolitanum.**—An easily-grown bulb that might with advantage have its merits more generally recognised than they are is this member of the onion family. Bulbs of it are cheap, and six or eight together in a pot five inches in diameter form effective little masses, which are extremely useful for greenhouse decoration. It is also very pretty grown in a suspended basket.—W. T.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

There were more exhibits than usual at the Royal Horticultural Hall on the occasion of the fortnightly meeting held on April 16 and 17. It is curiously true that, whenever there is a two-day show the applications for space are always larger and more numerous than for an ordinary meeting. On this date the first competitive daffodil show was held, and, though not so extensive or fine as would have been the case in an ordinary season, the promoters were satisfied with the result of this first attempt, remembering that daffodils are fully a fortnight earlier than usual.

Orchids were fewer than usual, but daffodils, forced flowering shrubs, auriculas, the inevitable carnations, and a host of rock garden exhibits, combined to fill all the available space. A big crowd thronged the hall all through the day until about 5,30; apparently few remembered that the show remained open until 8 p.m., for beyond attendants, few people were present at 7 o'clock.

### FLORAL COMMITTEE.

A magnificent group of forced shrubs from Messrs. Wm. Cutbush and Son, Highgate, N., was very beautiful. Lilacs, mollis azaleas, laburnums, graceful wistarias, Prunus triloba, Azalea Yodogama, A. Hinodigiri, the splendid Rhododendron Pink Pearl, cytisuses, hydrangeas, were all most tastefully arranged right opposite the entrance, and constituted the largest and one of the most attractive of the many fine contributions in the hall. Besides their big group of forced shrubs Messrs. W. Cutbush and Son contributed an exhibit of greenhouse plants, and a handsome lot of perpetual carnations, these latter including fine flowers of Mrs. W. Ward, Countess of Onslow, Lady Meyer, the buff and scarlet Mrs. Waldorf Astor, Lord Rothschild, and Mikado.

Rhododendron Kewensis, R. arboreum, R. grande, R. campanulatum, R. Aucklandi rubrum, and many other splendid species, varieties and hybrids, with other rare hardy flowers, were all shown well by Mr. G. Reuthe, Keston, Kent. The rhododendrons displayed by Messrs. R. Gill and Sons, Falmouth, excited admiration, especially the giant trusses of R. Falconeri, R. Broughtoni aurea, R. Aucklandi, and the brilliant R. Shilsoni.

Pillar roses in pots were delightfully shown by Messrs. Wm. Paul and Son, Waltham Cross; Tausendschon, Sylvia, Fairy, and the White Tausendschon were all very fine. Messrs. G. Mount and Sons, Canterbury, delighted the ladies with their beautiful long-stemmed blooms of such roses as Liberty, Mrs. G. Shawyer, Mdme. Abel Chatenay, A. R. Goodwin, Lady Hillingdon, Molly Sharman Crawford, and Richmond.

The roses from Mr. G. Prince, Longworth, were very handsome, especially the blooms of Rayon d'Or, Mrs. E. Mawley, Mrs. A. Cocker, White Killarney, and Mrs. A. R. Waddell. Messrs. B. R. Cant and Sons, Colchester, exhibited roses finely, and had lovely flowers of Mrs. E. Mawley, Rose du Barri, Lady Reay, Anna Oliver, and the new pale pink H.T. variety named St. Helena.

Gorgeous hippeastrums from Messrs. Jas. Veitch and Sons, Chelsea, were splendid in size, form, and colour; Paradox, Endera, Jadera, the crimson Brilliant, and Hermia were all grand. The same firm submitted the dark blue form of Cineraria Feltham Beauty, the white, blue-tipped Cineraria hybrida (A.M.), obtained by crossing Cineraria cruenta with Senecio tussilagensis. Gerbera hybrids and the graceful Crowea augustifolia came from the same firm. Very graceful and beautiful were the plumose Nipholepis Neuberti, Adiantum cardiochlæna, davallias, and Pteris Childsi, shown by Messrs. H. B. May and Sons, Edmonton.

Mr. James Douglas, Great Bookham, provided a treat for auricula lovers by exhibiting a grand collection of well-grown plants. The variety of colouring was excellent, and especially good were Mrs. Gardiner, Canary, Roxburgh, purple (A.M.); Janet, Prince Charming, Elaine, lavender-mauve with white centre; Regalia, and Narcissus, palest sulphur. Mr. Douglas showed three tubs of the giant forget-me-not Mysotidium nobile. Very beautiful were the sheaves of Gerbera hybrids, finely exhibited by Mr. H. Ellison, West Bromwich. Spanish irises were set up in large, bold bunches by Mr. R. D'E. Day, Sutton Scotney, and very showy they were.

Messrs. Stuart Low and Co., Enfield, were represented by a bank of perpetual carnations, in which Lady Alington, the new, flaked, Samuel Gratrix, R. F. Felton, Empire Day, My Favourite, and the quaintly-coloured Cinnabar were conspicuous. Greenhouse plants from the same firm included large bushes of Metrosideros floribunda, carrying numbers of its red bottle-brush inflorescences. Superb flowers of such fine perpetual carnations as Carola, Mrs. C. F. Raphael, White Chief, White Wonder, Orpheus, and Beacon, were staged in fine large sheaves by Mr. H. Burnett, Guernsey. Messrs. W. Wells and Co., Merstham, gained an A.M. for carnation Wodenethe, a new white, sweetly scented, perpetual variety, raised in America, and one that bids fair to have a great future.

Messrs. Allwood Brothers, Haywards Heath, had fine flowers of Empire Day, Fairmount—a glorified Mikado, Marmion, the showy Fireglow, and other fine carnations. Mr. C. Engelmann's carnations were good, as usual, and included the famous Carola, the yellow Sunstar, and the brilliant red-flaked Harlequin.

Echium fastuosum, carrying seventeen spikes of bluish flowers, was shown by Mrs. Henderson, Sedgwick Park, Horsham. The rosy-flowered and free Azalea Maxwelli (hardy), was well shown by Messrs. R. and G. Cuthbert, Southgate. Mr. J. Phillips, gardener to the Hon. H. B. Portman, Buxted Park, Sussex, contributed a group of large and well-grown schizanthuses, showing the usefulness of these flowers for conservatory decoration in spring.

Messrs. Whitelegg and Page, Chislehurst, again showed fine groups of Saxifraga Red Admiral, S. Pencilled Beauty, S. Lady Dean, and S. Rhei superba. Messrs. G. and A. Clark, Dover, filled a rock garden with popular subjects, and also showed Spiræa arguta, the bright Geum Mrs. Bradshaw, anemones, polyanthuses, and glaucous-leaved junipers. Messrs. J. Cheal and Sons, Crawley, made good use of small flowering shrubs, cytisuses, rhododendrons, azaleas, Japanese maples, etc., in their rock garden exhibit, and used popular subjects in the foreground. Tree pæonies were a feature of the exhibit from Mr. James Box, Lindfield, but the scarlet Anemone Rouge Ponceau was not less attractive.

Messrs. G. Jackman and Son's exhibit of hardy flowers included trolliuses, iberis, Primula Sieboldi in variety, and the pretty, dwarf forms of Iris pumila. Mr. Maurice Prichard, Christchurch, had a rock garden, and here Saxifraga R. W. Hosier was very fine, and so were Primula Cashmeriana, Fairy Queen, Phlox canadense, Violet Queen, Saxifraga Bathonensis, and Cytisus Ardoinei. Mr. Clarence Elliott, Stevenage, had lovely colonies of Viola gracilis, Oxalis enneaphylla, Androsace Chumbyi, Saxifraga Bathonensis, and Gentiana acaulis, on a low rock garden. Mr. Prichard, Wimborne; Mr. L. Greening, Richmond; and the Misses Hopkins, Shepperton, all staged rock garden exhibits. Messrs. Jas. Peed and Sons, Norwood, had a quite good exhibit of alpine flowers, arranged on rockwork; aubrietias and iberis were very good.

Messrs. J. Piper and Son, Bayswater, had a large rock garden exhibit, raised well above the level of the floor, and thus easy to inspect. Azaleas, acers, and bamboos formed a background for beautiful groupings of Primula malacoides, Allysum saxatile citrinum, Primula Veitchi, Lithospernum Heavenly Blue, Aubrietia Lavender, and other charming subjects. Another rock garden and a very pretty one, because it was not overdone, was arranged by Messrs. T. S. Ware, Lim., Feltham. Libertia pulchellum, Saxifraga Bathonensis, Trillum grandiflorum, Daphne Cneorum, Orchis papilionacea, Phlox amœna, and Alyssum montanum were interesting in this display.

The brilliant pelargoniums from Messrs. H. Cannell and Sons, Swanley, were a great attraction, especially the bunches of Arabic, Uranus, New York, Vesta, King Victor, Hall Caine, and Paul Crampel. Exceptionally fine were the splendid bunches of cut pelargoniums staged by Mr. H. J. Jones, Ryecroft, Lewisham. In the variety Mrs. F. Huggett the individual blooms were 3½in. across, while Tom White, Arabic, Mrs. Henry Wood, Hibernian, Fred Gulliver, and Fred Tozer were all of wonderful size and colour. Mr. Vincent Slade was also an exhibitor of pelargoniums, bringing bright blooms from Taunton.

### ORCHID COMMITTEE.

The deep purple Pleione juunanense was well shown by Mr. F. W. Godman, Esq., South Lodge, Horsham, who also submitted Odontoglossum Godmani with long drooping spikes of purple and white flowers. A giant spike of Odontoglossum Souv. de Victor Hye de Crom carrying twenty-one flowers and buds was shown by Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks. Mr. H. T. Pitt, Rosslyn, Stamford Hill, showed a little group containing Cypripedium Chapmani, Odontoglossum Souv. de Victor Hye de Crom, and Lælio-cattleya Rosslyn.

A pretty little group of orchids from Messrs. J. and A. McBean, Cooksbridge, contained lovely spikes of fine forms of Odontoglossum crispum, Cattleya Mossiæ, C. Mendeli, and other good things. Odontoglossums from Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, included O. crispum Leonard Perfect (grand), O. c. Chapmani, O. c. Clive, O. c. Angela, O. c. Pittæ, O. Titania, O. ardentissimum, O. splendidissimum, O. percultum, O. Solon, and Odontioda Cooksoniæ. The brilliant Lælio-cattleya G. S. Ball was finely shown by Messrs. Hassall and Co., Southgate, and with these were Brasso-cattleya Alexandria, Miltonia Bleuana, Odontoglossum eximium, a fine form of O. percultum and Renanthera Imschootiana shown in fine condition.

Mr. Hopkins, gardener to Francis Wellesley, Esq., showed Lælio-cattleya Bertram, a splendid cross between L.-c. Hopkinsi and L.-c. Cappei (A.M.), with orange sepals and petals, and an intense crimson purple lip. Mr. Shill, grower to Baron Bruno Schroder, The Dell, Egham, exhibited Cattleya Schroderæ Empress with eleven beautiful blooms. From the Liverpool Orchid Nursery Company, Gateacre, came a beautiful set of Lælio-cattleya G. S. Ball and a few other orchids.

Odontioda Bradshawiæ, with two fine spikes, Miltonia Bleuana rosea, with six spikes, a good Odontoglossum ardentissimum, the red-spotted O. Aira, and the grand Brasso-cattleya Queen Alexandra were exhibited by Messrs. Charlesworth and Co., Hayward's Heath. M. Claes, Brussels, Messrs. Peeters and Co., Brussels, and M. Lambeau, each sent a few orchids, chiefly cattleyas and miltonias. Messrs. Cypher and Sons, Cheltenham, made a capital display of orchids, and exhibited Lælia Latona, Cattleya Skinneri, Odontioda Cooksoniæ, the old Miltonia stellata, Odontoglossum Edwardi, Oncidium concolor, and the bright Renanthera Imschootiana and the fine Brasso-cattleya Leeana, among many other good things.

Messrs. Sander and Sons, St. Albans, made a good display with the pretty Dendrobium Devonianum, Cattleya Schroderæ, Brasso-cattleya Langleyensis and Cattleya Fernand Denis. In Messrs. Stuart Low and Co.'s group from Enfield, Cattleya Schroderæ, Odontoglossum Edwardi, Cattleya Mendeli, and Brasso-cattleya Imperatrice de Russie were especially noteworthy.

Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, exhibited the lovely Cattleya Mendeli Thule (A.M.) and the handsome Odontoglossum crispum Saga which received a First Class Certificate.

### DAFFODIL COMMITTEE.

This body had plenty of work to do. Many of its members acted as judges in the competitive classes, and afterwards had to adjudicate upon groups and discuss the merits of about two dozen novelties. At the committee meeting Mr. H. B. May, representing the Peter Barr Memorial Committee presented the Rev. G. H. Engleheart with the handsome Peter Barr Cup, to be held by him for the ensuing year.

Messrs. Barr and Sons presented a beautiful collection of choice daffodils, with a few tulips. A few especially fine daffodils in this excellent lot were Falcon, Lord Kitchener, the shapely Monarch, Cæsar (a fine poet), the pretty cream trumpet Loveliness, Lord Roberts, The Bride, Cleopatra, St. George, Ibis, and a quaint little seedling with a deep orange-red eye and heavy orange staining along half the length of the perianth segments. Messrs. Cartwright and Goodwin, Kidderminster, had a fresh and bright group of daffodils, and here the bold frilled trumpet variety Titanic was, curiously enough, the most attractive flower. Nemesis, White Star, the lovely White Cristalla, White Cloud, May Hanson, and White Rose, all lovely triandrus forms, with Cairngorm, Herod, Van Waveren's Giant, were all very fine.

Messrs. R. H. Bath, Lim., Wisbech, filled a large space with a capital lot of daffodils and tulips; among the former we made special note of Queen of Poets, Horace, Maggie May, Hypatia, Weardale Perfection, Orange Maid, Marie Hall with straight yellow trumpet, Whitewell, and Dorothy Kingsmill. Some new daffodils from Mr. A. M. Kingsmill, Shovel, Bridgwater, were almost all unnamed, and included some wonderfully fine things with broad, flat crowns. Anchorite, Sarchedon, Buttercup, Zouave, Victory, and Moonbeam were splendid named sorts. From Dublin, Messrs. Hogg and Robertson brought over a collection of tulips and daffodils, the former constituting the leading feature, and Hecla, Dr. Wagner, Gesnereana lutea, Clara Butt, Flambeau, Fire King, Bartigon, and Fairy Queen were exceptionally good.

Some beautiful daffodils from the Lissadell Bulb Farm, Lissadell, Sligo, lost somewhat in effectiveness by being rather crowded in the vases. Nevertheless, the white triardous seedlings were lovely, and very fine were Mdme. de Graaff, Muriel, Will Scarlett, Acme, Mars, and Maggie May. Messrs. Jas. Veitch and Sons, Chelsea, had a goodly set of daffodils, but their flowers were rather too closely together. Cœur de Lion, West Loedt, Glory, Lord Roberts, King Alfred, Argent, Homer, Lucifer, and Horace were all good.

Splendidly set up were the daffodils from Miss F. W. Currey, Lismore, Ireland. Each variety was set well apart from its neighbour, and in the case of Sunset, Queen Sophia, Will Scarlett, Lord Kitchener, Cossack, Warley Scarlet, Red Emperor, Firetail, Ermine, and Challenger, the blooms were of extreme beauty; the last named has a deep orange rim to an orange-yellow cup. Mr. C. Bourne, Bletchley, had Queen of Hearts, the fine shapely Imperialist with soft orange crown—a beauty, Mrs. J. H. Veitch, Weardale Perfection, Gloria Mundi, and a few other good things.

Mr. H. D. Phillips, Olton, put up a capital lot of daffodils in the lower annexe, but everyone looked at the fine new Seville with its broad, flat, orange-red crown (A.M.), and seemed to have little admiration left for the other fine things Mr. Phillips showed. A fresh and bright lot of daffodils from Mr. Robt. Sydenham, Birmingham, included some very good specimens of Una, Will Scarlett, Flamingo, Watchfire, Bert Ponting (very bright), Orange King, Great Warley, Monarch, Occident, and Glory of Leiden. Lily of the valley, tulips, liliums, and anemones were also included in the exhibit.

The Rev. G. H. Engleheart put up a splendid lot of seedling daffodils, and showed a fine series of poeticus varieties and others closely akin to this race; he also had a few very large trumpet varieties, and some flat-crowned sorts of great beauty, but the varieties were staged under number only. Messrs. E. H. Krelage and Son, Haarlem, showed several new seedling daffodils, and the lovely creamy-white trumpet variety Mrs. Ernst H. Krelage, gained an A.M. Mr. C. Van Tubergen, jun., also showed several good new daffodils, as did Mr. Chapman, gardener to Mrs. Norman Cookson, Wylam, whose variety Mrs. N. C. Cookson was much admired.

### FRUIT AND VEGETABLE COMMITTEE.

A group of early vegetables and salads from Messrs. Sutton and Sons, Reading, proved very interesting, and the exhibit included White Gem turnip, Snow White broccoli, Golden Ball lettuces, Winter Beauty tomatoes, Satisfaction cucumber, Satisfaction mushrooms, Tender and True French beans, and April cabbages.

Mr. Funge, gardener to Mrs. Bischoffsheim, Warren House, Stanmore, showed two boxes of fine fruits of Royal Sovereign strawberry.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Odontoglossum crispum Saga, from J. Gurney Fowler, Esq. (Gardener, Mr. J. Davis), Glebelands, South Woodford.

Award of Merit. — To Narcissus Mrs. Ernst H. Krelage, from Messrs. E. H. Krelage and Son, Haarlem; to Narcissus Silver Spangle, from Mr. F. H. Chapman, Rotherside Gardens, Rye; to Narcissus Seville, from Mr. H. D. Phillips, Olton, Warwickshire; to Freesia Le Phare, from Mr. C. Van Tubergen, jun., Haarlem; to Cineraria hybrida, from Messrs. Jas. Veitch and Sons, Chelsea; to Carnation Wodenethe, from Messrs. W. Wells and Co., Merstham; to Alpine Auricula Roxburgh, from Mr. Jas. Douglas, Great Bookham; to Cattleya Mendeli Thule, from J. Gurney Fowler, Esq., Glebelands, South Woodford; to Lælio-cattleya Bertram, from Francis Wellesley, Esq. (gardener, Mr. Hopkins), Westfield, Woking.

### MEDALS.

Silver-gilt Flora.—To Messrs. Wm. Cutbush and Son, Highgate, for flowering shrubs, carnations, etc.; to Messrs. Barr and Sons, Covent Garden, for daffodils; to Miss F. W. Currey, Lismore, Ireland, for daffodils.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Mr. J. Douglas, Great Bookham, for auriculas; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Messrs. J. Piper and Son, Bayswater, for alpines, etc.; to Messrs. R. H. Bath, Lim., Wisbech, for daffodils and tulips; to Mr. H. D. Phillips, Olton, for daffodils; to Messrs. Hassall and Co., Southgate, for orchids; to Mr. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian.—To Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; to Lissadell Bulb Farm, Lissadell, Sligo, for daffodils; to Mr. C. Bourne, Bletchley ,for daffodils; to Mr. Funge, Warren House Gardens, Stanmore, for strawberries; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to the Liverpool Orchid Co., Gateacre, for orchids; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. R. Gill and Sons, Falmouth, for rhododendrons; to Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Mr. M. Prichard, Christchurch, for alpines, etc.; to Messrs. T. S. Ware, Lim., Feltham, for rock garden.

Bronze Banksian.—To Messrs. H. Cannell and Sons, Swanley, for pelargoniums; to Messrs. J. Cheal and Sons, Crawley, for rock garden; to Mr. R. D'E. Day, Sutton Scotney, for Spanish irises; to Mr. C. Engelman, Saffron Walden, for carnations; to Messrs. G. Jackman and Son, Woking, for hardy plants; to Mr. H. J. Jones, Lewisham, for pelargoniums; to Mrs. L. Edwards, Llangollen, for saxifrages; to Mr. G. Prince, Longworth, for roses; to Messrs. Whitelegg and Page, Chislehurst, for saxifrages, etc.

---

## Daffodil Show.

Evidently the framers of the schedule of the Royal Horticultural Society's Daffodil Show, held on April 16 and 17, were under the impression that they should provide for all classes of exhibitors, as they arranged for a most comprehensive show. The classes, however, were poorly supported, as far as entries were concerned, owing to the abnormally early season, but the quality throughout was of a fairly high order of merit.

The premier class for forty-eight varieties, representing all sections, only produced one exhibitor, Mr. C. Bourne, Olde Wharf House, Bletchley, who was awarded the premier honours—a gold medal. The most striking varieties were White Knight, Will Scarlett, Lemon Belle, White Lady, Lord Roberts, Madame de Graaff, Alys, and Monarch. A fine collection for such a dry period. In the class for twelve trumpet varieties, three flowers to each vase, Mr. J. Mallender, Scrooby, Bawtry, was the only exhibitor, and won the first prize with fresh blooms of The Miller's Daughter, The Colonel, Sybil Foster, Weardale Perfection, and some seedlings. For twelve incomparabilis varieties, Mr. Mallender received the chief award, his most conspicuous sorts being Royal Star, Torch, Homespun, Gloria Mundi, James Janson, and Lucifer.

There were two entrants for twelve vases of Barri varieties. Here Mr. F. H. Chapman, Rotherside Gardens, Rye, won first prize with well-staged examples of Equinox, Odalisque, Tritoma, Beacon, Memento, Satellite, Cossack, Ember, and Maybird. Mr. C. Bourne was second with clean flowers of Occident, Red Chief, Queen of Hearts, White Ensign, and Egret. In a similar class for Leedsi varieties, there was but a single entrant, Mr. J. Mallender, who had some promising seedlings, with Katherine Spurrell, White Lady, Armada, Waterwitch, and Miss Langhorne. For nine poeticus varieties, the first prize was well won by Mr. F. H. Chapman, who had a beautiful exhibit of Idyll, Kestrel, Ruskin, Horace, Socrates, Nocturne, and Cassandra. Mr. C. Bourne was placed second with excellent vases of Sonnet, Epic, Acme, Horace, Homer, Almira, and Lullaby.

### AMATEURS.

The premier amateur class was for twenty-four varieties, fairly representing all sections, the first prize, a silver cup, being deservedly awarded to the Rev. T. Buncombe, Black Torrington, North Devon, who had nice, clean examples of Red Chief, P. R. Barr, Juliet, Glory of Leiden, Chryseis, Evangeline, Leonie, Cassandra, and Mrs. Langtry. The second prize was awarded to Mr. H. R. Darlington, Park House, Potter's Bar, who had good examples of King Alfred, Weardale Perfection, Glory, Virgil, and Bullfinch. For six trumpet varieties, there were three entries, the Rev. T. Buncombe leading off well with fine examples of Treasure Trove, Grandis, Cornelia, Sybil Foster, and Madame de Graaff. Mr. H. R. Darlington came second; his most attractive blooms were King Alfred, Monarch, and Cornelia. The Duke of Rutland (gardener, Mr. W. H. Divers), Belvoir Castle, Grantham, was third.

The class for six incomparabilis varieties secured a better competition, the Rev. T. Buncombe coming first with Gloria Mundi, Chryseis, Leonie, Whitewell, and Rosy. Mr. H. R. Darlington was second, while Mr. W. H. Divers brought up the rear. The Barri varieties secured two entries, the Rev. T. Buncombe winning first with nice vases of Stone Chat, Broad Wing, and Ptarmigan; Mr. H. R. Darlington was a close second.

In a smaller class for six Leedsi varieties Mr. H. R. Darlington won well with White

Lady, Maggie May, and Enid. The Rev. T. Buncombe was a good second, and Mr. W. H. Divers had to be content with third place. For six vases of poeticus varieties Mr. H. R. Darlington was awarded first prize for good clean blooms of Virgil, Epic, Sidney, and Horace, while the same exhibitor was equally successful for three vases of double varieties, staging Golden Rose, Sulphurens, and Golden Phœnix in first-rate condition; Mr. W. H. Divers was second. There were two competitors.

In the class for a collection of twelve varieties, here Mr. W. B. Cranfield, East Lodge, Enfield Chase, N., came to the fore, with really good examples of Glory of Leiden, Mrs. H. G. Veitch, Noble, White Queen, Lady Mary Boscawen, Peter Barr, Horace, and Lemon Queen. The second prize was won by Mr. G. F. H. Banks, Couchmore, Crawley, with some nice trumpet varieties, while for three vases of trumpets, Mr. R. Morton, Grange Dene, Woodside Park, N., was first with Lord Muncaster, Glory of Leiden, and Monarch. Mr. G. Stocks, 44, Bentley Road, Doncaster, was a fair second. For three trumpet varieties, Mr. W. B. Cranfield was easily in front with Madame de Graaff, Florence Pearson, and Weardale Perfection, while Messrs. G. Stocks and R. Morton followed in the order named. The incomparabilis varieties of three vases only produced two exhibits, Mr. W. B. Cranfield being placed first, with Mr. R. Morton second. In the Barri section Mr. W. B. Cranfield was first with good examples of Aftermath, Barri conspicuus, and Castile. For three Barri varieties Mr. R. Morton was to the front with good typical flowers of Incognita and Royal Star. In the Leedsi section Mr. R. Morton was placed first with fine examples of White Queen and Lord Kitchener. Mr. W. B. Cranfield was second, while in the poeticus class the same exhibitor was most successful, with fine flowers of Horace, Elegy, and Kingsley, Messrs. Morton and Banks were placed equal seconds.

### NEW VARIETIES.

Mr. C. Bourne was the only cultivator to stage in the class for twelve varieties placed on the market since 1907, and he won the silver cup with Whitewell, Golden Idol, Lemon Belle, Great Warley, Orange King, etc. For twelve varieties not in commerce, Mr. E. M. Crosfield, Cossington House, Bridgwater, won the first prize and gold medal with fine flowers of Dick Turpin, Mougli, Pedestal, Honeymaid, and a number of seedlings; Mr. F. H. Chapman followed with some very pretty varieties, which were under number. Mr. C. Bourne was the first prize-winner for three varieties not in commerce, staging Queen of Hearts, Symphony, and Golden Idol, while Mr. W. B. Cranfield followed, and the Rev. T. Buncombe brought up the rear.

In the class for six seedling varieties raised by the exhibitor, Mr. E. M. Crosfield proved the victor, staging Mougli, Touchstone, Anchorite, and Dulcimer. Messrs. E. H. Krelage and Son, Haarlem, came second with some nice numbered seedlings, and Mr. F. H. Chapman was third, Bridegroom being his best variety. For three poeticus seedlings Mr. A. M. Wilson, Shovel, North Petherton, Somerset, was most successful, while Messrs. Krelage and Son won first prize with a good white trumpet variety named Mrs. Ernst H. Krelage, Mr. C. Bourne following with Orange King, and Mr. W. Welchman, Wisbech, was third.

## Cornwall Daffodil and Spring Flower Society.

This flourishing society is fortunate in its patronage, for the patronesses are Her Majesty Queen Mary and her Majesty Queen Alexandra, while among the vice-presidents are the Viscountess Falmouth, the Earl of Mount Edgcumbe, Sir Arthur Pendarves Vivian, and Mr. T. A. Dorrien Smith. The shows are always a leading feature in the West, and though in the present season the severe frost early in February killed a number of the rarer and tenderer shrubs, and the earliness of the season has made daffodils scarce, the exhibition was quite equal to those of former years, though some who won first prizes in earlier shows were unable to compete.

The show was held in the great Market Hall at Truro on April 11, a late date for Cornwall, whose shows are usually held at the commencement of the month. Ever since the inception of the society the position of hon. secretary has been held by the Hon. John Boscawen, and under his invariable tact and courtesy, every arrangement is carried out to perfection, and no complaints have ever been made. During the afternoon the hall was crowded, visitors arriving from all parts of England as well as London, while everyone of note in Cornwall and Devon appeared to be present.

The most interesting class in the daffodil section was that for thirty varieties in commerce or not in commerce. In this class the first prize was won by Mr. T. C. Williams, who took first prize last year, with a most beautiful stand, composed of seedlings raised by himself. Unfortunately only two were named, all the rest being numbered, which rather detracted from the interest of the stand. Among the most attractive were 184, white perianth with deep yellow cup, edged orange; 12, a fine bicolor trumpet; 419, white perianth, spreading flat cup of bright orange; 354, bright golden trumpet of fine form; 142, creamy-white perianth, with spreading golden cup, edged bright orange; 47, white perianth, pale orange flat cup; A 12, very large incomparabilis, with canary-yellow perianth and deep yellow cup; 266, white trumpet slightly drooping; 401, white perianth, with bright orange-scarlet cup. In the class for the best collection of daffodils in commerce, the first prize was won by Mrs. Soltau-Symons, with a good stand in which Rosella, Tangerine, Cœur de Lion, Ptarmigan, Beacon, Red Chief, Eoster, Scarlet Eye, and Salamander were especially good. In the next twelve classes the prices of bulbs were limited to 10s. The premier awards were made as follows: Six magni-coronati, Mrs. Soltau-Symons; six incomparabilis, Miss Mabel Williams; six Barri, Mrs. Soltau-Symons; six Leedsi, Mrs. Soltau-Symons; three poeticus, Mrs. Soltau-Symons; fifteen distinct varieties, Mrs. Soltau-Symons, with Weardale Perfection, Mdme. de Graaff, White Lady, Tangerine, Maggie May, Horace, Oriana, Eoster, Rosella, Cavalier, Beacon, Ptarmigan, Red Chief; finest bloom magni-coronati, Miss Clarice Vivian, with Mdme. de Graaff; finest bloom incomparabilis, Miss Mabel Williams, with Gloria Mundi; finest bloom Barri, Mrs. Soltau-Symons, with Red Chief; finest bloom Leedsi, Miss Clarice Vivian, with Bianca; finest bloom triandrus and cyclaminens hybrids, Mrs. Soltau-Symons, with Dorothy Kingsmill; finest bloom poeticus, Mrs. Soltau-Symons, with Horace; three varieties double, Mrs. Parlby; fifteen varieties, any section in commerce, or not in commerce, Mr. P. D. Williams, with a very perfect stand, containing Moonbeam, White Wax, Snow King, Susan, Madrigal, Ormolu, Princess, and eight unnamed seedlings.

In the classes in which there was no restriction as to the price of bulbs: Finest bloom magni-coronati, Miss Clarice Vivian first, with Diogenes; finest bloom incomparabilis, Miss Clarice Vivian first, with Wagtail; finest bloom poeticus, Colonel R. Nowell Usticke first, with Cassandra; three finest blooms magni-coronata, Mr. P. D. Williams first; three finest blooms incomparabilis, Mr. J. C. Williams first; three finest blooms Barri, Mr. J. C. Williams first; three finest blooms triandrus hybrids, Mr. P. D. Williams first; three finest blooms poeticus, Mr. J. C. Williams first. There were also classes for children under fifteen years of age.

For three bunches of anemones, Mr. R. Fox first, with immense crimson flowers of A. coronaria. He staged thirty vases of these superb flowers, and was given an Award of Merit for them. Mrs. C. Williams was first for polyanthuses in three varieties in a basket; and Lady Margaret Boscawen for primroses in three varieties in a basket. In competition for the prizes for a collection of twelve hardy spring flowers, Mr. P. D. Williams was first with Iris bucharica, Caltha platypetala, Muscari Heavenly Blue, Pulmonaria arvernense, Viola gracilis, Fritillaria hybrid, Iris tingitana, Saxifraga speciosa, Anemone apennina, Tulipa retroflexa, Anemone pulsatilla, and a vase of hybrid daffodils, a cross between Minnie Hume and triandrus. For six hardy spring flowers, Mr. T. B. Bolitho obtained premier honours with Muscari botryoides album, Anemone Robinsoniana, Fritillaria meleagris, Myosotidium nobile, Muscari Heavenly Blue, and Artus tulip. An excellent collection of hardy plants arranged as a rockery was shown by Mr. E. J. P. Magor. In competition for the prizes for three bunches of double violets in three varieties, Captain W. Tremayne was first with Neapolitan, Mrs. J. J. Astor, and De Parme. Colonel H. F. Trefusis was first for three bunches single violets one variety, with La France. For three bunches of double violets in one variety, Captain W. Tremayne was first with Neapolitan. Lady Margaret Boscawen won for six vases of roses, and for three vases of roses Mr. G. J. Cookson obtained premier honours. Carnations in the two classes for three vases were well shown by Mr. G. J. Cookson. The finest plant of rhododendron was shown by Colonel H. F. Trefusis. The best group of rhododendron blooms was contributed by Mr. J. C. Williams with a collection of seedlings. The first prize for six varieties of rhododendrons from out of doors was contributed by Mr. J. C. Williams. Mr. J. C. Danbuz had three trusses of large-leaved rhododendrons. The best six trusses of rhododendrons from under glass came from Mr. D. H. Shilson. The finest truss of rhododendron from out of doors came from Mr. R. Fox, who was first for a truss of hybrid Sikkim rhododendron. The best bloom of camellia was a splendid flower of C. reticulata from Mr. J. C. Williams. For three large jars of sprays of outdoor camellias in three varieties, Mrs. John Williams was first, and for twenty varieties of hardwood flowering shrubs the premier award was made to Mr. R. Fox, who showed Andromeda japonica, Acacia diffusa, Daphne indica, Cytisus racemosus, Pieris formosa, Azalea carminata splendens, camellias, Pittosporum eugenoides, Magnolia Soulangeana, M. stellata, Daphne taureola, Staplylea colchica, Embothrium coccineum, Erica mediterranea, Berberis Darwini, Erica Veitchi, Cerasus Watereri, Grevillea sulphurea, Erica australis, Cytisus albus. There was a good deal of dissatisfaction at the judging in this class. In competition for the prizes for six varieties of hardwood flowering shrubs Sir Arthur Pendarves Vivian was first with Chorizema Lowi, Clematis indivisa, Embothrium coccineum, Viburnum rugosum, Cerasus Watereri, Acacia Riceana.

The nurserymen's exhibits added much to the attractions of the show. The Devon Rosery, Torquay, who received an Award of Merit, showed a fine collection of pot roses in full flower, these including Lady Helen Stuart, Prince Camille de Rohan, Beauty of Waltham, Camille Bernardin, Frau Karl Druschki, Captain Hayward, Prince de Bulgaria, Leonie Lamesch, Mrs. Sharman Crawford, Lady Quartus Ewart, and Abel Carriere. They also had some fine large-

flowered clematises in full bloom, amongst which were Marcel Moser, Fairy Queen, Lord Neville, Venus Victrix, Lady Caroline Neville, and Princess of Wales. Messrs. Robert Veitch and Son, Exeter, received a First Class Certificate for Osmanthus Delavayi, and an Award of Merit for their stand, which contained winter-flowering carnations Carola, Mrs. T. M. Crook, Colossus, Scarlet Glow, May Day, Lady Audley Neeld, Godiva, Enchantress, White House, Daphne poniana, D. collina, D. alpina, D. Cneorum, Eriostemon neriifolium, E. linearifolium, E. scaber, E. myoporoides, Cytisus Kewensis, Myrtus bullatus, Illicum religiosum, Rhododendron racemosum, R. eximium, R. Dr. Stocker, R. Princess Juliana, R. yunnanense, R. Smithi aureum, Correa bicolor, C. cardinalis, C. curiosa, Psoralea pinnata, Lonicera pileata, and Cytisus Beani. Mr. G. Reuthe, Keston, Kent, received an Award of Merit for Calypso borealis and Bryanthus erectus (rare). In his stand were included Cassiope tetragona, Rhapithamnus cyanocarpus, Rhododendron campylocarpum, R. Aucklandi, Boronia heterophylla, Callistemon salignus, Mertensia virginica, and a fine collection of rock plants, including Androsace carnea, Saxifraga calyciflora, S. ambigua, S. luteo viridis, S. lantoscana superba, S. Salomoni, S. valdensis, S. thessalica, S. balcana, S. porophylla, S. bronchialis, S. cochlearis, S. Vandelti, S. Stuarti, S. diapensoides. Messrs. Barr and Sons received an Award of Merit for Narcissi Ruby and Florizel, and showed a remarkably fine collection, among which were Cossack, Cœur de Lion, Ruby Marie Louise, Cingalee, Will Scarlett, Snow King, Cleopatra, Falcon, Peter Barr, Florizel, Magpie, Sheba, Dresden, Snowsprite, Red Prince, Socrates, Noblesse, Epic, Bloodstone, Peace, and Buccaneer. Messrs. Cartwright and Goodwin gained an Award of Merit for Narcissus Nemesis, and had an attractive stand on which were Amyas Leigh, Glory of Leiden, Royal Sovereign, Orangeman, Monarch, Inga, Evangeline, Castile, Pilgrim, Brilliancy, Cornelia, Creole, Weardale Perfection, Long Tom, Barcarolle, Fairy, Chloe, White Star, Heroine, Ben Avon, Cristilla, Fairy Queen, and Southern Star. Mr. H. E. Jephson received an Award of Merit for a varied collection of alpines.

A First Class Certificate was awarded to the Rev. A. T. Boscawen for Prostanthera rotundifolia, which he showed with vases of Gladiolus tristis. Mr. J. C. Williams received an Award of Merit for Rhododendron Augustini, and Mr. R. Fox for Rhododendron Liliani. Mr. J. D. Enys contributed a large stand, not for competition, containing Myosotidium nobile, Embothrium coccineum, Cerasus japonica, Magnolia Lennei, M. Osaka, M. Alexandra, Prunus sinensis flore pleno, Daphne Genkwa, Magnolia stellata, ericas, rhododendrons, and azaleas. Lady Falmouth and Mrs. John Williams showed branches of camellias, and Messrs. J. C. Danbuz and H. H. Williams collections of apples.

## Bristol Gardeners' Association.

The usual fortnightly meeting was held on March 11, at St. John's Parish Rooms. Dr. Shaw presided over a good attendance. A lecture on "Vegetables" was given by Mr. Binfield, gardener to Colonel Tagart, Sneyd Park. The lecturer selected four kinds for consideration, namely, potatoes, onions, runner beans, and peas, as being the most important and valuable vegetables grown. Mr. Binfield said the potatoes do not require fresh manure; good varieties are May Queen, Sharp's Express, and Up-to-Date. He stated that onions, runners, and peas require well-trenched and manured ground, and to mulch the two latter in dry weather. Dr. Shaw, and Messrs. Scott, Ayres, Springham, Curtis, and Woodward took part in the discussion.

For two schizanthuses, Messrs. Spry, Springham, and Bastin won in the order given. Messrs. Ayres and Garnish were awarded certificates, the former for apples, the latter for narcissi and stocks. Mr. Jennings was granted a special award for a specimen of Cymbidium Lowianum.

## Parkstone Gardeners' Association.

On April 11 Mr. G. Garner gave a lecture on "Twentieth Century Gardening" before a large attendance of members of the above association. The President, Dr. Crallan, presided.

Mr. Garner briefly reviewed the principal features connected with gardening during the past few years, drawing attention to the improvements made of late in bedding-out arrangements, to the more extended use of herbaceous, alpine, and rock plants, the advance made in sweet peas, in hardy and half-hardy annuals, generally; tuberous begonias, roses, and winter-flowering carnations. The lecturer also referred to the increase in the number of exhibitions, to the great good accruing through healthy competition, to the fact that gardening was being taken up more and more every year by amateurs; to the eagerness of the gardening public in seeking for information from the gardening journals, and to the generous supply of such information by the journals.

Reference was made to Gardeners' Mutual Improvement Associations, and to the good they are doing, especially in assisting young members to obtain information.

The President took the lead in a free discussion which followed, and said that quality of produce was being recognised now, more than ever, and he gave much praise to the horticultural Press for the valuable work it was doing. Mr. Hill remarked on the advance made in the culture of herbaceous plants, to the greatly improved way of arranging them in the borders, and to their increased use as cut flowers for table and house decoration. Mr. King referred to the extended use of chemical manures. Other members took part in the discussion, and put a number of questions to the lecturer on various subjects. Votes of thanks to the president and the lecturer brought to a close a very pleasant evening.

## United Horticultural Benefit and Provident Society.

The usual monthly committee meeting was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday evening, April 15. Mr. Charles H. Curtis presided. The Secretary reported that three deaths had occurred since the preceding meeting, and the sums standing to the credit of the late members were granted to their nominees, the largest amount being £62 4s. 6d. Several members over 60 years of age withdrew their interest, and one member over 70 years of age withdrew his deposit account, being the large sum of £130 5s. 2d., leaving £10 in the society till death. The amount of sick pay for the month was £57 15s. The matter of the Insurance Act as affecting this society is now in the hands of the actuary.

## Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College on the evening of 11th inst. Mr. Wm. Christeson presided. The lecturer was Mr. Alex. Innes, gardener at Hallyburton, who had for his subject "Chrysanthemum Growing Up-to-date." After briefly tracing the early history and evolution of the chrysanthemum in an interesting manner, the lecturer dealt with the practical aspect as practised with excellent results in the gardens under his charge. The various groups were in turn treated upon, the practice of up-to-date methods being easily recognised, leaving little scope for discussion, which was chiefly of a complimentary nature, all the speakers testifying to the abilities of the lecturer and the high qualities of the lecture.

The exhibits consisted of chrysanthemum plants illustrating the lecture, six vases of violets in variety, and a fourteen-year-old cyclamen in a 7-inch pot carrying a profusion of superb flowers, all from Mr. Innes, who was cordially thanked for his lecture and exhibits on the motion of Mr. D. C. Hutcheson and Mr. Wm. Grant.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—D. S. T., Morpeth: You will greatly oblige me by giving the name and address of the secretary of the Royal Caledonian Horticultural Society, and stating terms of membership?—The secretary of the society is Mr. Donald Mackenzie, 23, Rutland Square, Edinburgh. There are different rates of payment, members paying £2 2s., £1 1s., 10s. 6d., and 5s. respectively.

PLANTING OUT FORCED DAFFODILS.—H. G., Rochdale: Is it worth while saving forced daffodils after they have flowered, and planting them out in shrubbery or other borders?—Certainly. If the bulbs have not been too severely forced, and provided they are carefully treated as soon as the flowers are over, they may be planted out in any suitable place almost at once. When removed from the conservatory they should receive the shelter of a frame, and be provided with sufficient water. A process of hardening off should follow, and planting take place in April while the leaves are still green. Excepting for the removal of the crocks, each potful of bulbs should not be disturbed.

LOSS OF SEEDLING STOCKS.—P. N., Weedon: A very large number of young seedling stocks have failed this year, and appear to have damped off. Can you tell me the reason of failure?—Seedling stocks are very impatient of an excess of moisture, and will damp off wholesale if the soil in which they are sown becomes sour in the least degree. It is better to raise seedling stocks in shallow pans or boxes, than in pots. In any case, extreme care in watering is necessary, as well as a light position near the glass, as soon as the seedlings appear.

FAILURE WITH SWEET PEAS.—F. B. C., Canterbury: I obtained my sweet pea seeds from a well-known seedsman, and am very disappointed with the results. Quite a number of the seeds have failed to germinate, and many more were slow to make growth. The seeds were sown in pots at the end of February, in a cool greenhouse, and so far as I am able to judge, they have been well cared for. It sems to me the seeds must have been of poor quality; but perhaps you may be able to indicate a cause of failure.—In the absence of specimens of seeds that have not germinated we can only suggest that failure is chiefly due to the hardness of the skin of the seeds; if these seeds had been taken from the soil as soon as a number of others sown at the same time had germinated, and the skin or shell had been just cut or filed through, germination would in all probability have followed.

CHEAP TICKETS FOR INTERNATIONAL HORTICULTURAL EXHIBITION.—J. M. S., Chew Magna: Could you kindly give me any information regarding the coming International Show to be held in May next? I have only taken your splendid paper for three months, but during that period have failed to find anything relating to cheap tickets for bona fide gardeners.—Where can such cheap tickets be obtained?—The directors of the International Horticultural Exhibition give us very little information respecting arrangements, and are not taking that opportunity which the advertising pages of the horticultural Press afford for giving publicity to the forthcoming event. But what little information has reached us we have published, and in our issue of March 2 we issued a list of the county secretaries, a list supplied at our request and on behalf of a correspondent. It is, we understand, to the county secretaries gardeners should apply for cheap tickets. You should apply to Mr. W. Jefferies, Cirencester, who is the county secretary for Gloucestershire; or to Mr. F. W. Cooling, 11, Northgate Street, Bath, who is county secretary for Somerset.

EMPLOYMENT AT KEW.—J. C., Slough: Kindly tell me how to proceed for the purpose of obtaining employment in the Royal Gardens, Kew.—Apply for employment, and address your letter to the Curator, Royal Gardens, Kew, Surrey. State age and experience. You will then receive a form to fill up and return, and if everything is satisfactory you will then wait your turn for admission.

LÆLIO-CATTLEYA WHITELEGGEI.—M. B., Swanley: Please tell me the parentage of L.-c. Whiteleggei, or L.-c. G. G. Whiteleggei.—L.-c. Whiteleggei was raised by crossing Cattleya Hardyana with L.-c. callistoglossa, and is named after Mr. Whitelegg, who was formerly gardener to Mr. Bradshaw, and is now a nurseryman at Chislehurst. Cattleya Hardyana is a hybrid between C. Dowiana and C. Warscewiczi, and L.-c. callistoglossa is derived from C. Warscewiczi and Lælia purpurata, the latter being the seed parent.

RUST ON PINKS.—S. R. J., Coventry: I have some pinks in pots, and have been growing them in frames; they looked very well until lately, when the leaves became rusted like the enclosed specimens. Please tell me the cause and cure of the trouble.—The disease is due to the presence of the Pink Rust (Puccinia arenariæ), which invariably makes itself evident by means of circular clusters of small blackish spots. A moist and close atmosphere weakens the tissues and encourages the disease, so that opposite conditions militate against the disease. Your best plan is to frequently sponge the leaves with a rose-red solution of permanganate of potassium.

SHORT-LIVED DAFFODILS. — S. S., Cambridge: Can you suggest a reason for the especially short daffodil season we are experiencing this year?—Many circumstances have combined to make the daffodil season of 1912 a very short one. The hot summer of 1911 ripened leafage and bulbs excessively, and so perhaps there was less substance than usual in the bulbs. Then the ground was dry at planting time in many cases, and so rooting did not immediately commence. A wet, comparatively mild winter induced early growth, and the daffodils were forced into bloom in a mild, early springtime, and as soon as the bulk were in flower the brilliant sunshine and drying winds quickly took all the brightness out of the flowers, so that individual blooms were not long available for exhibition purposes, though looking well enough in the mass. One large grower and raiser has already labelled 1912 as "a most impossible season for daffodils."

## NAMES OF PLANTS.

W. C., Epsom.—Davallia hirta cristata.

J. B., Cirencester.—1, Odontoglossum crispum; 2, a good Cattleya Trianæ.

R. C. W., Woking.—1, Pieris japonica; 2, Prunus triloba; 3, not recognised; 4, probably an Uvularia.

S. E. G., Andover.—1, Erythronium Denscanis; 2, Erica mediterranea; 3, Episcia chontalensis; 4, Begonia fuchsioides.

W. E. H., Kingston Hill.—1, Spiræa prunifolia; 2, Pieris japonica; 3, Pyrus malus floribundus; 4, Berberis Darwini; 5, poor specimen, probably Epimedium Perralderianum.

F. W., Oxon.—1, Triteleia uniflora; 2, Helleborus fœtidus; 3, a Fritillaria, possibly F. Meleagris; 4, looks like the root stock of Rodgersia podophylla; 5, not recognised, should have been sent in flower.

## OBITUARY.

◆

### MR. GEORGE WREN PIPER.

With much regret we have to record the death of this veteran rosarian, which occurred at Uckfield on the 9th inst. in his 74th year. For a long period Mr. Piper was a frequent exhibitor of roses at the shows of the National Rose Society, and other of the leading societies. Some years ago he introduced to commerce the well-known tea-scented rose Sunrise, and later he distributed the variety known as Peace. Owing to failing health Mr. Piper had lately lived in comparative retirement at Uckfield, Sussex. He leaves three sons and two daughters, and the business established at Uckfield by him about 1860 will be carried on under the management of Mr. Thomas W. Piper.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, April 23.—Breconshire Daffodil Show.

WEDNESDAY, April 24.—Royal Botanic Society Meeting.
North of England Horticultural Society, at Leeds.

THURSDAY, April 25.—Midland Daffodil Show at Birmingham; two days.
Norwich Spring Show.
Falmouth Spring Show; two days.

TUESDAY, April 30.—Royal Horticultural Society; Narcissus Committee meets at 11.30 a.m.; Fruit, Floral and Orchid Committees at 12 o'clock; Lecture at 3 p.m. on "Potatoes" by Dr. Redcliffe Salmon; Scientific Committee at 4 o'clock.
National Auricula and Primula Society's Show at the Royal Horticultural Hall.

WEDNESDAY, May 1.—National Auricula and Primula Society, Midland Section, at Birmingham.

THURSDAY, May 2. Linnean Society Meeting.
Manchester and North of England Orchid Society.

SATURDAY, May 4.—French Horticultural Society of London.
North of England Horticultural Society; Conference on "Horticulture in Secondary Schools and Farm Institutes," at Newcastle.

Guaranteed Gardenalities

GUARANTEED GARDENALITIES

FLORA ABUNDA

The name by which the most reliable FERTILIZERS and INSECTICIDES are popularly known to an appreciative public—The name which guarantees QUALITY and EFFICACY.

Carmona Fertilizer.

Plants feed with avidity and thrive on the elements of Carmona Fertilizer. Carmona, the guaranteed Fertilizer, is all plant food, scientifically compounded. Carmona feeds naturally. One after the other elements of Carmona are released in proper succession and become available, life-giving, plant food which plants absorb and thrive upon.

**Carmona Fertilizer,** the final phase in specialised scientific fertilizers,

**BRINGS THE BEST OUT OF PLANTS.**

**Prices: 1 Cwt., 20/-; ½ Cwt., 12/6; 28lbs., 7/6; Tins, 6d., 1/-, and 2/6.**

**SPECIAL SWEET PEA FERTILIZER.**—In this splendid fertilizer all the elements are contained to produce first-class blooms in size and colour. It should be applied occasionally during the growth of the vine, and in order to obtain the finest possible blooms it should be fed to the plants more liberally when the bloom buds are showing. Success in Sweet Pea growing is assured to all users of the specially prepared Carmona Sweet Pea Fertilizer.

**Prices as for Carmona, the Guaranteed Fertilizer above.**

Velvas Lawn Sand.

**Weedy Lawns** are transformed by the magic of Velvas into veritable carpets of rich green grass of excellent quality. Velvas Lawn Sand destroys weeds, daisies, plantains, etc., and fertilizes the grass, thickening up the existing growths, and covering bare spaces with an abundant growth of new grass.

**Prices: 1 Cwt., 20/-; ½ Cwt., 11/-; 14lbs., 3/6; Tins, 6d., 1/-, and 2/-.**

£350 in Cash
for users of
Carmona Fertilizer.

The above magnificent sum to be awarded to successful exhibitors at the Great Guaranteed Gardenalities Horticultural Exhibition—open to Carmona users only. Entry free by coupon from Carmona packages. Under one roof at the Botanical Gardens, Edgbaston, on August 28th and 29th next, will be congregated the finest possible floral and vegetable testimonies to the wonderful feeding properties of Carmona Fertilizer. As a user of Carmona Fertilizer you have as good a chance as the next keen amateur of growing something to perfection and to win one of the handsome cash prizes into which the £350 is being divided.

GUARANTEED GARDENALITIES

Clift's Fluid Insecticide and Soil Sterilizer

has created a record in soil insect pest destruction; 806 dead insects, including dozens of Wireworms, were killed by one application of "a 1 in 100 solution" of Clift's Fluid on a patch of land 16ft. by 3ft.

These are the most remarkable figures of insect destruction ever published, and were achieved in the course of exhaustive experiments conducted by an eminent Biologist.

Before you sow or plant, pave the way to success by treating the soil with Clift's Fluid Insecticide and Soil Sterilizer. It is absolutely uninjurious to plants, and is the finest Insecticide in the world for the destruction of soil insect pests.

**Prices: 1 Gallon, 6/-; ½ Gallon, 3/6; Pint tins, 1/-.**

A copy of the Biologist's report on Clift's Fluid Insecticide and Soil Sterilizer will be sent **post free** to anyone sufficiently interested in the destruction of soil insect pests to read some dozen typed quarto pages of really interesting figures and facts in connection with three months' experimenting.

Clift's Manurial Insecticide,

a powder for the destruction of Slugs, Wireworms, Millipedes, Leather-jackets, etc.

To be mixed with the soil prior to planting or sowing, or sprinkled and lightly raked in around growing plants.

Combined Insect Destroyer and Fertilizer of a most durable character. Recommended by professional gardeners and horticultural experts and instructors throughout the Kingdom.

**Prices: 1 Cwt., 10/6; ½ Cwt., 6/6; 28lbs., 4/3; 14lbs., 3/6; Tins, 6d., 1/-, and 2/-.**

READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s., post free, from KELWAY and SON, LANGPORT, SOMERSET.

From an article in "The Field," August 12th, 1911, on The Best Gardening Books:
"I do not know of anything dealing with herbaceous borders more comprehensive than Kelway's Manual."

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
——, Esq., Penmon, Beaumaris, Anglesey.
"I shall probably want some more Herbaceous things, as those we got from you last year have done splendidly. I do not know whether it is the excellence of your plants or the season, but some of them have grown enormous."

NOW IS THE TIME TO PLANT KELWAY'S NEWEST GLADIOLI.—These new Gladioli are a revelation. They should be planted by all who want glowing effect of colour in their beds and borders, and flowers for the house in July, August, and September. We recommend trial of a selection of our "Cream of the World" Collection of named varieties; flowering bulbs, for instance, one dozen for 9s.; per 100 £3 10s. Other choice collections, 30s. and 45s. per 100. Full descriptive list on application. Postage free for remittance with order.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

NOW IS THE TIME TO PLANT

KELWAY GAILLARDIAS are very enduring on the plant, even in dry weather, and as cut flowers they retain their freshness and brilliance for a long time after cutting. Choice named collections 12s. and 18s. a dozen; from pots.
Carriage and packing free for remittance with order.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Selective Culture.

Selective culture, which implies the influence of man's needs and taste as distinct from the purely natural selection, which has led to such infinite diversity of type in both the animal and vegetable kingdoms, must have been commenced at a period long antecedent to any human records. At the outset, no doubt, the unsophisticated roots, foliage, and fruits were devoured with but little discrimination by savage nomad races, as they came across them in their hunting expeditions, or were forced in times of stress to seek for anything which appeared to be edible. Experience would in time teach them what to choose and what must be avoided. It may, then, be assumed that, when circumstances permitted the formation of a settlement, such forms of vegetation which had proved to be nutritious would be encouraged to grow in the locality by the scattering of seed or by transplanting; so that, in this way, the foundation of agricultural methods would be laid. Here, already, selection would have begun by choosing the fittest wild types, and obviously the next step would be the selection of any of these which showed improvement under the rude culture afforded them. The result of these operations was that in the earliest botanical records extant we find a number of fruits, vegetables, and cereals which had already been so transformed by long-continued selection that it is difficult, and sometimes even impossible, now to indicate which was the originally wild species whence these varieties sprung. It may even be possible that in the process of evolution the original wild species has disappeared, its varietal descendants only surviving by virtue of the protection afforded by constant cultivation. The wonder, in this connection, is that so many wild species have been gifted with such powers of variation and responsiveness to culture as to yield the marvellous results which we see around us nowadays. If we visit our flower, fruit, and vegetable shows, we see a practical infinity of forms of vegetation, in which size, shape, flavour, scent, habit, and, in short, every vegetative character has been utterly transformed by man's selection. The few tiny, hard seeds of the grass tribe are multiplied and swollen into the comparatively large ones of wheat, barley, oat, and maize, and all their kin; the sour or acrid berry of wild plum or gean is represented by a host of luscious plums or cherries; the leather-coated almond has hidden itself, as it were, behind the blushing, blooming cheeks of peach or nectarine; the simple petals of the rose family, such as dot the wild bushes in our hedges, are transformed into cataracts of brilliantly-coloured blossoms or huge individual ones of queenly beauty and unimaginable delicacy; the tough, fibrous roots of the wild carrot, turnip, etc., have been transformed into great masses of tender nutritious material; small, hard tubers into huge edible ones; and even the foliage, as in the cabbage, has been expanded and varied in many ways to form valuable food for man, and so much of the animal kingdom as he, in like selective fashion, has brought under his sway. In considering all this series of transformations, it is folly not to recognise the debt we owe to that beneficent creative power which has endowed all these plants not merely with the capacity of responding to cultural conditions by increased growth, but of varying every now and again on different lines, and thus leading up to different forms, which do away with that monotony which a mere accretion of growth would have involved. Thanks to this capacity for sporting, which appears to be utterly beyond man's powers to induce or determine, we have now a practically infinite variety of fruits, vegetables, and flowers to choose from, as our exhibitions demonstrate. To some extent, also, we are beginning to comprehend the laws which underlie the inheritance of those characters which form the selective cultivator's opportunities, and are consequently becoming able to determine with greater certainty the lines of progress to be pursued; while simultaneously scientific research is revealing day by day fresh methods of increasing the fertility of the land, and thus expanding its productiveness.

MR. EDWARD BULL.
Proprietor of Messrs. William Bull and Sons, Chelsea.

---

**Mr. Edward Bull,** proprietor of the firm of Messrs. William Bull and Sons, King's Road, Chelsea, is widely known among horticulturists, as business duties take him to many parts of the British Isles. He was educated at Ravensnowle, Anerley, and the City of London School, and, after receiving private tuition, entered his father's business at an early age. After the death of his father and the illness of his elder brother, the responsibility of the business fell upon his shoulders. About 1901 he conceived the idea of raising seedling orchids in large quantities, to see if it were not possible to place really good varieties before the public at a modest outlay as compared with the high prices paid for the finest forms of imported species. With Mr. Lakin's help he has carried out this idea with great success, and, incidentally, has maintained the reputation of his firm for new and rare plants. In recent years he has taken up the work of improving hippeastrums, and with happy results. Indeed, Mr. Edward Bull is as keen on introducing hybrid and cross-bred novelties, as his father was in introducing new plants from all the ends of the earth. To encourage plant breeders, he is giving three silver cups at the Royal International Horticultural Exhibition for the best hybrid odontoglossum, the best hybrid cattleya, and the best odontioda respectively.

**Royal International Horticultural Exhibition.**—In connection with this great gathering two conferences will be held in the Recreation Hall, Chelsea Royal Hospital, at which subjects of an international character will be discussed. The Right Hon. A. H. Dyke Acland, the chairman of the Science and Education Committee, will preside at both conferences. The first will be held on May 23, commencing punctually at two p.m., and the subject for discussion will be Horticultural Education. The speakers will be Professor L. H. Bailey, Cornell University, U.S.A., who will deal with the question of "Horticultural Education in America"; Herr K. Weinhausen, of Berlin, who will speak on "Horticultural Education in Germany"; and W. Hales, Esq., of Chelsea Physic Garden, who will give an address on "The Education of a Gardener." The second conference is arranged for May 24, and will commence at 9.30 a.m. The subject will be "Legislation in Connection with Plant Diseases and Pests," and the speakers will be Professor Ritzema Bos, of Holland, who will give an address on "The Value of Importation Regulations as a means of Preventing the Introduction of Plant Pests from Abroad"; A. G. L. Rogers, Esq., of the Board of Agriculture, who will deal with "The Aims of Legislation in Great Britain"; H. Maxwell Lefroy, Esq., M.A., F.Z.S., F.E.S., of the Indian Department of Agriculture, who will speak on "Legislation in Connection with Insect Pests"; and H. J. Güssow, Esq., F.R.M.S., Botanist to the Canadian Government, who will give an address on "Legislation in Connection with Fungus Diseases." The several addresses at each conference will be followed by a discussion.

**Rose Conference and Dinner.**—The National Rose Society will hold a Rose Conference at the Holborn Restaurant on May 20, at five p.m., when the president, Rev. J. H. Pemberton, will deliver a lecture on "The Modern Development of the Rose." The lecture will be followed by a discussion. There will be no charge for admission. At seven p.m. the same day the members of the society will dine together, and to the dinner some of the leading foreign rosarians, who will be over for the International Horticultural Exhibition, have been invited as guests of the society. The charge for dinner will be 5s., exclusive of wine and coffee. Mr. Edward Mawley, V.M.H., Berkhamstead, hon. secretary, should be applied to for tickets.

**Rainfall of the Winter,** 1911-12.—In an interesting letter which appeared in the "Times" of Tuesday, April 16, on the rainfall of the past six months, Dr. H. R. Mill states that, taking the average rainfall for that period as 100, that of the winter half-year 1911-12 in Scotland was 111, in Ireland 136, in England and Wales 141, and in the British Isles as a whole 131, the excess over all being very nearly equal to two months' rainfall. It places the excessive rainfall of the six months in a striking light when it is recognised that as much water was deposited on the surface of the British Isles in that time as during the whole year 1887. Dr. Mill expresses the opinion that it is not as a rule, safe to pay much attention to extreme readings at individual stations, as there is always the possibility that an error of observation or transcription may infect them; but the general rainfall of large areas can be accepted as free from such risk. He gives particulars of the general rainfall of the Thames Valley above Teddington, an area of about 3,800 square miles, for a period of 29 years. The average rainfall of this large region for the year has been estimated as about 27in., of which 12.50in. fall in the summer six months, and 14.50in. in the winter six months. Considering the year broken as near the equinoxes as the end of the months allows, and composed of the summer six months with the next following winter six months, it was found that there has not been an instance of greater disparity between the summer and winter rainfall than in 1911-12, when from April to September there fell only 8.11in. of rain, and from October to March 23.53in. The summer rainfall was 35 per cent. below the summer average, the winter rainfall 62 per cent. above the winter average. The summer half-year of 1893 was a little drier, with 7.82in., or a deficiency of 39 per cent.; but no other winter since the comparison became possible in 1883-84 was so wet. The nearest approach was the winter six months of 1903-04 with 19.33in., an excess of 35 per cent.; but, instead of being preceded by one of the driest summers, that winter had been preceded by the very wettest summer in the record. The six months' winter rainfall of 1911-12 was greater than the whole rainfall of seven out of the 29 years under consideration, viz., 1887-8, 22.20in.; 1890-1, 21.65in.; 1893-4, 22.41in.; 1897-8, 21.79in.; 1901-2, 22.32in.; 1904-5, 22.08in.; 1906-7, 22.87in.

**Royal Botanic Society and the International Exhibition.**—We learn that the Royal Botanic Society have offered a plant of the giant water-lily—Victoria regia—for exhibition at the forthcoming Royal International Horticultural Exhibition at Chelsea, and have also offered two large gold and two silver medals for roses and carnations.

**Racemose Gooseberry.** — Mr. Worthington G. Smith, of Dunstable, recently sent drawings to the R.H.S. Scientific Committee, illustrating flowers and fruit of a racemose form of gooseberry, which had been referred to previously as a hybrid between the gooseberry and the black currant on account of the thickly-produced clusters of very dark berries and their flavour, which was said to be intermediate between the gooseberry and black currant. On careful examination of the flowers and fruit he had, however, been unable to find any trace of black currant. The plant appeared to be wholly gooseberry with flowers and fruit borne in racemes of from two to five. He could detect no black currant flavour, although the taste was delicious and strong. No oil glands are present on any part of this new form, and the fruits are perfectly glabrous. The pollen is exactly that of the garden gooseberry. It flowers three weeks in advance of the black currant. The merit of the plant lies in its great fruit-producing properties, as on a given length of branch it produces more fruit in weight than, probably, any other bush extant. The colour of the fruit when ripe is deep, almost black, maroon or dark mahogany, becoming black. The cuttings strike freely in any soil, many of last year's shoots being nearly a yard in length. Seeds planted by Mr. Smith did not germinate. The plant originated as a seedling in a market-grower's garden in the South of England, where it was regarded as a variety more curious than useful. Mr. R. H. Nicholls, of Dunstable, has acquired the stock.

**Relative Popularity of Show Auriculas.**—In an interesting contribution to the report of the Southern Section of the National Auricula Society Mr. J. L. Gibson gives a list of the show varieties exhibited not less than ten times during the years 1902-11. The names of the varieties and the number of times staged are as follows: Acme, 141; Mrs. Henwood, 101; Heather Bell, 93; Ruby, 91; Mrs. Potts, 88; George Lightbody, 84; George Rudd, 80; Abraham Barker, 78; Rev. F. D. Horner, 75; Shirley Hibberd, 71; Abbe Liszt, 65; Rachel, 58; Richd. Headley, 57; Favourite, 44; Mrs. Phillips, 40; Miss Barnett, 36; Black Bess, 35; Gerald, 32; Mikado, 32; Olympus, 31; Lancashire Hero, 30; Cleopatra, 30; Conservative, 28; Heroine, 26; Col. Champneys, 26; Wm. Brockbank, 24; Harrison Weir, 22; Marmion, 21; Dr. Hardy, 20; Dinham, 18; Mrs. Dodwell, 18; Jas. Hannaford, 16; Miss Ethel, 13; Prince Charming, 11; Perseverance, 11; Brunette, 11; Gladiator, 11; Eucharis, 10; Frank, 10; Beauty, 10. With reference to the relative positions of the varieties, Mr. Gibson observes: "Some old-time favourites owe a relatively high position only to past glories; while some of the younger competitors, like Harrison Weir, Mikado, and Favourite, would have been higher but for their youth. Favourite, for instance, has largely supplanted Mrs. Potts, and Black Bess, constantly exhibited up till 1906, is now never seen; while Mikado, gaining its credentials in that year, has steadily come to the front, and is now recognised as one of the finest selfs."

**Monsieur Jules Vacherot.**—A portrait of this distinguished French landscape gardener appears in the last issue of our contemporary "Jardinage." His work in laying out the grounds of the great Paris International Exhibitions of 1889 and 1900 is well known, and appreciated. He also designs the spring and autumn shows of the National Horticultural Society. He laid out the French Section at the Franco-British Exhibition at Shepherd's Bush, has remodelled the King of the Belgians' gardens at Laeken, and done much other useful work.

**Front Garden Competition at Kingston.**—For many years the authorities at Kingston-on-Thames have interested themselves in the improvement of flower gardening, especially in connection with front gardens attached to the dwellings of artisans. This has led to a considerable improvement in the appearance of the town. This year the Mayor of Kingston, Councillor G. E. J. Street, is offering a silver challenge cup for the best-kept front garden in the borough. Kingston's example might well be followed by other towns.

**Horticultural Conference at Newcastle.**—Under the auspices of the North of England Horticultural Society, a conference will be held at Armstrong College, Newcastle, on Saturday, May 4. Earl Grey will preside, and proceedings commence at three o'clock, when Sir Thomas H. Elliott, permanent secretary of the Board of Agriculture, will lecture on "Horticulture in Secondary Schools and the New Farm Institutes." Mr. H. J. Chapman, of Oakwood Gardens, Wylam, will follow with an address on "The International Horticultural Exhibition of 1912."

**New Experimental Garden for Lancashire.**—The new experimental garden at the Lancashire County Council's farm near Preston is nearly completed, and should prove an important factor in the horticultural education that is being carried on in the county. The garden is situate within a ten-minutes' walk of Hutton and Howick railway station, and was established in the latter part of last year. The ground, which previously formed part of a pasture farm, consists of four acres of good loam overlaying a bed of marly clay. The garden has been established for educational and experimental purposes, and not as a source of profit; but the work will be so arranged as to have a commercial value. Botanical beds have been provided for the use of students, and for the information of market growers various fruits and vegetables will be grown, and their value for market tested. In the interest of fruit growers experiments have been arranged to demonstrate the results of the various methods of planting, pruning, training, and spraying of fruit trees; the effect of lime and the various kinds of manures; and the prevention and destruction of insect and fungoid pests. Arrangements are being made for training elementary school teachers to take the subject of gardening in the day schools. One of the features will be a model cottage, which is being erected on a special part of the Hutton farm, with a garden to be devoted to horticultural instruction conducted on commercial lines. The garden has an area of 20 rods, part of which will be devoted to the cultivation of vegetables under a proper system of rotation, and part to fruit and flowers. A strict account will be kept of the receipts and expenditure. The fruits that will be grown in the garden will comprise apples, pears, plums, gooseberries, black currants, raspberries, strawberries, and rhubarb. A so-called French garden, with an area of one-sixtieth part of an acre, is being formed with the object of determining whether the climatic conditions in Lancashire are favourable to the growth of early vegetables and saladings under the French system. The head gardener is Mr. J. Gillett, and the horticultural instructor for Lancashire is Mr. A. G. Sowman, who has written an excellent description of the garden and its objects.

**Victorian Fruit Exports.**—According to information received by the Agent-General for Victoria, Australia, about 318,000 cases of fruit will be despatched from Melbourne to London and Antwerp during the present season.

**Spring Flowers at Sefton Park, Liverpool.** — Mr. Jas. Guttridge, superintendent of the Liverpool Parks, is to be congratulated upon the beautiful display of early flowers in the large palm house at Sefton Park. Near the north door is a fine group of hippeastrums surrounding the lovely marble representation of Highland Mary, with lachenalias overhead. Near the opposite door is a mixed group of lilacs, rhododendrons, spiræas, genistas, wistarias, azaleas, and tulips. Cineraria stellata is good, and Senecio Moorei, mixed with daffodils, was delightful a week or two ago. Facing the marble seat is a group of choice orchids, including many lælio-cattleyas, oncidiums, and dendrobiums, with tulips, roses, and ferns as a basal setting.

**American Gooseberry Mildew.** Having received information that the summer stage of the Gooseberry Mildew (Sphaerotheca Mors uvæ )was found in a Cambridgeshire garden on April 15, the Board of Agriculture urges gooseberry growers to carefully examine their bushes, promptly report the presence of the disease, and, if the least evidence of the fungus is found, to spray the gooseberries with potassium sulphide used at the rate of 1lb. to each 32 gallons of water.

**Tobacco Growing in Ireland.**—From the annual report of the Department of Agriculture and Technical Instruction for Ireland, we learn that in 1911 pipe varieties of tobacco were planted on one hundred acres, cigarette varieties on twenty-eight acres, cigar varieties on five acres, and varieties for the production of nicotine on one acre. The season of 1911 was, on the whole, exceptionally favourable for tobacco growing. The crop would probably have been the best both as to average yield and as to quality that has been grown since the beginning of the experiments had it not been for the fact that the tobacco on about fifteen acres was injured by insects and disease. The tobacco grown in 1910 at all centres except two was sold to manufacturers, the average price obtained being 5¼d. per lb. The prices ranged from 4d. to 6½d. per lb. for pipe varieties, 6d. per lb. for cigarette varieties, and from 3½d. to 8d. per lb. for cigar varieties. The reports of the manufacturers who purchased the crop were similar to those made on the 1907 and 1908 crops. Most of the tobacco was blended carefully with foreign leaf, but in one case Irish-grown tobacco alone was used with successful results.

**Tulips at Sheffield.**—Last Sunday was a great day at the Sheffield Botanic Gardens because of the wonderful display of tulips that greeted visitors. Thirty thousand were on view, and most of them had their flowers all fresh and newly opened. Proserpine, Belle Alliance, Vermilion Brilliant, Keizerskroon, and White Hawk were particularly fine, the purity of the white blooms of the latter causing not a little comment, and it was generally conceded that the coal strike, and consequent reduction of black smoke and dust, was largely responsible for this pleasing state of affairs.

**Sweet Pea Prizes for Children.**—One of the special features of the exhibition of the National Sweet Pea Society, to be held at Boston, U.S.A., July 13 and 14, which is attracting much attention, is the proposed display by school children. A leaflet has been issued showing the schedule of some twenty-four classes, open only to school children, and carrying simple suggestions for the successful growing of sweet peas. A large number of these has been distributed through school superintendents in Boston and vicinity, and an interesting exhibition is anticipated. The "Weekly Florists' Review" states that the seed stores note a considerable demand for seeds as a consequence of these school children's prizes.

**A Newly-discovered Fossil Plant.**—At the monthly meeting of the Royal Society of Edinburgh, a communication from Dr. W. T. Gordon, Edinburgh, was read by Professor James Geikie on "Rhetinangium Arberi, a New Fossil Stem from Pettycur." This newly-discovered fossil plant has, according to Dr. Gordon, several features which render the type rather important from an evolutionary standpoint. The specimens, of which three have so far been obtained, were derived from rocks of Lower Carboniferous age at Pettycur, Fife, and Edrom, Berwickshire. The Pettycur specimens are better preserved, and anatomical description was therefore based on the stems and petioles from that locality. One important feature was the occurrence of resin ducts and sacs in practically every tissue in the stem—wood, inner cortex, and outer cortex—and the first part of the generic name denotes this characteristic. At the same time, the monostelic axis and the general anatomy of that axis are distinctly of the Heterangium type. The generic name therefore represented two well-marked features of the stem. The specific name was given in honour of Dr. E. A. Newell Arber, who supervised the work of the author when in Cambridge. The affinities of this new plant were interesting; for, while it resembled Heterangium in many points, there were several characteristics which seemed to indicate some relation with Sutcliffia and the other coal measure Pteridosperms. But there was no genus with which it seemed more closely allied than Dr. Kidston's new genus, Stenomyclon. Indeed, Rhetinangium was a possible phyllogenetic link between the lower Pteridosperms as represented by Heterangium and the higher members of that group.

## YELLOW SAXIFRAGES.

Only a few years ago the number of saxifrages with yellow flowers was very limited, and the writer can well remember the enthusiasm among alpine cultivators when such beautiful flowers as Saxifraga Boydi were brought within their ken. Since then many new species and varieties have made their advent, and it may be said that we have now a good choice of plants of this colour. We had, then, it is true, a small number of yellow saxifrages, but some of these did not accommodate themselves to the ordinary conditions of our gardens, and there were others which did not flower freely enough to give satisfaction to their growers.

### Saxifraga Hirculus.

One of the older plants is the native Saxifraga Hirculus, the Marsh Saxifrage, whose limitations as to position are indicated by the popular name it bears and never does really well anywhere where it cannot receive an ample supply of moisture. It is at its best by the side of a little streamlet; an artificial or natural bog in the garden; or the margin of some little tank or pool where it can obtain plenty of the moisture it calls for.

The ordinary S. Hirculus is an upright-growing plant about six inches high, and having narrow leaves, and bearing fair-sized good yellow flowers on the tops of the stems. There is a scarce, but superior variety, S. Hirculus major, which is taller, has larger flowers, and is altogether more desirable.

### Saxifraga aizoides.

Here we have another and desirable native plant with yellow flowers, and also a lover of moisture. It is a low-growing, more tufted plant, making small cushions of pretty foliage and bearing pleasing yellow flowers. It is eclipsed in colouring by the fine variety S. aizoides aurantiaca, which is now rather scarce, and has its blooms of a deep orange yellow. It is rather a pretty plant, and is withal not quite so desirous of moisture as S. Hirculus. The writer, in default of an ideal position, such as the edge of a pond or stream, grew it for several years on the lower part of the shady side of a small rockery, giving it good soakings of water every few days. It will also do well on wet rocks. There is a later-flowering variety, called S. aizoides autumnalis.

### Yellow Varieties of S. aizoon.

We have now two very beautiful yellow varieties of Saxifraga aizoon, one of our most useful Silver Saxifrages. They are beautiful enough when not in flower, their rosettes of silver-edged leaves giving great pleasure, but they are still more so when they throw up their little spikes of yellow flowers. The finer of the two is called S. aizoon flacescens, and this has beautiful little flowers of a good lemon-yellow. The other, S. aizoon lutea, is not so bright in its colouring, but it is much cheaper than its ally. These should have a sunny place and gritty soil.

### Saxifraga aspera.

Some will object to the inclusion of this among the "yellow" saxifrages, but its blooms are of a kind of butter colour, and may be included in a somewhat broad list. It is of mossy habit, and can be grown in sun or shade on the rockery. It is easily cultivated in a mixture of peat and loam with sand and grit, or with leaf-soil substituted for the peat.

### Saxifraga apiculata.

This charming little saxifrage is one of the most valuable for the rockery, and is one which is not at all difficult to cultivate. It makes neat, flat cushions of small leaves, and has charming little primrose-coloured blooms in early spring. It likes a sunny place in gritty soil. As it blooms very early, its beauty is prolonged by protecting it from the stress of the spring showers of rain and sleet by a sheet of glass. It is quite hardy, however.

### Saxifraga aretioides.

Here we have a scarce and lovely saxifrage, which makes exquisite little silvery tufts of dainty rosettes, surmounted by beautiful yellow flowers, which are wonderfully large for such a small plant. Its variety primulina, with paler flowers, is rare indeed now, although formerly better known. These require a choice spot in sun and a gritty soil with peat and sand, or leaf-soil and sand. These are among the daintiest of our yellow saxifrages.

### Saxifraga Boydi and its Varieties.

Saxifraga Boydi is a lovely plant, which originated in a Scottish garden, and forms beautiful little plants of grey-green, surmounted by charming, bright yellow flowers. It has not a good reputation in the garden, but is very lovely. The raiser grows it in sun, and in a soil largely composed of sand, and this proves as good a treatment as can be suggested. There are two varieties with paler flowers, the one named S. Cherrytrees and the other S. Faldonside.

### S. cymbalaria.

Here we have a lovely annual saxifrage, with glossy leaves and delightful yellow flowers. It begins to flower when only about an inch high, and gradually rises, flowering all the time, until it is about six inches high. It loves shade and moisture, and sows itself so freely that it is practically a perennial.

### Saxifraga Elizabethæ.

Queen Elizabeth's saxifrage is a delightful plant, and a much better doer than such favourites as S. Boydi, while the flowers are of excellent colour, and the habit of the plant capital. It makes a good clump of deep green leaves, surmounted by many bright, almost saffron-yellow flowers. I think it blooms more freely in small plants than when large, but it is one of the best of all the yellows in this glorious family of flowers. It does well in gritty soil in sun.

### S. Ferdinandi-Coburgi.

This is a rare beauty, an ardent lover of the sun, and also having a liking for lime. It is a rock-loving species, and a charming thing with little tufts of silvery-grey and good yellow flowers.

### S. juniperifolia (or juniperina).

Probably named the Juniper-leaved Saxifrage on account of its spiny leaves, this is one of the yellow saxifrages which is rather a disappointment to many. It is usually a shy bloomer, and makes big tufts of foliage (for a plant of its class, I mean), but bearing few of the rather dull yellow flowers. I have always found it flower best if it had a sheet of glass or a handlight over it, but it is inferior by a long way to S. Elizabethæ and others of its class.

### S. sancta.

We may make the same remark about S. sancta, which, however, seems to do better in some places than in others. It makes large masses of pretty leaves, but bears few of its nice yellow flowers in proportion.

### Other Species.

S. mutata, a curious rosetted one with coppery flowers; S. Kotschyi, pale yellow; S. pseudo-Haussmanni, S. scardica, and the true S. luteo-viridis, may be mentioned among other yellow-flowered saxifrages. The new and very lovely S. Paulinæ should not be forgotten by those wishing to form a good collection of these charming yellow forms, or who wish to purchase a few to associate with their lovely kinswomen of different hues. S. Arnott.

---

## THINNING GARDEN CROPS.

The importance of thinning crops is often overlooked, or neglected, until considerable damage has been done, in some instances irreparably so. Most people who are interested in a garden have no doubt noticed how soon plants that stand close together in the seed beds become drawn, and when planted out seldom present that sturdy appearance one likes to see. It is, however, not only seedlings that are apt to be neglected, but even plants in the herbaceous and shrubbery borders are often left far too long in an overcrowded condition, thus spoiling what might otherwise have been noble specimens.

Let us first deal with the thinning of vegetable crops, as that is all-important at this season of the year. No doubt some have made special note of the difference in the cropping of early peas that were raised under glass to those sown in the open ground. Those raised artificially being planted out at regular intervals, have ample room to develop in their early stage, commencing to make lateral growths near the ground, while those that are left thickly together, where they are sown, make no laterals at all. Though it is advisable to always sow thicker than the plants are intended to stand, thinning should be attended to as soon as it is safe to do so, in order that the plants may grow sturdy from the commencement, for unless they have ample room to develop their foliage, it cannot be expected they will produce an abundant crop of the finest fully-developed pods. Some varieties require more room than others, their foliage being much larger, and it is advisable to allow those that are sown during the summer more space than the early sowings. Thinning, however, must be done with judgment, so as to allow all plants the same amount of space between them.

Many no doubt have observed how quickly radishes that stand singly are ready for use, and the small amount of foliage they make compared with those that grow thickly together. If this is the case with radishes, it also applies to other crops, therefore those who are desirous of having them mature quickly must pay attention to thinning at the earliest possible moment. Turnips that are much crowded together seldom make bulbs good in shape or of the finest quality. To have them bulb early they should be thinned to the proper distance when the plants are quite small, otherwise instead of having sweet, fleshy roots, there will be nothing but plants with thick leaf stalks and overgrown foliage, which soon run to seed, and should a few of them form bulbs such are usually tough and stringy, having been too long in arriving at maturity. The distance allowed between each must depend on the variety grown, as some make far more foliage than others. The strap-leaved kinds may be grown closer together than the others; in each case, if the plants are too close together, there will be a superabundance of foliage and very poor roots. The same remark applies to early carrots, though these making but slight leaves may be allowed to stand much closer together, as not being so dense in foliage the light and air passes through it more freely. Late carrots should be allowed a greater distance between them, as these, making more ample foliage and larger roots, need more space in which to develop, if nice clean well-shaped roots are to be had. Beetroot and parsnips grown on rich soil make a quantity of foliage, the latter especially, and unless ample space be allowed the roots are never so good.

It is seldom that onions require much thinning unless they are sown thickly, as the foliage is not overabundant, and if the bulbs touch each other it is of no consequence unless they are required for exhibition purposes, when, of course, they must be allowed more room. It is seldom that lettuce remain where they are sown, being transplanted from the seed bed in order that they may have more room to develop. Bulbous or fleshy-rooted plants, with few exceptions, do not succeed when transplanted, therefore they must be thinned to the proper distance where they are sown. Thinning, then, is done with a twofold object—one to induce the plants to develop more rapidly, therefore to arrive at maturity more quickly; the other to produce finer specimens, whether of flowers, fruit, or vegetables.

It is useless to thin the crops when the mischief has been done, for if one is to obtain the full benefit of the operation this should be performed as soon as circumstances will permit. Advantage should always be taken of showery weather for thinning vegetable crops, as the plants then come up much easier, and those that are left soon recover themselves after having the others removed. When thinning is completed, run the Dutch hoe between the rows to destroy any small weeds that may be appearing. H. C. P.

---

## SOME OF THE NEWER TEA-SCENTED ROSES.

I look upon Mrs. Foley Hobbs (A. Dickson and Sons, 1910) as the best of recently-introduced tea-scented roses, both for exhibition and garden use. The blooms are large, shapely, with thick shell-shaped petals. In colour it is a delicate ivory-white, faintly tinged with pink on the edge of the petals.

Miss Alice de Rothschild (A. Dickson and Sons, 1910) is rich citron-yellow. The high, pointed flowers are freely produced on vigorous plants.

Mrs. Herbert Stevens (McGredy and Son, 1910) is a free-growing, floriferous variety, with shapely flowers. The colour is white, with a distinct peach shading towards the centre.

Lady Hillingdon (Lowe and Shawyer, 1910) is now so well known in the exhibition tent and for table decoration that it seems superfluous to say anything further. Under glass this rose is simply charming, and the deep apricot-yellow buds on long stems are all that could be desired, except, perhaps, that the flower-stems are a little weakly, and need support. As an outdoor variety it is a little early to speak of it. My plant last year gave flowers freely, but they had the same failing—weak stems.

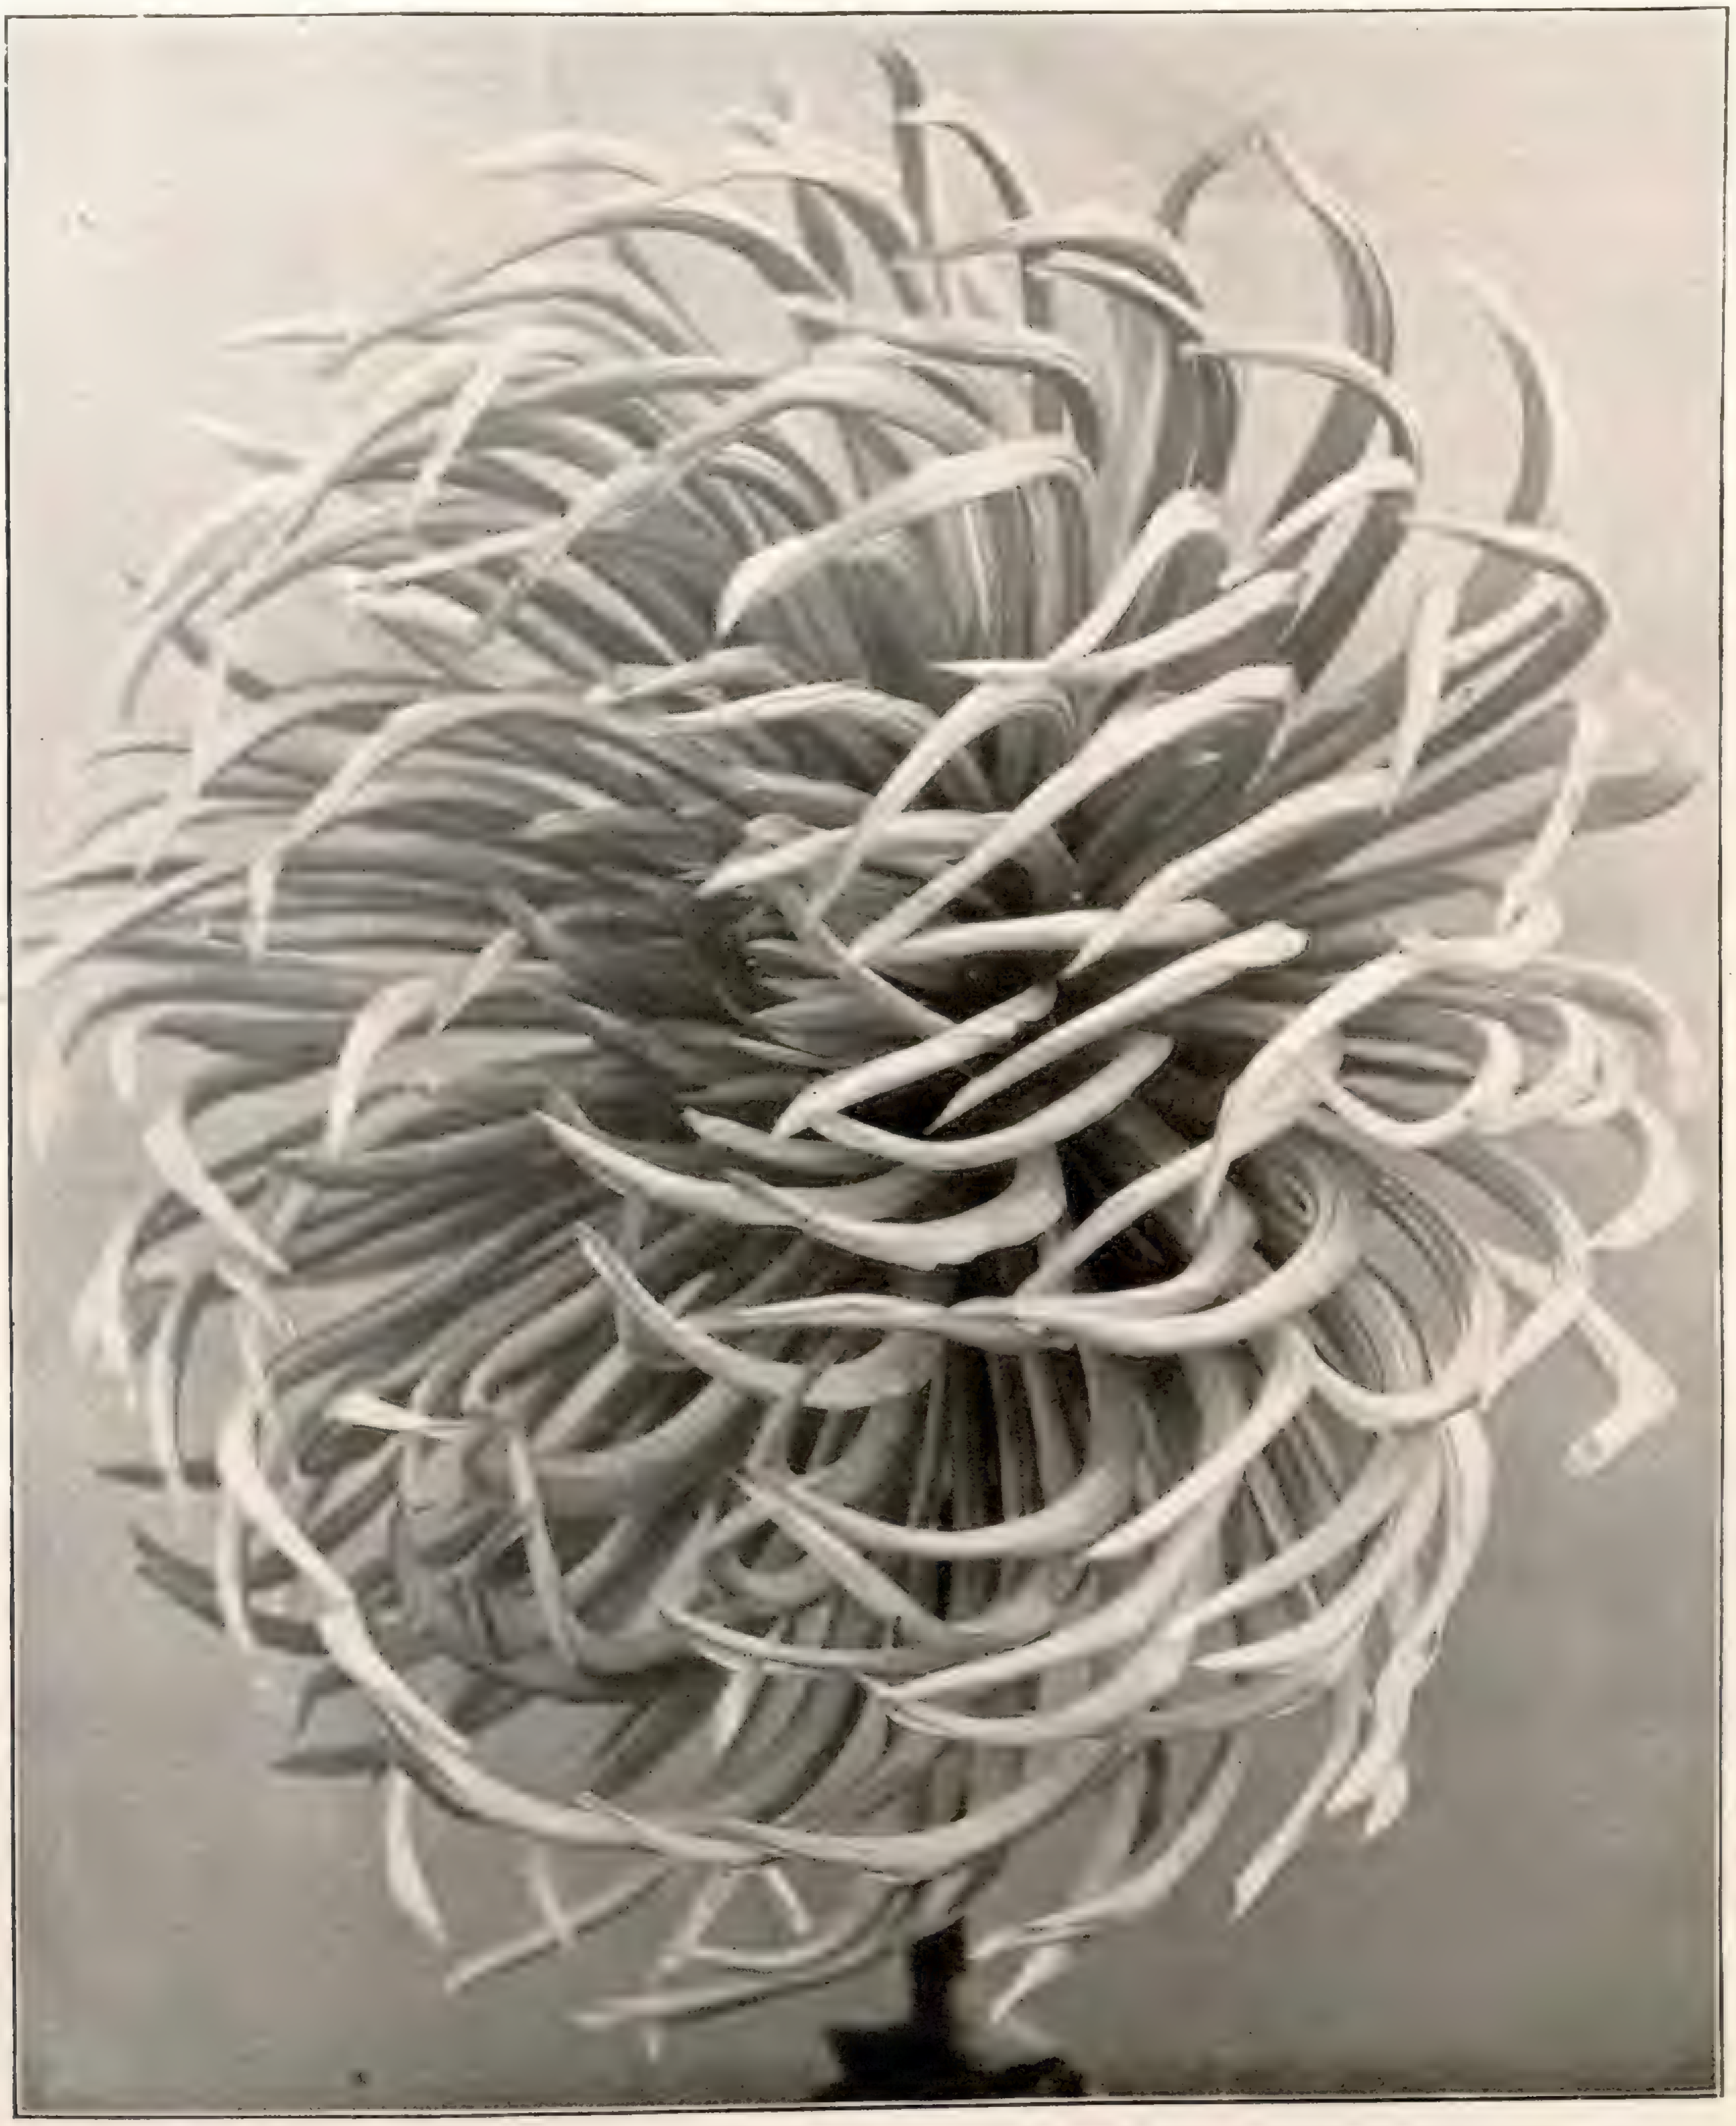
Alexander Hill Gray (A. Dickson and Sons, 1911) is said to be the largest pure yellow tea-scented rose yet introduced, with a strong likeness to Maréchal Niel in perfume and colour, the latter deepening as it develops. As a pot rose, it should be valuable, and as an autumn-flowering variety, too, it should be useful in the open.

Mrs. Hubert Taylor (A. Dickson and Sons, 1909), shell-pink, edges of petals ivory-white, and of vigorous growth; free-flowering. E. Molyneux.

## THE NEWER CACTUS DAHLIAS.

Early in the month of May most lovers of the dahlia look up their note-books or diaries for the past year before deciding which of the newer varieties they intend to grow. Now it is always a difficult matter to select new varieties from show boards; for, while one can form a pretty good idea of the flower itself, we can only guess at the habit of the plant, and the kind of stem it carries flowers on.

Now the latter point is one that has received far more attention from amateurs during the past four years than previously, and the first query one receives when mentioning a new dahlia is, "What sort of a stem has it got?" One is pleased to note that our raisers are now paying attention to this point, and I feel quite sure that in the next few years we shall see the end of the hideous syphon-like stems that have been all too closely associated with the exhibition cactus dahlia.



CACTUS DAHLIA MISS STREDWICK.

A beautiful cactus variety raised by Messrs. J. Stredwick and Son, St. Leonard's-on-Sea. The blooms are of large size, and the colour mauve-pink passing to light pink at the tips of the florets, the centre soft yellow.

Coming to the new varieties that will be sent out early in May this year, I find we have about the usual number; but amateurs, as a rule, only add a limited set to their collections, so that they want the most distinct. It is a difficult matter to obtain new colours in the cactus section now, although new shades are produced; so the chief improvement is in the form and habit of the plants. It will be generally admitted that last season was a most unfavourable one for flowering new varieties, at all events in the month of September; though later, with a cooler atmosphere, there was a decided improvement.

Although I did not see all the new varieties, I think I saw the majority of them, and, on looking up my notes, I find I was most favourably impressed with the following varieties: Miss Stredwick, I consider the most distinct seedling of the year; it is best described as mauve-pink, with a yellow tinge at the base of the florets, and is a very handsome flower. Golden Wave, a soft golden-yellow, is somewhat after the build of Harold Peerman, but considered to be a deeper flower. Frederick Wenham is a fine variety, a warm fawn-pink in colour, and a very desirable shade. Richard Box should make a fine addition to this section, being a soft pale yellow, and a deep, elegant flower. Mrs. H. S. Brandt is a very large flower, after the type of William Marshall, but the colour is salmon-buff, shaded yellow in the centre. John Woolman is a fine scarlet-shaded rose, quite a distinct form; while Fulgent should make a splendid addition to this class, being a bright dazzling scarlet, and the flower is deep and of good form.

DAHLIA DUCHESS OF MARLBOROUGH.

A charming variety belonging to the garden cactus section, raised by Messrs. J. Cheal and Sons, Crawley. The flowers are of good form, and the colour silvery-pink.

Coming now to the garden cactus type, it is a pleasure to record the rapid strides that are being made to produce a class that will flower freely in our gardens, and at the same time exhibit all their flowers well above the foliage. Of the new varieties, Duchess of Marlborough stands out clearly as an improvement on Mauve Queen; it is similar in colour, but possesses a more bushy habit. Sunlight is an ideal form, the colour—yellow, shaded orange—being quite distinct, and there is no question as to its flowering capabilities. Stability, a mauve-pink variety, is another pleasing addition to this class.

It may be added that, although the past season did not help this particular section in its relation to other cactus kinds, there were several of the 1911 varieties that will maintain their reputation for some time to come. Sweet Briar is a charming pink, very free-flowering, and a splendid habit. White Ensign is worthy of its name, carrying its flowers well above the foliage without any sign of drooping. Mrs. Forrester Paton, scarlet-crimson, forms a mass of flowers. Mrs. Landale, a yellow ground, edged rose, is free-flowering, and has a capital habit.

The striking new cactus varieties for 1910 were somewhat limited in number, though it is not right to condemn any variety after one season's trial, and that an unsatisfactory season. The following gave the best results, and are quite distinct: Claudius, a bright, bold crimson, every flower good. Dr. Roy Appleton, best described as a glorified C. E. Wilkins, being larger and deeper in form than the latter variety. Flossie Ridout, the best yellow of the year, of free habit, and with perfect flowers. Golden Eagle, bright yellow, suffused fawn and rose. Kingfisher, a pure lilac flower, most distinct; rather tall a grower for exposed positions. Mrs. Chas. Wyatt and Mrs. Douglas Flemming are both white, and are both excellent in their way. New York, orange-yellow, was very constant right through the season. Sherlock, bright orange-cinnamon, is the best of its colour.

J. B. Riding.

## ORANGE CULTURE.

For conservatories and as decorative plants in pots, orange trees are very much appreciated in some gardens. They are not, however, grown as extensively as they deserve to be. The trouble and expense is not really great, and specimens last for a considerable time in excellent condition if ordinary care be taken of them. Having had considerable experience in the cultivation of oranges on a fairly large scale for private purposes, I will briefly give a few hints which may prove serviceable to those cultivators who have not had much experience in the production of oranges.

### Sowing Seeds.

Fill a few pots with light but rich loam two-thirds, leaf-soil one-third, and a fair quantity of coarse sand. Sow one seed in each small 60-sized pot, and then plunge the pots to the rims in a bottom heat of about 75 deg. When the resultant plants are 2in. high they must have more air and light, and be transferred to larger pots when sufficient roots have formed. But it is advisable to partly plunge the pots, after the repotting, for about two weeks, then stand them on the warm bed for a week, and finally place them in cooler quarters, giving abundance of air night and day on all favourable occasions.

### Cuttings.

If cuttings are rooted in the autumn, the current year's shoots, with a heel of older wood attached, should be selected. They must be placed in a very sandy compost in a cool frame, but safe from frost. If cuttings are rooted in spring, younger wood—shoots without a heel of hard wood attached to each one—must be chosen, and inserted in almost pure sand. Plunge the pots in a strong bottom heat in a close, moist atmosphere, and maintain the sandy compost in a very moist state. Roots will soon form, and then the cultivator must gradually inure the young plants to air in a greenhouse. During the first year plants nearly 2ft. high may be grown. Rich fibrous loam, leaf-soil, well-rotted cow manure, and sand to ensure drainage, form the best compost.

### Grafting.

Young seedlings may be cut back, and grafts inserted. Those about four months old will serve for stocks; and if they can be grafted while in a warm house, with a moist, close atmosphere, and the pots plunged in a warm bed, only damp moss will be needed for wrapping round scion and stock, after making both secure with soft matting.

Both the citron and shaddock make good, robust stocks, and they are most serviceable in cases where the trees are intended to be planted out in beds in an orangery, or grown on large tubs.

### Cleanliness.

The leaves of oranges soon become soiled even in districts where there is not much smoke from surrounding chimneys, and so syringing and sponging are necessary to keep the foliage quite clean and healthy. Fresh air, whenever the weather is favourable, must be admitted by night, as well as in the daytime.

The St. Michael's, the Mandarin, and Blood Red are three good varieties to grow.

Geo. Garner.

## CULTIVATION OF PERPETUAL CARNATIONS BY AMATEURS.

(Concluded from page 320.)

### Autumn and Winter Management.

About the middle of August the carnations should be removed into the house. We often have cold, dewy nights at the beginning of September, and I feel sure that rust and other fungoid diseases are often due to plants being left outdoors too late in the season. The house should be well scrubbed with hot water and soft soap, and everything made clean before the plants are put into it. Keep the house cool by giving plenty of air, and, if the weather is hot, sprinkle the paths during the day, being sure that there is time for it to become dry before night. It is a good plan to fumigate the house as soon as it is filled to make sure of having them clean for the winter.

At the end of September or early in October, according to the weather, fire heat must be commenced, but do not have the temperature above 50 degrees at night, and if the morning is warm and bright, shut off the fires early so as to avoid a too sudden rise in the temperature.

During the winter months the secret of success is to water carefully, and maintain a buoyant atmosphere in the house. Give air on all favourable occasions—in fact, the ventilators should not be entirely closed, but air admitted by the top ventilators even in foggy weather, if the pipes are warm in the house. When watering, do not splash water about, especially during dull days, but take advantage of a bright morning to syringe the plants about once a fortnight with salt water (one ounce to a gallon), to keep down red spider, syringing with clear water two days afterwards. Continue to keep the growths tied, to disbud, and keep everything clean, picking off all dead leaves and weeds, pricking up the soil occasionally when the opportunity may be taken of sprinkling in some approved manure. Manures, however, should be very carefully applied during the winter months, or a sappy, soft growth and poor flowers is the result.

### Watering and Syringing.

From March to June, when the pots are filled with roots, the old soil becoming exhausted, and when more air can be given to harden the growths, then more frequent applications of manure of greater strength may be given. In April, May, and June, even farmyard or sheep manure placed in a bag and soaked in a tub of water may be given with advantage.

The greatest difficulty amateurs seem to have, is to distinguish between application of water and syringing in winter and late spring. In the dull days of winter as little water as possible should be used in the house, and a dry, airy atmosphere maintained; but in late spring and early summer, during sunny, warm days, the plants should be syringed and the paths sprinkled to maintain a more humid atmosphere, as evaporation is taking place quicker. Shading should also be applied at this time of the year, either in the form of blinds, or the glass sprinkled with whiting, to which a little size and blue stone are added, to make it stick. Perpetual flowering carnations are subject, like most plants, to a variety of diseases and pests, but so long as the plants are kept growing under proper conditions, and prompt measures taken to destroy them on their first appearance, they will cause very little trouble. Red spider, I have always said, can be destroyed by syringing with salt water, and in the winter, and when syringing is best not practised, paint the hot-water pipes with a paste of lime and sulphur. Green fly is easily destroyed by fumigating with some form of nicotine, or spraying in the summer with ivory or nicotine, soft soap, or boiled quassia chips and soft soap.

## NEW PLANTS.

◆

### ODONTOGLOSSUM CRISPUM SAGA.

This fine variety of an old favourite carried a handsome spike of seventeen flowers. The blooms are individually of excellent shape and size and set closely along the spike. The ground colour is white, shaded with rose, and heavily blotched with bright purple-brown. F.C.C., R.H.S., April 16. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

### CATTLEYA MENDELI THULE.

This very large-flowered white form is extremely beautiful; the only bright colouring is a blush shading on the lip and a yellow throat. A.M., R.H.S., April 16. J. Gurney Fowler, Esq., Glebelands, South Woodford.

### LÆLIO-CATTLEYA BERTRAM.

A very brilliant secondary hybrid obtained by crossing L.-c. Hopkinsi with L.-c. Cappei. The sepals and petals are golden-orange, shaded with rose, while the lip is of the most intense and rich ruby-crimson shade. A most effective orchid. A.M., R.H.S., April 16. Francis Wellesley, Esq., J.P. (gardener, Mr. Hopkins), Westfield, Woking.

### DAFFODILS.

Mrs. Ernst H. Krelage.—A very beautiful, exquisitely formed, and finely-balanced flower, with cream-white perianth and elegant frilled trumpet. A.M., R.H.S., April 16. Messrs. E. H. Krelage and Son, Haarlem.

Seville.—A showy variety, with white perianth segments and a broad flat crown of rich orange colour. Seville Orange would have been an excellent name. A.M., R.H.S., April 16. Mr. H. D. Phillips, Olton, Warwick.

Silver Spangle.—A charming daffodil of medium size, with white perianth segments and a broad, flattish, crimped crown of soft yellow hue. A.M., R.H.S., April 16. Mr. F. H. Chapman, Rye.

### CARNATION WODENETHE.

A splendid American-raised, white-flowering perpetual carnation; the blooms are of large size and fine substance, and carried on excellent stems. One special attraction of this variety is its delightful fragrance. A.M., R.H.S., April 16, Messrs. W. Wells and Co., Merstham.

### AURICULA ROXBURGH.

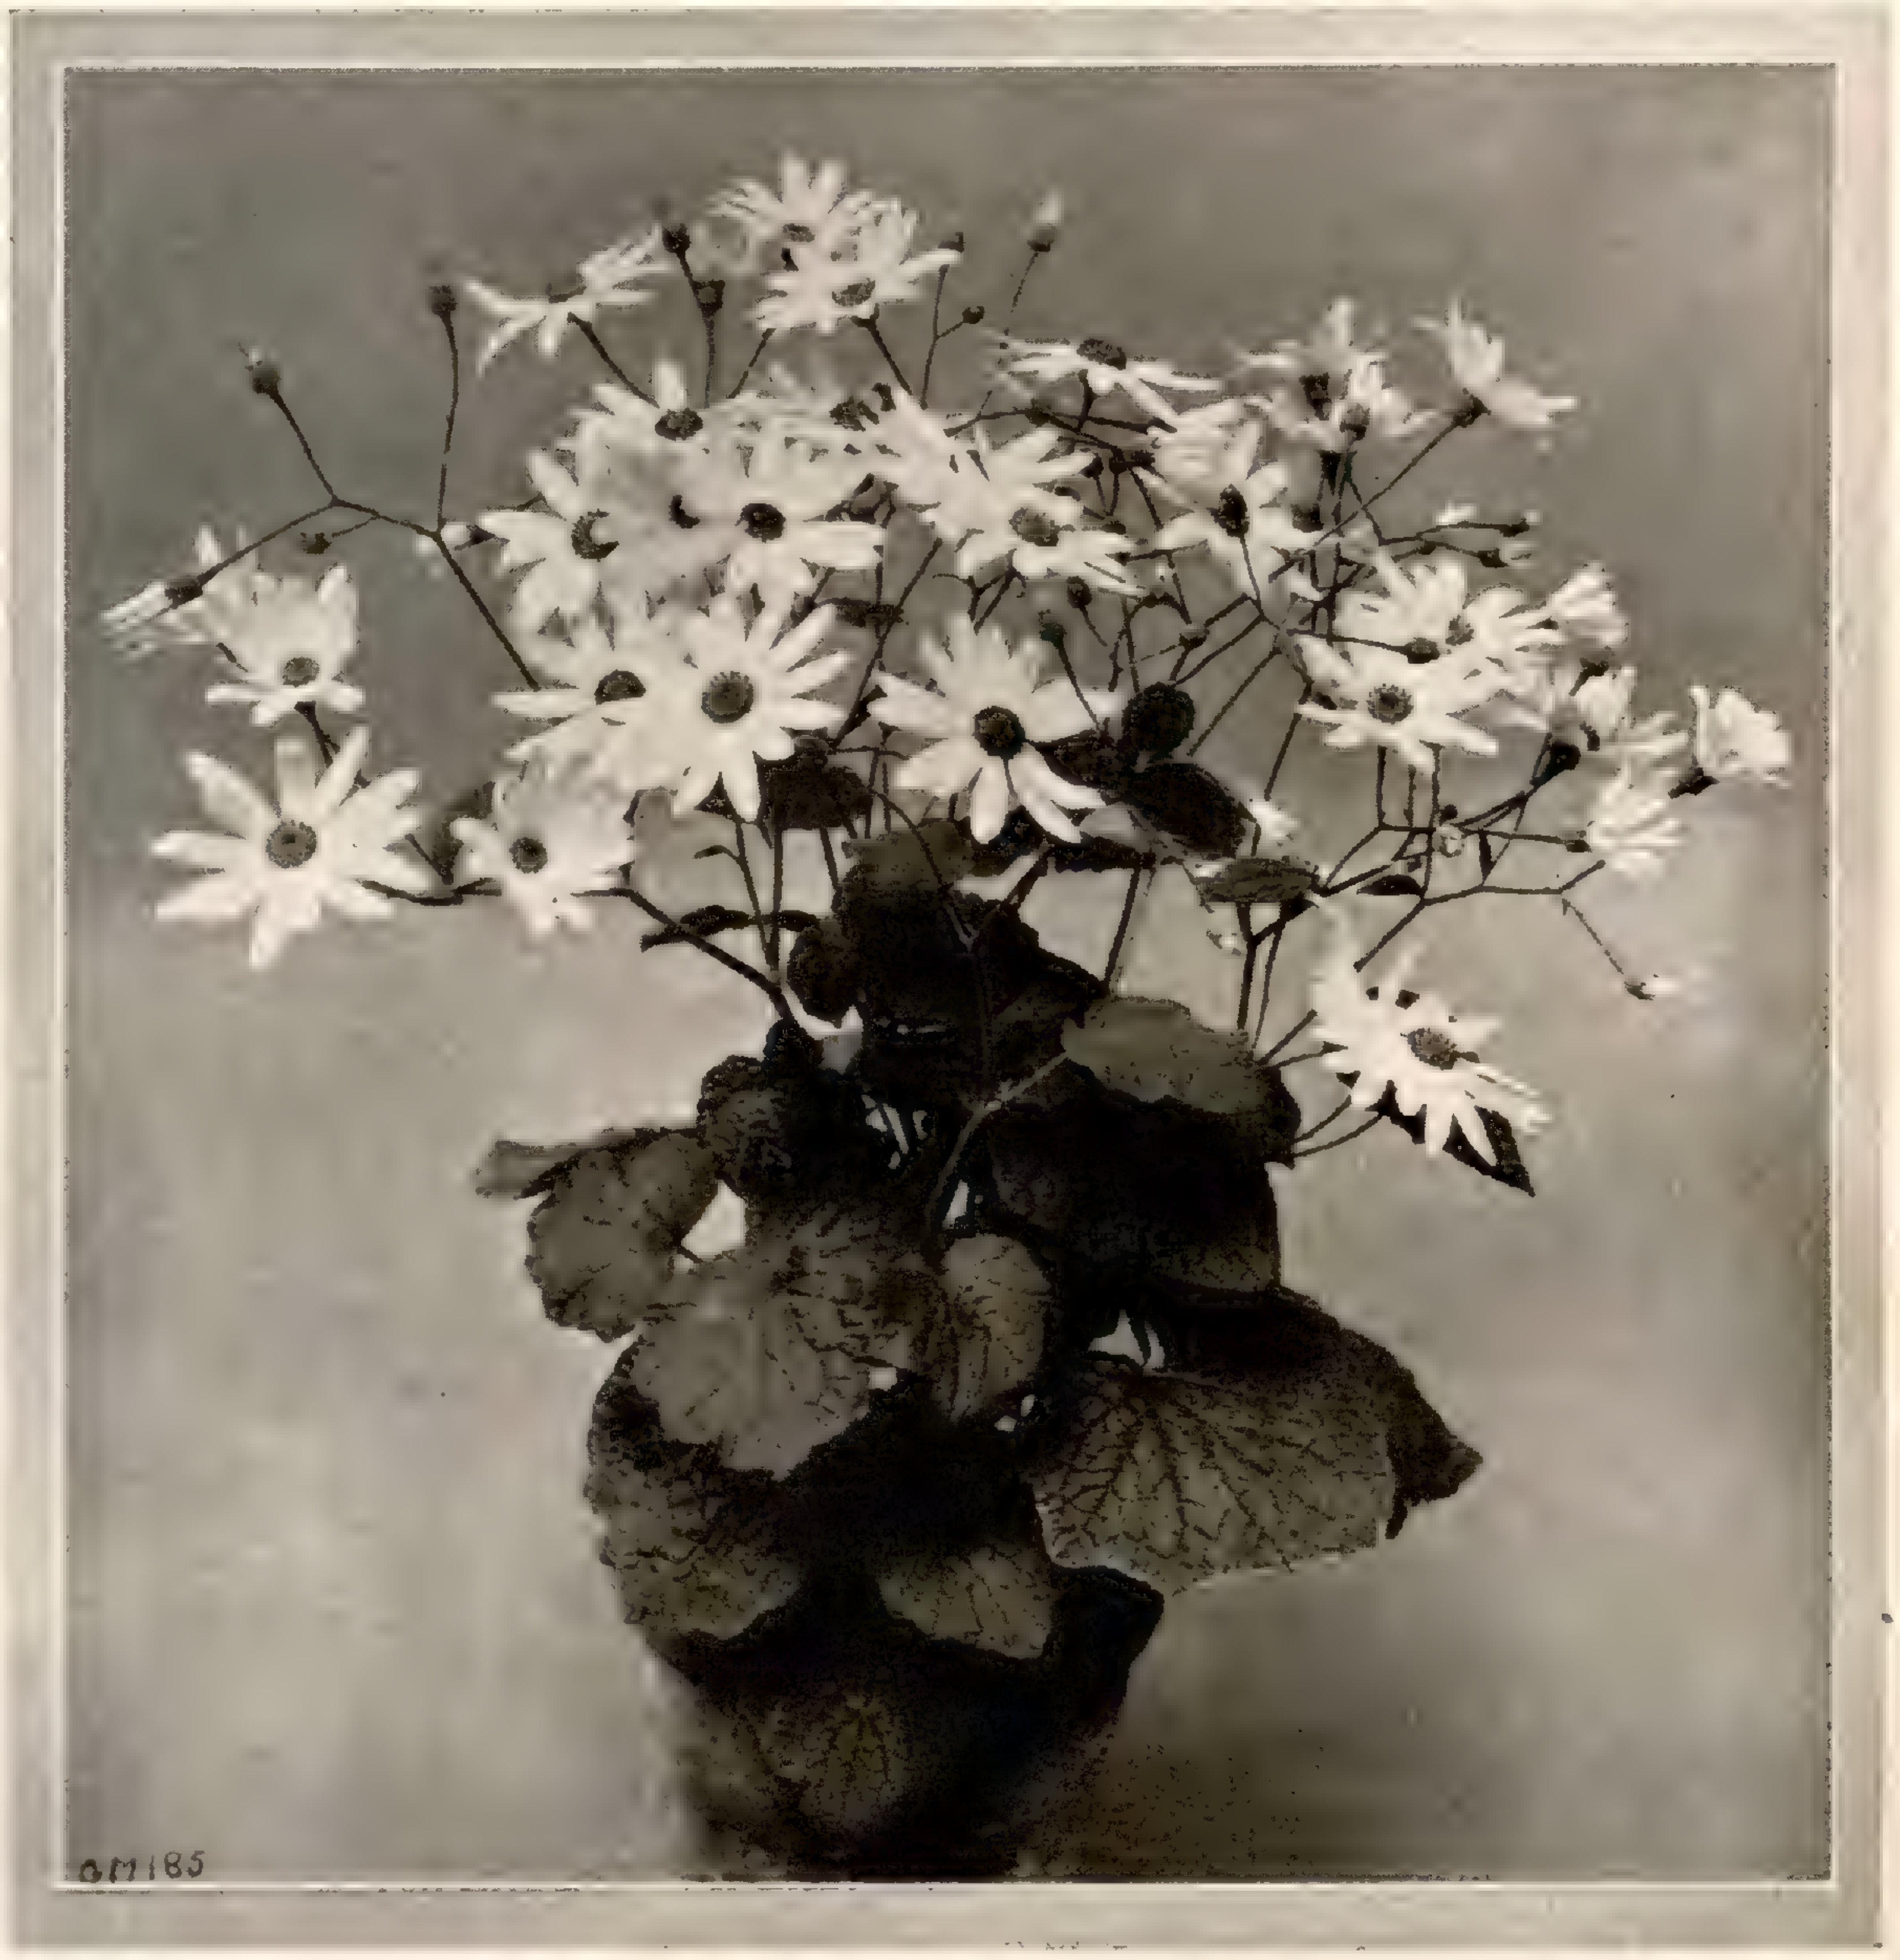
A very fine Alpine auricula, bearing its deep purple-blue flowers on sturdy trusses. Each flower has a well-defined white centre. A.M., R.H.S., April 16. Mr. James Douglas, Great Bookham.

### CINERARIA HYBRIDA.

An elegant hybrid described as having been derived from the intercrossing of Cineraria cruenta and Senecio tussilaginis. The plants are of lighter, looser habit than the old florist's forms, and the white, blue-tipped flowers are very pretty. The leafage suggests Cineraria Heritieri, rather than C. cruenta, as one of the parents, but that does not affect the merit of the hybrid which is very high. A.M., R.H.S., April 16. Messrs. James Veitch and Sons, Chelsea.

### FREESIA LE PHARE.

A useful addition to the steadily growing group of coloured freesias. This newcomer has smaller flowers than those of the well-known F. refracta alba, and the colour is rose, suffused with violet. A.M., R.H.S., April 16. Mr. C. van Tubergen, jun., Haarlem.



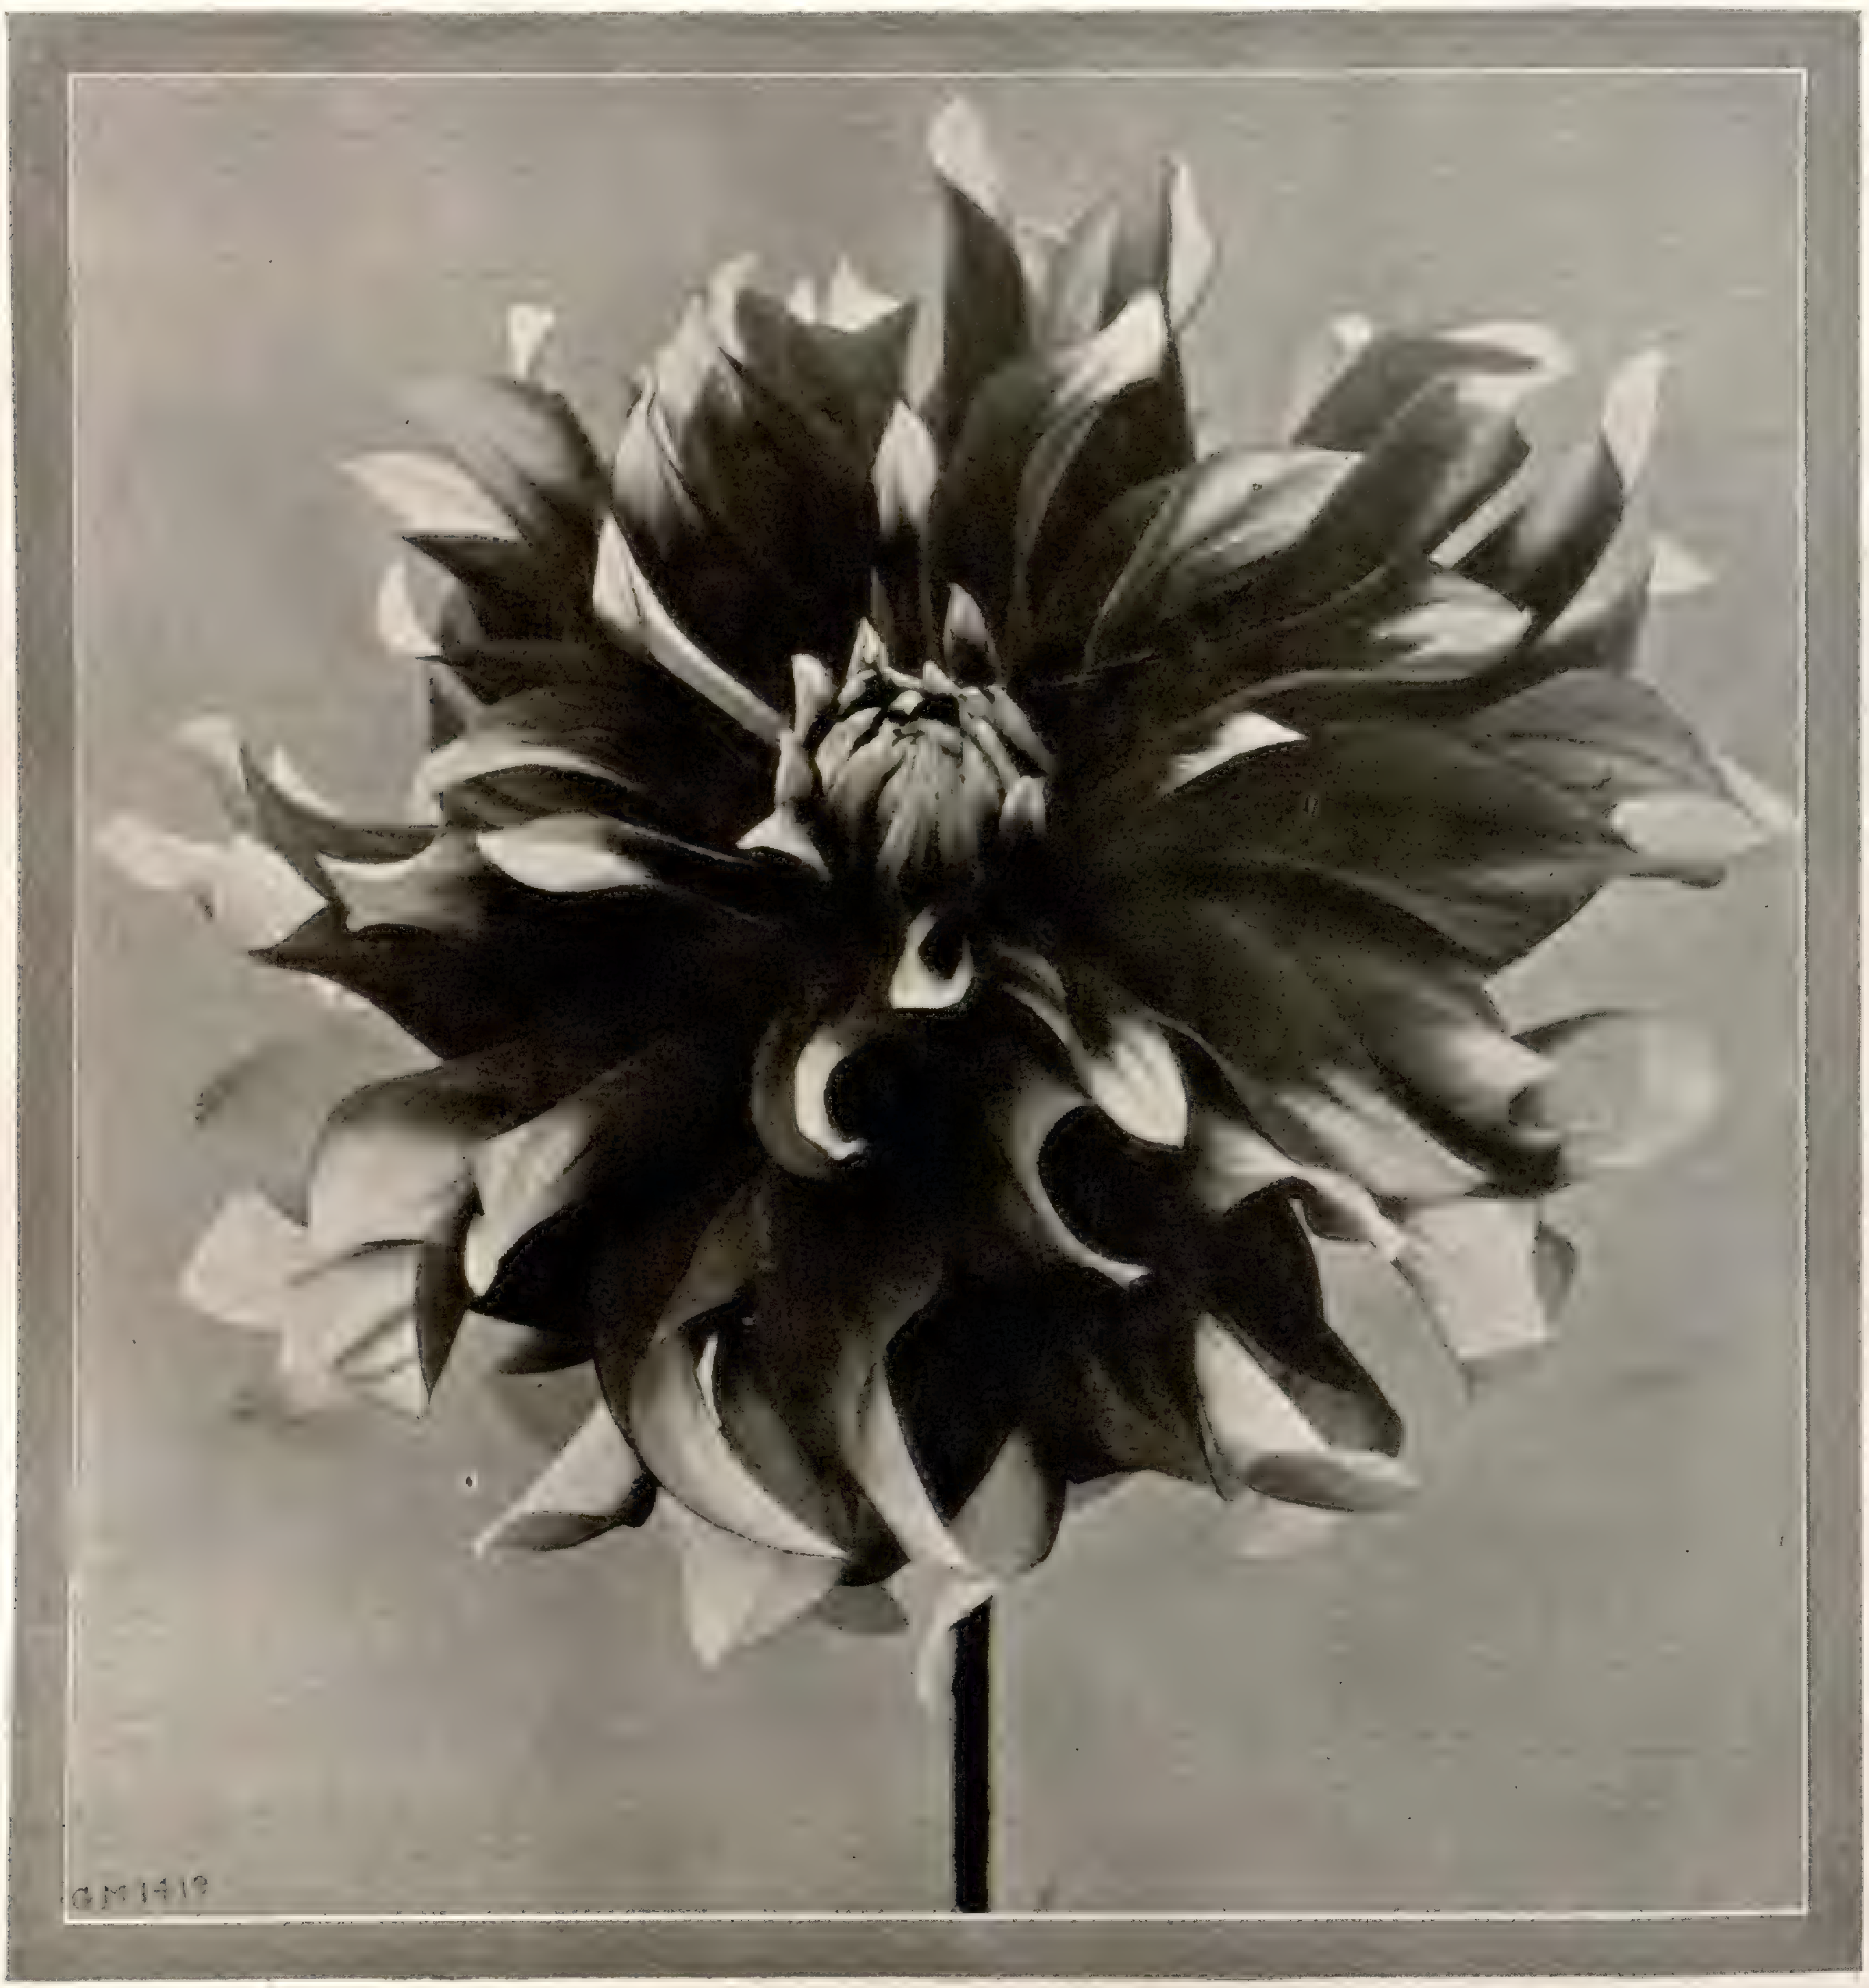
CINERARIA HYBRIDA.

Raised by crossing Cineraria cruenta with Senecio tussilaginis. Flowers white, tipped with blue. A.M., R.H.S., April 16. Messrs. J. Veitch and Sons, Chelsea.

## GIANT DECORATIVE DAHLIAS.

This section or type of garden dahlia, which is sometimes referred to as the "Douzon" type, originated in France; and most of the varieties, judging by their names, were raised in that country.

Although of such immense size, the blooms are not by any means coarse; and, what is very important for garden decoration, the flowers are borne on long, stiff stems, well above the foliage. In profusion of flowering and continuity these giant-flowered sorts equal the best of the cactus section. As they are particularly vigorous in growth, a few plants will suffice in small gardens, but in large public parks and private establishments these varieties should be grown in quantity for massing. Being tall in growth, they may be planted in wide shrubbery borders, in large groups of one variety or as a background for varieties of less stature. There is another side to their value, and that is for cutting. The long, stiff stems enable the giant decorative dahlias to be used extensively for large vases. A dozen flowers and buds of the variety Souvenir de Gustave Douzon, with 30in. stems, in a large vase, would be difficult to surpass, when a bold effect is desired.



DAHLIA ATTRACTION.

A remarkably handsome giant decorative variety, the blooms of large size and of a deep crimson-maroon colour, with light rose-coloured tips to the florets. Raised by Mr. C. Turner, Slough.

No trouble is experienced in the propagation of the giant decorative dahlias; in fact, the old stools, when placed in heat, produce cuttings more freely than most sections. In one season, from cuttings, the flowers are not only gigantic, but the tubers as well.

### Varieties.

Souvenir de Gustave Douzon.—The blooms of this dahlia are truly "gigantic." Some six or seven years ago, when not so well known, a large bed containing upwards of one hundred plants of this variety at Kew, created quite a sensation among the visitors. In good soil the plants grow 6ft. to 7ft. in height. The colour is a pleasing shade of orange-red. The blooms are well formed, and borne erect, with plenty of substance in the broad petals.

Le Colosse.—This is a very large, showy variety, with broad petals. The plants are vigorous, the red flowers being borne well above the foliage.

Yellow Colosse.—A useful companion plant to the foregoing, with bright yellow flowers. These, as will be seen from the illustration, are similar in form and size to the red variety.

Jeanne Charmet.—A charming combination of colours, lilac-pink at the edges shading to white in the centre of the flower, with a yellow shade at the base of the petals. The flowers are very large, and freely produced on long, stiff stalks.

Madame Van Der Dael.—A pretty shade of silvery-pink best describes the well-built flowers of this variety.

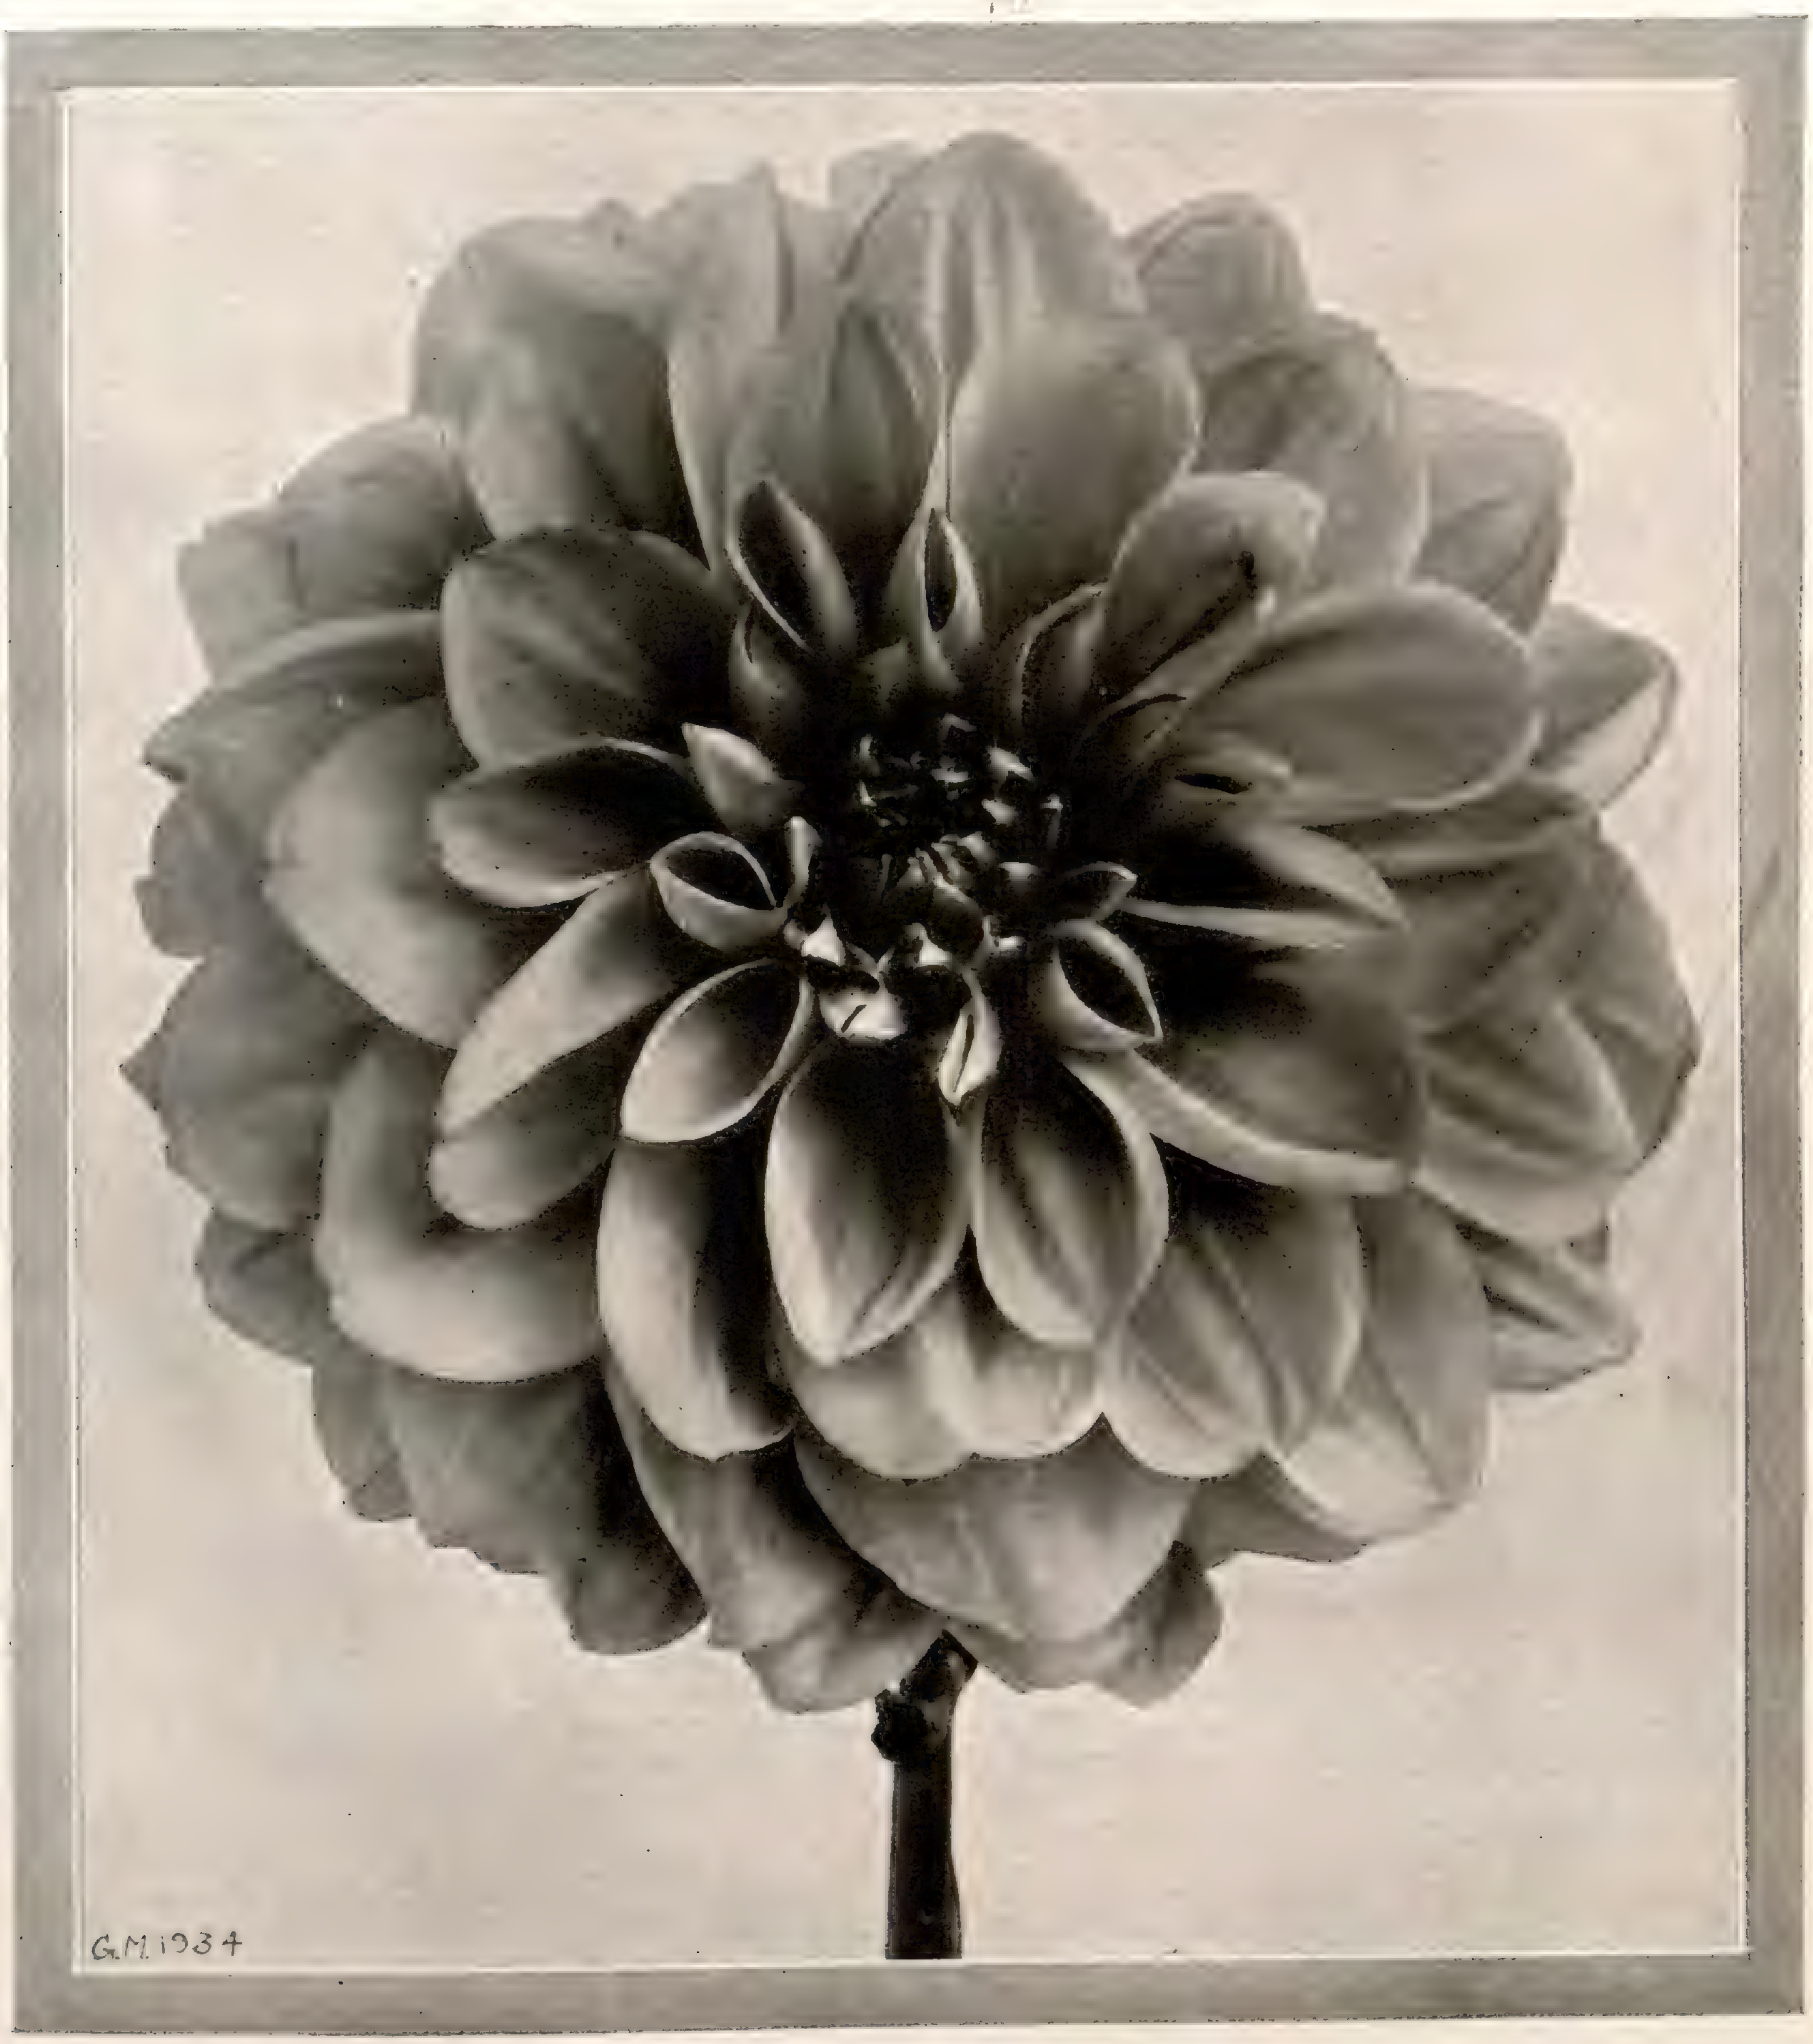
Papa Charmet.—An effective variety with large crimson-maroon blooms. The petals are broad, and prettily crimped or curled.

Madame A. Lumiere.—An exquisite flower, pure white, the petals tipped with violet-red, distinct and free.

Mdlle. Hélène Charmet.—The best white variety of the true giant-flowered double decorative type. Most catalogues also include two other white varieties in this section, namely Grand Duc Alexis and Perle de la Tête d'Or. Both are beautiful, free-flowering varieties for garden decoration, but of rather different build to the Douzon type. In some catalogues the name Charmet is spelt Charvet.

Attraction.—This variety, which is illustrated, was raised by Mr. C. Turner. The ground colour is crimson-maroon, with light rosy tips. The broad petals have a slight twist, which adds considerably to the charming effect of the flowers. This variety must not be confused with a single cactus variety which also, unfortunately, bears the name of Attraction. A. Osborne.

Kew.



DAHLIA YELLOW COLOSSE.
A distinct and attractive yellow-flowered variety, belonging to the giant decorative section.

## ROSE NOTES.

When using the knife among our roses this season it was gratifying to notice how firm and sound the majority of the shoots were. I do not deny that in many cases the top growth was not so well developed as might have been desired, but we have little use for that, and when cut down to where we meant to leave them, the buds were particularly sound and promising.

Even during the autumn of last year I noted how sound, and with the favourable russet-brown bark, the base of our maiden plants were. Doubtless much of this may be attributed to the excessively dry weather at that time, and consequent compulsory steady growth. But I am sorry to find that much wood was too soft upon the Wichuraianas to stand the sharp snap of frost at the end of January and early in February. The season was so moist and mild here that growth scarcely ceased in sheltered positions, and so was naturally unable to stand many degrees of frost. Quite half of their length, however, was nicely sound; also, owing to the very steady way the first growth was produced, the ripened eyes are much closer together than usual. Although we shall probably have more blossom in a closer compass, I fear the effect will not be so pleasing as when the trusses are far enough apart for ample foliage to come between. A simple mass or bunch of flowers does not appeal to me to the same extent as the association of the clusters of flowers with the glistening green foliage.

In cutting off the shoulders of budded standards, also the tops of dwarf stocks, I find the buds inserted last summer have passed through the winter in a very satisfactory manner, and are now quite ready to burst, being plump and bright looking. It has already been remarked that these set to the stock better than usual when inserted, and I then suggested the steady growth of stock as a great factor to this end. So far as our own buds are concerned, they never looked more promising, and we are surely safe from severe frosts now. Young growth, however, will have much to pass through yet, unless we have an abnormal spring.

Late in winter or early in spring is the time we find most suitable for planting stocks made up from cuttings, such as the Manetti, briar, De la Grifferaie, and polyantha stocks. To plant these in the autumn means full exposure through the winter of the bark that has been underground during the previous winter and summer. This is, therefore, rather soft and tender, and I prefer not to expose it unnecessarily early. In the case of seedling briars we run no such risks because the crown of these has been exposed from the first. It is well to give a little consideration to distance when planting stocks, and this depends very much upon the variety to be worked. If dwarf growers of a habit such as Killarney, Madame Abel Chatenay, and Lady Ashtown, the stocks will be at a suitable distance if planted nine inches apart in the row, and the rows two feet from each other. But with those of stronger growth, Lady Waterlow, Gustave Regis, and Gruss an Teplitz, for example, we must give a little more room. One foot from stock to stock, and the rows two and a-half feet apart, will be found suitable. Extra strong growers should be worked upon stocks fifteen inches apart in the row, and the latter three to three and a-half feet from each other.

I give these hints because it is a pity to have such wide differences of growth, with only one uniform distance allowed for development. It will be found better to work the stocks in small beds, rather than where the plants are to remain. There is not the same length of untidiness, and it is better to lift and trim off any suckers that may be forming before putting the roses into their permanent quarters. Nor can one be so sure of a "take" as to allow of stocks being in their permanent quarters from the commencement.

I would like to say a word or two about the grouping of roses. Too often we find beds and borders containing varieties of such vastly different habit of growth that much of the effect is discounted; in fact, it is only a muddle, instead of an artistic effect. No doubt the best effect is gained by one variety in a bed, or, at most, two or three. It is very easy to find these of suitable habit, and of almost any desired colours, among the numerous grand bedding roses now available, and a little thought in this direction will be repaid.

Under glass the roses should now be in full growth and flower, except in quite cool structures. Careful ventilation and watering has much to do with keeping clear of mildew. As usual, insects are certain to be in evidence, and I can only once more refer to the necessity for prompt measures against these. The various insecticides and methods of application having been so often treated upon I do not propose any additional remarks, except to warn against the use of too powerful solutions. This also applies to the use of liquid stimulants, which will be much needed by roses in pots. So many failures have come to my knowledge that were undoubtedly caused by using these too strong, on the supposition that as a little did good more must be better, that I ask no excuse for once more advising a freer use, if you like, but do not increase the strength.

ROSARIAN.

# STREAK DISEASE IN SWEET PEAS.—I.

Much has been written about the cause of "streak" in sweet peas, and if printers' ink could have cured the disease it would have long ago ceased to trouble us.

A high authority says: "The name by which the disease is known to-day—Thielavia basicola—was given to it by Zopf in 1876, since when, it has engaged the attention of various scientists, all of whom by various and different methods have arrived at the conclusion that errors of watering and manuring were largely responsible for the existence of the disease wherever it occurred.

Probably no one cause contributing to the weakening of the root, and thus laying it open to attack by the fungus, will be found that will fit all cases of disease, but there seems no doubt that if care be taken to avoid every possible check to root development and activity, the 'streak disease' will cease to be so troublesome."

The same authority says, "Overwatering must be avoided at all costs." Whilst freely admitting that "overwatering" would destroy plants, let us rather seek the primary cause of "streak disease" in some other direction, for sweet peas growing under glass are ordinarily watered daily if necessary, and not infrequently twice a day, and yet there is no appearance of "streak."

Instead of concerning ourselves with the name of the disease, or even as to its nature, we may consider the physiology of the plant and its functions.

The sweet pea belongs to the leguminose family of plants, all of which are naturally supported by nodules on the root containing nitrogen-gathering bacteria, which, in their turn, assimilate the free nitrogen of the atmosphere for the use of the plant. I said naturally, for this function seems to be imperative, as when we unnaturally feed any of the leguminous plants mainly on nitrates or nitrogen-containing material, these plants freely feed on the nitrates of the soil, and it appears that nitrogen-gathering bacteria in the root nodules die of inanition; in fact, an unnatural balance is set up in the economy of the plant, which assumes a parlous condition, susceptible of any and all diseases to which the plant is liable, and death ensues.

"Streak," or any of the fungoid diseases, may be latent, developing when suitable conditions are afforded.

I do not feel concerned to prove this, for it is sufficient to know that plants of sweet peas remain healthy, and free from "streak" and other diseases, when nitrates and nitrogen-containing materials are not applied to the soil in which the plants are to be grown.

It is an established fact that the legumes of our pastures are all destroyed by the too free application of nitrogenous manures, and it is not surprising that the sweet pea should also be susceptible, and succumb to similar treatment.

E. W. Duckwall, in "Bacteriological Technique," says: "The bacteria which prove so valuable in fixing the atmospheric nitrogen for the benefit of peas, have a peculiar life history. They are widely distributed in the air, water, and soil, but are frequently absent in some localities, or are so few in numbers as to be of little value to peas grown in such places. When through inoculation, bacteria gain entrance, rapid multiplication takes place, so that in a short time the sap is teeming with countless myriads of these tiny organisms, which fill up all the channels, multiplying, until this cycle of their life history is accomplished."

In a general way, for the healthy growth of sweet peas, most soils require an annual application of phosphates and potash, chalk or lime (ad lib.), with small quantities of magnesia salts, etc., and all these may be applied without being associated with nitrogen-containing material, such as animal manure and the like.

A question may naturally arise. If the use of dung and other kinds of organic manure are to be avoided in the growth of sweet peas, how is the necessary supply of humus in the soil to be maintained? The answer is by manuring the preceding crop with organic manures containing nitrogen, if this be necessary.

If it should be desirable to grow sweet peas on the same land year after year, the supply of humus may be maintained by the application of well-rotted manure, which has been prepared by remaining in a heap for about twelve months, for it has been ascertained, that stable manure loses, approximately, 25 per cent. of its nitrogen every three months, and the soil bacteria during the twelve months would have worked up the nitrogen-containing material successively into nitrates, and free nitrogen, and the latter would by this time have been liberated, and lost in the atmosphere, the residue being mainly organic manure minus nitrogen.

A question might arise, if nitrogenous manures are not to be used, how are plants to be fed and to be made to produce exhibition blooms? The answer must be: Wait until the plants become well matured before applying any nitrogen, then, possibly, an addition might do but little harm, and might be the means of winning the cup, even although it might ultimately injure the plants.

It does not follow that because nitrogen is absolutely essential to the successful growth of most crops it should be so for all plants.

Nitrogen acts as a poison to sweet peas and all legumes, and the sooner this is recognised, and acted upon, the better.—

ROBERT HOLMES.

Tuckswood Farm, Old Lakenham.

# RUBUS ARCTICUS.

This diminutive rubus is not frequently found in gardens, probably because it is not always an easy subject to establish, but when once thoroughly at home it proves an exceedingly interesting and attractive plant for the rock garden. This spring it is producing its lovely rose-pink blossoms in profusion.

It enjoys partial shade, and a colony of it here, that is partly shaded by the overhanging Prunus prostrata, is growing splendidly. Though perfectly hardy, it practically disappears during winter, and commences growth in the early spring. Its diminutive stems are never more than a few inches high, and its bright green foliage makes a fitting setting for the beautiful flowers, while in the autumn the leaves assume a pleasing shade of bronze.

A well-drained site should be chosen for it, such as a position in the forefront of a rockery, for which it is well suited. A soil in which peat predominates suits it best, and in this it thrives, sending out underground stems, which come up around the original plant. About the time growth is commencing, a light top-dressing of soil similar to that in which the plant is growing can be given with advantage. During bright summer weather, Rubus arcticus deserves much benefit from being damped over late in the afternoon. If the plant is given this treatment, and kept free from weeds, its cultivation should be attended with success.

J. GARDNER.

## DAHLIA CULTIVATION FOR EXHIBITION & DECORATION.

In May dahlia growers turn their attention to the land. Quite early in the month they thoroughly dig over the plot devoted to dahlias, and where the soil is of a heavy, more or less clayey, nature, this operation will leave it in a rough state. Of course, the best way to treat soil of this description is to let the clods get dry, and then wait for a shower, when it is mere child's play to break up the masses of what a few hours previously was very hard earth. But there is a danger in leaving heavy land in a rough state, and that is the possibility of not having rain before planting time, so it is perhaps the wiser plan to knock down the clods as soon as sufficiently dry, and then turn the fine soil underneath, and bring another lot of heavy soil to the top. In our case, we have to dig and break down again as many times as will suffice to get a friable condition to a good depth, which is sometimes a matter of four diggings.

It is, however, impossible to lay down any definite rule as to working the land, as in the case of one grower, it may be possible to plant out, even after a heavy rain, whereas on another class of soil, it would be folly to attempt it. One general principle must be followed, and that is, prepare a deep, well-worked, and manured subsoil, as well as surface. I must here state that I have never had any experience with soil on which dahlias grew so luxuriantly that they buried the flowers, and so can give no advice as to treatment in such cases. In the south the trouble is to get them strong enough, and to this end good cultivation is the general rule.

Returning now to the young plants in the frames. These should be growing rapidly, albeit not so much upwards as in sturdiness, and only one danger is met with here, but this is a somewhat general one. I refer to allowing the plants to become root-bound. At this period, if a plant is examined, it will be seen that strong thick roots, three to six or so in number, are pushing through the soil. These are to form the tubers for next autumn. These should not become twined round inside the pot. Anyone who plants out a root-bound plant can very easily see the result when lifting the tuber in the autumn, as instead of a spreading free lot of roots, the tubers have formed a compact mass resembling a club, and have not derived full benefit from the manure even at a short distance away from them. About a week previous to the day when it is intended to plant out, begin to harden off by having the lights, at first partially, and then wholly, removed at night time.

Other details of management have been referred to as important, but the work of planting out is doubly so. While on the one hand we exhibitors may go to one extreme, it is only too often that the dahlia has to put up with the other. A brief outline of the work of transferring to the open ground may perhaps explain the system usually in vogue amongst exhibitors, who are not troubled by an undue exuberance as regards foliage, and a corresponding scarcity of bloom. Where the dahlias are grown in rows, measure off the plot, allowing 5ft. between each row and 4ft. between the plants in the row. Having thus parcelled out the plot, dig out a hole about 18in. square, and rather over 12in. deep, where each plant is to be placed. Next put about two fork-loads of manure in the bottom, and thoroughly incorporate this with the soil; this operation will also enlarge and deepen the hole. Having replaced all the soil previously dug out, and lightly pressed it down, all is ready for the planter.

I need hardly mention in detail all the little items connected with the work of holing, such as working to a line, and so on, as any grower will soon arrange a system of his own, so as to finish up one row of holes before starting the next. Before transferring the plants to the open ground dip them in a strong insecticide.

Where dahlias are planted in shrubberies or for decoration generally, it will pay to put manure under them just the same as for exhibition purposes. In the case of pompons and singles, it is usual to withhold manure, or the flowers will be too large and coarse-grained for competition. It may appear quite an easy matter to obtain a small flower, but to get a really tiny but perfect pompon is not so easy, for if starved the plants produce shallow flowers, and if grown freely they may become too gross. I have seen good flowers grown on poor land, on little wiry-wooded plants; and on the other hand, I have seen large plants covered with small compact flowers, the quantity of growth serving as a check to size. In the case of doubles the only fear is in having the plants too gross and succulent, as by so doing, although huge flowers may result, they will lack neatness and symmetry.

In planting the different sections, put out the cactus varieties any time after May 25, for late August or September shows, the doubles rather later, and the pompons and singles any time, as these flower earlier and continue indefinitely.

One more word as to planting, and that is, don't put the ball of earth too deep, just comfortably under the surface of the soil is sufficient. I saw some tubers last autumn which had been eight inches deep, i.e., eight inches of stem under the soil. One other little matter I always insist upon, and that is to have a stout stake placed to each plant at once.

H. Stredwick.

## THE GENTIAN CUP.

We have much pleasure in giving our readers an illustration of the Gentian Cup which Messrs. R. Wallace and Co., Colchester, are offering as a prize at the forthcoming International Horticultural Exhibition, for the best rock garden in a space not exceeding 100 square feet in the amateur section. The cup is a particularly handsome one, and quite distinct in design from the majority of prize cups. It is of silver, and the vase or cup proper represents a large upright bloom of the lovely Gentiana acaule; while over the base, and in a most natural manner, appear representations of other gentianas. So distinct a prize is worthy of a keen competition, and Messrs. Wallace are to be congratulated upon the success of a design that is entirely in keeping with the class in which it will be offered. Such a splendid memento of the International Horticultural Exhibition is calculated to inspire competitors, and induce them to put forth their very best work in rock-garden construction and furnishing, in an effort to win it. The cup has been manufactured by Messrs. Johnson, Walker, and Tolhurst, 80, Aldersgate Street, London, where it is on view, from a design by Mr. George Dilliston, who is in the employ of the Messrs. Wallace.

THE GENTIAN CUP.
Offered by Messrs. R. Wallace and Co. as a prize at the Royal International Horticultural Exhibition.

**Camellia Apollo.**—Camellias have flowered remarkably well in the open air in the Bournemouth district this year. But none have excelled the flowers of the abovenamed variety, which commenced to open the first week in March in Mr. W. Child Clark's garden at Michelgrove House. Some blooms were shown in a large flat bowl at the spring show held on March 26 and 27, and they were perfect. The colour was very clear and an intense crimson. Some of the blooms measured more than 1ft. in circumference.—G. B.

## SUPERNUMERARY VINES.

When planting a vinery it is an excellent plan to put in a row of supernumerary canes at a reasonable distance from the front, and permanent, row, so that the vinery may be fully utilised, and a double crop of fruit obtained for several years. The permanent vines need not be cropped so heavily when this is done, and this is in their favour for the future, remembering that the vines should bear continuously and well for forty years, at least.

The planting of an extra row of canes means making a special border for their use for a few years; this is easily done by using freshly-cut turves as a retaining wall. The extra canes need not have so much space as the permanent rods, and three feet apart will suffice. They will fruit heavily and well for ten years if necessary. I need hardly say the length of these vines depends upon the width of the vinery; if this is eighteen feet wide then the life of the extra vines is prolonged. The point to attend to and to guide the grower is how the permanent vines are extending, for as these progress the lower spurs of the extra rods should be removed.

One of the best examples of the use of supernumerary vines I have seen for a long time was at Aldenham House last year, where Mr. Beckett had replanted an old vinery mainly with Muscats. From the extra canes he obtained from six to eight bunches of very fine grapes, and at the same time his permanent vines were growing away sturdily with a good promise for the future.

For supernumerary vines stout year-old plants should be employed, and instead of cutting them down to within a couple of eyes of the base, as is the best plan in pruning the permanent rods, the canes are left long enough to give three shoots on the wires; a pair of side growths and a leader. There may be exceptions to this method of pruning, such as an extra high roof, when the vine rods might not be long enough. The remedy then is to prune to a suitable eye, and train the leading shoot upwards on to the wire. In this case there is a probable loss of a season's fruiting, therefore in selecting the canes preference should be given to the special circumstances.

When planting new vineries, especially where the structure is a span-roofed one, and devoted entirely to grapes, and perhaps one hundred feet long, and about twenty feet wide, the plan of curtailing the number of plants and training the vines afterwards on the extension principle is on the increase, and rightly so, because the method has many advantages. For instance, the cost of plants to furnish both sides of a house of the dimensions noted, on the older plan of one vine to every yard or four feet, is a considerable item. No fewer than fifty canes will be needed at the wider distance apart. In the case of the extension principle six vines will suffice, or at the most eight, four on each side. The saving, too, in border making is considerable, especially when we consider how difficult it is to procure suitable soil in some localities. When planting on the single rod system a continuous border is necessary the whole length of the house and on both sides; it need not be more than a yard wide the first year, but it will require extending the next. In the case of the six or eight vines for extension, a border for each plant, eight feet long, will last several years.

The method of extending the vines is that of encouraging a vigorous growth on each of the main stems, laying a rod along the bottom wire at right angles from the main stem, and from this basal, horizontal rod taking up other rods resulting from the growths selected at not less than four feet apart. It is surprising how quickly a house can be furnished with vines under this system of training, for in a few years as many as one hundred bunches can be taken from each vine, ranging in weight from three pounds to six pounds in the case of such sorts as Alicante, Madresfield Court and Muscat of Alexandria, which succeed admirably on this principle. I well remember the original vine from which the late Mr. J. Meredith, Garston Vineyard, cut the bunches that were the means of illustrating the value of this grape, and thus bringing it prominently before the public. The vine was planted at one end of a vinery, with a partition in, and as the vine grew the partition was removed to allow of extension, and right well did it succeed. This was in the year 1872, or thereabouts. E. Molyneux.

Swanmore Park.

## THINNING AND STAKING ANNUALS.

Early thinning is one of the most important points in the culture of annuals when they are sown outside. Immediately the seedlings are large enough to handle they should be slightly thinned out, and then in a short time, when they have grown close together again, the final thinning should be accomplished. The space allowed for the development of each plant must be governed by the size it is likely to attain. Take, for instance, a single plant of the blue cornflower, which, when given sufficient space, grows into a bush of fine dimensions, and the Shirley poppies make large plants when provided with plenty of room. Not only is thinning conducive to large-sized plants, but the flowering season is considerably lengthened. When the seedlings are allowed to remain in the beds or clumps just as they come up, the result is thin growth, small flowers, and a very short season.

The cornflowers and tall coreopsis, and, in fact, all annuals of similar growth, require from eighteen inches to two feet of space to attain full development. The smaller-growing kinds, such as godetias, clarkias, etc., must be thinned according to their habit. Careful thought is necessary when thinning a bed or clump of mixed colours of any particular kind. Among mixed larkspurs the plants of one colour are stronger growing than those of another colour, therefore, when dealing with them it is highly important that neither all the large nor all the small seedlings are removed, otherwise only one colour will be the result from a packet of mixed seeds.

Many annuals require support of some kind, and how to obtain a natural effect while giving this necessary support is, in many cases, a difficult problem to solve. The principal idea should be to provide something of sufficient strength to keep the plants in an upright position, and to allow them to grow as naturally as possible. Anything in the shape of formality should always be avoided, for nothing looks worse than bunched-up plants. Unless the plants absolutely require staking, the latter should not be attempted. Gaillardias, alonsoas, and others with similar habit, provide a more pleasing effect when they are allowed to grow naturally. Salpiglossis, cosmeas, etc., which produce a single stem and branch from it, require one stick, and when the side shoots become heavy they must be looped up. For the majority, the twiggy ends of pea sticks will be found most useful. E. C. Pooley.

## MESSRS. WILLIAM BULL AND SONS' NURSERIES.

The name of William Bull has been associated with the introduction of new plants over a long series of years, and it would be an easy matter to compile a very long list of subjects that have been distributed from the establishment in King's Road, Chelsea. In the earlier years of the firm's history stove plants, economic plants and species of orchids, were the principal novelties, though other subjects were not omitted; and, if memory serves us aright, Mr. Wm. Bull sent out the first new sweet pea—Bronze Prince—raised by the late Mr. Henry Eckford.

But other times bring other manners, and at present the firm, now conducted by Mr. E. Bull, the younger son of the late Mr. William Bull, is very largely occupied in producing hybrid orchids. Fifteen years or so ago many of the houses at Chelsea were filled with large batches of orchid species, whereas to-day no fewer than eleven houses are devoted to seedling orchids that range in size from the merest little green blob that indicates a fully germinated seed, up to goodly plants carrying numerous spikes of elegant flowers.

Any doubts as to the possibility of cultivating orchids in London would be immediately set at rest by a visit to Messrs. Bull's establishment at Chelsea. Only one difficulty seems to arise in this orchid manufactory, and it is the one of opening the flowers of some kinds, notably the cattleyas and their hybrids, during the dull months of the year. Judging by the wonderfully healthy appearance of the almost innumerable seedlings, and the fine growth and spikes made by the young plants just reaching their time of first flowering, one might be tempted to assert that the subdued light of London town is altogether conducive to the best results in connection with the vastly interesting work of raising orchids from seeds.

It was in 1903 that Messrs. William Bull and Sons commenced in real earnest to raise new orchids by cross-fertilisation and hybridisation, and in the person of Mr. J. Lakin they have found a clever raiser and a capable grower. It is of interest to learn that at Chelsea there seems to be no specially suitable time of the year for sowing orchid seeds, and even those that germinate late in the year only remain somnolent, as it were, until the new year arrives, and then they grow away capitally. The seeds are kept for a little while after ripening, and are then sown, no matter what the time of year. Another point of great interest is that the seeds are never sown in or on a specially prepared medium, but always on the surface of the compost around a newly-established plant of several years old, which will not need repotting for some little time.

With the help of a magnifying glass the seeds may be seen in various stages of germination, while, of course, it is quite easy to follow the development of seedlings from the time they make a first tiny leaf. Mr. Lakin has no faith in the use of the various fern fibres for quite young seedlings, believing that good peat fibre is far better until the plants are approaching the flowering stage, when the various peat substitutes may be used with advantage. The batches of seedling odontoglossums and odontiodas are a fascinating study, and one may readily pick out those derived from Odontoglossum Edwardii, O. Rossi, and, at a certain stage, O. crispum. Odontoglossums are most extensively grown, and of special importance on the occasion of a recent visit was a large batch just opening their flowers, and derived from crossing O. crispum Franz Mazreel and O. c. Alphonso. The earliest of these have given a number of very finely blotched forms and so far there has not been a poor variety. The plants are about three and a-half years old. O. Zena (O. sceptrum × O. Harryanum), with bright yellow and brown flowers, is a very effective hybrid. O. splendidissimum, obtained by crossing O. Pescatorei with O. ardentissimum, is giving a fine series of large, shapely, and well-marked flowers of good substance. O. Pescatorei crossed with O. luteopurpureum, named O. Brandtiæ, is an attractive and most variable hybrid, the extreme forms quite closely resembling one parent or the other.

Odontoglossum Thompsoni is very fine, and the oldest batch is producing a perfect forest of long, graceful spikes, to be presently studded with purple flowers. The unflowered seedlings are extremely promising, and among these we made special note of those derived from O. Edwardi × O. Vuylstekeæ, O. Rossi × O. percultum, O. Rossi × O Lambeauianum, O. ardentissimum × O. Uro Skinneri, O. triumphans × O. Rossi, and O. Rossi × O. Harryano-crispum, which combination has already produced the distinct and handsome O. Smithi.

A batch of Odontioda Bradshawiæ was interesting, as showing the fairly wide range of colouring this hybrid will give, though it is the brilliant crimson-scarlet forms that are usually seen at exhibitions. The useful rosy Odontioda Chelseaensis is flowering freely, and is a very useful and easily grown hybrid.

Two little batches round which considerable hopes centre are the result, respectively, of crossing Miltonia Bleuana virginalis with M. vexillaria Cobbiana, and Oncidium crispum, crossed with Cochlioda Noetzliana. One plant of the former, still quite a youngster, was found to be producing a little spike on the occasion of our visit.

One large house is wellnigh full of cattleya, lælio-cattleya, and brasso-cattleya hybrids that ought soon to reach a flowering stage, but tiny seedlings of these groups are not numerous, few being raised, because, as already stated, their first flowers do not open kindly in town. Of Lælio-cattleya Baden Powell, L.-c. Bletchleyensis, L.-c. Lady Wigan, L.-c. Aphrodite, L.-c. Myra, etc., there were first-rate batches, mostly in sheath or showing flower buds.

Cypripediums do capitally at Chelsea, and of C. bellatulum, C. Tautzianum, C. Fowlerianum magnificum, C. Maudiæ magnificum, and numerous hybrids of C. bellatulum and C. niveum, there were particularly fine healthy examples; while the whole range of autumn and winter flowering sorts were fully represented, and seedlings were noticed in all stages of development. Certainly the orchid department shows what skill can do in the raising and cultivation of orchids in towns, and, at the same time, incidentally demonstrates how widespread is the love of orchids, because it would obviously be useless to keep on raising crossbreds and hybrids unless there were plenty of people ready to buy them. A nursery is not run on philanthropic lines.

Besides the orchids, the chief plants grown largely at Chelsea by Messrs. William Bull and Sons are palms, from tiny seedlings up to the big specimens in the large winter garden; liliums of many kinds, and amaryllis. Of these latter the firm has now an excellent strain, as was made evident on the occasion of the firm's centenary celebration last year. If they can be kept back sufficiently these brilliant flowers will be largely shown by the Messrs. Bull at the forthcoming International Exhibition. At the present moment spring cleaning is in full force at Chelsea, and the large winter garden and its occupants are being prepared for the elegant and beautiful display annually provided during May.

SEEDLING ORCHIDS.

Part of a house filled with seedling Odontoglossums and Odontiodas at Messrs. William Bull and Sons' Nurseries, Chelsea.

Passing through the packing sheds we saw in full working order the arrangements provided for the careful and prompt despatch of orders, and a question, suggested by the numerous cwt. bags of Bull's plant food, led to the information that this fertilising speciality meets a first-rate demand, and it is quite a common occurrence for the firm to despatch two tons in a day.

---

**Celosia pyramidalis.** — While many bedding plants proved very unsatisfactory in 1911, the different forms of this celosia showed that the weather conditions just suited them. During late years a very improved strain has become popular, the habit of the plants being much better and the colours more clearly defined than was at one time the case. A very effective arrangement noted in Regent's Park last summer was one in which some fine, brilliantly-coloured examples of this celosia were disposed thinly over a carpet of Lotus peliorhynchus, the greyish foliage of the latter serving as a foil to their bright hue.—W. T.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

DENDROBIUMS.—For some weeks past the numerous species and hybrids have formed a prominent feature in the orchid houses. Many of them have now passed out of flower, and are pushing forth new growths from the stem-like pseudo-bulbs, which will produce roots when they are a few inches high. It is at this time that any necessary repotting should be attended to. Healthy plants which have sufficient room for development need not be disturbed, but may, for appearance sake, be surfaced with new material. Young, vigorous plants that are root-bound should be shifted on with as little root disturbance as possible, using receptacles that will accommodate the plants for two years. Overpotting is detrimental. For strong growing kinds like D. nobile, D. Wiganiæ, D. Ainsworthi, D. Rolfeæ, D. Blacki, and others of this class, the ordinary flower pots is suitable; while for the dwarf growing species, and those of pendulous habit, as D. crassinode, D. cretaceum, and D. crepidatum, shallow pans which can be suspended close up to the root are preferable. Remove all useless back-bulbs that have flowered, and remove as much of the compost from the back part of the plant as is practicable. By this means smaller pots than otherwise would be possible can be used. My remarks in the issue of April 6 in respect to compost for Dendrobiums is also applicable to this class; in fact, all of them will succeed in such a compost. As the plants are potted a few stakes should be inserted, and a number of the pseudo-bulbs tied to them to keep the plant from rocking. If this matter is left to a later period, there is a danger of injuring the young roots. Place them in the East Indian house, or warm plant stove, keeping them well up towards the light. Dendrobiums also thrive exceedingly well in warm vineries, but unless they are scrupulously clean, they are not desirable companions to vines. They delight in early morning sunshine, and also in afternoon sun; but until new pseudo-bulbs begin to form they must be shaded during the hottest and brightest part of the day. Keep the compost rather dry for several weeks after repotting, until the new roots are seen to be pushing through the compost. When well established a more abundant supply of water at the roots is necessary. The undersides of the leaves may be syringed lightly with tepid rain-water, several times a day in warm and bright weather. During the growing season a moist, humid atmosphere must be maintained at all times, as dendrobiums resent a dry, parched atmosphere, which will undoubtedly bring in its train an attack of thrip and other insect pests.

PROPAGATION.—It is desirable each year to propagate a few plants, especially of the rare varieties, to replace plants that have become exhausted through over-flowering, or any other cause. This is done by cutting off some of the old pseudo-bulbs that have failed to bloom, those that have flowered being useless. These should be laid upon some damp sphagnum moss in a hot, moist propagating frame, or upon the surface of living sphagnum moss, in the pots of Ærides and Vandas growing in the East Indian house. Young plants may also be obtained by cutting the bulbs into short lengths, taking care to have a sound eye or bud to each piece, and placing these firmly in small pots filled with sphagnum moss, being careful that the eye or bud rests just at the surface of the moss. Young growths will soon appear, and when they produce roots they should be potted up in small pots like the other plants. The eyes, or buds, should, if possible, be put into a propagating frame to produce growths, being afterwards gradually hardened off, until they are able to withstand the ordinary conditions of the house. Young seedling dendrobiums may be repotted at this season.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

DIPLADENIA BOLIVIENSIS.—This is a pretty and useful species, bearing a profusion of white flowers with a rich yellow throat. Unlike the majority of the dipladenias, this is not so subject to that dreaded pest mealy bug, and as the leaves have a smooth surface, they can be readily cleaned. The flowers are exceedingly useful for wreaths and bouquets when wired. The best position for the plant is upon wires near the roof-glass of the stove, or it may be grown as a specimen upon a balloon-shaped trellis. Propagation is readily effected by cuttings of the short, half-ripened, spur-like shoots. Insert these in small pots filled with peat and sand, and plunge in a hotbed. When nicely rooted pot singly, and again plunge until well established, when a stage or shelf near the light will answer. Shift into larger pots as thought necessary, using peat in a lumpy condition, and plenty of sharp sand, and small pieces of charcoal. Ample drainage is essential.

CELOSIAS.—Golden rules to observe in the cultivation of these useful plants are, plenty of heat, accompanied with humidity during the season of active growth; and free, unchecked growth from the time the seedlings are pricked off until flowering time. Seeds should be procured from a reliable source, as this is one of those plants hardly worth growing unless the strain be of the best. When one has a good strain it is good policy to perpetuate it by saving seeds annually. Assuming that seeds have already been sown for an early batch of plants, the seedlings should be given a shift into small pots as soon as large enough, and encouraged to make quick growth. The present time is opportune for making the principal sowing, and the resulting plants, if well grown, will produce their plumes at a time when most useful. This batch will have a better chance than the earlier one, owing to the increasing hours of daylight and more congenial conditions generally. A good compost consists of about three parts fibrous loam to one each of leaf-soil and dried cow manure, adding plenty of sand, and a sprinkling of wood-ash or soot. Plenty of humidity in the atmosphere of the house or pit in which the plants are grown is absolutely essential, for the double purpose of ensuring luxuriant growth, and to keep down red spider and thrips.

CYPERUS NATALENSIS.—When kept in quite small pots we find this graceful little plant most useful for associating with both ornamental foliaged plants, or flowering plants in the houses, or for decorative purposes in the dwelling. They are easily raised from seed, and by sowing a pinch, say, once a month, we ensure a succession of small plants to replace others that have become pot-bound, or otherwise damaged. Sow the seeds in heat, and when about an inch high, lift carefully with a pointed stick in small clumps of about 6 or 8 plants, and pot in small 60's, in which size they remain. By placing several seedlings in the centre of each pot the growth made is fine and grass-like, therefore more graceful than when only two or three are used.

TEMPERATURE.—More natural conditions for the free growth of the various plants now prevail, and the temperature of the various structures may accordingly be increased. Close early in the afternoons, and syringe heavily overhead and among the pots in which the plants are growing. The floors and walls also should be damped at least once in the evening. Avoid using more fire-heat than is absolutely necessary to maintain the proper temperature throughout the night.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY MELONS.—The fruits will have attained a good size, and some means should be adopted to support them, either by the use of nets or boards. Care should be exercised not to make use of any supports until absolutely necessary, or the fruits will often assume a shape and form that is not characteristic of the particular variety grown. Continue to give manurial assistance frequently, until the fruits are fully developed, and show signs of ripening, when it must be discontinued, using only clear tepid water until the fruits are ripe. Attend to the stopping of the laterals, and remove all leaves that show signs of decay, using a sharp knife. Keep a sharp look-out for canker in the main stems, and, if discovered, the affected parts should be well rubbed with dry lime; in fact, we always use lime around the base of the stems of our plants as a preventative, and water is never allowed to come in contact with the base at any time. Discontinue the use of the syringe, and admit air freely when possible by the top and side ventilators, leaving them open a little at night during the ripening period. All fruits should be cut immediately they are ripe, and placed in a warm fruit room for a day or two before being used.

SUCCESSIONAL PLANTS.—Carefully attend to the pinching and tying of the shoots, and fertilise the female flowers as they open until the required number are set. Give plenty of water, but exercise care in the use of stimulating manures at this period. Plants that were raised from seeds a few weeks ago should be potted on into 6-inch and 7-inch pots, and these will be found very useful to take the place of those in the early house, after the crop is finished.

SECOND EARLY VINES.—Constant care will be required in the final thinning of the berries; this work should be allocated to a capable workman, who thoroughly understands the requirements of the particular varieties to be operated upon. Great assistance is afforded for the proper development of the berries if the shoulders of the bunches are carefully tied up to the wires by slender pieces of matting; this work requires a certain amount of skill and judicious care. Give liquid and chemical stimulants frequently to vines that are carrying a heavy crop, and during the stoning period several applications of lime-water should be given.

PEACHES AND NECTARINES. — The fruits in the early houses have almost completed their stoning, so freely syringe the trees to keep the foliage clean and healthy, but it must be discontinued when the fruits commence to ripen. Continue to water frequently with chemical and farmyard liquid manure, until the ripening stage is reached, when clean tepid water will be sufficient. Admit air by the top and side ventilators, allowing a little to remain on at night. Stop all second growths at one leaf, and endeavour to expose the fruits to sunlight.

LATE PEACHES.—The trees in the later houses are much on a par with each other, the exceptionally mild spring we have experienced having induced the trees in the late houses to flower at the same time as the second early ones. Pay attention to the young growths, thin the fruits judiciously, and give the roots a copious supply of clean tepid water. As the days lengthen and the sun gains power, the syringe must be frequently used to keep the foliage clean and healthy.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

SUB-TROPICAL PLANTS IN THE GARDEN.—These are very effective when arranged in a position exposed to full sunshine, but protected from the high winds. The ground should be well trenched and manured for their reception, as a deep and rich rooting medium is essential to vigorous growth. From now until the first week in June, which is the best time to plant them out, the plants should be gradually hardened off; and it is essential to have vigorous specimens in 6-inch pots by planting time. Among the more effective plants for this style of gardening the cannas are especially suitable; they are now obtained in varied and charming colours, and their foliage is most effective. Ricinus in variety are specially handsome foliage plants. Some of the solanums are very desirable, and S. robustum, S. marginatum, and S. pyracanthum should be chosen. Melianthus major is an effective foliage plant, and can either be raised from seeds annually, or the roots can be kept from year to year.

HARDY BAMBOOS.—The present is the best time to plant these elegant subjects, and in gardens where the soil is of a heavy loamy nature they succeed admirably when given positions sheltered from the cold winds. The best to plant are Arundinaria nitida, a tall graceful bamboo with small leaves; A. anceps, a very desirable kind; A. aristata, a distinct plant; A. spathiflora, tall, with dense plumose growths; and A. japonica, a popular and vigorous grower. Bambusa fastuosa forms a tall noble plant; B. palmata is quite distinct, with broad leaves; and B. quadrangularis is a striking bamboo with square stems. Among the phylloastachys, P. aurea is a good one for massing in beds, while P. castillonis, P. flexuosa, P. Quilioi, P. violescens and P. vividi-glaucescens are all handsome and worthy of inclusion. Arundinaria auricoma is a dwarf variegated form, and A. Veitchi is a lowly grower, suitable for planting towards the back of the rock garden. Bamboos succeed best in a rich, moist soil, which should be deeply cultivated before they are planted. At this season of the year they derive much benefit from a liberal top-dressing of manure, and any old or dead stems should be cut out near the base.

GENERAL WORK.—Subjects like pampas grass, rheums, and gaunneras can be successfully transplanted now, and where it is so desired they can be increased by division of the roots. Place some fresh soil around them, and give a thorough watering after planting. It is wise to have material at hand to provide protection against frost for tender subjects. Frequently hoe over the surface of the flower borders and beds. The present is a good time to apply weed killer to paths, but it is more effective when put on during showery weather. Take care that box edges and grass verges are not damaged by its use, and guard against the utensils employed being used for other purposes.—F. Gardner, Batsford Park Gardens.

ROYAL SHOW

DONCASTER,
July 2nd to 6th, 1912.

73rd ANNUAL EXHIBITION of Horses, Cattle, Sheep, Pigs, Poultry and Farm Produce; Jumping, Sheep Dog Trials, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE MAY 31st
(Live Stock entries close May 20th).

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16, Bedford Square, London, W.C.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE.

April 16.—Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Rev. Canon Fowler, Dr. A. B. Rendle, Professor G. Henslow, Messrs. A. Rolfe, W. E. Ledger, W. Hales, J. T. Bennett-Poë, A. W. Sutton, A. Worsley, J. Fraser, and J. F. Chittenden (hon. secretary).

STACHYS PALUSTRIS.—Mr. J. Fraser showed a specimen of the rhizome of this common British plant, and remarked on the similarity between it and the Chinese Stachys tuberifera, the rhizomes of which are edible.

WALLFLOWERS.—Professor G. Henslow showed a series of dark red and paler yellow wallflowers which had been grown at Wisley from seed obtained by him in 1911 by crossing a virescent wallflower with carpellary stamens with pollen from red and yellow plants respectively. No malformed flowers had appeared in this generation.

TASMANIAN ORCHIDS. — Mr. Odell showed, on behalf of Mr. Andrew Kingsmill, an interesting series of coloured photographs of Tasmanian orchids, representing the following terrestrial genera: Pterostylis, Chiloglottis, Caladenia, Diuris, Calochilos, Dipodium, Glossodia, and Diplarrhena.

DOUBLE RANUNCULUS FICARIA.—Mr. Chittenden showed a semi-double form of Ranunculus ficaria, having several series of strap-shaped petals green on the outside, as well as two or three whorls of stamens, which had appeared in the garden at Wisley.

CARPENTARIA CALIFORNICA. — Mr. Odell showed foliage of this plant spotted with numerous brown spots, owing to the attack of the fungus Cladosporium herbarum.

DISEASED LILIUM CANDIDUM.—Mr. E. H. Jenkins sent leaves of Lilium candidum showing numerous æcidia of a Uromyces, which was referred to Mr. Chittenden for further examination.

PETRÆA VOLUBILIS.—Rev. F. Page-Roberts sent a dried inflorescence of a climbing plant with blue flowers from Ceylon, which was recognised as the American Petræa volubilis (see "Botanical Magazine 628), a plant which varies considerably in colour.

SAXIFRAGA GRANULATA.—A reputed hybrid of S. granulata was referred to Mr. J. Fraser for report.

BI-COLOURED HYACINTH.—Mr. W. B. Gingell, of Dulwich Park, sent an inflorescence of a hyacinth having one side red, the other blue, which was referred to Rev. Prof. Henslow for further examination.

## Devon Daffodil and Spring Flower Society.

The annual exhibition of this society was opened on April 18 in the Guildhall, Plymouth. It was certainly not so large a show as those of the past few years, which was accounted for by the extreme earliness of the season which had brought on the daffodils so rapidly that at the date of the show the majority of them were over. However, some very excellent narcissi were exhibited, and the hard-wooded flowering shrubs were never better, several splendid stands being present.

In the class for twenty-four varieties of daffodils, first prize was won by Miss Ida Pope with a fine stand containing Bernardine, King's Norton, Ben Simonite, Victory, Silene, Colonist, Japonica, Bird's Eye, Ruby Cup, Albatross, and Estelle. In the class for a group of daffodil seedlings not yet in commerce, Mr. T. Batson was first with a collection of fine flowers. Among them were white perianth, with wide yellow cup; cream perianth, with spreading orange cup; white perianth, yellow cup, edged crimson; primrose-yellow perianth, with orange-scarlet wide cup; pale yellow perianth, with gold cup, centre green, very large golden trumpet, bicolor trumpet, and white trumpet.

Mr. W. A. Watts showed, not for competition, some very attractive new seedlings, namely, White Rose, a double-flowered white with deep cup, for which he was awarded a First-class Certificate; Red Beacon, white perianth with flat orange-scarlet eye; Tinsel, white perianth, yellow eye, edged orange; and Verdant Green, perianth white, stained with green, and green eye. For nine trumpets, Mr. T. Batson was first with King Alfred, excellent; J. B. M. Camm, Mrs. Camm, Cleopatra, Treasure Trove, Rev. D. R. Williamson, Mdme. de Graaff, Grandee, and Weardale Perfection. In the class for three incomparabilis, Mr. T. Batson occupied the first place with Princess Mary, Homespun, and Gloria Mundi. The same exhibitor was first also with three incomparabilis bicolor, with Will Scarlett, Consul, and Chryseis; and for three Barri, yellow, with Blood Orange, Glitter, and Stonechat. In competition for three Barri bicolor, Miss Ida Pope obtained premier honours with Cossack, Firebrand, and Circlet; and for three Leedsi with White Lady, Elaine, and White Queen. The Hon. Mrs. Colborne was first for three poeticus with Horace, Cassandra, and Comus. In the single bloom classes the awards were made as follows: Trumpet, Mrs. Soltau-Symons first with Mdme. de Graaff; incomparabilis, Miss Ida Pope first with Victory; Leedsi, Mrs. Soltau-Symons first with White Lady; Barri, Mr. H. G. Hawker first with Greeneye; poeticus, Mrs. Soltau-Symons first with Cassandra. There were also twelve classes, confined to residents in the county of Devon.

In the class for a collection of twelve varieties of hardy spring flowers, Mr. H. W. Grigg occupied the first place with a very good stand, containing Trillium grandiflorum, Fritillaria imperialis yellow, Fritillaria imperalis red, Muscari Heavenly Blue, Fritillaria meleagris, Anemone Robinsoniana, Erythronium grandiflorum, Ranunculus asiaticus, Trillium erectum, Trollius citrinus, Leucojum æstivum, and Fritillaria persica. For a collection of nine varieties of hardy spring flowers, Mrs. Ashley Froude first with a very excellent selection, comprising Fritillaria meleagris, Iris tingitana, Tulipa strangulata, picta, Anemone pulsatilla, Caltha platypetala, Tulipa Greigi, Epimedium niveum, Iris Susiana, and Primrose Pompadour.

In competition for the prizes for fifteen varieties of hard-wooded flowering shrubs, Mr. T. B. Bolitho occupied the first place with Viburnum rugosum, Cytisus præcox, Prunus sinensis alba flore-pleno, Pyrus malus floribunda, Jasminum primulinum, Correa bicolor, Cydonia Maulei, Acacia cultriformis, Corokia cotoneaster, Acacia diffusa, Clianthus puniceus, Clianthus puniceus albus, Ribes aureum, Grevillea ornithopoda, Grevillea sulphurea. For six varieties of hard-wooded flowering shrubs, Mr. H. W. Grigg was first with the beautiful scented Viburnum Carlesi, for which he received an Award of Merit, Calceolaria violacea, Distyllum racemosum, Boronia heterophylla, Eriostemon neriifolium, and Correa cardinalis.

The attractiveness of the show was considerably increased by the exhibits staged by the several nurserymen. The Devon Rosery, Torquay, had a most attractive arrangement with a quantity of pot roses in full bloom. Among these were Lady Hillingdon, Climbing Mrs. Grant, Francesca Kruger, Snowstorm, Countess of Derby, Irish Engineer, Mrs. Sophia Neate, Beaute Inconstante, Etoile de France, and Caroline Testout. There was a fine collection of tulips in which were Bouton d'Or, Pride of Haarlem, Flamingo, Clara Butt, Rembrandt, Cottage Maid, and Golden Queen, very fine. A few flower sprays of the rare Gladiolus tristis were shown, and there was a fine specimen plant of Petræa volubilis in full flower, as well as fifteen dishes of apples in excellent condition. Messrs. Robert Veitch and Son, Exeter, showed, in fine condition, Rhododendron Dr. Stocker, R. concinnum, R. Williamsi, R. yunnanense, R. Yodogama, R. Fordi, R. racemosum, Azalea Hexe, Erica mediterranea, E. arborea, E. Veitchi, E. australis, Chorizema Lowi, Eriostemon nerriifolium, E. scaber, E. myoporoides, Grevillea alpina, Correa cardinalis, C. curiosa, C. bicolor, C. ventricosa, Cyrtomium Rochfordi, Osmanthus Delavayi, Lomatia ferruginea, Hibbertia dentata, Viburnum Sieboldi, V. plicatum, Eupatorium ionanthe, Dracæna lentiginosa, D. Draco, Beschorneria yuccoides, Acacia lineata, A. Drummondi, and Boronia megastigma. Messrs. Barr and Sons contributed a fine stand of daffodils, in which were Will Scarlett, Aspasia, Cygnet, Glitter, Queen of the North, Challenger, Monarch, Vivid, Anak Firebrand, Bianca, Orangeman, Ariadne, Mascotte, Snowcrest, Red Beacon, Minerva, Venus, Cleopatra, Sheba, Ibis, St. George, and Enid. Messrs. H. B. May and Sons, Upper Edmonton, showed a splendid selection of ferns and clematis.

## Bournemouth Gardeners' Association.

Short lectures on the "Cultivation of the White and the Yellow Arum Lily" were given at the last fortnightly meeting by Messrs. Evans and Pavey respectively. Both gentlemen have had some considerable experience with these useful plants, and spoke with confidence as to the treatment that suited them best.

Mr. Evans dealt with the white arum, and strongly advocated planting out the plants after flowering. He said the ground in which the plants are grown during the summer months should be well manured if it was at all poor in quality, as it was a great mistake to starve the plants. The better they were treated in this respect the more freely would they flower. Single roots in 6in. pots were best, and these, if well cultivated, would bear five or six spathes in a year. The lecturer did not advocate the use of chemical manures, but good farmyard liquid manure properly diluted. He said all small offsets should be removed when the plants were being put out, and not at the time of lifting and repotting.

Mr. Pavey, in dealing with the yellow arum, said it was not as free-flowering, of course, as the white kind, but the spathes retained their freshness much longer, and owing to its decorative value, the plant deserved a more extended culture than it at present received. Plants raised from seeds flowered at the end of the fifth season; offsets at the end of the third season. The flower stems were very brittle, and soon snapped off, and if care was not taken afterwards, the collar of the plant split up and decayed. When the plants were first started, said the lecturer, they should have a rather high temperature to grow in, but directly the flower stems appeared, a greenhouse temperature was the most suitable. Green fly soon attacked the young growths, and the latter must be kept free from the pest.

There was a free discussion at the conclusion of the two lectures. Some beautiful plants in pots, and cut flowers in vases were staged, namely: cinerarias, crotons, genistas, roses, narcissi, and zonal pelargoniums. Mr. Heath, gardener to G. G. Russell, Esq., ably presided, and was accorded, with the lecturers, a hearty vote of thanks.

## Norwich Exhibition of Spring Flowers.

The spring show of the Norfolk and Norwich Horticultural Society, held in St. Andrew's Hall, Norwich, on the 18th inst., may be regarded as a success. In the outside bulb classes a shortage of exhibits was noticeable, due, of course, to the fact that these flowers are so very early this season. The quality of the other hardy flowers, greenhouse flowers, and pot plants was high, and both as regards the quality and quantity, were of a high degree of excellence. The public evidently thought the show was a good one, as may be gathered from the fact that there was an increase of £20 upon last year's gate money.

There was only one circular group set up for the challenge cup presented by Colonel Petre, this coming from Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton Hall. It consisted mainly of Stellata cinerarias, lilies, and roses, with suitable foliage plants. Mr. Notley is an adept at arrangement, as was made evident on this occasion.

In the cut flower section Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park, achieved a great success, winning first for twelve bunches exotic, and first for twelve bunches hardy flowers. He had fine bunches of orchids in the first-mentioned, whilst among the hardy flowers the attractive feature was the bold bunch of gentians and the beautiful hardy irises of several kinds. Mr. George Davison, gardener to Colonel Petre, Westwick House, Norwich, had lead in the narcissi section. His stand of thirty-six varieties was a wonderful exhibit. The substance and freshness of the flowers was an education. Mr. Davison has been working for some years in hybridising the trumpet varieties, and he has raised some splendid things. He had one or two shown here under number, and it would have needed a bold bid to have secured the stock of either of them. Mr. Woodhouse, gardener to the Master of the Rolls, staged in this section some fine blooms of the most up-to-date sorts. S. Cozens Hardy, Esq., J. Cator, Esq., M.P., Mr. Frank Neave, and Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, were also prominent exhibitors and winners for narcissi.

Violets were well represented, and it was a grand half dozen bunches which Mr. F. J. Endersby, gardener to J. H. Gurney, Esq., Keswick, took first place with. Pansies, polyanthus, flowering shrubs, and tulips all had their devotees, and contributed largely to the brilliant display of cut flowers.

In the pot plant section first mention is due to the orchids from Miss V. Fellowes, Shotesham. She was placed first in both classes, and the exhibit was awarded a R.H.S. medal for the best exhibit in the pot plant section.

Next to these, we think, came the six calceolarias staged by Mr. F. Williams, gardener to Louis Tillett, Esq., Catton. They were shown just in the best of condition, with well-balanced heads of bloom. Cinerarias of the stellata type made a bold show, but the award of the judges was open to much doubt. Mr. E. Greene, gardener to E. Reeve, Esq., was certainly not distinctly beaten by those from Dr. Osburne's gardener. Mr. A. Coombe, gardener to Lord de Ramsey, Haverland, easily took first for cyclamen, and deserved all the praise that his fellow gardeners bestowed upon him for plants which were so fresh for such a late date. Pelargoniums (zonal and regal), primulas, lily of the valley, mignonette, and other seasonable subjects were also staged.

Strawberries were the only fruits shown, and the primary awards went to Mr. F. J. Endersby and Mr. W. Chettleburgh. Vegetables were fairly well represented, and in the section Mr. W. Chettleburgh achieved the greatest success.

The trade made a very effective display. Messrs. Daniels Bros., Lim., Town Close Nurseries, Norwich, were well to the fore from an educational point of view, with a varied exhibit, comprising forced shrubs of all kinds, roses of the newest and best, carnations, and hardy rockery plants in pots, which went to prove that at any time buyers can obtain these for immediate planting and effect. Awarded silver medal. Hobbies, Lim., Dereham, made one of their unique displays of roses, using ramblers for the back rows and the newest H.T.'s for the front. It would be futile to start giving names; suffice it to say that the best were there. (Silver medal.)

Messrs. A. J. and C. Allen, Hergham, Norwich, had a large and varied collection of roses in pots. They secured certificates for Duchess of Westminster and Edward Mawley. Juliet was well shown, both as standards and bush plants, whilst a good thing in yellow ramblers was Shower of Gold. (Silver medal.)

Mr. R. C. Notcutt, Woodbridge, made a great feature of flowering shrubs, forced lilacs, genistas, viburnums, and wistarias being very attractive.

A word of praise is certainly due to the energetic hon. secretary, Mr. C. E. Pilling, for initiating new ideas of arrangement, and giving the Norwich Spring Show a start under improved conditions.

## Reading Gardeners' Association.

The final meeting of the present session took place in the Abbey Hall on Monday, when the President occupied the chair. There was a good attendance, including a number of ladies.

By special request, Mr. T. J. Powell, of The Gardens, Park Place, Henley-on-Thames, had consented to give another of his "Practical Demonstrations in Artistic Floral Work." As is well known, Mr. Powell is inimitable in the art of floral decoration, and his efforts on the present occasion were of the same high order as his previous demonstrations. As a preliminary, Mr. Powell gave examples of the different methods to be adopted in the display of cut flowers, first in a vase, afterwards in a bowl. The subjects used were spiræas, magnolias, and forsythias, each in turn being most cleverly handled. Mr. Powell then gave two examples of the way in which a dinner table should be decorated. With a table of sufficient size to seat about twelve or fourteen persons, he first gave a most artistic and at the same time delightfully simple example, making use of only delicate young beech foliage as a setting to the blossom of wild cherry. A centre bowl, with subsidiary bowls, was brought into service, and the whole produced a really delightful effect.

In his second example, Mr. Powell dispensed with the bowls, but requisitioned wire arches with striking effect. The arches were first covered with Asparagus Sprengeri, among which bunches of Pelargonium Fire Dragon were afterwards studded. The table under the centre arch was embellished with Liberty silk in a soft eau-de-nil shade; this in turn being covered with foliage and geranium blooms. Mr. Powell suggested, too, that the same arches covered in season with the foliage and flowers of the climbing rose, Dorothy Perkins, would give a charming effect. At the conclusion of his demonstration, Mr. Powell received a very hearty vote of thanks.

Members were at this meeting invited to contribute flowers for use at the Royal Berkshire Hospital and Reading Union, and a fine display of spring blossoms was staged. The flowers, contributed by a large number of members, consisted of schizanthus, wallflowers, arabis, auriculas, polyanthus, narcissi of sorts, Cineraria stellata, berberis, arums, tulips, spiræa, myosotis, begonias, ferns, roses, asparagus, stocks, fuchsias, primulas, rhododendrons, etc., and were duly forwarded to these institutions the following morning. A collection taken during the evening on behalf of the funds of the hospital amounted to £2 10s., and this sum, with the Society's annual subscription, will be forwarded to the secretary through the Reading Workpeople's Hospital Association. The tables, etc., were kindly lent by Mr. J. E. Phillips, London Street, Reading. A specimen orchid Dendrobium densiflorum was exhibited by Mr. H. Sims.

## North of Scotland Horticultural and Arboricultural Association.

A most successful opening session of this recently resuscitated society has just been brought to a close. It has extended from November, 1911, to April, 1912, during which period some capital papers were read. Dr. James W. H. Trail, Professor of Botany in Aberdeen University, gave the first paper, dealing in a most admirable manner with the subject of "How to obtain improved races of Cultivated Plants," and then there followed papers on Vegetables and Fruits, the Sweet Pea, Meteorological Lessons, the Carnation, Garden Cities, Cottage Gardening, and Hardy Spring Flowers. All of these subjects were dealt with in a most interesting and instructive manner, and an outstanding feature of the session was the enormous attendances.

It was exceedingly gratifying to see meeting after meeting in the Botany Classroom, Aberdeen University, where the society met, crowded to the doors with intelligent and enthusiastic audiences. The discussions, too, were warmly entered into, and a wealth of information extracted.

To the officials the warmest congratulations are due for the fine way in which everything was engineered, and it is no mere lip service to say that to the president, Mr. John McKinnon, Haddo House Gardens; the vice-president, Mr. A. Robson, Aberdeen; the secretary, Mr. William Reid, 8, Hadden Street, Aberdeen; and the treasurer, Mr. William Wyllie, 18, Market Street, Aberdeen. the members feel deeply indebted for their unwearied efforts—efforts ungrudgingly and whole-heartedly given.

At the closing meeting, Mr. Robson, through the unavoidable absence of Mr. McKinnon, took the chair. The subject for the evening was a paper sent by Mr. Joseph Sangster, Lissadell Gardens, Sligo, Ireland, on "Hardy Spring Flowers." Mr. Sangster, who knows it well, dealt with the climate of the north of Scotland and its suitability for the cultivation of spring flowers. Many spring flowers, Mr. Sangster contended, which would make progress in the north-east of Scotland during the winter months would succumb to the rigours of a winter in the midlands of England. He also dealt in an instructive manner as to the time bulbs should be planted, how they should be planted, their cultivation and flowering, etc. A hearty vote of thanks was given the secretary, Mr. Reid, for reading the paper, and he was instructed to convey the warm thanks of the meeting to Mr. Sangster for his valuable contribution.

It was agreed, on the motion of Mr. C. S. France, F.B.S., to remit to a committee to consider the question of a summer excursion to gardens in the vicinity of Aberdeen. Mr. France also moved that it be remitted to the committee to consider the advisability of promoting an exhibition of spring flowers next year. Undoubtedly there has been a growing interest in the cultivation of bulbs and spring flowers in the north-east of Scot-

and in recent years, and it is felt a show would be welcomed and well patronised. The motion was heartily agreed to.

---

### Croydon Gardeners' Society.

The culture of sweet peas for exhibition was the subject of a paper read before the members of the Croydon and District Society at the Sunflower Temperance Hotel on the 16th inst. Such a popular subject accounted for the big attendance of members, and many were anxious to hear from Mr. Thos. Stevenson, Woburn Place Gardens, Addlestone, his methods of producing the magnificent blooms, for which he is world famous. Although sweet peas may be grown in any good soil, that of slightly heavy nature will produce the best blooms.

To prepare the soil was Mr. Stevenson's first advice, and this operation must be done in the winter months by trenching the ground three spits deep, and where rows are wanted the trench should be opened 5ft. to 6ft. in width. Where ground lays cold the subsoil should be left at the bottom and incorporated with this fresh cow manure and leaf-soil. The advantage of this will be found in hot, dry summers, such as that experienced last year. Leave the surface in a rough state for the weather to pulverise during the winter; then before the plants are put out it can be broken down into a friable state with a fork. A little bone meal and superphosphate may be added with beneficial results to the plants.

The autumn sown seeds will be found to do the best, and, in Mr. Stevenson's experience, he has found these plants almost immune from disease, especially the dreaded streak disease. Seed should be sown in 48's pots, although smaller sizes may be used, or even boxes, using a good open soil for them; place in a cold frame and keep closed until they have germinated. Then give air on all favourable occasions, even a little in the middle of the day when snow or frost prevails. The pots containing the seedlings should be placed in spent ashes up to the brim; this method will conserve moisture to a marked degree. When frames are closed, and in severe weather, a mat thrown over them will keep out the frost. Avoid coddling them as much as possible to get a strong growth in the plants.

If sowing in spring is resorted to, the best time is in the first week of February. The plants may be raised in a cool greenhouse on a top shelf near the glass, or on a slight hotbed; the idea at all times is to keep them steadily growing into sturdy plants. About the middle of March, if the weather is suitable, they should be planted in the open ground after well hardening off, and a fine tilth of soil for their reception must be obtained. The seedlings are best shaken free of all soil, and a hole deep enough to allow the long tap root to be straightened out should be made. Plant with care to avoid bruising the roots as much as possible. In staking, birch or beech boughs placed near them will give the young plants support for their tendrils. Straight canes may be used for exhibition flowers, but only two or three growths may be left, and these tied up loosely with raffia. Good bushy sticks may be used where flowers for ordinary decoration are required, and these placed at a fairly good space from the plant, and slightly bending forward at the top. Train the plants on the outside of the sticks to allow them to obtain as much air as possible.

The hoe should be kept in use along the sides of the rows at least once a week to aerate the surface soil. When the first flowers are out a mulch of decayed manure or leaf-soil should be put along the sides of each row or around clumps where they are grown in this form, and, in Mr. Stevenson's opinion, watering is not necessary until after the mulch is put on. Artificial manures, such as a special sweet pea manure, or a little nitrate of potash, nitrate of soda, or sulphate of ammonia, may be used, but administer these sparingly.

Greenfly and thrips must be kept down by using a safe insecticide, and as a precaution against streak the plants should be syringed at intervals with a solution of sulphide of potassium, using ¼oz. to one gallon of water, or permanganate of potash will act in the same way. Where exhibition blooms are required, remove all flowers excepting those showing colour a few days prior to the show. The stems should be cut several hours previous to staging them, and placed in water at once; they will expand considerably after being cut, providing they are not in too young a state before severing from the plant. Staging for exhibition was a point in Mr. Stevenson's remarks greatly emphasised.

With such a popular subject there was plenty of discussion at the end of Mr. Stevenson's discourse, and he supplemented his remarks considerably when replying to questions put to him.

---

### GARDENING ENGAGEMENTS.

Mr. H. J. Salloway, for the past four years foreman in Closes Hall Gardens, Gisburn, Yorks, and previously foreman at Dutton Park, Cheshire, has been appointed gardener to the Countess of Cardigan, Deene Park, Wansford, Northants.

Mr. H. Dove, of Cranmere, Mitcham, has been appointed gardener to Mrs. Druce Thornhill, Sevenoaks, Kent.

---

**Cotoneaster lumifusa.** — For clothing steep banks this Chinese cotoneaster is one of the most useful of the genus. It is of a strictly procumbent habit, has neat, roundish, evergreen leaves of a dark green tint, while the berries are deep scarlet in colour. Of rapid growth, this cotoneaster will, under favourable conditions, soon cover a considerable space.—S. W.

Carmona Fertilizer.

Plants feed with avidity and thrive on the elements of Carmona Fertilizer. Carmona, the guaranteed Fertilizer, is all plant food, scientifically compounded. Carmona feeds naturally. One after the other elements of Carmona are released in proper succession and become available, life-giving, plant food which plants absorb and thrive upon.

**Carmona Fertilizer,** the final phase in specialised scientific fertilizers,

**BRINGS THE BEST OUT OF PLANTS.**

**Prices: 1 Cwt., 20/-; ½ Cwt., 12/6; 28lbs., 7/6; Tins, 6d., 1/-, and 2/6.**

**SPECIAL SWEET PEA FERTILIZER.**—In this splendid fertilizer all the elements are contained to produce first-class blooms in size and colour. It should be applied occasionally during the growth of the vine, and in order to obtain the finest possible blooms it should be fed to the plants more liberally when the bloom buds are showing. Success in Sweet Pea growing is assured to all users of the specially prepared Carmona Sweet Pea Fertilizer.

**Prices as for Carmona, the Guaranteed Fertilizer above.**

Velvas Lawn Sand.

**Weedy Lawns** are transformed by the magic of Velvas into veritable carpets of rich green grass of excellent quality. Velvas Lawn Sand destroys weeds, daisies, plantains, etc., and fertilizes the grass, thickening up the existing growths, and covering bare spaces with an abundant growth of new grass.

**Prices: 1 Cwt., 20/-; ½ Cwt., 11/-; 14lbs., 3/6; Tins, 6d., 1/-, and 2/-.**

£350 in Cash
for users of
Carmona Fertilizer.

The above magnificent sum to be awarded to successful exhibitors at the Great Guaranteed Gardenalities Horticultural Exhibition—open to Carmona users only. Entry free by coupon from Carmona packages. Under one roof at the Botanical Gardens, Edgbaston, on August 28th and 29th next, will be congregated the finest possible floral and vegetable testimonies to the wonderful feeding properties of Carmona Fertilizer. As a user of Carmona Fertilizer you have as good a chance as the next keen amateur of growing something to perfection and to win one of the handsome cash prizes into which the £350 is being divided.

GUARANTEED GARDENALITIES

Clift's Fluid Insecticide and Soil Sterilizer

has created a record in soil insect pest destruction; 806 dead insects, including dozens of Wireworms, were killed by one application of "a 1 in 100 solution" of Clift's Fluid on a patch of land 16ft. by 3ft.

These are the most remarkable figures of insect destruction ever published, and were achieved in the course of exhaustive experiments conducted by an eminent Biologist.

Before you sow or plant, pave the way to success by treating the soil with Clift's Fluid Insecticide and Soil Sterilizer. It is absolutely uninjurious to plants, and is the finest Insecticide in the world for the destruction of soil insect pests.

**Prices: 1 Gallon, 6/-; ½ Gallon, 3/6; Pint tins, 1/-.**

A copy of the Biologist's report on Clift's Fluid Insecticide and Soil Sterilizer will be sent **post free** to anyone sufficiently interested in the destruction of soil insect pests to read some dozen typed quarto pages of really interesting figures and facts in connection with three months' experimenting.

Clift's Manurial Insecticide,

a powder for the destruction of Slugs, Wireworms, Millipedes, Leather-jackets, etc.

To be mixed with the soil prior to planting or sowing, or sprinkled and lightly raked in around growing plants.

Combined Insect Destroyer and Fertilizer of a most durable character. Recommended by professional gardeners and horticultural experts and instructors throughout the Kingdom.

**Prices: 1 Cwt., 10/6; ½ Cwt., 6/6; 28lbs., 4/3; 14lbs., 3/6; Tins, 6d., 1/-, and 2/-.**

# THE PEA MOTH (ENDOPISA NIGRICANA STPH).

This moth, writes R. Stewart MacDougall, M.A., D.Sc., in the "Journal of the Board of Agriculture," appears in the literature under a number of names, the generic names being Grapholitha, Tortrix, Laspeyresia, and Endopisa, while the specific names are nigricana, pisana, nebritana, and proximana. The pea moth is well known in Central and in South Europe. It is found over Britain to Perthshire, and also in Ireland.

The caterpillars of the moth are the cause of the so-called worm-eaten peas. The moth is a widely-distributed one, and the damage done is frequently great; yet the references to this insect, in the economic literature, are comparatively rare. In 1911, from different parishes in England—some of them noted for their pea-growing—complaints came to the Board of Agriculture regarding loss due to the ravages of the caterpillar. One correspondent wrote that while "peas without grubs were selling at 110 shillings a quarter, similar peas infested by the caterpillar fetched only 85 shillings a quarter." An interesting point in the communication was that, during the past summer, whereas most of the samples grown on land that carries peas once in 10 years or so were infested, there was not the slightest trace of the insect on land, somewhat remote from other pea-growing fields, in which it was known that peas had not been grown for 80 years.

The moths fly at the time of flowering of the pea; the caterpillars live in the pods, and when full-fed leave the pods and creep a little way into the soil. The caterpillar is destructive to both field and garden peas. One or two other leguminous plants have been named as possible host plants, the seed in each case being sought while still forming in the pod.

## Description of Adult Insect.

The fore-wings of the moth are dark-brown or black, and have a metallic sheen or gloss; at the front margin of the fore-wings short white streaks or spots may be seen; there is a very faint eye-like mark towards the apex of each fore-wing, this mark containing within it small black streaks; near the hind margin, about the middle of the wing, is a curved white streak; fringes to the wing resemble the ground-colour. The hind wings are pale- brown or bronzy-brown, with white fringes. The underside of all four wings is pale and with a leaden gloss. The antennæ are black-brown. The moth measures 1-5 inch in length, and from ½ inch to ⅝ inch in spread of wings.

## Larva.

The caterpillar is 16-footed, and measures 1-3 inch when full-fed. The colour is a very pale green or yellowish-white; the head is brown or blackish, and lobed; on the upper surface of the joint behind the head is a dark horny plate; the segments of the body have a number of dark dots or warts, each of which carries a bristle-like hair.

## Life History.

The moths are found flying in June and July (some may be found in flight in August). The Continental text-books write of the flight taking place soon after sunset. Barrett, on the other hand, writes of the moth as "found in plenty sometimes along the hedges bordering a field which has produced a crop of peas in the preceding year," and as "loving to sit in the bright sunshine on oak and other bushes, flying away with extraordinary swiftness if disturbed to revel in the sunshine in another bush," and he adds, "as it seems to be on the wing throughout the day there seems no reason to suppose that it flies also at dusk."

The females lay their eggs on the young pea-pods. The same female may lay "1 or 2 or 3" eggs on a pod. The caterpillar on hatching eats through the pod in order to reach its normal food, i.e., the seed or pea. The tiny entrance-hole heals up, so that externally the pod may appear quite undamaged, while inside the peas are being attacked by the caterpillar. Some peas are gnawed, others more or less destroyed. Caterpillars may be found at work from July onwards. The caterpillar, on attaining its full size, leaves the pod and passes a little way into the soil, where it spins a web round itself, and so passes the winter. In the next spring pupation takes place, and the adults appear in due course.

Taschenberg states that infested pods ripen earlier than those not infested, and open slightly, so that the full-grown caterpillars can creep or press themselves out. The caterpillar may eat its way out of the pod.

Correspondents sometimes confuse the work of this caterpillar with the destructive work of the larva of the Pea Beetle, described in Leaflet No. 150. The following distinctions may prevent confusion:

Caterpillar of Pea Moth: Caterpillar has sixteen legs; pupation in soil; the peas are irregularly gnawed externally; the attacked peas are often woven together by silk threads, and there is a marked granular excrement. Grub of Pea Beetle: Grub legless; pupation in pea; the peas are eaten internally; there is no sign of spun threads and the hollowed peas appear clean, without external excrement.

A closely-allied species, known as Grapholitha or Laspeyresia dorsana, is rarer in Britain. It is found in the North of England, and in Scotland has been taken as far north as Inverness. Its caterpillar is longer than that of E. nigricana, and is orange-yellow in colour. On the Continent it appears as a pest on peas, with a life-history resembling that of E. nigricana.

In Britain wild species of Lathyrus have been named as host plants.

## Preventive and Remedial Measures.

The time when this pest of the pea can be most advantageously fought is when the caterpillar is in the soil for its winter rest. Where possible a thorough raking or deep hoeing of the soil as soon as it is free from peas would turn up and destroy many of the caterpillars. A field attack should be followed by deep ploughing before winter.

The collection and burning of infested pods, and the firming of the soil at the foot of the plants to hinder the entrance of the caterpillars, have also been recommended. When peas are "shelled" for culinary use all larvæ found should be destroyed.

---

**The Testing of Sanitary Compounds.**—At the twenty-seventh ordinary general meeting of Jeyes' Sanitary Compounds Company, Lim., held recently at the offices of the company, 64, Cannon Street, the Chairman, Mr. H. H. Nelson, stated that Dr. Klein had been appointed scientific adviser to the company. He mentioned that Dr. Klein was the originator in this country of the special branch of research in which the company was most interested, and no man to-day stood higher both as regards professional and personal estimation. All the standard products of the company—Jeyes' Fluid, Cyllin and Corporation Fluid — were now tested by Dr. Klein, and certified as regards their relative guaranteed values (by the Rideal-Walker test), whilst every tender issued by the company was accompanied by the method of test, with every detail exactly set out, so that such values might be checked upon precisely similar lines and conditions. He hoped this arrangement would tend to abolish the disputes which had proved inseparable from guaranteed standards often checked by operators unaccustomed to manipulating such delicate tests. The company always used the Rideal-Walker test because their scientific adviser and other distinguished authorities regarded it as the most accurate. It was the business of Jeyes' Sanitary Compound Company to meet the demands of the public, and it had been the policy of the company for 27 years not to allow themselves to be surpassed as regards the excellence of the various products they supplied.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

OXLIP OR COWSLIP.—S. P. R., Fulham: Will you kindly tell me if the larger of the two specimens sent is the true oxlip (Primula elatior). It comes from Corfe Castle, Dorset, and, although the specimen is from a plant which has been cultivated at Corfe for a year, I am assured the field ones are just as large. This example was found growing among cowslips. Sorry I have not a whole plant to send, but I enclose some cowslips for comparison.—The specimen sent carries its flowers in a somewhat horizontal fashion, and there is also an absence of the folding at the mouth of the corolla, both characters which help very largely to distinguish the oxlip from the cowslip.

PROPAGATING BUNCH PRIMROSES.—H. C. C., St. Neots: I have a fine bed of bunch primroses, and so many of the varieties are so good that I propose to increase the stock and plant more largely for next spring's display. Of course, I understand that the plants may be increased by division, but I am anxious to carry out the work with the best possible results, and therefore seek your advice.—Proceed at once to prepare a plot or border in a semi-shaded spot, for the reception of the bunch primroses; if the ground has been well dug and manured during the winter, little need be done beyond adding a goodly dressing of leaf-soil and forking this into the top six inches. When the plants have lost their floral beauty propagation should not be delayed. Give the bed a good watering (failing moist weather) overnight, and lift the plants next morning, putting them in a shady place as lifted. We assume you have already placed a label to the plants you wish to increase, with the colour recorded thereon. Deal with one plant, or colour, at a time, and cover the rest of the plants with a damp mat. With a large, strong, and sharp knife, carefully divide each specimen, doing the work so that each growth, or each division, has its complement of roots. Plant with a trowel, and give a good watering. The distance at which to plant will depend upon the size of the divisions and the space at disposal; but if the rows are eighteen inches apart and the plants a foot apart, that will allow plenty of room for development, for hoeing and for a subsequent top-dressing of leaf-soil and old manure, when the stock becomes established, and is growing freely. All this may appear to be much ado about bunch primroses, but, here, as in so many cases, it is chiefly the proper consideration of many

**Syringes**

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No. 1 Four Oaks Undentable, 1½ × 20in. 21/; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅜ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3C, Sutton Coldfield.

No. 47A.—Lean-to, 10ft. by 7ft. ... ... £9 10 0

All parts are numbered ready for easy re-erection by any handy man.

apparently little matters that make for success, even in connection with simple, beautiful and common hardy flowers.

LAYERING PERPETUAL-FLOWERING CARNATIONS.—Mr. F. James, of Falcondale Gardens, Lampeter, South Wales, has very kindly sent us the following interesting note in relation to the point raised in these columns in our issue of April 13, respecting the advantages of layered perpetual carnations over plants from cuttings: "Having been a regular reader of your valuable paper for several years, I take the liberty of writing you with reference to the layering of perpetual-flowering carnations as raised by your correspondent in the Gardeners' Magazine of April 13. When we layered our Malmaison carnations on August 1, 1911, we had several old plants of perpetual varieties, and by way of experiment we layered several. The rooted layers were potted on September 25. They were not stopped, but allowed to grow along with the Malmaisons through the winter in a temperature of 45 to 50 degrees. They commenced to flower at the end of March, and are now (April 18) carrying from nine to twelve fine blooms each, with plenty of healthy growths which will be stopped in due time, and the plants will be potted again for flowering next winter. As we have had such great success from propagation by layers we shall more largely increase our stock by this means towards the end of the summer. Whether this experience is worthy of publication I do not know, but I thought possibly the information might be helpful to some of your readers." We are obliged to Mr. James for this useful letter.

DISFIGURED PHYLLOCACTUS.—C. B., Hounslow: Will you kindly tell me what is the cause of the disease which attacks my cacti, and what can be done to cure and prevent it? I have made the specimen a good deal worse than it was by dusting sulphur on it. I have used carbolic soap with little success. Before they were attacked my plants looked even healthier than those at Kew. The leaf sent is from a plant that was but a tiny slip, two inches high, two years ago.—There is no trace of fungus disease on the specimen sent, and so we conclude the injury is due to some error in cultivation, possibly in connection with watering and temperature. Cacti often look quite green and healthy, and the temptation to increase their vigour by free applications of water is great, but the result is collapse.

COTTON AS AN ORNAMENTAL PLANT.—C. W. C., Cardiff: My employer has sent me a pod or boll of cotton, containing seeds, and I should like to raise a few plants, as I understand these are of a very ornamental character when carrying their open-end seed pods. Any information you can give me in this matter will greatly oblige.—Cotton (Gossypuim) is quite ornamental when well grown and carrying a considerable number of expanded seed pods, each showing its contents of silky cotton. The plants are not easy to manage, and it is very desirable that an early start should be made, owing to the great difficulty experienced in keeping the plants safely through the winter. You are too late to make a successful start unless circumstances are unusually favourable. Sow the seeds in light soil, in a hot moist pit or stove, and pot the seedlings separately as soon as they are large enough to be so treated, using light rich soil. Give larger pots as the need arises, and keep the plants in the stove until they begin to flower, when a drier atmosphere should be provided, but not necessarily a lower temperature, though this latter may be permitted when the pods burst. Save a few of the seeds and start them into growth in brisk heat next January or February.

## NAMES OF PLANTS.

F. H. C., Worcester.—1, Alyssum saxatile citrina; 2, Geum montanum; 3, Vitis Coignetiæ.

L. B., Charlbury.—1, Amelanchier canadensis; 2, Triteleia uniflora; 3, Berberis Darwini; 4, Lycaste cruenta; 5, Odontoglossum Rossi; 6, O. cirrhosum.

B. S. A., Hants.—1, Prunus sinensis; 2, double, flesh-coloured peach; 3, double rose-coloured peach; 4, Pyrus eleagnifolia; 5, Magnolia stellata; 6, Forsythia suspensa.

W. B., Uckfield.—1, Asparagus verticillatus; 2, probably Blechnum brasiliense, poor specimens; 3, Phlebodium aureum; 4, Cyrtomium falcatum; 5, a sedum, send when in flower.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, April 30.—Royal Horticultural Society; Narcissus Committee meets at 11.30 a.m.; Fruit, Floral and Orchid Committees at 12 o'clock; Lecture at 3 p.m. on "Potatoes" by Dr. Redcliffe Salmon; Scientific Committee at 4 o'clock.
National Auricula and Primula Society's Show at the Royal Horticultural Hall.
WEDNESDAY, May 1.—National Auricula and Primula Society, Midland Section, at Birmingham.
THURSDAY, May 2. Linnean Society Meeting.
Manchester and North of England Orchid Society.
SATURDAY, May 4.—French Horticultural Society of London.
North of England Horticultural Society; Conference on "Horticulture in Secondary Schools and Farm Institutes," at Newcastle.
TUESDAY, May 7.—Scottish Horticultural Association.
WEDNESDAY, May 8.—East Anglian Horticultural Club.
Royal Society of Arts.
MONDAY, May 13.—United Horticultural Benefit and Provident Society.
TUESDAY, May 14.—Royal Horticultural Society; Committees meet at 12 o'clock; Master's Memorial Lecture at 3 p.m. on "Gardening and Drought," by Professor J. Bayley Balfour, F.R.S., V.M.H.; Scientific Committee at 4 o'clock.
National Tulip Society's Exhibition at the Royal Horticultural Hall.
Devon County Show at Plymouth.
WEDNESDAY, May 15.—North of England Horticultural Society, at Leeds.
THURSDAY, May 16.—Manchester and North of England Horticultural Society.

## OBITUARY.

◆

### MR. JAMES BLACKLOCK.

It is with regret that many will learn of the death of Mr. James Blacklock, for many years gardener at Southwick, the Kirkcudbrightshire seat of Sir M. J. M'Taggart Stewart, Bart. Mr. Blacklock, who has been in failing health for some years, died at Castle-Douglas, where he has been residing, having retired two or three years ago because of the condition of his health. He was an exceptionally able all-round gardener, never allowing his favourite subjects to monopolise his attention, and the gardens at Southwick were always maintained in good condition, although the staff was somewhat limited for the size of the place. Mr. Blacklock was highly esteemed in horticultural and other circles. He was a well-read and studious man, and as he was always genial and kindly his company was much appreciated, and he was held in very high respect in and around Southwick, where he had been for many years.

## NEW BOOKS.

### FERNS AND FERN CULTURE.

By J. Birkenhead, revised by F. Parsons. (H. B. May and Sons, Upper Edmonton, and W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 1s.

The largely-increased interest that is now being taken in both British and exotic ferns, renders the appearance of a new edition of this excellent handbook on these elegant and interesting plants most opportune and welcome. It has been our duty as well as pleasure, to speak in highly appreciative terms of previous editions, but, whatever may have been the praise previously bestowed upon the work, such praise would fall considerably below the present requirements. The author, who for many years cultivated ferns on a large scale, possessed a wide knowledge of the various genera, species, and varieties, and contrived to give within the compass of a shilling handbook an immense amount of information on the cultural details and the making of selections for various purposes. Since the second edition was prepared and published by the author, there have been many changes in connection with ferns, as with other classes of plants, and it was wisely decided that the third edition, the one now before us, should be subjected to a thorough revision.

This important task was entrusted to Mr. F. Parsons, who occupies a leading position in Messrs. H. B. May and Son's establishment at Upper Edmonton, and has a thorough acquaintance with all that relates to the various classes of ferns and their cultural requirements. The knowledge possessed by Mr. Parsons of ferns and selaginellas, these latter being also included in the book, has been fully utilised in the work of revision, which has been so thorough in every respect as to deserve the highest praise. The book is freely illustrated and admirably printed, and will be found equally valuable to all classes of cultivators.

### VINES AND VINE CULTURE.

By A. F. Barron, V.M.H. ("Journal of Horticulture," 10, Essex Street, Strand, W.C.) Price 5s.

The publication of the fifth edition of "Vines and Vine Culture" reminds us of one whose memory will long remain fresh in the minds of those who are conversant with the services he rendered in the cause of fruit culture, and of the unabated interest that is being taken in grapes and their cultivation. Prominent among the services that the late Mr. Barron rendered during his long and active life was the publication of the work now before us, which during the past thirty-nine years has been regarded as the most important text-book on the subject with which it deals. Possessing a knowledge that was quite unique, both of the many varieties of grapes and of their cultural requirements, he was not slow to recognise the fact that growers would require in a book of the first-class something more than information on the making of vine borders, planting vines, watering, syringing, and details of a similar character. He therefore set himself the task, which was by no means a light one, of dealing with the grape vine in its relation to the commercial establishment as well as the private garden, of giving a sketch of the ancient and modern history of the grape vine, and preparing a list of varieties in which their distinctive characteristics, cultural requirements, and historical aspects would be dealt with.

In a word, Mr. Barron recognised the necessity of a comprehensive work on the subject of grape growing, and he achieved a degree of success that evoked the warmest praise, and secured for it a continuous demand throughout the long period that has elapsed since the publication of the first edition. New editions have been published from time to time, and of these, three were prepared by Mr. Barron himself, who was thus responsible for the first four issues. The fifth edition has been prepared for publication by Mr. W. P. Thompson, who was for some years with Mr. Barron at Chiswick, and has long been regarded as an authority on grapes. Mr. Thompson has, in his revision of the work, shown remarkable judgment. He has in no way altered the plan of the work, which admittedly is a good one, but has done whatever has been necessary to bring it up-to-date, and thus place it fully abreast of the most advanced views on the production of grapes for private use and the market. Therefore, those who take "Vines and Vine Culture" as their guide will find that it will give them the fullest information on the many and varied details with which those who are responsible for the management of vineries should be acquainted.

### ROSES.

By H. R. Darlington. (Messrs. T. C. and E. C. Jack, 67, Long Acre, London, W.C.) Price 2s. 6d.

The book on roses is one of the latest of the additions that have been made by Messrs. Jack to their series of works on present-day gardening.

### THE EVERYDAY USES OF PORTLAND CEMENT.

(The Associated Portland Cement Manufacturers (1900), Lim., Portland House, Lloyd's Avenue, London, E.C.) Price 2s. 6d. net.

The use of Portland cement has been greatly extended within recent years, and it is now utilised in many ways that were not contemplated a few years since. This extension has been due in part to the improvement in its manufacture and consequent reduction in cost, and in part to a fuller recognition of its possibilities in the building art. The object of the book before us is not so much to instruct the builder, but to furnish the farmer, gardener, estate owner, and manufacturer with some account of the many uses to which the material can be put with advantage. It, however, supplies the members of the technical professions and trades with a comprehensive and clear summary of certain aspects of the subject upon which hitherto there has not been much trustworthy information available. The work is freely illustrated, the illustrations of garden accessories being of special interest, and to those who are familiar with the use of Portland cement it will be found of much service as a reminder and reference book.

Langport, Somerset.

NOW IS THE TIME TO PLANT. Kelway Gaillardias are among the most brilliant, the hardiest, and the most easily grown of the herbaceous perennials; they give abundant bloom in the same year that they are planted, and blossom profusely from June to November. Choice named collections, 12s. and 18s. a dozen. From pots. Carriage and packing free for remittance with order.
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE, RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.

## NOTE OF THE WEEK.

### The Cult of the Orchid.

The announcement made by the Council of the Royal Horticultural Society that it is proposed to arrange a conference in conjunction with the exhibition of orchids that will be held at Westminster in November next is a matter of considerable interest, and should give much pleasure to those who are specially concerned with this fascinating class of plants. It is some years since cultivators and raisers have had an opportunity for meeting for the purpose of discussing points of practical importance relating to the cult, and since the last conference was held, much has happened. The cultivation of orchids has greatly extended among those classes of the flower-loving community whose gardens are furnished with the means essential to success in the culture of tender plants, and the activities of raisers have not only had the result of largely increasing the number of hybrid orchids, but of creating by hybridisation new genera, of which that formed by the exquisitely beautiful odontiodas is the most noteworthy. The changes in the world of orchids have within a comparatively recent period been great, and they have followed each other in such rapid succession that it has not been easy to keep pace with them. To those who are unable to give their undivided attention to these "aristocrats of the floral world," it appears but a few years since cultivators had to depend upon importations, that had been collected with an infinity of trouble, and not a little danger, for increasing or replenishing their stocks of the majority of the various kinds. Now a very different state of things obtains. There are importations of orchids as at other periods, but they are fewer, and, speaking generally, they are not regarded with the importance that was assigned them in bygone days. The cause of the decline in the demand for the specific forms and varieties of species is the large and rapid increase in the number of hybrids in cultivation. Since the raising of seedlings on systematic lines was proceeded with by both trade and private growers, immense numbers are annually produced, and as they are, for the most part, the result of hybridisation or cross-fertilisation conducted with a view to obtain improved forms, the average merit is remarkably high. Seedlings of outstanding merit usually command prices that are somewhat high, but after these have been selected, there remains a goodly proportion bearing flowers that are at once distinct and beautiful, and these are disposed of through the usual channels at a relatively small cost. This point is of importance because there are some who hold the opinion that the cult of the orchid is only adapted to the conditions that obtain in the gardens of the wealthy. No greater misapprehension could well exist, for no classes of plants grown under glass can be cultivated at much less expense than orchids thriving in a cool or intermediate house, and the cost of forming a small collection of beautiful hybrids and varieties is really not costly, as evidenced by the thousands of gardens of moderate size in which orchids are grown in sufficient numbers to form a distinct feature. This statement has further proof in the small but interesting collections that may be met with in the gardens of amateurs who are able to make arrangements for heating and ventilating the house or houses when they are away from home during the day. Sometimes comparisons are made between orchids and hardy plants to the disadvantage of the former, but no good service is rendered thereby, because of the great differences between the two classes. Both are wondrously beautiful, require skill to grow them to a high degree of perfection, and both must have frequent attention to maintain them in a condition that justify their being assigned a place in a well-kept garden. Orchids must have the shelter of glass and some amount of artificial heat during the greater part of the year, and in return for this shelter and warmth they yield a wealth of flowers during the autumn and winter months when the beds and borders in the flower garden are practically destitute of floral attractions. There are large numbers of hybrid cypripediums possessing much beauty that attain their highest degree of perfection during the winter months, and these have the additional merit of thriving in suburban gardens, because of their immunity from the deleterious effects of such fogs as reach them. Yet another recommendation is the length of the period over which the flowers retain their freshness and beauty, a point of much importance to owners of small collections. One of the strongest recommendations that could well be given orchids is the great value of the most beautiful of the kinds flowering during the dullest period of the year, and as the Royal Horticultural Society is arranging its forthcoming exhibition for the purpose of bringing into greater prominence the kinds that bloom in autumn and winter, there is justification for the belief that the exhibition will be immensely attractive and of great value from an educational point of view. As the programme has not been arranged, it cannot yet be said whether winter-flowering orchids will be discussed at the conference or not, but a discussion on the merits of the existing kinds and the possibility of an increase in numbers and

MR F. G. DREW,
Chairman of the Reading Gardeners' Association.

usefulness would not be wanting in utility. Doubtless hybridisation in orchids will be given a prominent position among the subjects selected, for while there is no longer a necessity for discussing matters of an elementary character relating thereto, the enormous numbers of hybrids that have been raised and introduced to cultivation should furnish ample material for a free interchange of opinion among these who have had some experience in this interesting phase of orchid culture that should prove useful, and may have a far-reaching effect upon future efforts in the creation of new forms. The splendid results that have been obtained in the raising of hybrid brassocattleyas, cattleyas, cypripediums, dendrobiums, lælio-cattleyas, odontiodas, odontoglossums, and some others represent an immense amount of accumulated knowledge, which, placed at the disposal of those who are now commencing orchid hybridisation, would be of much value to them and also be useful to the advanced workers in suggesting the great advantage they may derive from proceeding on lines they have not yet followed. However that may be, the proposal to hold a conference shows that there is much vitality in the cult of the orchid, and justifies the expectation that it will assist in still further extending the cultivation of the flower in its many forms in British gardens, and thereby greatly enhance the attractions of plant houses, more especially at the season of the year when flowers in the open are few in number, if not non-existent.

---

**Mr. F. G. Drew,** whose portrait we have the pleasure of giving herewith, occupies a position in horticultural circles of no small importance; and it must be immensely gratifying to his many friends, and, indeed, to all who appreciate ability and perseverance, to have unquestionable evidence that he discharges the duties of his office with credit to himself, and advantage to all concerned. Mr. Drew is the chief of the horticultural department of the University College, Reading, now one of the leading centres at which practical and scientific gardening is taught, and has proved a worthy successor to the late Mr. Charles Foster, who was in charge of it several years. Mr. Drew is also the chairman of the Reading Gardeners' Association, a point of some importance as showing that the members thereof appreciate the value of the educational work in which he is actively engaged, and his other good qualities. It is not without interest, as a proof of what can be accomplished by well-directed effort, that previous to entering on his present charge Mr. Drew had not done any teaching, or had the opportunity of attending the meetings of gardeners' associations. But he had received a thorough training in the practice of gardening in private gardens and nurseries under some of the leading exponents of the gardening art, and he had concurrently therewith devoted some share of his attention to the scientific aspects of plant culture and garden management. Judging from the results, he may be assumed to have an inquiring turn of mind, and have solved many of the difficulties associated with educational work while wholly engaged in practical work. There is no occasion to enter at length into the details of Mr. Drew's career previous to his appointment to the position he now holds in connection with the University College, Reading, which is doing splendid work in all branches of education that come within the scope of its activities. He was five years in charge of the Wych Cross Gardens, when they were in the making, and as these represent some of Mr. Mawson's best work, the experience has, we have no doubt, proved most helpful in obtaining a full acquaintance with landscape gardening and garden making generally. Mr. Drew was successively foreman at Buxted Park and Longford Castle, under Mr. Prinsep and Mr. Hazelton respectively, and previously he spent several years working among orchids, being first of all in the hybridising department of one of the principal nurseries, in which special attention is given to these plants. We have had the pleasure of visiting the gardens of the University College on several occasions, and have been much impressed with the excellence of the educational work that is being done within their boundaries, and in the interests of horticulture, and of all concerned, we trust it may long continue on the present lines.

**Spring Flowers at Hampton Court.**—As stated in these pages a few weeks since, the spring flowers in the gardens of Hampton Court are this season producing a series of displays of great beauty, and are attracting immense numbers of visitors. On the 26th ult. Queen Mary, accompanied by two of the Royal Princes, visited the Hampton Court gardens for the purpose of seeing the spring flowers, and was conducted round them by Mr. Marlow, the superintendent.

**Great Autumn Exhibition at Bruges.**—The Société Royale d'Horticulture de Bruges are arranging an International Horticultural Exhibition, to be held from the 11th to the 18th of August at the old market place, and in the adjoining Government buildings and Belfry of Bruges. The Government and town are assisting very largely to assure the success of the enterprise. The Royal Horticultural Society of Bruges is the oldest in the world, having been founded February 5, 1651, since which time it has, without intermission, followed and aided by its work and exhibitions the evolution of horticulture until the present day. In August the famous market place in Bruges will be transformed into a flower garden, surrounded by giant bay trees, for which Bruges is so famed, and in the adjacent buildings below the Belfry, immortalised by Longfellow, exhibitors will find spacious halls, where they will be able to group their collections of orchids and palms, new and rare plants, etc., to the best advantage. The ever-increasing number of visitors which arrive yearly in August to see "The Venice of the North," with its museums and art galleries and quaint Flemish architecture, will find another attraction in this horticultural exhibition. Programmes will be supplied, and inquiries answered by Mr. Ch. Steinmetz, Secretary, Bruges, Belgium.

**Another Weather Record.**—Records of all kinds possess some amount of interest, but they are not always desirable, and it may be safely assumed that gardeners, and, indeed, all who are engaged in cultural methods, have had for the present sufficient weather records. We had, last year, a record summer, both as regards heat and drought. During the past winter we had a record rainfall, February was remarkable for its mildness, March for its rainfall, and during the past month the fall of rain was so light that it may be regarded as one of the driest Aprils on record. There was but little rain throughout the month, and in this respect it ranks next to April, 1893, a year remarkable for the spring drought that was so disastrous in its effects upon both garden and farm crops. As in the year last-named, there has been so large an excess in the amount of bright sunshine that it has been considerably above the average. Throughout the month there has not been a day in which bright sunshine has not been recorded in London. The bright sunshine has been accompanied, during the greater part of the month, by cold, drying winds, and a low night temperature, which have been anything but favourable to tender vegetation. There have also been several severe frosts, that have done much damage to cherries, pears, plums, and other hardy fruits, but the extent of the damage cannot well be measured at the time of writing.

**Title of Gardening Journal.**—On April 26, in the High Court of Justice, before Mr. Justice Neville, Messrs. W. H. and L. Collingridge (proprietors of "Amateur Gardening") obtained a perpetual injunction against the Cable Printing and Publishing Company, Lim., and another, restraining the defendants from printing, publishing, selling, or disposing of, and from offering or exposing for sale, any newspaper with the name of "The Amateur Gardener's Weekly," or by any other name so similar to "Amateur Gardening" as to induce the public to believe that the defendants' paper is that of Messrs. W. H. and L. Collingridge, published under the aforesaid title. The defendants were ordered to pay costs.

**A Gardener's Golden Wedding.**—A few days since Mr. and Mrs. Thomas Hughes, of Llandforda Gardens, Oswestry, celebrated their golden wedding, when they entertained their friends, received many congratulations, and were the recipients of numerous presents. Mr. Hughes has been head gardener at Llandforda Hall 39 years, having been appointed by the late Sir Watkin Williams Wynn in 1874. For the greater part of the time Mr. Longueville has been the owner of this fine seat, and it is evident that Mr. Hughes' services are valued, for he was presented with purses of gold from his employer and several members of the family. Mrs. Hughes was presented with a handsome brooch by Miss Longueville. The garden employees also made a presentation to Mr. and Mrs. Hughes, who happily enjoy the best of health, and have our heartiest congratulations.

**Croydon Spring Show.**—The Croydon Gardeners' Society will hold a spring flower show in Horniman Hall, North End, Croydon, on Wednesday, May 8, from 3 to 10 p.m. This exhibition is of great interest, because its object is to encourage a love of horticulture in all sorts and conditions of people, and to attain that end the members of the society contribute of their best without fee or reward of any kind, and the public is admitted to the display free of charge. The committee, however, always welcome exhibits from traders and others who may not be members, but are willing to help in the production of a really first-class display.

**Orchid Exhibition and Conference.**—As already announced in these pages, an exhibition of orchids will be held under the auspices of the Royal Horticultural Society, at their hall in Vincent Square, Westminster, on November 5 and 6. One of the objects of this exhibition will be to demonstrate the increasing importance of orchids as autumn and winter-flowering plants. It has also been arranged to have, in conjunction with the exhibition, a conference on orchids. This will take place on the second of the two days in the lecture room, from 11 a.m. to 1 p.m., and from 2 to 4 p.m. Papers on the cultivation, cross-fertilisation, and hybridisation of orchids will be read.

# ROYAL HORTICULTURAL SOCIETY.

Another meeting, with the Hall in Vincent Square packed with exhibits, and, during a greater part of the day (April 30), crammed with Fellows and visitors. Orchids were not numerous, but tulips were plentiful and gay, and hardy flowers of many kinds filled a large space, while early vegetables were excellent.

## FLORAL COMMITTEE.

Some very fine spikes of the blue-flowered Echium truncatum and of the creamy-yellow Celsia cretica Cliveden var., from W. W. Astor, Esq., Cliveden, Taplow, were capital novelties, and each secured an Award of Merit. Keeley's variety of Cheiranthus mutabilis, shown by Mr. Rickards, Usk Priory, Mon., gained a similar award, and appears to be an excellent plant, dwarf and free-blooming. The pink-flowered and graceful Deutzia longifolia, a Chinese introduction, was brought up by Mr. C. Fielder, V.M.H., gardener to Miss Willmott, V.M.H., Warley Place, Great Warley; it gained an A.M., and was much admired.

DEUTZIA LONGIFOLIA.

A hardy shrub from China with blush-coloured flowers. A.M., R.H.S., April 30. Miss Willmott, V.M.H., Great Warley.

The roses from Messrs. George Mount and Sons, Canterbury, were very lovely, the blooms large and on long stems. Mrs. John Laing, Lady Hillingdon, White Killarney, Mrs. Alfred Tate, the splendid Richmond, Mdme. Abel Chatenay, Mrs. G. Shawyer, Liberty, Ulrich Brunner, and Frau Karl Druschki were largely shown, with Tausendschon overhead. A grand display. Another exhibit of roses was from Messrs. B. R. Cant and Sons, Colchester, who displayed St. Helena, the new cream-pink H.T. variety; Goldfinch, Elizabeth, Claudius, Rose du Barri, Caroline Testout, etc.

Messrs. Frank Cant and Co., Colchester, had a very pretty display of climbing roses in pots, showing Blush Rambler, Minnehaha, White Dorothy, Excelsa, Yellow Banksian, and Dorothy Perkins behind big blooms of popular H.T. and H.P. varieties. Messrs. Wm. Paul and Son, Waltham Cross, filled a corner of the hall with pillar roses, and they showed splendid specimens of Tausendshon, White Dorothy, White Tausendshon (very fine), Rubin, and Kathleen, with the showy hybrid briar variety Juliet in front.

The magnificent Pink Pearl rhododendron was superbly shown and in quantity by Messrs. John Waterer and Sons, Lim., Bagshot, who encircled the group with dark and rich-hued Japanese maples. Hydrangeas were finely shown by Messrs. H. B. May and Sons, Upper Edmonton; H. Moriesi, with huge rosy bracts, H. Mdme. Mouillere, and H. Thos. Hogg were all in first-rate form. Azalea Marwelli, A. ledifolia, and A. amœna Fosteriana were shown by Messrs. R. and G. Cuthbert, Southgate.

Of great interest were the varieties of Araucaria excelsa exhibited by Messrs. T. Rochford and Sons, Broxbourne. A. excelsa Silver Star, with silvery tips to all the branches, was very effective, and scarcely less so was A. c. elegantissima aurea (A.M.), with yellowish-green tips. Pteris Parkeri, very bold, with broad divisions to the fronds, was exhibited by Messrs. J. J. Parker and Co., Whetstone, and promises to be a good useful plant.

Flowering shrubs were capitally staged by Messrs. Wm. Cutbush and Son, Highgate, who had handsome specimens of Wistaria, Cytisus præcox, Azalea mollis, Hydrangea Mouillere, the lovely Daphne cneorum major, and rhododendrons. The carnations from Highgate included excellent flowers of Miss Winnie Hey, Rose Doré, Countess of Lathom, the pretty Goldfinch, Aima Ward, Mrs. Waldorf Astor, and the rich crimson Lord Rothschild, clove-scented. Messrs. W. W. Rogers and Son, Red Lodge Nursery, Southampton, exhibited Spiræa Van Houttei, S. bracteata, double gorse, Pyrus John Downie, Cytisus præcox, and rhododendrons.

Sweet peas were delightfully shown by Messrs. Dobbie and Co., Edinburgh. Very lovely were the bunches of Afterglow, May Campbell, Dobbie's Thos. Stevenson, Dobbie's Cream, Mrs. Cuthbertson, Edrom Beauty, Melba, and Stirling Stent. Some exceptionally fine spikes of antirrhinums were included. In an annexe Mr. C. W. Breadmore, Winchester, put up a lovely lot of sweet peas, the flowers fine, and on long stems. Princess Mary—a bluish Afterglow—Aggie Elder, Mrs. A. Ireland, Maud Holmes, Lavender George Herbert, Lady Curzon, May Campbell, and Marjorie Linzee were all fine among many others.

Splendid carnation blooms from Mr. H. Burnett, Guernsey, included famous examples of Marmion, R. F. Felton, Scarlet Glow, Pluto, White Wonder, Mikado, and Britannia. Messrs. Allwood Bros., Hayward's Heath, presented a small set of carnation blooms set in artistic vases; Lady Alington, Geisha, Empire Day, Scarlet Glow, and La Rayonnante were a few striking varieties. Mr. C. Engelmann, Saffron Walden, exhibited carnations in fine form, putting up large sheaves of Carola, Regina, Rex, Salome, the yellow Sunstar, and Lady Northcliffe.

The greenhouse plants exhibited by Messrs. Stuart Low and Co., Enfield, included Acacia pendula, A. cordata, A. armata, Correa cardinalis, the sweet-scented Boronia heterophylla, etc. The same firm put up a large exhibit of carnations in which My Favourite, Marmion, Fairmount, and Lady Alington were among the best. Sixteen distinct varieties of cinerarias from Messrs. Jas. Veitch and Sons, Chelsea, attracted a great deal of attention by reason of their elegance. The Feltham Beauty set, notably Dark Blue and Pink, were beautiful, while Antique Rose, Matador, and Snowball represented the older florists' forms, and Cineraria hybrida was quite new and distinct. The Pompadour strain gained an A.M.

Brilliant pelargoniums from Mr. H. J. Jones, Ryecroft, Lewisham, again drew attention to themselves, and there were many admirers of Medusæ, A. Lovett, Queenswood, Harry James, R. C. Pulling, Mrs. E. Hathaway, and J. Wisby. The blooms and trusses were of fine size. Messrs. W. Wells and Co., Merstham, had a small group of chrysanthemums, preliminary to the International. It was interesting to notice fair blooms of H. E. Converse, Queen Mary, Wells' White, Henri Yvon, Champ d'Or, Crimson Grunawald, and Francis.

Some new verbenas shown by Mr. W. J. Godfrey, Exmouth, were beautiful; they were of dwarf habit, and very free; the varieties were Triumph, rose-pink; Devonshire Lass, blue with white eye; Violet Girl, deep violet; and Ruby, deep ruby-red with white eye. As pot plants these are perfect, and doubtless quite as useful for bedding. Messrs. H. Cannell and Sons, Swanley, were represented by show and regal pelargoniums in great variety, and by a rich scarlet zonal variety named Maxime Kovalesky.

A very neat and pretty rock garden exhibit from Messrs. Barr and Sons, Covent Garden, was greatly admired. It was well planted with aubrietias, Phlox subulata grandiflora, Lychnis alpina, Myosotis Barr's Alpine Blue (very fine), Iris Susiana, I. Brunette, Primula involucrata, and P. pulverulenta. Messrs. G. and A. Clark, Dover, made a feature of Anchusa italica Opal, trollius in variety, Iris Susiana, Lupinus polyphyllus roseus, and flowering shrubs. Cytisus præcox, Exochorda Alberti, Pyrus Scheideckeri, Cerasus J. H. Veitch, and other fine flowering trees and shrubs were arranged by Messrs. J. Cheal and Sons, Crawley, as a background to Primula japonica, saxifragas in variety, Lithospermum Heavenly Blue, phloxes, and aubrietias.

A pretty rock garden arranged in the annexe by Messrs. Whitelegg and Page, Chislehurst, was freely planted with Lithospermum Heavenly Blue, Primula japonica in variety, Saxifraga rosea superba, S. sanguinea superba, and S. Pencilled Beauty. Mr. G. Reuthe, Keston, Kent, showed a host of primulas, and a selection of tulips, together with heaths, rhododendrons, and azaleas in great variety; the Himalayan rhododendrons and the bright Edwardsia tetraptera and Embotherium coccineum were very handsome.

Remarkably beautiful were the wonderful saxifrages exhibited in lovely condition by Mrs. E. Lloyd Edwards, Bryn Oerog, near Llangollen. Some were set up in round boxes and others in square patches. Chief among the varieties were the white S. granulata Comet (A.M.), S. Edward VII., deep red; S. rosea superba, very bright; S. delicata, whitish; S. sanguinea superba, rich deep red; S. Mrs. J. F. Tottenham, white (A.M.); and S. Rose Beauty; a lovely exhibit. A great group, composed of Anchusa italica Dropmore var., and A. i. Opal, edged with Prunus sinensis fl. pl., and pink astilbes, was a striking feature, the blue of the anchusas attracting as much attention as the stateliness of the plants. St. Brigid anemones, a fine strain, were capitally staged by Messrs. Reamsbottom and Co., Geashill, King's Co., Ireland.

Messrs. J. Peed and Sons, West Norwood, were large exhibitors of gloxinias and caladiums, and put up a display of alpine plants. Mr. Hemsley, Crawley, contributed a rock garden exhibit, and in this we made note of Pentstemon Scholeri, the red P. Roezeli, the neat little Mathiola valesiaca, quite hardy and perennial; and Primula siberica, the latter also rare. A pretty garden was arranged by Messrs. Pipers, Bayswater. A rockwork margin, carrying shrubs and small trees, surrounded a flag-stone terrace, with saxifrages, primulas, violas, etc., in the crevices of the stones, and all kinds of alpines in the rockwork. An old stone seat, a small lily pond, and tubs of hydrangeas added picturesqueness to this quite interesting contribution.

Mr. Maurice Prichard, Christchurch, submitted a rock garden exhibit filled with choice subjects, such as Dianthus Napoleon III., Aubrietia Lavender, Oxalis enneaphylla, Gypsophila cerastioides, Androsace Chumbyi, Phlox Violet Queen, the rare Silene Hookeri, and the rare and interesting Lewisia Howelli (A.M.). The rock garden exhibited from Mr. Clarence Elliott, Stevenage, was gay with large colonies of Saxifraga Stormonth's Seedling, Phlox subulata Vivid, P. s. Nelsoni, double yellow alyssum, Daphne cneorum, Gentiana verna, and Aubrietia Lavender.

Numerous other exhibits of hardy flowers and alpine subjects were on view, notably from the Guildford Hardy Plant Company; Messrs. G. Jackman and Son, Woking; Mr. Russell, Richmond; the Burton Hardy Plant Nurseries, Christchurch; Messrs. W. Fells and Son, Hitchin.

### ORCHID COMMITTEE.

Two First-class Certificates were granted on this date, and these fell respectively to Cattleya Schroderæ var. Glebelands (with the lip almost wholly deep yellow), from J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford; and to Odontoglossum Uro Skinneri Burford var., from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking. This variety has a very large and beautiful rose-coloured lip.

Messrs. Sander and Sons, St. Alban's, contributed an interesting group of orchids wherein the leading features were Dendrobium albo-sanguineum, Brasso-cattleya Veitchi, the pretty Oncidium pulchellum, Cattleya Schroderæ in fine form, Cymbidium devonianum, and Dendrobium thyrsiflorum. Mr. H. A. Tracey, Amyand Park Road, Twickenham, put up a pretty group of orchids, and here Cattleya Schroderæ was prominent, with various odontiodas, excellent odontoglossums, Lælio-cattleya G. S. Ball, Chysis bractescens, and other beautiful things.

Particularly fine were the two pans of Lælio-cattleya G. S. Ball from Messrs. Charlesworth and Co., Hayward's Heath; near this were fine examples of Odontoglossum Jasper, Brasso-cattleya Digbyano-Mendeli, Miltonia vexillaria Cobbiana, and Lælio-cattleya Dominiana. Mr. Hopkins, gardener to F. Wellesley, Esq., J.P., Westfield, Woking, submitted Cattleya Mossiæ Lady Northcliffe, and the white-petalled C. Mendeli Chief Justice. Mr. F. M. Ogilvie, Oxford, showed Odontoglossum Lambeauianum Valerie, carrying thirteen splendid blooms.

Odontoglossum Cooksonianum figured prominently in the group from Messrs. Hassall and Co., Southgate; O. Jasper, O. eximum, and O. crispum were all well represented, with Cattleya Mossiæ and Miltonia vexillaria Cobbiana. Brasso-cattleyas were much in evidence in the group from Messrs. J. Cypher and Sons, Cheltenham, and the kinds were B.-c. Leeana, B.-c. Maroniæ albens, and B.-c. Maroniæ.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, presented some good varieties of Cattleya Mossiæ and C. Mendeli, associating with these Odontoglossum Thompsoni, Renanthera Inschootiana, Oncidium serratum, and Cattleya intermedia alba. Messrs. J. and A. McBean, Cooksbridge, showed fine forms of Cattleya Mossiæ, with Odontioda Charlesworthi, Odontoglossum ardentissimum, light forms of O. crispum, and Lycaste Denningiana.

### DAFFODIL AND TULIP COMMITTEE.

A large display of tulips from Messrs. Barr and Sons, Covent Garden, proved very attractive, and the range of colouring displayed was particularly large. Velvet Queen (A.M.), a deep blackish Darwin variety, Scarlet Emperor, the rich Inglescombe Pink, Margaret, Louix XIV., Feu Brilliant, Clara Butt, the elongated pale yellow Moonlight, and the brighter, elegant Mrs. Moon were a few fine varieties. Messrs. Cartwright and Goodwin, Kidderminster, displayed a small collection of tulips, and had excellent blooms of Inglescombe Yellow, Mrs. Cleveland, Clara Butt, Mrs. Moon, Julie Vinot (new pink), and Donders. A lovely lot of May-flowering tulips, well grown and well set up, was arranged by Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., M.P., Ranston, Blandford, Clara Butt, Orange King, Prof. M. Foster, and Pride of Haarlem were particularly good.

Tulips were capitally exhibited by Messrs. Sutton and Sons, Reading, the flowers, clean and bright, being arranged in a sharply sloping bank, in large bunches, with ferns between the vases. Velvet King, Feu Ardent, King Harold, Old Gold, Pride of Haarlem, Angelina, Inglescombe Yellow, and Clara Butt stood out prominently. Phlox Drummondi Sutton's Purity, a white free-flowering variety, was shown in first-rate form in pots, by the Reading firm. Tulips formed the bulk of the display arranged by Messrs. G. Bunyard and Co., Maidstone, but lilacs, Weigela Fleur de Mars, Pyrus Scheideckeri, and Cytisus incarnatus purpurens were charming flowering shrubs associated with them. Messrs. Walter T. Ware, Inglescombe, Bath, presented superb flowers of Inglescombe Yellow, Clara Butt, and Grenadier (A.M.) tulips, the latter orange-scarlet, with yellow base, and of large size.

The tulips from Messrs. R. H. Bath, Lim., Wisbech, were very effective, and well arranged over ferns. A few of the varieties that especially appealed to us were Michlen, Remembrance, King Harold, Clara Butt, La Tulipe Noir, Mr. Farncombe Sanders, Erguste, and Mrs. Moon. Messrs. R. Wallace and Co., Colchester, had fine tulips, and staged these extensively; Mrs. Moon, Mr. Farncombe Sanders, Viola, Clara Butt, Margaret, La Candeur, Pride of Haarlem, Inglescombe Pink, Psyche, and Electra were all in capital condition. The same firm presented a collection of irises, Hecate, Vaga, Leichtlini, Haynei, and Walhalla being the best. Primula Forresti was also well shown.

### VEGETABLE COMMITTEE.

Messrs. Sutton and Sons, Reading, presented a splendid collection of early vegetables and salading, showing first-rate dishes of Satisfaction and Sutton's Market cucumbers, Satisfaction broccoli, Early Giant peas, Masterpiece French beans in pots, early turnips and carrots, mushrooms, potatoes, lettuces, radishes, etc.

Messrs. Jas. Veitch and Sons, Chelsea, put up a neat exhibit of vegetables and salading, showing Ideal cucumbers, Model broccoli, Canadian Wonder French beans, Early Paris lettuces, radishes, mushrooms, spinach, etc.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Cattleya Schroderæ var. Glebelands, from J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford; to Odontoglossum Uro-Skinneri Burford var., from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

Award of Merit.—To Tulip Velvet Queen, from Messrs. Barr and Sons, Covent Garden; to Tulip Grenadier, from Mr. Walter T. Ware, Inglescombe, Bath; to Cheiranthus mutabilis Keeley's var., from Mr. R. W. Rickards, Usk Priory, Mon.; to Lewisia Howelli, from Mr. W. Prichard, Christchurch; to Echium truncatum, from W. W. Astor, Esq., Cliveden, Taplow; to Celsia cretica Cliveden var., from W. W. Astor, Esq., Cliveden; to Cineraria Pompadour strain, from Messrs. Jas. Veitch and Sons, Chelsea; to Deutzia longifolia, from Miss Willmott, V.M.H. (gardener, Mr. C. Fielder), Great Warley, Essex; to Saxifraga Mrs. J. F. Tottenham and S. Comet, from Mrs. Lloyd Edwards, Llangollen; and to Araucaria excelsa elegantissima aurea, from Messrs. Thos. Rochford and Sons, Broxbourne.

(Continued on page 369.)

## ORNAMENTAL JUNIPERS.

The junipers as a body are less popular for garden planting than several other families of conifers, yet the genus includes a number of decorative species, in addition to several varieties which are distinctly ornamental by reason of their glaucous, silvery or golden foliage. The comparative disfavour in which junipers are held owes its origin, no doubt, to the fact that there are many gardens, even in the country, where they fail to grow satisfactorily, while in the vicinity of towns, more especially smoky towns, they are often a complete failure. On the other hand, there are numerous places where they grow quite well, and create a good impression, but it is always as well to carry out a little experimental planting before launching upon an ambitious scheme.

Junipers may be expected to thrive upon chalky soil, and the common Juniperus communis is to be seen growing freely in a wild state about some parts of the Chiltern Hills. On the other hand, luxuriant growth is made by certain kinds on peaty soil in the neighbourhood of Woking, therefore one particular kind of soil is not an all-important factor; a clear, pure atmosphere is, however, essential to success, and one rarely meets with any but miserable examples where the opposite is the case.

The Chinese Juniper (Juniperus chinensis) is one of the most popular kinds for general planting. The better examples form shapely pyramidal trees, with green or glaucous-green foliage of two kinds. Juvenile branches may bear leaves $\frac{1}{8}$ to $\frac{1}{4}$ inch long, but, on the older shoots they are scale-like, and arranged closely together. Several distinct varieties are known, those with glaucous, gold, or variegated leaves being considered the most valuable. Glauca, Pfitzeriana, and Smithi are conspicuous by reason of glaucous or bluish foliage, aurea (sometimes called J. japonica aurea), on account of its golden leaves, and variegata for its variegated leaves. The latter shrub, however, cannot be considered of such general use as the others, for the variegation is not constant, but occurs as patches of silvery leaves here and there, so giving the plant a diseased appearance. A good avenue of Juniperus chinensis is to be found in Ashridge Gardens in Hertfordshire.

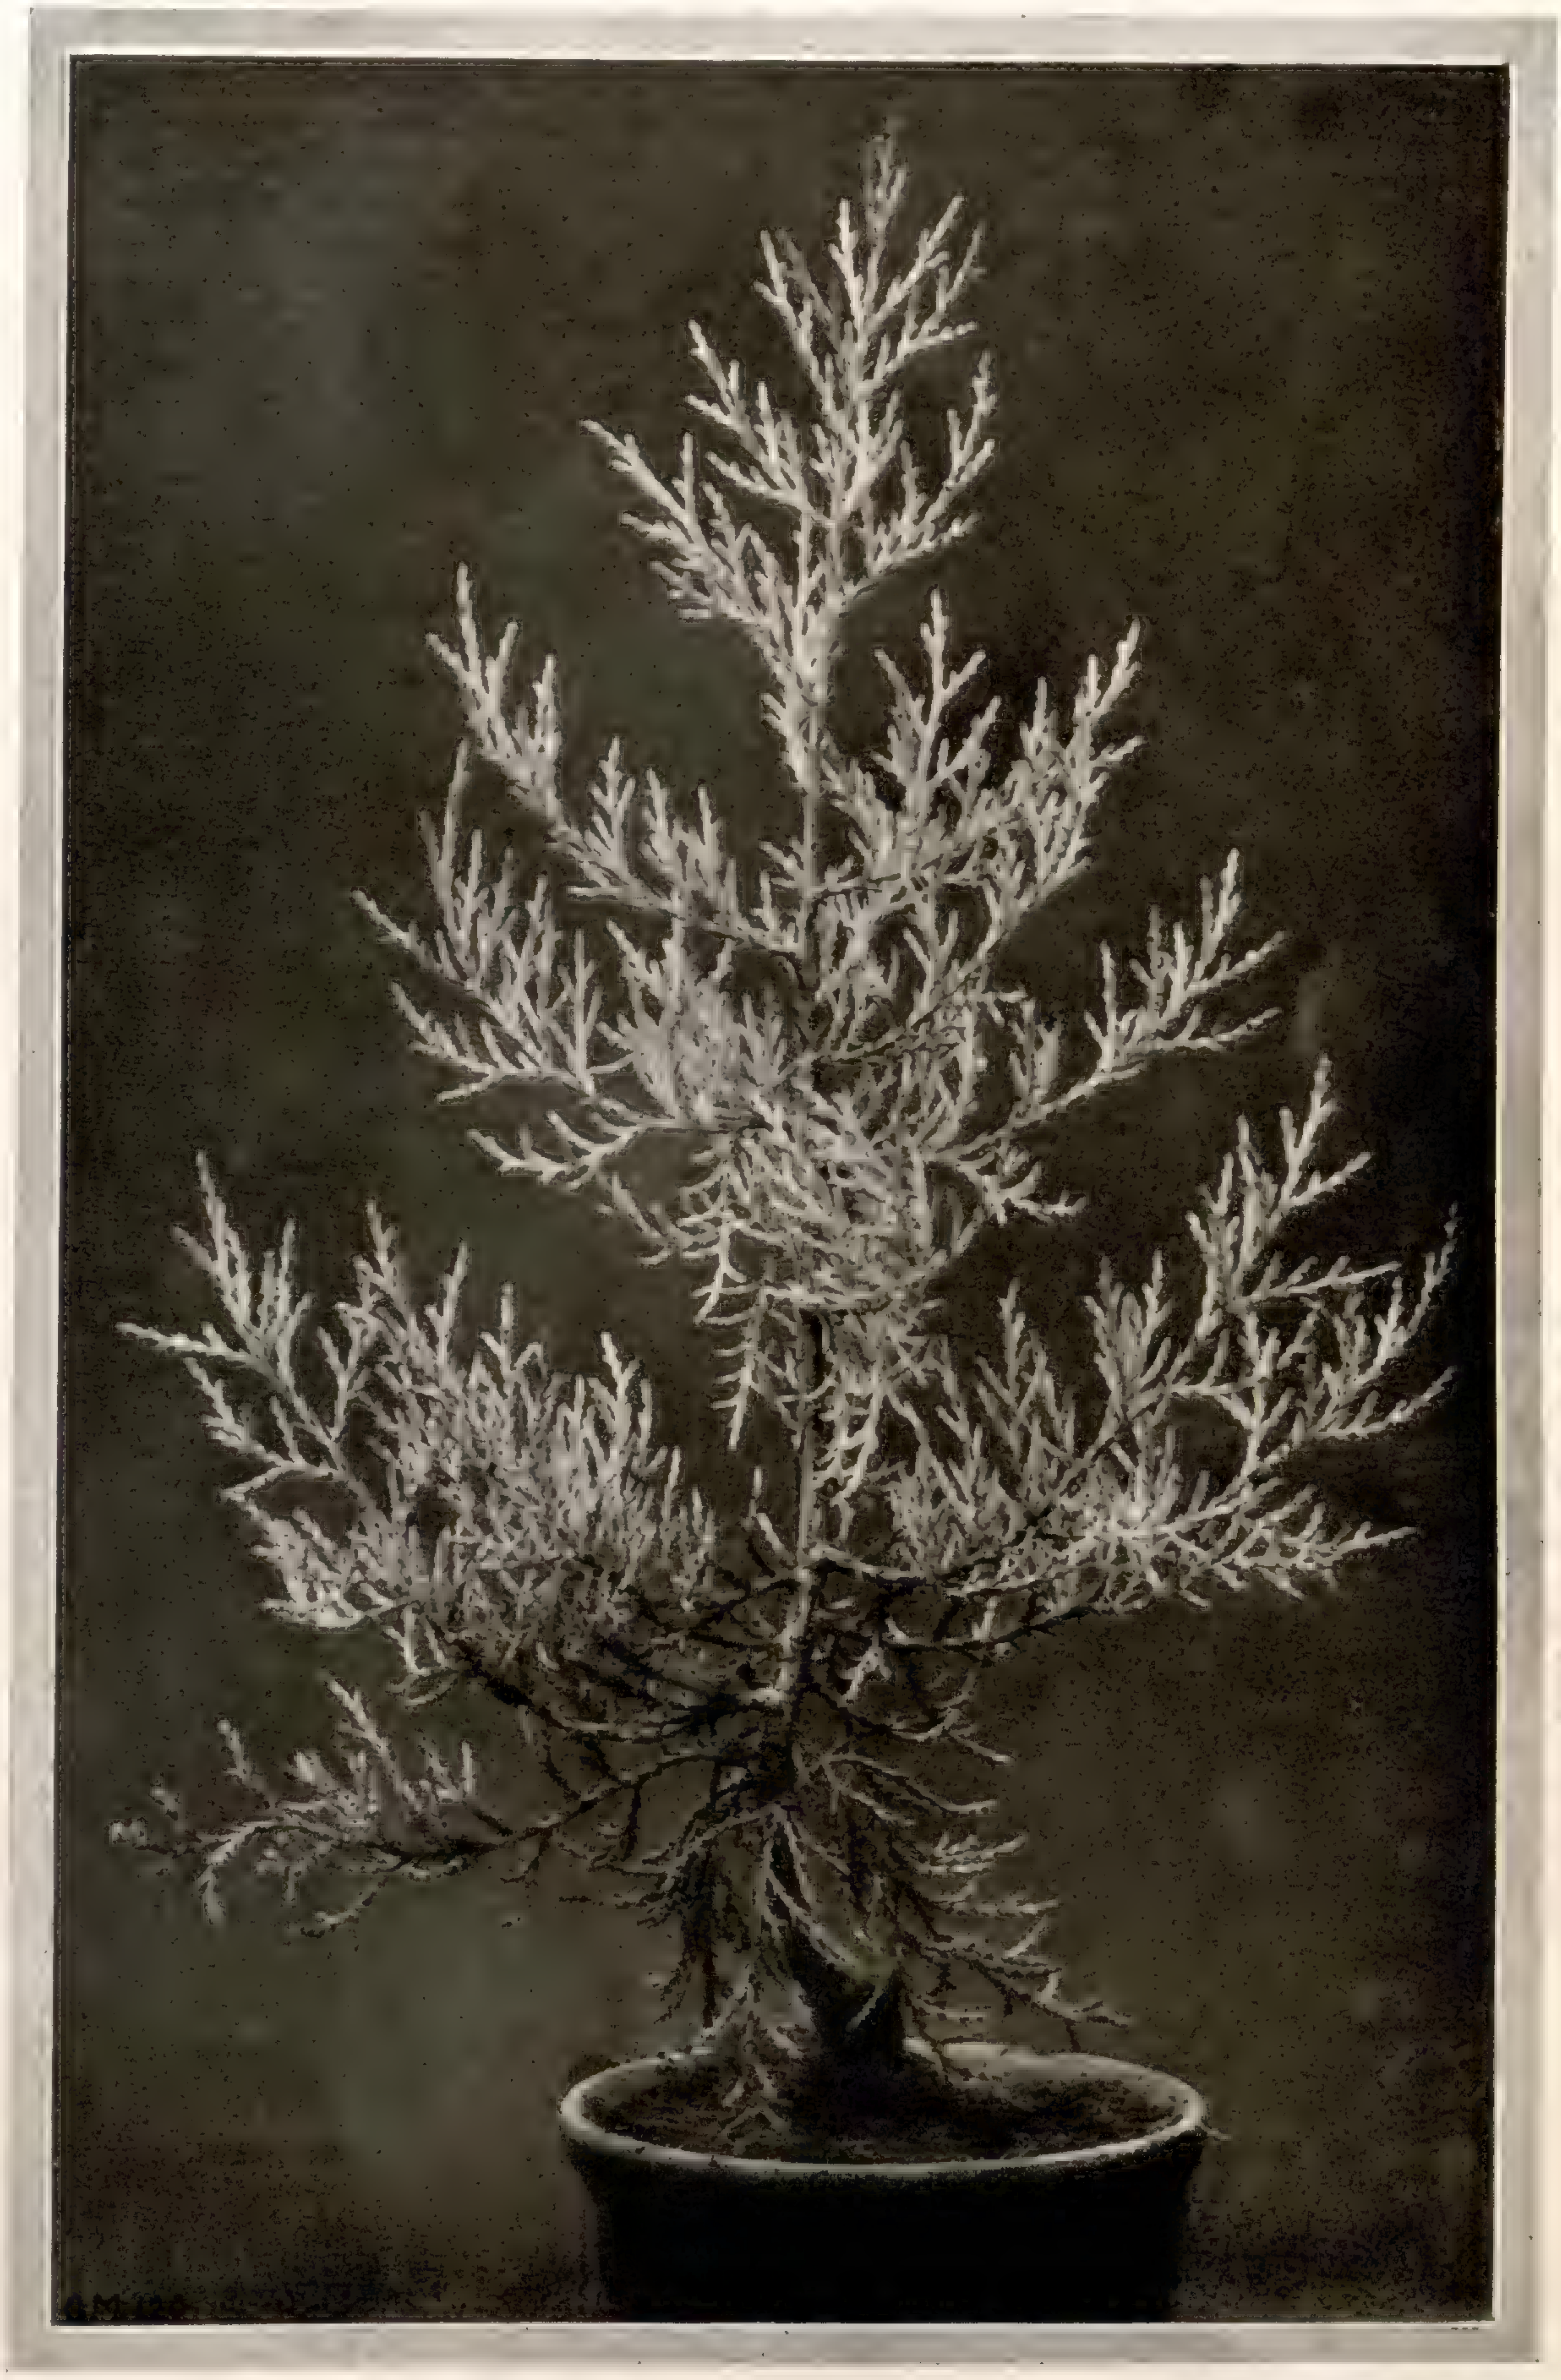
The Greek Juniper (J. excelsa) provides a pretty pyramidal shrub in the variety stricta. It is well worth attention from people who like compact, pillar-like plants.

When seen in good condition, J. pachyphlæa, which grows in a natural state about the shore region of the Mediterranean, forms a small, handsome tree with glaucous foliage. The accompanying illustration directs attention to one of a number of seedlings, which have recently been exhibited by Messrs. G. and A. Clark, Lim., of Dover, which have this desirable leaf colouring developed to a higher degree than the type. The subject of the illustration has been given the varietal name of elegantissima. Another showy variety of the same set is named conspicua. These were introduced from the mountains of Arizona and are quite hardy, and thrive in all soils.

The Common Savin (J. Sabina) is a useful shrub for covering banks in those places where junipers thrive, for its dense habit and green leaves have a good appearance the year round. Some of the varieties are, however, more showy than the type. This is specially so with humilis, procumbens, prostrata, and Knap Hill variety, all of which have more or less glaucous leaves; the variety procumbens is known as the Waukegan Juniper, and it is curious by reason of the foliage turning to a bronzy-purple hue on the approach of winter, reverting to its green or bluish-green colour towards the end of spring. All these kinds grow but a foot or two high.

J. spherica glauca is another kind recognised by its stiff, upright habit and bluish-green foliage.

The Red Cedar or Pencil Cedar (J. virginiana) forms a small tree with small scale-like green leaves pressed closely together as in many of the smaller-leaved junipers. Prolific in varieties, these are usually distinguished by their coloured foliage. Bedfordiana, elegantissima, glauca, Kosteriana, pyramidalis glauca, and Smithi pendula have glaucous leaves, and argentea, aureo-spica, and aureo-variegata have a variegated appearance, silver or gold patches appearing here and there.



JUNIPERUS PACHYPHLÆA ELEGANTISSIMA.
An attractive glaucous-leaved form, suitable for the rock garden, recently exhibited by Messrs. G. and A. Clark, Dover.

The Common Juniper (J. communis) is easily separated from the Savin by its looser habit and longer, sharp-pointed leaves. The type may grow from 4 to 6 feet high, but there are several alpine forms which are quite low-growing shrubs. Alpina aurea and aurea are showy varieties with golden leaves; fastigiata grows into a compact narrow pillar with rather glaucous foliage, and glauca is recognised by its bluish leaves, but has the habit of the type.

A juniper which is sometimes seen in very good condition is often called J. canadensis aurea; this, however, is said to be strictly a low-growing form of the Chinese juniper.

Kew. W. Dallimore.

---

**Azalea Hexe.**—During the present season this pretty little azalea has continued to make headway in popular favour, and it is now grown in many trade establishments in immense numbers. It was originally raised by the late Mr. Otto Forster over thirty years ago, by crossing Azalea amœna with one of the large-flowered Indian section.—T.

## SOME EFFECTS OF LAST YEAR'S SUNSHINE.

Now that we have had time to forget all the drawbacks and inconveniences that we suffered in consequence of the long drought of 1911, we have the happy recollection of having enjoyed what we had so long wished for, i.e., a real summer. We have no idea what 1912 may have in store for us, but, as usual, the prophets are at work: one says that we are going to have a second dry season, another foretells a wet one, but we must wait and see, and in the meantime the memory of last year has by no means passed away.

Most gardeners last season grew weary of the slush, slush of the watering-can and the hose-pipe, and more weary still were those who saw their crops languish in front of them in want of the water that they could not give, but amidst it all there was the hope that the drying and the warming of the earth, the like of which few of us had ever seen before, would have its beneficial effects. Though the growing season of 1912 is as yet not very far advanced, we can already see what we take to be evidence of this, and there are features on every side that point to the effects of last year's sunshine.

Take the grass, for instance. It does not seem long since those broiling days of last August when lawns were burnt up as brown as a brick, and in the fields there was not a blade of green grass for the cattle to eat. Indeed, as some gardeners viewed their parched up grass plots, they had fears that the latter would never be green again, so lifeless did they look, and everybody sympathised with the farmers who had to cut their all too small stacks of new hay to provide a bite for the cattle which the latter could not get in the pastures.

But what a contrast to last summertime does this spring present! Never did anyone see the grass so green and plentiful in March as it was this year, and, while this has proved a godsend to the farmers who had little enough left in the way of roots and fodder, it necessitated lawn mowers being set to work weeks before this is necessary in the ordinary way. At the middle of April there was more grass in the meadows than we have seen many a time at the end of May, and there are prospects of farmers obtaining good hay crops to fill up the empty stack yards. The condition of lawns is just the same, all the traces of last year's drought are gone, the brown patches are brightly green again, and there is a look about the herbage that is suggestive of vigour and vitality. There has been nothing about the condition of the winter to account for all this, no more manure than usual has been applied, and we may therefore conclude, without much fear of question that the burning and roasting last season was also a ripening process, a storing up, as it were, of force and vigour, and all that was required was the power of moisture to liberate the vitality, and set it moving. During the past winter we had the moisture, but without last year's sunshine there would never have been the abundance of grass that is a subject for general comment this spring, and people who thought their lawns would never be green again are now secretly pleased that they were so brown and burnt up last year.

At the end of March there began a feast of daffodils, the like of which, perhaps, we have never enjoyed before. These have been marked by two predominating features. First, like the grass, they were early; in fact, too early for some of the bulb shows, and, secondly, they were remarkably fine. Never, I think, have I seen such magnificent specimens of the trumpet daffodils as were in full bloom about Easter, and all sections were noted for their stout stems, leathery foliage, and fine flowers. In Easter week I passed through a district on the borders of Gloucester and Worcester where the wild single daffodil grows in such profusion that it is a veritable weed. The pastures on every side were fields of gold, being yellowed over with the nodding flowers, which people came to see and pick from localities round about. I had a talk with a few of the native folk who have seen the natural daffodil show every spring for many years back, but the general expression of opinion was that there had never been so many daffodils, never had they grown with such long stalks, and never had the individual flowers been so fine. I could believe this, for I picked a bunch of the wildings, and a number of the flowers were as large as some of the garden varieties. And how do we account for daffodils in field and garden being so fine this spring? Can it be anything else than the influence of last year's sunshine, which ripened and matured the bulbs in a way that is anything but usual in this country, and this spring we have enjoyed the result of Nature's process. All the spring bulbs have been equally satisfactory, hyacinths, tulips, and daffodils, in pots, in beds, in borders, in grass, in pleasure gardens, and, lastly, in the fields and woodlands, everywhere and under all conditions have they given evidence of the way the bulbs were ripened up last season.

If I mistake not, there are readers of the GARDENERS' MAGAZINE who have made records this season in respect of the date on which they cut their first dishes of asparagus, for in more places than one cutting began in March, which is unusually early for this vegetable to come in without forcing. In that big asparagus-growing country in and about the Evesham Vale it is customary to bank up the beds in the autumn and cover the crowns with the soil from the alleys between. In the spring this soil is loosened and drawn back to the alleys between the beds, before growth, but in a number of cases this work has had to be omitted because the early growth pushed its way through the covering, days before it was expected. All this means that the harvest of the asparagus beds has begun much earlier than it usually does, and the heads are very fine and strong. How is it accounted for? Surely, it must be another case of last year's sunshine ripening up the crowns and filling them with the vitality that is now responding to the moisture and the genial temperature which prevail.

There are some market gardeners who do very well out of forced mint in the early spring, but in many cases this year there has not been much sale for it, though there is no evidence that less mint than usual has been consumed. The explanation is rather than the herb in beds outdoors was more forward in growth than usual, and there was consequently a shorter and smaller demand for the forced article. I have never seen rhubarb and seakale push up their growths so early, nor yet so vigorously as they have done this spring, and for this one can only give credit to the way the crowns were ripened last season.

Finally, there is a word to be said about the seeds. Many of the vegetables last year were a poor seed crop, and the price lists in catalogues gave evidence of this, particularly in cases of beans, peas, onions, and carrots. With most people, perhaps, dear seeds means economy in the use of them, and through sheer force of circumstances the principles of thin sowing have been adopted in more than one garden this spring. Is there any need to regret it? Not a bit of it, for if seeds were a short crop last season they were good, well-ripened, and full of latent force. Perfect rows of early peas and broad beans point to this, and I see no misses or failures in beds of onions, carrots, and parsnips.

In fact, look where you will, you see evidence of that dry but glorious summer of 1911 in the blossom on the fruit trees (surely pears were never more thickly covered with bloom), the bursting buds on the forest trees, the verdure of the hedgerows, the abundance of flowers in season, and the promise of those that are yet to come. Indeed, everything in Nature seems to be endowed with an unusual amount of strength, vigour, and freshness, and plant life seemed impatient for the winter to pass, so ready was it to burst into growth. H.

## CYCLAMENS.

Among our winter-flowering greenhouse plants there are not many more useful than cyclamens, for not only are their flowers attractive, but the foliage on well-grown plants is also most beautiful, as the markings are very striking. The present is a very important period of growth, for much depends on the next few weeks whether the plants assume the dimensions one desires. The most promising plants should be transferred to 48's pots. The compost should be of a light, rich, sandy nature, and the pots clean and well drained. When potted, place in a pit near the glass; whether a small or large quantity are grown it is always preferable to keep cyclamens by themselves in order that all may receive similar treatment. They should always be shaded from the bright sun, but the atmosphere should be such as to cause a gradual, steady growth, not dry and harsh, otherwise red spider and other pests will soon make their appearance. If the pit faces the east, the plants should be watered as soon as the sun has passed from them, at the same time giving the foliage a slight damping over with the syringe to keep down insects. Ventilate early in the morning, and shade before the sun has too much power.

If the cyclamens receive due attention in the way of watering, shading, and ventilation they will have made sufficient progress to necessitate their being transferred into their flowering pots about the middle of June. This time 32's or 24's may be employed, but unless extra large plants are desired the former size will be found quite large enough, and the most useful, as they will carry plants from fifteen to eighteen inches in diameter. Care must be taken when giving the final shift to avoid injuring the foliage; pot fairly firm, keeping the corms level with the soil.

When the plants have received their final potting, they should be stood a sufficient distance from each other to allow of a free circulation of air among the foliage, so as to keep the same as sturdy as possible.

In all probability a few flowers will commence to show themselves about August, but these should be removed as they appear, otherwise the plants will not make that progress one likes to see. A sharp look-out must be kept for insect pests, and at the first signs of these do not fail to fumigate, for if they once get the upper hand, the foliage never presents the same healthy appearance afterwards.

There are some delightful shades of salmon, salmon-pink, and crimson, which are most attractive among cyclamens. The giant white forms, too, are most useful either as pot plants or for cutting. They form neat specimens for indoor decorations, but they must not long be subjected to the dry atmosphere of a room, or the foliage will turn yellow and fall.

H. C. PRINSEP.

# EARLY-FLOWERING HARDY PRIMULAS.

The dainty blossoms of this beautiful group of hardy plants are always appreciated, especially the first-comers. They are of immense value in the rock garden, where suitable places can be found to cultivate most of them. P. denticulata is usually the first to open its flowers, which are lilac in colour, and form a roundish cluster on a stout stem. It requires a damp position, and when planted in short grass so that the soil does not splash the foliage and flowers, it is very atractive. The white form (alba) is very pretty, having pure white flowers, and Cashmeriana has pale violet flowers with yellow centres.

P. farinosa, the pretty little Bird's-Eye primrose, is a native species, forming close-growing tufts of foliage, the undersides of which are covered with white powder. The numerous lilac blossoms form compact umbels on stems about three inches high. It delights in a moist, yet well-drained soil, in a half-shady position. To prevent the rain from splashing the soil over it, the ground should be carpeted with some close-growing plant, such as Arenaria balearica. In the event of this latter plant being utilised for the purpose of carpeting, it must not be allowed to overgrow the crowns of the primulas. This charming little primula will also thrive well in very short grass, in the shade of a large stone, but when planted in such a place, a guard should be used in the winter to prevent the crowns from being trodden on. The foliage dies down, and only a small crown, covered with white powder, is visible during the winter months. The white form is rather rare at present, and a beautiful variety.

P. frondosa is similar to the preceding, and is very often substituted for it, but the petals are not cut in the centre, as are those of P. farinosa, neither are the flowers stems so mealy as those of the latter species. The same treatment answers for both.

P. marginata is a lovely species from the Alps, with leathery foliage, which is heavily margined with whitish powder. The flowers are of a soft lavender colour, and are produced early in the season. This species must not be confused with Auricula marginata, the latter having yellow blossoms. P. marginata delights in a crevice between the rocks, with a half-shady aspect. A mixture of sandy loam, leaf-soil, and old mortar rubble will be found an excellent medium for the plants to grow in, and the latter should be firmly wedged in position with pieces of stones.

The bright rose-coloured flowers of P. rosea, a lovely Himalayan species, provide an effective bit of colour in the early part of the year. It is one of the most accommodating species of the whole primula family, for it reproduces itself very freely from seeds, and plants appear and thrive in places where one would not think of planting them. Being a moisture-loving subject, it forms an admirable plant for a small bog garden, and when once established may be relied upon to maintain its position. Many of the so-called hardy primulas are very uncertain in their habits, but this is not the case with P. rosea, for it may be depended on to appear even in a season when many species are conspicuous by their absence. Self-sown plants left to look after themselves are always more healthy and vigorous than those which are fostered in pots.

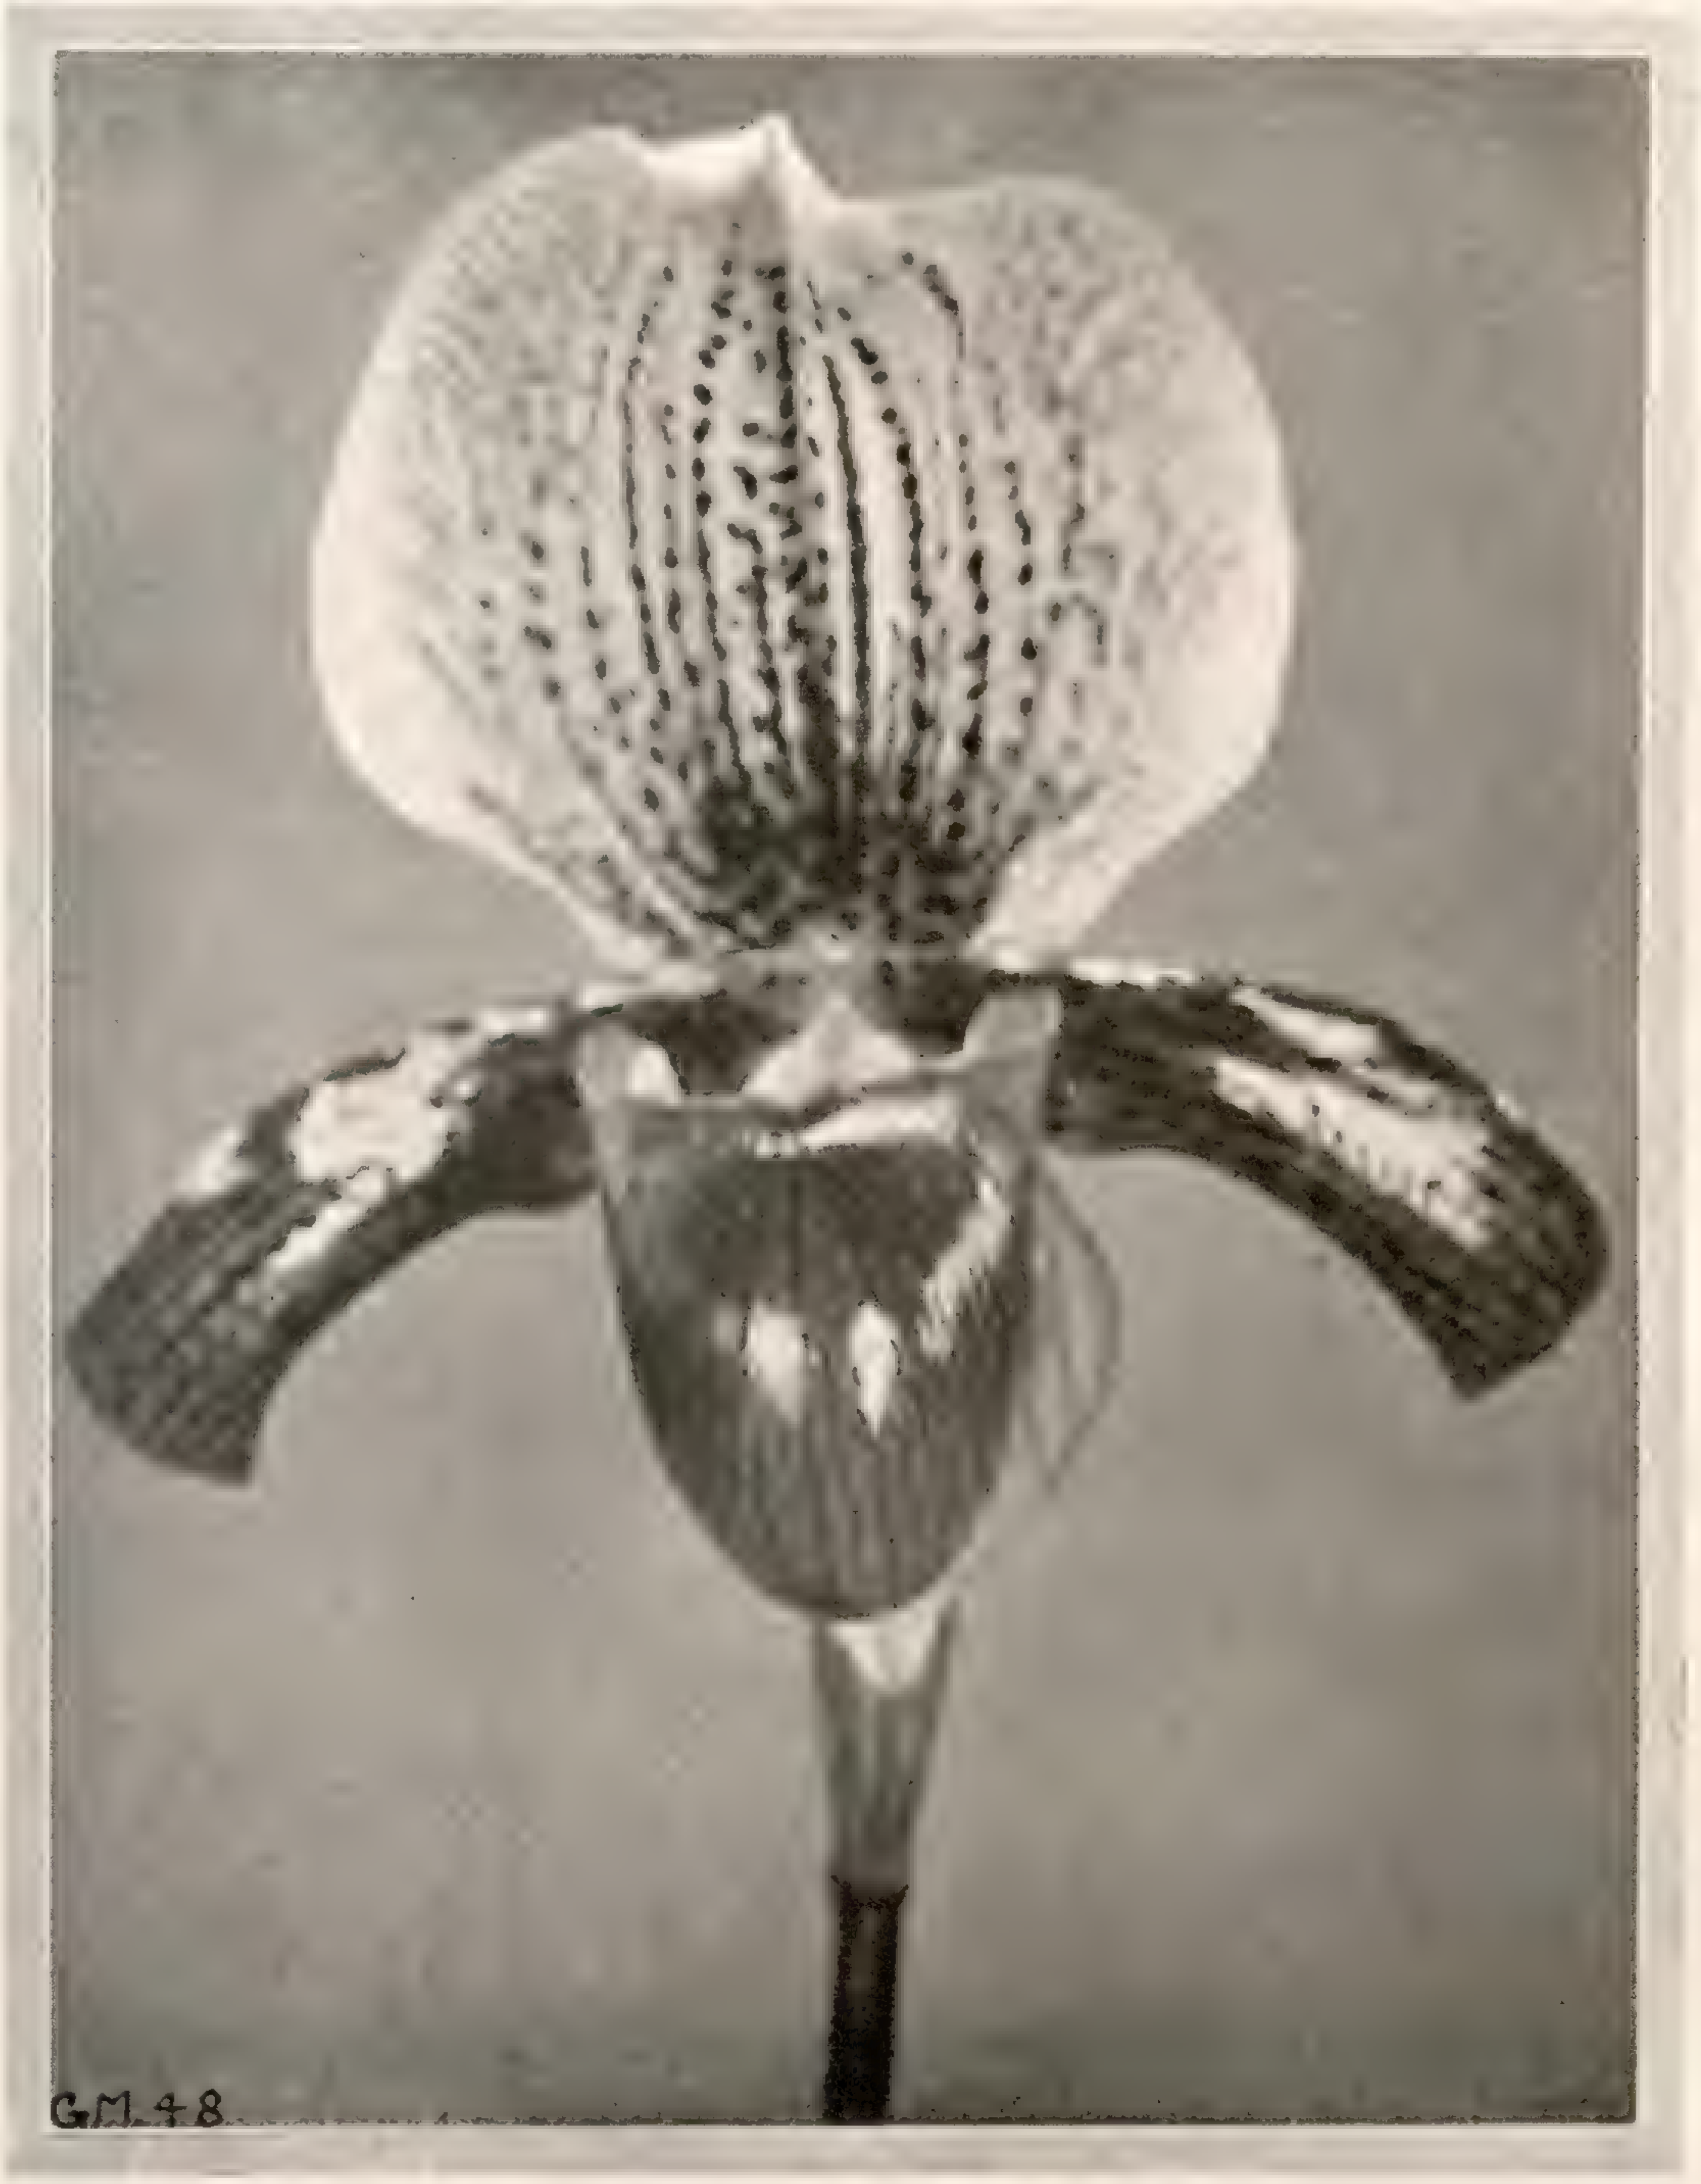
P. scotica is similar to P. farinosa, having purple flowers with yellow eye; it requires the same treatment as the latter species.

P. viscosa delights in half-shady crevices, and should be planted in a mixture of sandy loam and peat in equal parts. The crowns must be firmly wedged in with stones when planting, and occasional top-dressings will be required from time to time to hold the plants in their positions. The leathery foliage is produced in rosette form, and the pale rose blossoms are borne on short sturdy stems, rarely exceeding three inches in length. Mrs. G. F. Wilson is a form of P. viscosa, and a grand acquisition; the flowers are purplish in colour, with cream-coloured eye. It is extremely free in flowering and vigorous in habit. P. nivalis is a white form, of garden origin, apparently belonging to the viscosa section, and very hardy. E. C. Pooley.

Gnaton Gardens.

# CYPRIPEDIUM ROYAL SOVEREIGN.

Just before last Christmas, on the occasion when there was no exhibition at the Royal Horticultural Society's hall, but when the various committees met to consider new plants submitted, there were several remarkably fine cypripediums brought before the Orchid Committee. One of these, C. Royal Sovereign, exhibited by Messrs. Sander and Sons, St. Albans, secured a First Class Certificate. This hybrid is of extremely complex parentage. It was derived from C. Hera robustum, and C. Urania var. Martin Cahuzac. C. Hera is the result of crossing C. Boxalli with C. Leeanum, and every orchid lover knows that C. Leeanum is the result of crossing C. insigne with C. Spicerianum. On the other side, C. Urania was obtained from C. Io crossed with C. Charlesworthi; and C. Io comes from C. Argus and C. Lawrenceanum.



CYPRIPEDIUM ROYAL SOVEREIGN.

Flowers white, brown, and purple. F.C.C., R.H.S., December 19, 1911. Messrs. Sander and Sons, St. Albans.

The dorsal sepal of C. Royal Sovereign is white, faintly blush tinted, and prettily marked with lines of bright purple spots. The base is bright green. The petals are bright burnished brown, with a few dark spots, reminiscent of C. Argus; the lip is burnished brown of a rich shade. The influence of C. Charlesworthi is most noticeable in the form of the petals, and in the pale staminode. C. insigne expresses itself in the lip, and C. Spicerianum is evident in the dorsal sepal.

**Plumbago rosea.**—For usefulness and beauty this rosy-scarlet subject is unsurpassed for winter flowering in the plant stove. To fully realise its extreme beauty a good batch should be grown, and, when in flower, disposed en masse in a prominent position in the show-house. This species requires very similar treatment to the foregoing. Pot up the old plants, and place in heat to provide cuttings; these latter will soon form on the mature wood, and from the base. If a sufficient number of cuttings can be procured from the upper part of the plant the basal growths may be left to form specimens. The best examples we have grown were old stock plants. When plenty of cuttings have been rooted it is a good plan when potting up to place two young plants in each pot, and grow them as a single specimen. Avoid overpotting and overwatering, especially in the early stages.—H. T. Martin.

## AMONG THE ALPINE FLOWERS.

> "Flowers worthy of Paradise, which not nice art
> In beds and curious knots, but Nature boon
> Poured forth profuse on hill, and dale, and plain."
> —JOHN MILTON, in "Paradise Lost."

Worthy indeed of Paradise are the alpine flowers of the time. They are enchanting in their loveliness, some spreading into great sheets of floral beauty, and others smiling modestly up to catch our eyes as we wander among our favourites, looking for aught fresh or new for the season. Old favourites there are among them—flowers which have delighted long-departed generations of flower lovers, and which will, let us hope, give equal pleasure to the generations to come after us. As we look upon these flowers we feel linked with the old gardeners, who had fewer flowers to love than we, but who could hardly admire their plants more than do we of this generation, for whose benefit all corners of the world seem to be ransacked for floral treasures.

It is strange to feel that many of these alpines of ours were cultivated by men of the olden time; and that many of those we love have come from far-off lands, whose wealth of floral beauty was unknown to Parkinson and others whose memory we revere still as true admirers of our flowers. This is not in the way of our notes, but is merely a reflection which presses upon us as we walk among our plants, and enjoy their fascinations in the most brilliant weather.

### Erythronium Johnsoni Pink Beauty.

One who has known and loved this flower for several years cannot refrain from expressing pleasure that it has of late been favourably noticed in the gardening Press when shown in London. It is a beauty indeed, with its exquisitely marbled foliage, which is not only wonderfully beautifully marbled, but is glossy, as if it had been polished to the highest degree. Of beautiful form, tinting, and texture, is this leafage of the lovely Pink Beauty, one of the prettiest of the American erythroniums, to whose charms the writer has long fallen a victim, and which he must bow down and worship for their loveliness. As for the flowers, who can attempt to describe the colour? "Pink Beauty," indeed, is this plant, but the name, as do all names of flowers, with perhaps a few exceptions, fails to convey the impression of the colouring. Looking at these flowers this morning in the bright light of the morn, it seemed as if the delicate pink colouring was slightly veiled by a delicate frosting—a film of some material, which softened, yet did not lower the wonderful colouring of these graceful petals of this lovely flower. It is many years now since the writer first tasted the delights of these American dog's-tooth violets in his garden, and he would be unwilling to be without their beauty now. As for their culture, it seems an anti-climax to discuss such a matter-of-fact theme. Suffice it to say that these American erythroniums do well with the writer in the rock garden and in a border in a light and open soil. They last longer in flower in partial shade, but are lovely anywhere. Pink Beauty is one of the many charmers we cannot do without.

### Trillium erectum.

One may speak of this as representing the lovely Trinity flowers we have available for our rock gardens, and when properly placed, can add so greatly to its many pleasures. The writer well remembers the rock garden of a friend who has long crossed the bourne, and where a noble clump of a splendid variety of Trillium grandiflorum delighted in a shaded part, where it grew partially under trees, and where it had the moisture it loved. To perch the trilliums on a dry rockery, high to the winds that blow, and to be scorched by the sunshine, would only be to court disaster, and a corresponding disappointment. But there are few rock gardens where a group of some of the trilliums cannot be accommodated in congenial quarters, where they would thrive happily and flower bravely year after year. A low corner, well shaded from the sun, and with plenty of moisture for the delectation of the Trinity flowers, but not, it must be enforced, in stagnant wet, would suit them well, and there they would give pictures of beauty in their season. There is hardly a poor trillium, and T. erectum is only selected because the group of this species is the largest of those in the writer's garden. It is looking very attractive as this is written, the white flowers of the prettiest variety being most beautiful.

### Geum montanum.

Bright now is the Mountain Avens (Geum montanum), whose yellow flowers look so well on the attractively formed and coloured foliage. There are good and there are poor forms of this geum, and those who have seen the best varieties, and have obtained the poorer ones when ordering them, may take heart of grace, and try again, so as to obtain a good variety. One has seen some people who had purchased a poor specimen when not in bloom, and who were attributing the small flowers to errors in cultivation. Not, perhaps, so brilliant as its sister, G. reptans, it is a much easier flower to grow, and I have it excellent, both well up on a terrace of the rock garden, and also on a low level part at the base. In both cases the geum thrives, and flowers well in the ordinary soil. Some six inches or more high, this is a long-flowering, satisfactory, kindly plant to the rock gardener.

### Saxifraga Fergusoni.

In our desire to obtain large-flowered, red, mossy saxifrages, we are, I fear, likely to lose sight of some of the smaller ones, which are very bright and beautiful, and I wish to put in a plea on behalf of S. Fergusoni, after the type of Guildford Seedling, but a little earlier. Of close growth, with charming little deep crimson flowers, it is a plant worth cherishing for the cooler slopes of the rock garden.

### Other Flowers.

With a good variety of erythroniums, some fritillarias, scillas, ornithogalums, violas in plenty, arabises, aubrietias, the lovely Cytisus kewensis, and other brooms, and the host of flowers with which the season has dowered us, we are by no means willing to admit that any other season can surpass this in the rock garden. Our treasures are many, and our delights are correspondingly great, as we gaze upon and cherish our flowers. S. ARNOTT.

---

**Psychotria jasminiflora.**—The blossoms of this pretty stove shrub may be described as being among the whitest of the whites, for they are absolutely clear in tint, without a tinge of colour. In general appearance the blossoms suggest those of a bouvardia, and like a bouvardia this plant blooms in great profusion. It is of rather upright growth, and somewhat sparingly furnished with oblong-shaped leaves of a palish green hue. This psychotria, which is also know by the generic name of gloneria, flowers principally during the spring and early summer months.—T.

## ROSE ENEMIES.

Already, towards end of April, our roses are badly infested with green-fly, not only in sheltered corners and upon walls, but quite in the open. I do not pretend to account for it, but these pests always seem to come more abundantly during the prevalence of easterly winds, which have been frequent here (Mid-Sussex) of late. There are a large number of reliable insecticides upon the market, and most of these can be purchased in small quantities well suited for growers of only a few roses. All of these are good, and it would scarcely be fair to mention any one specially, and I will therefore give a few that are cheap, and, when properly prepared and applied, are most satisfactory.

Very simple to use is Cyllin soft soap, which is now largely used in Kew and other well-known botanic gardens. A fact that should speak for itself. This can be used at the rate of one pound dissolved in a pint and a-half of hot water. The solution should be further diluted by using three ounces—or about a small teacupful—of it to a gallon of soft water. It may also be used at the rate of one ounce of the soft soap to a gallon of water, without the aid of hot water first, but I find it dissolves better with partial boiling.

One cannot really be too careful in using poisons. Think of the painful cases so often brought out at the coroner's inquest, and make sure that no insecticides or weed-killers are available to thoughtless persons and children. This soft soap also has the advantage of killing mildew. Used at fortnightly intervals, it will keep all clean, and protect the younger growths.

Carbolic soap at the rate of half an ounce to two gallons of water is a very cheap remedy against insects, but more especially against mildew. Mo-Effic can be used as directed upon the packets, and is very effective, without leaving any sediment upon the foliage and flowers. Calvert's carbolic soap makes a cheap wash, and is prepared by boiling one and a-half pounds in six or seven quarts of water, afterwards diluting this at the rate of one in seven.

A very good home-made wash can be made from one pound of quassia chips, one pound of soft soap, and ten gallons of water. Bring to the boil, and let it simmer for about an hour. It may afterwards be used diluted with an equal amount of water. If put into jars this will keep well.

An ounce of sulphide of potassium dissolved in a gallon of hot water, and then diluted by the addition of two gallons of water, may be used when cold, but is more effective at a temperature of 70 to 75 degrees.

Under glass one has the additional help of fumigation, and I have great faith in this when not overdone. There can be little doubt that a good syringing on the morning following fumigation renders the latter more effective. One not only cleanses the foliage of dead insects, but kills those that have not quite succumbed, and would probably revive. If fumigation and syringing are used in connection upon two successive days, the newly-born insects are also exterminated.

The greatest mistake when battling against insects and diseases is made by using remedies at too great a strength. The growth is checked by this error, even to being equally as bad as the fault we wished to remedy.

Much may also be said in favour of early operations, while the constant use of weak solutions from the time growth becomes active, often leads to almost complete freedom from insects and mildew.

ROSARIAN.

## LUPINUS POLYPHYLLUS.

Lupinus polyphyllus is an old-fashioned garden plant of fairest repute. Often grown under adverse conditions—to which the plant is entirely indifferent—it becomes when fairly established, one of the most reliable subjects among herbaceous plants, and is withal a plant of striking effect. Growing to a height of 3ft. or more, the stately spikes of blue flowers tower above the handsome foliage, so that it commands instant attention from June till August. Although a meritorious plant, even for the choicest borders, it is in wild garden planting that Lupinus polyphyllus merits the highest praise, its adaptability to varying conditions, its hardiness, and extreme floriferousness commending it for such positions, while in woodland planting generally and the bolder kinds of water gardens, there are usually positions that invite success with this sterling subject.

It succeeds in most soils, provided the position is well drained, as stagnant water is the chief danger to guard against. Little preparation of the ground is necessary, beyond trenching and manuring; the former should be performed in a thorough manner, bearing in mind, especially in woodland planting, that once the plants are established, they have generally to look after themselves.

The type is the best plant for shrubbery and woodland planting; it varies to some extent from seeds, but the colour is usually some shade of blue or purple-blue. The white perennial Lupinus polyphyllus albus also succeeds under similar conditions, and it is one of the most distinct white-flowered perennials. By using it sparingly with the coloured forms, its own beauty gains in impressiveness, while the contrast obtained accentuates the others. The variety roseus is esteemed for border planting, the colour is rose-pink, passing to a deeper shade. This varies somewhat from seeds, a fact of little moment in wild gardening, as the colour harmony is all one can desire, but for borders it is often desirable that the seedlings should first be flowered in reserve, and the best examples marked for future guidance in permanent planting.

Several of the coloured forms of Lupinus polyphyllus have been selected and given distinctive names by trade growers, an advantage that readily appeals where borders are required to be planted to colour. Of these the most distinct include Dusky Prince, flowers dark purple-blue; Enchantress, grey-blue; Purple Queen, immense spikes of rich purple-blue and white flowers. Lupinus Moerheimi is a striking variety, with spikes of soft rose and white flowers; it is less robust in habit than the others, its distinctive merit being that of a first-class border flower.

Between Lupinus polyphyllus and the shrubby species, L. arboreus, occur several hybrid forms, the flowers in several instances being yellow, a colour absent among the herbaceous forms; in the variety Somerset the flowers are of a clear yellow tint; The Bride is soft primrose with a flush of rose, and Daisy Hill has blue and lilac flowers carried in the greatest profusion. These hybrid forms are of semi-shrubby growth, and are specially adapted for light soils and somewhat arid conditions.

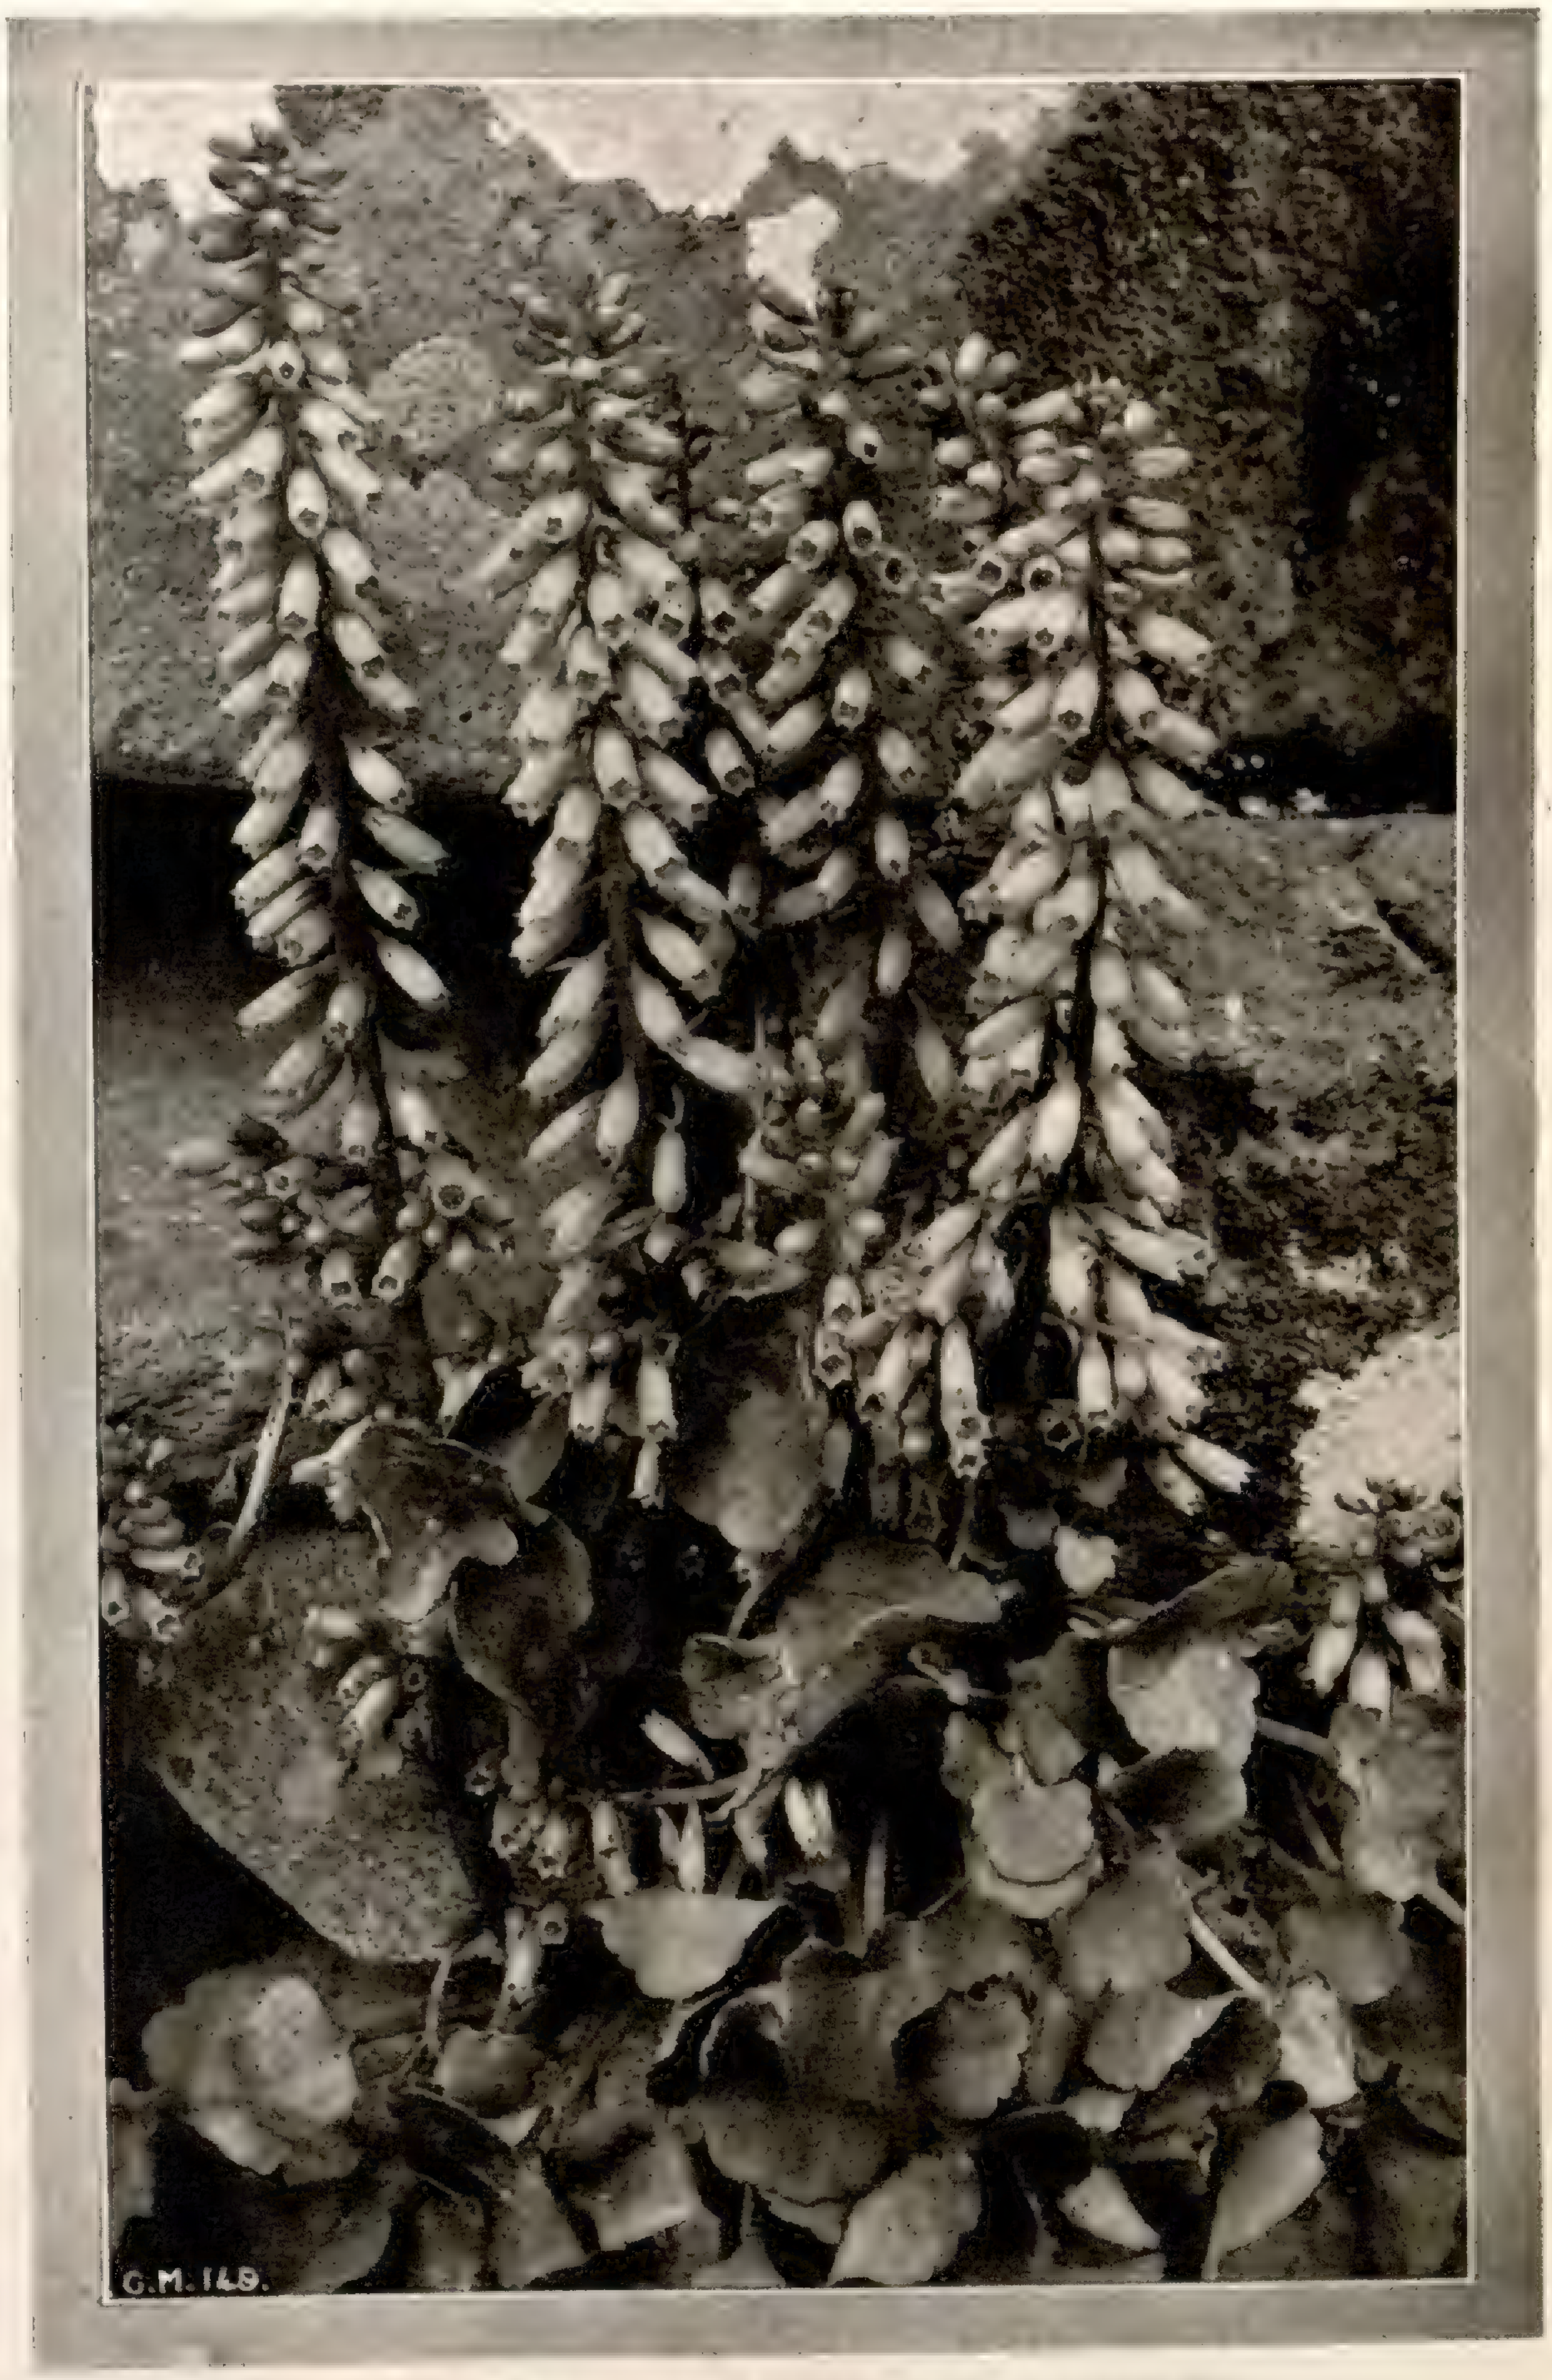
THOMAS SMITH.

Coombe Court Gardens.

**Grape Culture.**—An illustrated guide to the culture and management of vines in greenhouses and in the open air is published at GARDENERS' MAGAZINE Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.). Full particulars are also given as to renovating old vines, and the best varieties to grow.

## THE PENNYWORT.

What is regarded in many places as a weed becomes a plant of interest, perchance of beauty, in another country, or in another part of the same country. It is strange how, even in our own land, certain native plants are found in profusion in one district, whereas they must be sown, or transplanted, ere they become established in another district. The Pennywort, Cotyledon umbilicus, is a case in point. Speaking broadly, it is a western plant, and is found from Argyll to Cornwall, sometimes ascending to a height of 1,000ft. in Wales, and yet it cannot be found wild in many an eastern county. In some parts of Wales it is quite plentiful, while in South Devon one may often see it. The writer remembers a long lane at Mutley, near Plymouth, where, on a rocky bank, the pennywort has taken possession of every available space, covering soil and rocks with a heavy veil of light green succulent leaves. The drooping, cylindrical flowers are closely set upon the erect spikes, and their colour is yellowish-green.



THE PENNYWORT (COTYLEDON UMBILICUS).

An interesting British plant, bearing erect spikes of greenish-yellow flowers. The specimen illustrated was growing in a wall near Harlech, North Wales.

Now that wall gardening is a feature in many establishments, it is worth while to consider the claims of any native plants that appear to be adapted by Nature for this particular method of cultivation. The popular and beautiful stonecrop receives the consideration it deserves, but the pennywort has hardly received attention yet in this direction, though, as the illustration shows, it is well worthy of such consideration. As the plant has a tuberous root stock, the best method of establishing it would seem to be that of seed sowing on the spot. The rounded, radical leaves, each with a depressed centre, have suggested respectively the popular names of pennywort and navelwort, but not all the leaves are of this shape, as the cauline ones are more or less spathulate.

## PÆONY-FLOWERED DAHLIAS.

As each succeeding year sees the introduction of new varieties of the pæony-flowered dahlias so does their popularity increase for garden decoration. One old florist, famous as a grower of the cactus section, was overheard to remark, when the pæony-flowered dahlias were first introduced from Holland, that they threw seedlings with better flowers on the rubbish heap when he was a boy. There were some growers in this country, however, who saw possibilities in those first flowers exhibited at the Earl's Court Dahlia Show, and several succeeding exhibitions. Until a comparatively recent date the National Dahlia Society have devoted their efforts principally to the encouragement of varieties with exhibition blooms. There are some among the officers and members, however, who realise that if the dahlia is to continue to find favour for garden decoration, varieties which push the blooms well above the foliage on long stiff stalks must be grown.

No section has made more rapid strides than the pæony-flowered dahlia to meet the demand of the gardener, professional and amateur, for free-flowering varieties for garden decoration and cutting. With their long flower stalks and freedom of flowering this type is very effective. The blooms are semi-double, varying in form, some of the varieties having blooms nine inches across. Being vigorous in growth, a few plants may find a place in the herbaceous or mixed borders while they are especially adapted for large beds and borders in the pleasure grounds. Yet another place for these stately dahlias is among shrubs, where they will, as most of the varieties are tall, brighten up the shrubbery borders in autumn.

The following twelve varieties comprise a distinct and varied selection of varieties of proved merit: Baron G. de Grancy, creamy-white; Bertha von Suttner, salmon-pink, shaded yellow; Dr. K. W. van Gorkom, white, shaded rose; Duke Henry, reddish-crimson; Geisha, yellow, suffused with rose; Germania, crimson-scarlet, shaded yellow; Glory of Baarn, soft pink; Hugo de Vries, orange-brown; King Leopold, pale yellow, tall in growth; Merveille, orange-yellow; Queen Wilhelmina, pure white; and Titian, rich rose.

A. Osborne.

---

## SMALLER-GROWING CYRTANTHUS.

Some of the species of cyrtanthus, such as C. obliquus, have large bulbs, and, as a rule, they do not flower very freely; but, on the other hand, several kinds are comparatively small growers, and flower with considerable freedom. Among the members of this group are Cyrtanthus angustifolius, C. McKeni, C. Macowani, and C. lutescens. The bulbs of all these are small, and from them are pushed up grass-like leaves a foot or so in length. The erect flower scape, which also reaches a height of about a foot, is terminated by an umbel of tubular-shaped, curved blossoms. In C. angustifolius they are of an orange-scarlet colour, in C. McKeni white, C. Macowani crimson, and in C. lutescens pale yellow. These bulbs require ordinary greenhouse treatment. They should be potted in a soil mainly consisting of loam and sand, as in this they do not need frequent repotting. If kept moderately dry during the winter the plants will in spring, with additional warmth and more moisture, quickly push up their flower spikes, and when in bloom they are exceedingly pretty. More than this, the flowering season is not limited to the spring months, as blossoms are produced at all seasons.

K.

## THE CENTURY PLANT.

As a consequence of the large specimen of Agave atrovirens in the Kew collection having reached the flowering stage, much has been written during the past few weeks about the so-called Century Plant. Judging from the articles and paragraphs that have come under our notice, the majority of the writers regard themselves as authorities on the subject, although evidently very few are acquainted with the fact that there is more than one agave popularly known under that name.

The species that is generally known is A. americana, which, according to tradition, was introduced to Europe about the middle of the sixteenth century, and first flowered in England at Hampton Court in 1714. Whether the flowering of this specimen created much interest is not at the present time quite clear, but whatever may have been the amount of interest shown in the development of the stately flower stem and the production of the huge panicle of flowers, it must have been more or less local, for there were then no means by which information relating to episodes in plant life could be readily disseminated. That a considerable amount of interest was evinced in this species for many years subsequent to it having become known to science, there can be no doubt, for in Martius' "Flora Brasiliensis" fifty books are mentioned in which reference was made to it between 1554 and 1748. The plant has long been widely distributed in gardens and at one time it enjoyed considerable popularity for placing in prominent positions on terraces during the summer months. The handsome variegated variety known as A. americana variegata has also enjoyed considerable popularity both for the terrace and conservatory.

AN EFFECTIVE ARRANGEMENT OF PÆONY-FLOWERED DAHLIAS AT KEW.

The length of time required by this agave to reach the flowering stage gave rise to the popular name of Century Plant. There is, however, no foundation for the common belief that it blooms once in every hundred years. It blooms once, and once only, for when a plant has flowered it dies. Plants may have reached their hundredth year before completing their life cycle, but no authentic record has yet come under our notice of their having done so. Probably the average life of a plant of A. americana would be nearer fifty years than one hundred, but there is not sufficient evidence available to fix any definite period for the flowering of the agaves popularly known as century plants.

A. atrovirens, which is now coming into bloom at Kew, is not unlike the older species, but it is taller in growth, and has leaves that are of greater length, and somewhat narrower. The Kew specimen has a spread of about fifteen feet, but Karawinski, by whom it was introduced to cultivation, states that leaves of wild plants growing under favourable conditions, attain a length of twelve feet. As will be readily seen from the illustration given herewith of the specimen before it began to produce its flower stem, this species is stately in aspect, and has much to recommend it to those who take in interest in the larger-growing agaves, and have a spacious structure available for its cultivation. Like the other species here referred to, A. atrovirens is a native of Mexico, and was introduced to cultivation in 1860. It first flowered at Kew in the winter of 1887-8, and, as the plant could not be placed in the open at that season of the year, it was removed to the palm house to afford room for the development of its tall flower stem. This latter attains, according to Mr. Baker, a length of between twenty-five and thirty feet, and the flowers are borne in a panicle some seven feet in length, at the top of the stem. The height of the plant with its flower stem is now about twenty feet.

AGAVE ATROVIRENS.

The fine specimen now coming into bloom at Kew, as it appeared previous to the development of the flower stem.

**Cotoneaster horizontalis.**—Of the innumerable cotoneasters that we have received from China this is one of the best and most distinct. Its regular, distichous style of growth forms a very notable feature, and it is especially attractive at different seasons. In the first place, its pretty pinkish flowers are borne in great profusion; next, they are succeeded by berries which, when ripe, are bright scarlet.—K.

## RUNNER BEANS IN FLOWER BORDERS.

In cases where a temporary background is desired for herbaceous borders in the vegetable garden, runner beans may be utilised to form one. The beans may be grown in a continuous row or in clumps at so many feet apart. For many years I grew a row of beans as a background to such a border in one garden that I had charge of. The row was over 300ft. in length, and generally averaged 7ft. in height. The beans flowered from June to October, and proved useful as well as ornamental. Pods were gathered regularly, as many as forty pecks in some months; and, of course, this regular gathering also resulted in continuous flowering.

The plants in the row were grown at a distance of 4ft. from the nearest herbaceous subjects, and I never found that any harm was done to the flowering plants in any way by the beans. This border could be seen from a very long distance, and the herbaceous phloxes, delphiniums, solidagos, spiræas, Michaelmas daisies, and other plants showed to great advantage in front of the wall of bean blossoms. G. B.

## IMPORTANT FACTORS IN ONION CULTURE.

However carefully details are carried out with regard to the cultivation of certain plants, perfection or complete success is not always assured. The onion, like many other culinary vegetables, will fail to make good growth on what is apparently excellent soil for other crops, while in that which may be regarded as anything but ideal ground, the best of results are obtainable with the minimum of expenditure. I have been able to grow Ailsa Craig onions, averaging 2½lbs. each in weight, on land just newly broken up, and where the dressing consisted of nothing more than a substantial amount of farmyard manure. The soil in the district of Basingstoke is undoubtedly naturally adapted to the growth of onions, for when Mr. Bowerman, who is now with Messrs. Sutton and Sons, was at Hackwood Park, he never failed to produce monster onions, averaging three or more pounds in weight. Mr. Kneller also, who for many years was head gardener to Sir Melville Portal, at Malshanger, was an equally successful grower, as also was Mr. Wasley, at Sherfield Manor. At the present day, Mr. Best, of The Vyne, and many other gardeners in this district, achieve the most excellent results in onion culture. The fact that allotment holders can place large bulbs averaging 2lbs. in weight on the exhibition tables of local flower shows throughout the months of July and August, is in itself sufficient proof that soil conditions have much to do with the success attending this culture.

### Deep Trenching.

This is an important factor in the cultivation of onions, either for general use or for exhibition purposes. I have compared autumn trenching with spring trenching after the ground has become well dried, and both systems of preparation have answered well. Perhaps the greatest harm is done when these heavy, retentive soils are dug over in spring, while they are still saturated with moisture, instead of waiting until they have become thoroughly dried so as not to become kneaded under the feet, like so much dough. When it is necessary to make the ground fertile by the application of heavy dressings of farmyard manure or other natural manure of a bulky character, such material must be got under in the autumn, and, if possible, when the ground is sufficiently moist to work well, and admit of ridging up for the winter. The deeper the ground can be trenched without bringing soil of an undesirable character to the surface the better, as the roots of onions are capable of penetrating to a very considerable depth, so lessening any risk of a check to growth likely to be encountered during prolonged drought.

### Manuring.

This must be performed cautiously. If farmyard manure is given, its composition must be such as will improve the mechanical texture of the soil. Well-fermented horse manure is invaluable for opening up, and thereby raising the temperature, of heavy, clayey loams, naturally cold and wet, while a manure largely composed of the excrement of cows and pigs is better adapted for such soils as have a tendency to become hot and dry, and which are not retentive of moisture. Much has been written about light soils for onions, and that these must be well consolidated, but from what I have seen of these consolidated dust-heaps, very few of them are capable of growing large specimen bulbs. Concentrated manures supplying potash, phosphoric acid, and nitrogen, can all prove helpful in the cultivation of onions, provided they are applied with care, and at the proper time.

On heavy, retentive soils, of which the subsoil is clay, a phosphatic manure like basic slag, is to be preferred to an acid manure like superphosphate, especially if the soil is in any way sour. Bone compounds, containing as they do a small percentable of nitrogen in addition to phosphates, are always beneficial to the onion crop, while if nitrate of potash does not prove too expensive to purchase it may take the place of either sulphate of potash or kainit, the latter fertiliser, however, being preferable to any other form of potash on light soils, as the large percentage of salt it contains is useful not only as a plant food, but also in conserving moisture. I have frequently used superphosphate and sulphate of ammonia, mixed together at the time of sowing in the proportion of one part of sulphate of ammonia to three parts of superphosphate, and very excellent results were obtained. In fact, I consider it preferable to apply the active nitrogenous manure in the form of sulphate of ammonia at the time of working the soil, instead of using a more quickly-soluble manure like nitrate of soda or nitrate of lime as a top-dressing after the plants are established.

### The Importance of Hoeing.

The value of deeply stirring the soil throughout the early stages of the plant's growth cannot be over-estimated, and in addition to keeping up a supply of moisture, it will do much to ward off attacks of mildew. In a season of drought like that of the year 1911, I discovered that where the ground around the plants was kept continually hoed, this had a much better effect on the plants than where continuous waterings were given, and the hoe used less frequently. It is nothing unusual to secure regular and well-formed bulbs of 3lbs. weight, but it is exceedingly difficult to put on additional ounces beyond this weight. Overhead waterings with liquid manure must be avoided, as many plants are killed in this way through premature decay of the foliage. When liquid manure is applied, it must be given fairly weak and in sufficiently large quantities to thoroughly saturate the whole of the cultivated soil.

I ought to have mentioned the good effects produced by the application of ground lime on soils containing an excess of organic matter, and on such garden soils as have a tendency to be heavy and unworkable in early spring. The lime must, however, be applied in autumn, and not in spring, as is usually done.

### The Best Plants.

Only the best plants must be transplanted for exhibition purposes, as I have observed that, however good the cultivation, a weakly plant will never gain that vigour of constitution necessary to enable it to develop into a specimen fit for show. Provided the seedlings are well hardened off before planting out, frost, however severe, does not appear to do them any injury, but an attack of mildew at a later stage of growth is a very serious matter. A very careful watch should be kept for signs of mildew during the month of July, and I have usually found that sulphide of potassium, used at the rate of one ounce to each gallon of water, is very effective in preventing the spread of the disease. Light sprinklings of flowers of sulphur between the plants once a fortnight is also recommended. In any case, it is well to take some precautionary measures before the mildew has much of a hold on the plants; otherwise it is difficult to check it.

J. C. Newsham.

## GARDEN SURPRISES.

There are not many gardens of surprises, and yet this expression can sometimes be aptly applied. It need not necessarily be a large garden, for it is not a difficult matter to so arrange a garden when it is first planned to create surprise features. I recently heard a garden of some repute, where choice hardy plants are extensively grown, described as "too much like a nursery." It was planted in a very formal manner, and you could almost see the whole at once. The plants were there, but their arrangement lacked taste and originality. This is a common mistake in many gardens, although most sites are capable of being laid out in a pleasing and artistic manner.

It is by no means necessary to have a great collection of plants, or to grow all the novelties to ensure a pretty garden; the secret lies in how the plants are arranged. In addition to this, trees and shrubs play a most important part in the moulding of a garden, for to create surprises it is necessary to make a free use of trees, as it is only by this means gardens can be intersected so that each portion forms a complete picture.

Besides choice shrubs, a careful use of conifers will be a great help, and the more ornamental of these form especially handsome objects. It should be the aim of the designer to so plant the garden that one section cannot be wholly seen from another. In this way surprises can be created which are often a source of increased attraction, and if the most is made of the various sections, they can be rendered extremely lovely and diverse. A great point is to make each feature quite different from another, both in its formation and in the subjects employed.

These remarks refer, of course, to the pleasure grounds, or to what some may call the semi-wild garden; but the latter is capable of being made most charming, and owing to its diversity, is often the most delightful part of the whole place.

Glades are always a source of beauty when appropriately located towards the outskirts of the garden, so as to reveal a view of the country beyond, or include some adjoining garden feature. When well placed, these glades give an impression of extent, which is often desirable if the grounds are rather small.

Suitable subjects to plant are very numerous, but I know of nothing more effective in the spring than Erica carnea, and a breadth of this, two acres in extent, with which I am acquainted, is a sight not easily to be forgotten. Here and there narcissi can be naturalised among the ericas, and Anemone apennina contrasts beautifully with it. Surprises in the garden can be created in a variety of ways, but their chief attraction lies in locating them where they are least expected, and the approaching features must be so arranged to produce that effect. A garden so designed is infinitely more attractive than one of a more or less stereotyped character, no matter how many gems it may contain.

Batsford Park. J. Gardner.

---

**Hollyhocks.**—These handsome plants are useful for planting in the shrubberies, and also at the back of the mixed flower borders; but, owing to the prevalence of disease, it is desirable to raise young plants every year by sowing seeds in heat early in February, and growing them in pots until large enough to plant out. They should be cultivated on deeply-dug and well-manured ground, when they will produce vigorous flower spikes. They will derive much benefit from a good mulching of half-decayed manure.

## CONVOLVULUS MAURITANICUS.

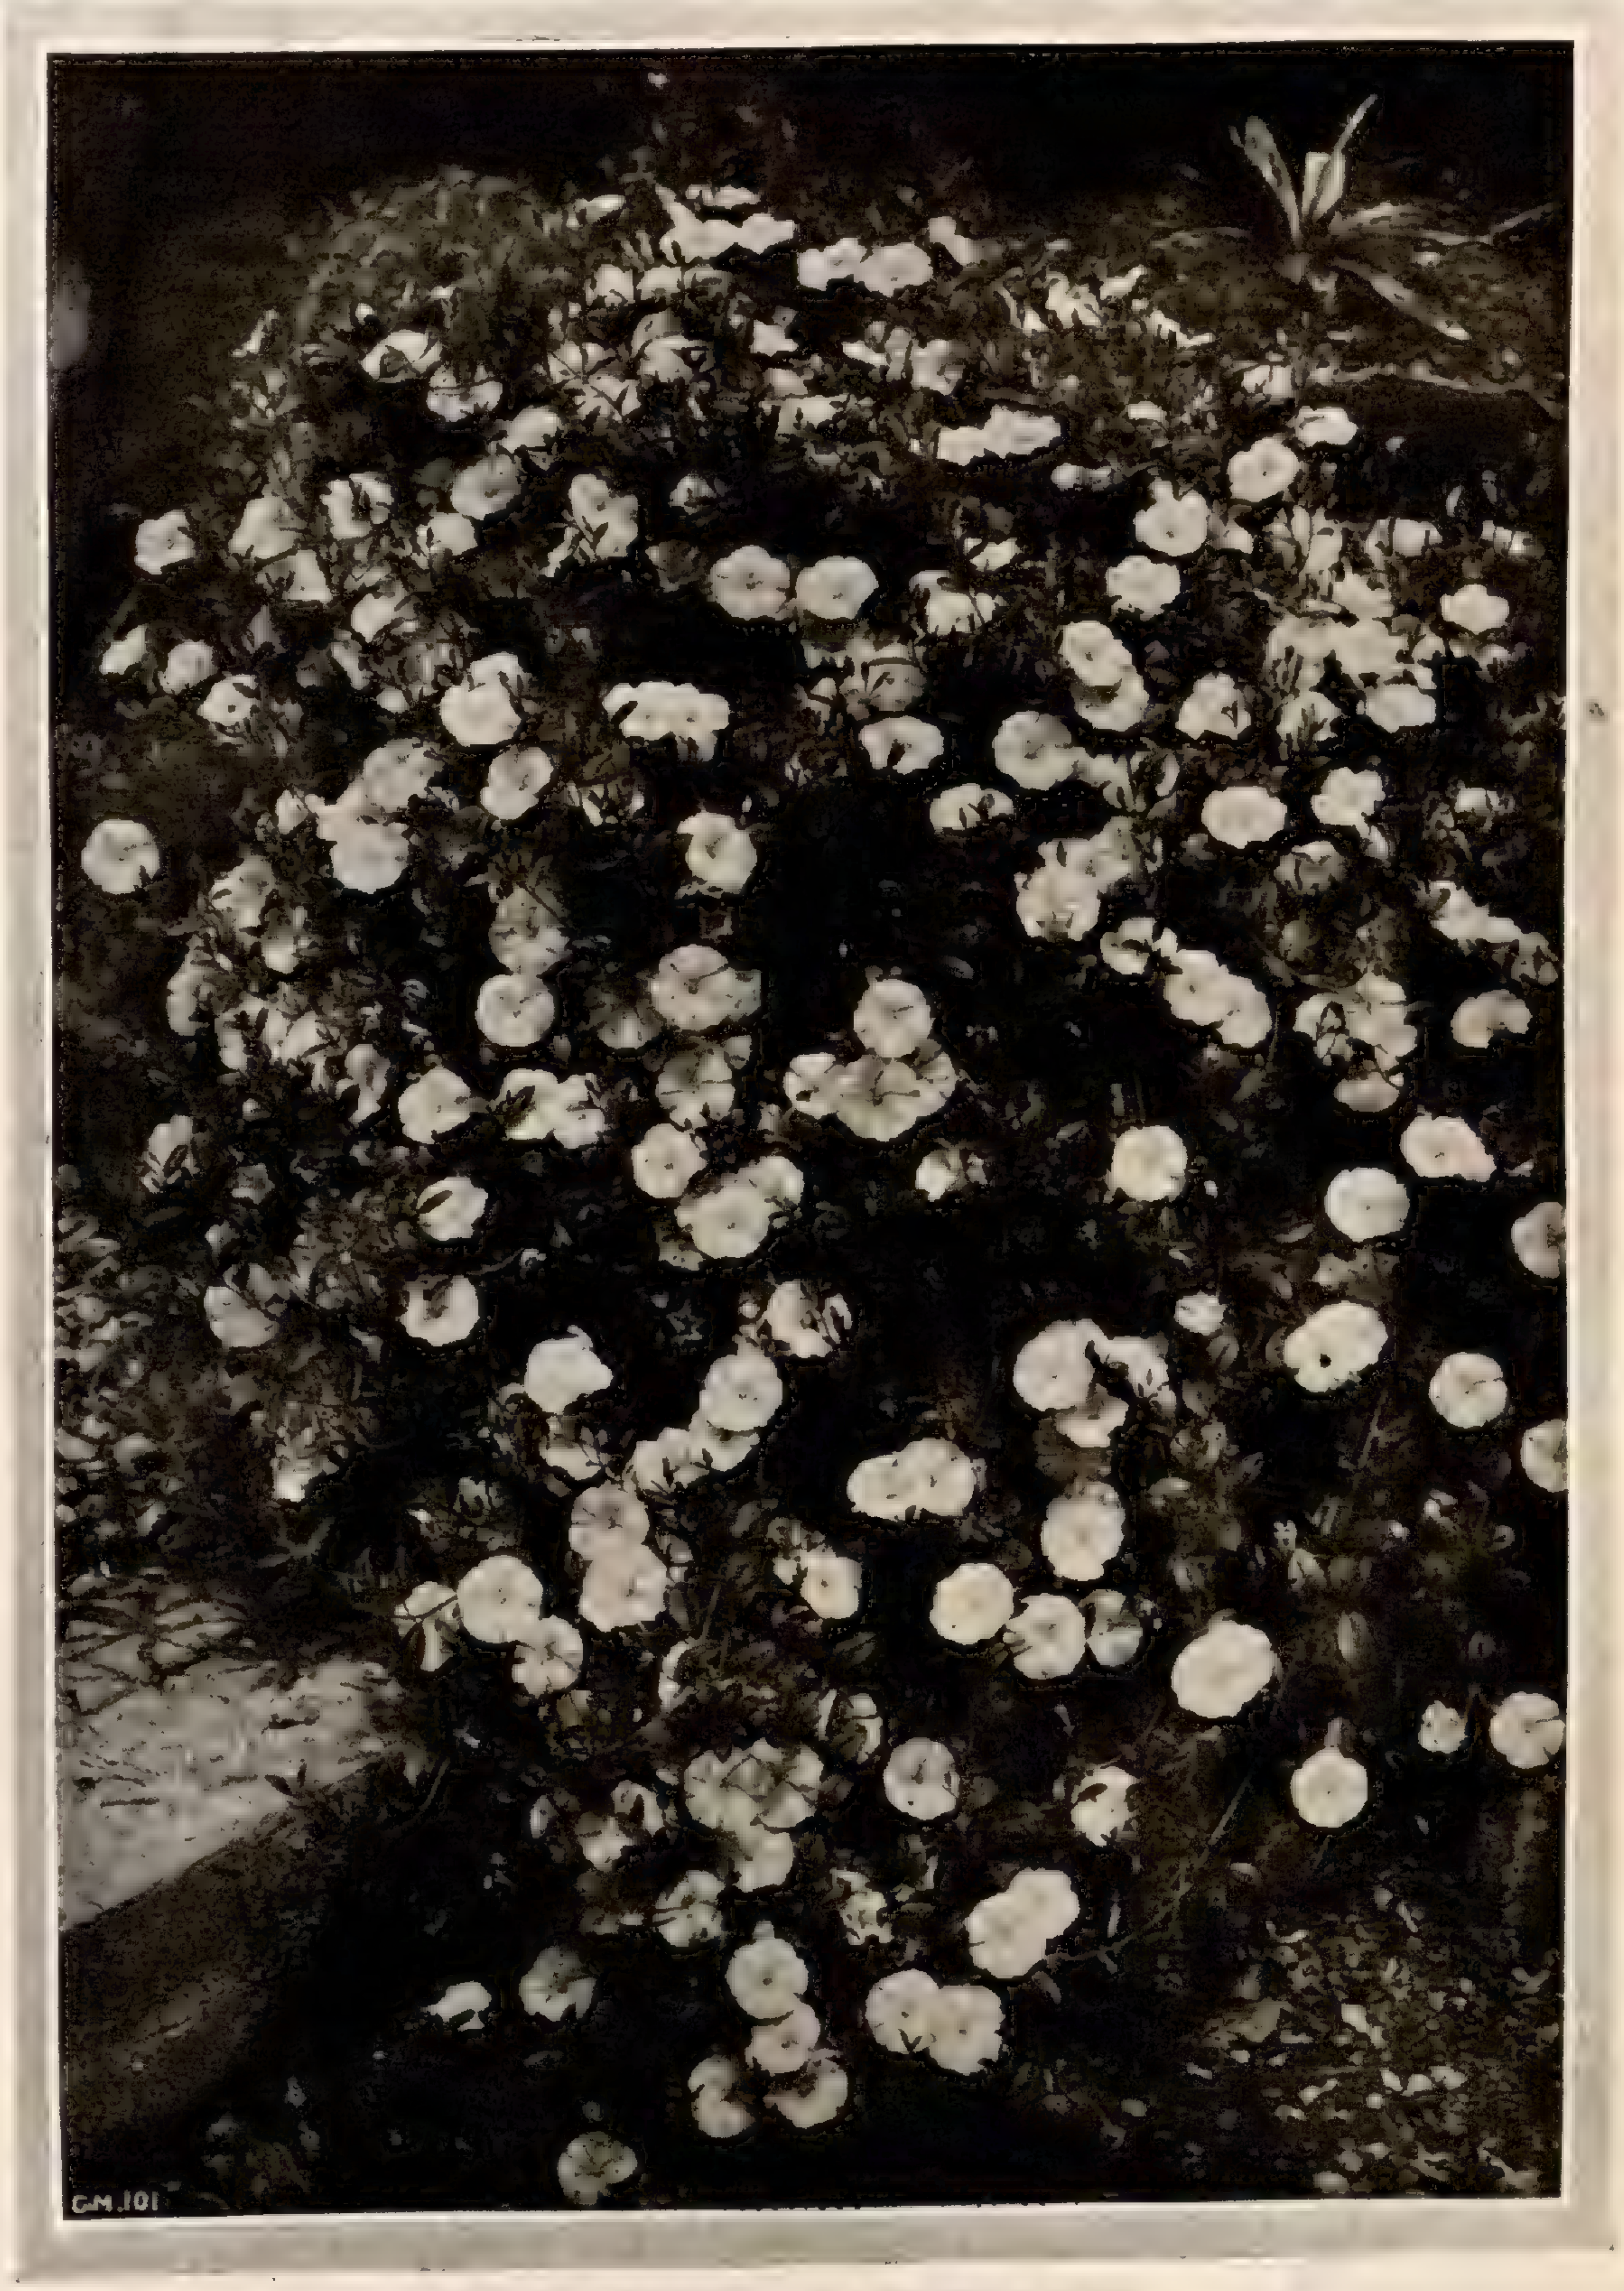
The blue rock Bindweed, as this convolvulus has been called, is one of the most beautiful and graceful of all the members of its family. Entirely free from the ramping, land-grabbing tendencies of so many of its race, C. mauritanicus is remarkable for its persistent flowering and neat, elegant habit. Although a native of Northern Africa, it has proved hardy in most parts of this country, and is one of the best plants for grouping that can be imagined. A dry, almost perpendicular bank entirely covered with this convolvulus, each plant forming a dense veil and throwing up innumerable graceful, drooping shoots, studded along their entire length by soft, lavender-blue flowers about the size of a florin, is one of the most beautiful sights it is possible to conceive. On a ledge of the rock garden, where its blossom-laden, pendant growths can hang freely down, it is seen at its best.

Distinct as it is from any other species in cultivation, it may be used with fine effect in almost any situation in the garden. In the warm, sunny crevices of the rockery, in a border with a southern exposure, or in the summer flower-beds, this charming plant will be found equally at home, while on a raised mound it will have a delightful effect, the long, drooping shoots falling gracefully all round, and laden with their lavender-blue flowers, forming an exquisite picture. It is never seen to better advantage than when creeping over some formal stone edging, which it converts from an eyesore to a thing of beauty. A fine example, such as that shown in the accompanying illustration, which is four feet in length and three feet across, bears myriads of blossoms. Happily, too, it is not a flower of a week. It commences its display early in July, in August is a sheet of lavender-blue, and continues to flower with decreasing freedom through the entire autumn.

The leaves are ovate, abundantly produced, and deep green, harmonising well with the pale blue flowers. To ensure satisfactory growth the soil must be light, warm, and well-drained, and the position sunny. It may also be used with advantage for hanging baskets, treating it in the same way as the Creeping Jenny, that is, allowing the stems to fall down and form a fringe. It should certainly be used more than it is for ornamental vases or baskets, and may be employed with equal advantage in or out of doors. It makes a most charming picture of soft, refined colour, such as no other plants could provide, and should be grown by all.

It usually survives the winter, as its roots are generally safe if growing in a soil from which excess of moisture readily passes away, but in cold districts it may be killed in an exceptionally severe winter. For this reason it is always advisable to insert a batch of cuttings in sand and cover them with a bell-glass in the autumn, as these strike freely, and, planted out in the spring, make good plants, growing and blooming through the late summer and autumn. The variety sabatius is only known to grow on one cape. It differs from C. mauritanicus in its mauve-coloured flowers with yellow centres, solitary or in pairs, and crowded together at the ends of the short branches.

WYNDHAM FITZHERBERT.



CONVOLVULUS MAURITANICUS.
A beautiful trailing plant with lavender-blue flowers.

## EUPATORIUM PURPUSI MONTICOLA.

Several of the tender kinds of eupatorium are appreciated for the embellishment of the greenhouse during the autumn, winter, and early spring months. Of those that come in with the new year, I like this E. purpusi monticola (syn. E. petiolare) the best, it being exceedingly free flowering, and more refined in appearance than some other members of the genus. The flowers, which are disposed in much-branched panicles, are arranged in small, rounded heads, a good deal suggestive of a daisy. When first expanded they have a pinkish suffusion, but after a time become almost, if not quite, white. They also possess a pleasing fragrance.

Like the rest of its class this eupatorium is of very easy propagation and culture. It may, during the summer, be treated much as a chrysanthemum. Although less in stature than some kinds, it may be grown as good-sized bushy specimens, in pots seven to ten inches in diameter, while neat litle examples in five or six inch pots will also flower well. Fairly long sprays may be cut for indoor decoration, and these last long in water.

Another species—Eupatorium vernale—has come a good deal to the front during late years. It is very pretty for growing into small plants, but for general decorative purposes I prefer that at the head of this note. For autumn, E. riparum and E. odoratum (known also as E. Weinmannianum) are as far as my experience extends, the best. S. W.

---

**Large-flowered Fuchsias.**—A great many of the newer fuchsias have large double blossoms, which, though individually showy, have some decided drawbacks. In the first place they are not borne as freely as the medium sized flowers, next, owing to their weight they are very apt to drop prematurely, and the loss of two or three blooms is apt to leave a considerable gap. For such reasons fuchsias of this class are not appreciated by the market grower, as they would not stand the shifting about inseparable from plants that pass through many hands before they are finally disposed of. Much the same objections apply to their use out of doors during the summer, as they are more readily injured by rough winds.—K.

## STREAK DISEASE IN SWEET PEAS.—II.

I have noticed pathologists and expert advisers recommend a change of ground for sweet peas. I think, however, when this cause is adopted, growers should inoculate the fresh ground, the seed, or plants, with the nitrogen-gathering bacteria, by mixing some portion of soil in which sweet peas have been grown with the fresh land to be cropped, small quantities of old soil only being necessary, say, a handful or less to the square yard, as such soil will be full of beneficial bacteria, or, if preferred, a sweet pea plant having nodules containing active bacteria may be selected, and the nodules may be crushed, and mixed with water, and applied with a little soil to the ground. This would be found to be efficacious. The nodules chosen should appear of a pinkish colour when crushed, and a sufficiency of bacteria may be taken from one plant to inoculate a whole garden.

When newly broken-up land, or land upon which sweet peas have not previously been grown, is to be used, inoculation of the soil is most important. The operation is so easy that it should not be neglected.

On the other hand, I find sweet peas succeed remarkably well when grown on the same land year after year, provided the correct system of manuring is adhered to. I have grown sweet peas six years' successively on the same ground without apparent detriment.

So much is heard about manuring of sweet peas that one is apt to attach too much importance to the subject, because, provided the soil contains a sufficiency of mineral manure (potash, phosphates, etc.) it matters not whether these were applied this year, last year, or the year before.

An overabundance will do no harm, a deficiency only of any mineral constituent determines the resulting crop.

I know from practical experience that when sweet peas and other legumes are grown exclusively with the aid of mineral fertilisers the crops are not affected with "streak," or any other diseases; even mildew fungus seldom does harm to plants in soil in which there is ample content of available potash.

Writing in the "Journal" of the Royal Horticultural Society, Mr. F. J. Chittenden says: "He doubts the efficacy of soil sterilisation by heating in connection with sweet peas, as it would prevent the formation of nodules upon their roots, and he, therefore, recommends as an alternative a thorough soaking of the soil with a solution of one part of formalin to two hundred parts of water, to be applied at least three weeks before the plants are put out or sowing of the seeds."

I have had several years' experience of growing sweet pea seedlings in soil partially sterilised by heat, and have always found the nodules form naturally and freely in soil which has been heated to 212F. Dr. E. J. Russell and other scientists have inspected my sweet pea seedlings growing in such heated soil, and have noted the nodule formation.

Theoretically, no doubt, one might expect nitrogen-gathering bacteria to be destroyed by such heating, but apparently they survive, as do spore-producing soil bacteria, or inoculation takes place through the media of water or air.

It is admitted that volatile antiseptics, such as formalin, for partial sterilisation of soil are not so effective as the heating process, as none of these completely destroy the harmful bacteria (protozoa and amoeba), whilst neither the antiseptic or heating process completely destroys the beneficial spore-producing organism. It therefore follows no special advantage is to be expected by using formalin; rather the reverse.

A point worthy of note is that when examining a "streaky plant," if nodules are formed upon roots they contain dead and inactive bacteria, although each nodule may contain countless millions of these bacteria.

I feel inclined to think that three-fourths of the destruction to sweet pea plants during recent years has not been due to streak disease, but has been the effect of over-manuring, or feeding, as it is commonly called.

I am quite prepared to hear some suffering enthusiast say, "I did not feed my plants at all," which means the plants died before the contents of the tub of "old stingo" had been used, or before the concoction to be made from the infallible chemical formula had even been prepared. Quite so! But what about the tremendous amount of animal manure, etc., deposited in the soil months before the peas were planted? Possibly the roots may have come into contact with this, resulting in the usual consequences—retarded growth, puckered leaves, distorted or discoloured flowers, shortened internodes, and destroyed root hairs, ending the probable sickening and death of the whole plant, in a way best known to the grower.

Marshall Ward has said: "The time is rapidly approaching when the farmer, or the gardener, will as little dare to neglect the study of physiology and pathology of plants, as the surgeon dare practise without a knowledge of anatomy, or the sailor hope to become a captain without studying navigation."

I believe the cultivator of the soil will soon recognise the necessity of becoming acquainted with the life history of the tiny organisms which exist therein. The knowledge of the existence of the various groups, and of their mutual relations, will most certainly tend to the more careful and economic use both of the farmyard manure and of artificial fertilisers.

E. W. Duckwall, in "Bacteriological Technique," says: "Peas grow well in chalky and other calcareous soils, but a fine growth depends almost entirely upon the presence of nitrogen-fixing bacteria, and it is possible to prepare the conditions artificially. When peas are planted in a soil containing all the elements for growth excepting nitrogen, they will thrive well if there are any nitrogen-fixing bacteria present, because these little workers will build up the nitrates for the plants, but if none of these are present the growth is poor, . . . the plants will cease growing, the leaves turning yellow, and there is no disposition to bear pods. The plants in this case are suffering from what is termed nitrogen hunger, when, at this stage, if the soil near the roots be moistened with water containing nitrogen-fixing bacteria, wonderful changes will be noticed in a short time. The stem and branches will grow stronger, the leaves will turn green, and the pods will fill with peas rapidly."

In the face of such evidence is it to be wondered if the reversal of such a complicated provision of Nature should be visited with such dire consequences when nitrogen is supplied in alien form.

Robert Holmes.

Tuckswood Farm, Old Lakenham.

An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price, 7s. 6d. net by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## THE FORESTS OF NORTH AMERICA.

In a lecture delivered recently before the Aberdeen branch of the Royal Scottish Arboricultural Society, Dr. Somerville said: In North America not only was there a variety of climate, but concurrently an enormous variety of vegetation, including trees. From an economic point of view the forests of North America were of the very first importance, and the United States constituted the most important of the timber exporting countries of the world. That country exported annually something like £18,000,000 to £20,000,000 worth of timber. The country the States drew upon most liberally for the ordinary class of timber was Canada. From facts submitted recently to the Canadian Government, the United States at the present time were consuming something like two-fifths of all the pulp-wood for manufacture into paper in United States mills. The Canadian Government was, however, extremely anxious to stop the exportation of raw pulpwood to the United States, and New Brunswick, Quebec, Ontario, and most of the important timber provinces of Canada had been passing Acts to prevent exportation of pulp-wood in the raw condition to the States.

Dr. Somerville proceeded, by means of maps, photographic slides of interesting parts of wooded country, of special forests, and of giant individual trees, to describe his visits to the United States and Canada. He described the great forests of spruce he found in New Brunswick. Exactly how much timber there was in Labrador could not be known, because as yet that province was largely unexplored. It was, however, from Labrador that large quantities of timber came which could be used for pulp for the manufacture of paper. Great hopes had been entertained that when the Canadian Northern Railroad, at present under construction, was opened, that great quantities of timber would be available in vast extents of forests. That hope, however, had not proved to be realised, because the surveyors who had been along the line of route reported that the country there was so poorly wooded that it could do no more than supply the constructional material required for the railway.

West of Lake Superior they got into the prairies, stretching away towards and beyond Winnipeg, where they had only scrub poplar and larch, and Banks's pine. Further west, in the purely prairie country, they found willows and poplars growing alongside the banks of the rivers. When they approached the Rocky Mountains they got a forest country extending south of the Selkirk range, and there they had several of the most magnificent of the American forests. It was in that district that many of the wonderful trees were found indigenous—the Sitka spruce, the Douglas fir, the Grandis pine, the Picea nobilis, and the Lawsoni fir. In the valley of the Mississippi they had many of the hardwood trees—chestnut, birch, cherry, and others at their best in that mountain range. Tennessee, North Carolina, and Virginia were right in the middle of that great hardwood forest area, in which very little cutting had been done. By means of a series of beautiful illustrations, Dr. Somerville gave his hearers a capital idea of all the various features he had referred to.

The lecturer then dealt with the characteristic trees of Eastern Canada, and showed what the Canadian Government were doing on the prairies to afforest the bare lands there and give protection to crofts and homesteads. That Government distributed young plants free of charge to settlers, and the distributions were made from nurseries at Indianhead, Alberta. The work was started in 1905, and by slides the lecturer showed how well the trees grew up in a matter of four years' time on an area that was previously treeless. It was interesting to know that trees doing best in the re-afforestation of the Canadian prairies were the trees commonest in Great Britain.

# PERPETUAL-FLOWERING CARNATIONS

## At the Hatherley Nurseries, Cheltenham.

It is a statement frequently made that the man who is successful is the specialist, and indeed this may be called the age of specialists. Our greatest physicians specialise in the study and treatment of one particular disease. In all branches of science and industry, and even in sports and hobbies we find men who are specialists in one particular line, at which, by reason of the concentration of their energies and interest, they become experts, and consequently achieve success.

In so far-reaching and many-sided a pursuit as horticulture, it is not at all surprising that we find the system of specialising in the cultivation of one class of plants very largely adopted, and certainly abundant evidence is forthcoming that they who follow this course are those who succeed.

Messrs. Young and Co., Hatherley, Cheltenham, may be cited as specialists who have come well to the front in their line, which is the cult of the perpetual-flowering carnation. Of late years their fine stands of well-grown flowers, tastefully arranged, have been much admired at the leading shows all over the kingdom, and it was in full expectation of finding an extensive stock of healthy plants that we visited Hatherley recently.

Carnations are worth seeing anywhere, at any time, but this visit was the more enjoyable by reason of the facts that the day was gloriously fine, and that the nursery is situated in a spot surrounded by scenery that may well claim mention among the most beautiful in England. The town of Cheltenham itself is endowed with beauties equalled by few towns in the country, but getting beyond the streets into the open country where grand views of the Cotswold Hills and well-wooded valleys are obtained, one feels compelled to pay tribute to this delightful bit of old England.

But to the carnations. These occupied ten or a dozen span-roof houses ranging from about 150ft. to 200ft. each in length. This means a considerable area to be occupied by one kind of plant, but every house was filled to its utmost capacity, plants of all sizes, from newly-rooted cuttings in the propagating beds, to fine big plants in full flower, being pictures of vigorous health and skilful culture. We looked carefully for rust, spider, and spot, those torments that are capable of converting the pleasure of carnation growing into an anxiety and thankless task, but by the time we had finished the round ye come to understand why Mr. Taudevin, the genial head of the firm, who every show-goer knows, can always wear a pleasant smile or enjoy a hearty laugh—his brain is not racked with the harassing problem of how to rid his plants of pests; he has learnt the far better plan of keeping the pests at bay. One thing was specially noticeable, i.e., that from the time the cuttings are taken there is no coddling, but a cool, rational treatment is afforded, both in the propagating house and the growing and flowering houses, and the whole system of cultivation is to give careful attention to light and ventilation, and to use brains as well as hands when manipulating the waterpot, while the great importance of cleanliness all round is fully realised.

As to varieties; the main collection, numbering about sixty varieties, embraces the best and most popular of both American and British carnations, the plan here adopted being to discard an old variety as soon as one of its particular shade of colour is obtained that supersedes it, either in form, quality, vigour, or habit. A list of these "superseded" varieties is published in Messrs. Young's latest catalogue, and numbers forty-two names. The firm is naturally proud of the fact that quite a number of really good and distinct varieties have emanated from the Hatherley Nurseries, the dark crimson Duchess of Devonshire holding pride of place as the best of the Hatherley novelties. This lovely flower is now widely known, Messrs. Young and Co. having exhibited it throughout England, Scotland, and Ireland, and the manner in which its finely-formed, richly-coloured flowers are everywhere admired must be very gratifying to the raisers. The fine batches of plants I saw fully demonstrated the free-growing and free-flowering qualities of the variety.

Another of Messrs. Young's varieties attracted attention, being so entirely distinct from anything else seen. Its name is A. S. Montgomery. The flowers are not large, but they are broad, smooth-petalled, and more after the style of a good border variety. The calyx is long and perfect, and the colour is a beautiful shade of musk-rose, or perhaps the catalogue description "lilac-pink," aptly describes the somewhat unusual shade. We have seen and admired blooms of A. S. Montgomery at the shows, but our interest in it was very much increased by the remarkable growth and habit of the plants. These grow over wires right up one side, and under the roof of a fairly lofty house. Nevertheless, the plants are anything but leggy, there being any amount of grass, side shoots, and flower stems right from the pots upwards. It is, in fact, almost worthy of being called a "climbing" carnation.

Lady Henderson, a salmon-pink, something in the way of Mrs. H. Burnett is another of Messrs. Young's introductions, and they were also the raisers of Queen, a pale yellow with slight pink markings; Cheltonia, and the pinky-mauve Mrs. Greswolde Williams.

A carnation that has for two or three years attracted a great deal of attention is the Hon. Lady Audrey Neeld, the variety that produces flowers of the same striking form and colour as Marmion, but which has earned for itself the reputation of being a true perpetual flower. Messrs Young and Co. have all along held a high opinion of this attractive flower, and we were not at all surprised to find a big stock of plants in all sizes. Mrs. C. W. Ward is another variety that is exceptionally well done. Those who saw the splendid flowers of it which Messrs. Young and Co. staged at the last show of the Perpetual-flowering Carnation Society will readily understand that this would be so. We asked what was considered the best white, and the answer came quickly that there was nothing yet to surpass White Enchantress for all-round quality and freedom. There are, however, several other good whites in the nursery, including the large-flowered Wodenethe, White House, and White Wonder.

Of much interest is a batch of plants in the open in perfect health. These perpetuals were planted out of three-inch pots and received no protection whatever. In all about fifty varieties were tested, all of which came through in perfect condition, with the exception of half a dozen plants of Governor Roosevelt. All the others are now making extraordinary growth, and running up to flower stems. Many of this type of plant are at present being planted out for summer flowering.

Capital batches of young seedlings and several unnamed seedlings of promise foretold that from Messrs. Young and Co. carnation lovers will receive in the near future still further novelties calculated to oust old favourites or to introduce acceptable new shades of colours into the comparatively new race that has so quickly and deservedly won the hearts of flower lovers in two continents.

---

**Evergreens under Trees.**—The number of evergreens that will hold their own beneath the shade of trees, where as a rule the soil is considerably impoverished, is a very limited one, among the best for the purpose being the aucuba, Berberis aquifolium, Butcher's Broom, some cotoneasters, Daphne pontica, Hypericum calycinum, ivies in great variety, and periwinkles of sorts. Of these last the smaller periwinkle (Vinca minor) will hold its own under more adverse conditions than the larger Vinca major.—S. W.

# WORK FOR THE WEEK.

◆

### THE ORCHID HOUSES.

TEMPERATURE.—Plants in all departments are now making new growth, and no time should be lost in giving them encouragement. To assist in bringing this about, the summer temperature should be now strictly adhered to. The figures given below should be maintained, as nearly as possible, when the outside conditions are genial and summer-like, but during a spell of cold, inclement weather, a degree or two lower will be better than using an excessive amount of fire-heat to maintain the temperature. Cool house—by day, as low as possible; night, 55 to 60 degrees. Intermediate, cattleya, and Mexican houses—by day, 70 to 80 degrees; night, 65 to 70 degrees. Warm house—by day, 75 to 90 degrees; night, 75 degrees. Cool orchids are soon injured by heat, and must now be kept as cool as possible. With the increased temperature within the houses, and the hotter and drier conditions outside, a greater amount of humidity must be maintained. The ventilation and the shading of the different houses must have every attention.

CŒLOGYNE CRISTATA.—This species, and its varieties, have now commenced to grow, and the supply of moisture to the roots should be gradually increased. Those in need of repotting should have attention, just as the young growths are about to push forth new roots. Those to be repotted should have all the old material shaken from their roots, carefully pulling the mass to pieces and cutting away all dead roots and old pseudo-bulbs, leaving three or four behind each leading growth. These plants grow and thrive for a very considerable time without being repotted, and where a quantity are grown a certain portion should be done annually, and in this way no great loss of flowers is experienced. Pans of suitable sizes are the best receptacles, and these should be well drained, placing over the drainage a good layer of sphagnum moss. The compost should consist of equal parts of peat, polypodium, osmunda fibre, and a good turfy loam (from which all the earthy particles have been taken), and sphagnum moss. In preparing compost, it is well to bear in mind that a moderate depth of material that will last is better than a large amount that will need renewing in a very short time. The specimens should be made up according to the uses the plants are intended for, slightly raised in the centre, making each piece secure with the potting mixture, and using copper wire pegs to hold them firmly in the compost. After repotting, place the plants in a shady position, and spray them overhead frequently to prevent the pseudo-bulbs shrivelling more than is avoidable. The cool end of the intermediate house is the best place for C. cristata, and when well established it does not require an excessive amount of shade. In a summer temperature ranging night and day respectively from 60 to 70 degrees, or even 80 degrees, the plants will grow rapidly.

OTHER SPECIES OF CŒLOGYNE which may also have attention at this season, should they require it, are C. flaccida, C. conferta, C. elata, C. sparsa, and C. speciosa. The whole of these delight in an intermediate house temperature, and when well established, an abundant supply of water at the roots. Cœlogynes, when in full growth, are among the most thirsty plants possible, but should be allowed to get dry before affording water, as if the compost is kept continually saturated the roots will be destroyed.

C. PANDURATA, C. DAYANA, C. ASPERATA, and others which are showing flower, must not be allowed to suffer for lack of water. These species require a plentiful supply of heat, and a shady, moist corner must be found for them in a warm house. Given a suitable position, they are all vigorous growers, pushing out over the sides of their receptacles in a short time. After flowering, should it be a necessity, they must be repotted, and they will succeed in a compost prepared as for C. cristata. Many cœlogynes are particular as regards their surroundings and conditions, and when one sees any particular plant doing well it is wise to take notice of its environment.—J. T. BARKER, The West Hill Gardens.

### CONSERVATORY AND GREENHOUSE.

STREPTOCARPUS.—Plants raised from seeds sown in January should have been pricked out in pans and be now growing freely. The most forward are ready for placing in 3in. pots. The best compost at this stage will be two parts loam, one part peat or leaf-mould, and one part silver sand, passed through a fine sieve. When potted, place the plants in a warm frame, or on an ash base, and keep close for a few days, damping them over with tepid water. Young plants readily respond to this treatment, and quickly become established. Great care must be exercised not to break or damage the leaves, which are very brittle. Streptocarpus should be grown in these pots until they open their first flower. The best varieties should then be selected and the plants potted into 32's, using compost as before, but in a coarser state. They should then be returned to the same position they previously occupied, and, with careful attention, they soon make fine plants. When they commence to flower they are best moved to the conservatory, and if the position is suitable they will last in perfection for several months. Streptocarpus, like many other subjects, are much more effective when in bloom if they can be staged by themselves in groups or in company with maidenhair ferns.

CALCEOLARIAS. — Herbaceous calceolarias are now making a fine show, and are most useful for conservatory decoration. (I hope to deal with seed-sowing and cultivation in a later note.) Calceolaria Clibrani is a new addition, and most useful. The tall, slender spikes of small, delicate, yellow blossoms, lend themselves most admirably to floral display. It is best propagated by cuttings, and any side shoots will root freely. The plants are best grown in batches; some are now opening their flowers, while the next batch, rooted in October, are fast filling their flowering pots with masses of roots; whilst the third batch is rooted and potted off into 60's. The compost best suited for them is good fibrous loam, leaf-mould, old mortar rubble broken finely, a little soot, and coarse sand. The best position to grow them in is on a shelf near the glass, where they get plenty of light; but care must be taken that they do not suffer from want of water. When the pots are full of roots give weak liquid manure.

CYCLAMENS.—These are fast passing out of bloom. All old corms and poor varieties should be thrown away at once. If it is thought advisable to keep a few of the best varieties, these should be placed in a cold frame, and given water sparingly, presently withholding it altogether and encouraging the plants to rest. The leaves will die off completely. Seedlings raised in February are ready for potting directly they have formed two leaves. Pot them into 3in. pots or pans filled to within one inch of the position near the glass, and dew them over frequently.

PRIMULAS.—Seed-sowing time for these has now arrived, and all who wish to have good plants by November must sow at once, as Primula sinensis, P. stellata, P. Kewensis, and P. malacoides are all best sown now. Choose pots or pans filled to within 1in. of the rim with sandy compost, make level and firm, and sow the seeds thinly on the surface and sprinkle with silver sand; cover with a piece of glass, and some paper, to encourage quick germination. The old double white primula and the improved form, Beauty of Exeter, are ready for propagating. Remove decayed leaves from the stems and pack sphagnum moss and silver sand firmly round the stem bases. The stems will emit roots, and when sufficiently rooted the growths may be severed, and each plant potted up separately.—LEWIS SMITH, Shotesham Park Gardens.

### THE KITCHEN GARDEN.

RUNNER BEANS.—After this date it should be quite safe to sow the first row of this favourite vegetable. They are better, more lasting and prolific, if trenches are prepared for their reception, as previously advised for celery. Keep the surface below the general level of the ground, this answering equally for watering, mulching, and keeping cold winds from the young plants when up. As very few vegetables are more tender than beans, every care should be taken to promote a regular growth. Previous to sowing, give the trench a surface dressing of burnt garden refuse, as beans revel in this material. Plant the seeds with a dibber, three inches deep, in double lines. Protecting material will probably be needed after germination has taken place, on cold nights; spruce or yew boughs are very handy and useful for this purpose. Make sowings at intervals of three weeks until the middle of June. Prizewinner, Hackwood Success, and Scarlet Emperor are excellent varieties for both home and exhibition.

FRENCH BEANS. — Good breadths, both of climbing and dwarf kinds, should be sown at intervals to maintain a good supply of young and tender pods. Make still one more sowing in a frame

BRUSSELS SPROUTS.—Those sown in boxes, and ultimately pricked off into skeleton frames, are now quite hardy and large enough for their final quarters. The site should command full sun to encourage a firm and hardy growth to withstand the winter. Providing the plot was early trenched, all it will need is levelling, at the same time harrowing in a good dressing of soot. Stake out the rows at three feet apart, and allow a distance of two and a-half feet from plant to plant. If dry, give a soaking of water immediately after planting. Dwarf Gem and Matchless are perhaps the two most profitable varieties.

BEETROOT.—The main batch should now be sown. Ground previously occupied by celery or leeks answers admirably for this crop, particularly if a good dressing of old rubbish-heap ashes, soot, and lime rubble can be strewn over the site and well worked into the surface soil. Rake and level up, and draw drills a good inch in depth, at fifteen inches apart. Blood Red, Dell's and Cheltenham Greentop are excellent varieties. If birds are troublesome, a few strands of thin twine stretched over the bed three inches above the soil wards them off wonderfully well.

NEW ZEALAND SPINACH.—A useful vegetable for dry seasons. Sow in drills eighteen inches apart on any narrow border in the kitchen garden; thin out to fifteen inches apart.

CELERY.—The first batch, now nicely established in boxes, is ready for planting out in prepared trenches. The trenches for this batch need not be so wide, as for the late and maincrop varieties, these not needing the amount of earthing that is necessary to preserve the later batches from frosts. Plant in single or double lines, one foot from plant to plant. Lift very carefully, and plant firmly, afterwards giving a watering. To prevent attacks of the dreaded celery fly apply a slight dusting of soot over the foliage fortnightly, this acting both as a tonic and insecticide. The maincrop and winter celery trenches should be prepared as soon as the ground becomes vacant, using the ridges for turnips, lettuces, and endive. Ply the hoe through all crops regularly.—GEO. ELLWOOD, Swanmore Park Gardens.

### HARDY FRUITS.

SWEET CHERRIES ON WALLS.—Some varieties of cherries naturally form too many growths on the spurs, and branches need to be freely disbudded to properly mature the wood and produce fruit buds. Where growths are needed to fill up spaces or for extension, the best-placed shoots should be selected and trained in without being stopped; all shoots at the back of the branches should be rubbed off, and those selected to form fruit spurs must be pinched at the third or fourth joint. The foliage of the various cherries differs considerably in size, and due consideration of this fact must be borne in mind when pinching or selecting growths for fruit spurs. Keep a sharp look-out for aphis, and, if noted, spray with quassia extract or some other suitable insecticide, as a preventive; it is good practice to spray the trees immediately after the flowering period.

PLUMS.—The general treatment of plums follows on similar lines to that advised for cherries; here again varieties differ in their habit of growth, and must be treated accordingly. Such varieties as Reine Claude de Bavay, and Transparent Gage (old variety), must not be pinched too closely back; rather more latitude must be allowed, otherwise they fail to produce fruiting spurs. There is every appearance of a heavy crop, and early thinning of fruits should take place when it can be definitely decided which fruits are likely to swell away satisfactorily. The Plum Aphis has already put in an appearance, and unless prompt measures are taken to eradicate the pest by spraying, it will quickly gain a strong foothold, and once the young leaves commence to curl up it is a difficult matter to reach the enemy.

PEARS.—All growths not required for extension should be pinched at the fourth or fifth leaf, and in some cases, to avoid overcrowding of the growths, thinning out is needed. The trees are carrying a wealth of blossom, and, so far as can be at present noted, the sharp snap of frost has not done much damage. If no further setback occurs, a considerable thinning-out of the fruits will be necessary to relieve the strain on the trees, and to eventually produce fine fruit; this operation should be carried out at an early stage of growth. Trees which are troubled by attacks of the Pear Midge should be carefully examined, and the infested fruits removed and burnt. The pest can be distinguished by the abnormal size and shape of the fruits.

MULCHING. — Trees newly planted against walls quickly feel the effects of dry weather, and require early attention in the way of watering and mulching; the mulching material does not require to be of a rich, feeding nature; the principal object is to keep the soil in a moist condition. In the event of mulching material not being available, the surface soil should be kept well stirred with the hoe. Trees recently planted in open quarters should also receive attention, and not be allowed to suffer for lack of moisture.

STRAWBERRIES.—The littering down of the beds should be completed as soon as possible; the surface soil should be well stirred and freed from weeds, and a dusting of soot applied before laying down the litter; strawy litter when used direct from the stables, unless well washed by rains prior to the fruits ripening, is liable to impart an unpleasant taste to the fruits. Means should be taken for protecting the early blossoms from frost and cold winds.—H. MESSENGER, Woolverstone Park Gardens.

---

**Prunus Pissardi Moseri flore plena.**—The original Prunus Pissardi rapidly made headway in popular favour owing to the rich purple colour of its foliage, while, regarded from a flowering point of view alone, it is decidedly ornamental, as the whitish blossoms are borne in great profusion. For forcing for early flowers its merits must not be overlooked, but in this respect it is greatly surpassed by this newer form, whose pink blossoms are larger than those of the type, and of a semi-double character. As the foliage is also richly coloured, it will no doubt, from the showy nature of its blossoms, be also in demand for outdoor planting.—T.

# ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.

### Privilege to Official Gardeners' Societies.

The directors have decided to grant a special privilege to members of bonâ fide gardeners' mutual improvement and similar societies. The secretaries of such societies purchasing not fewer than 20 admission tickets for the exhibition will be accorded a discount of 20 per cent. upon 1s. tickets, and 10 per cent. upon all higher-priced tickets. A parcel of 20 tickets and upwards need not be comprised of tickets all of the same value; in fact, it may be made up in any way convenient to the society, so long as not fewer than 20 are purchased at the same time. Societies wishing to avail themselves of these facilities must apply for their tickets on or before May 13, as no discounts can be allowed after that date.

### Exhibition Cups.

Never before has there been anything like such an array of valuable cups for presentation at an exhibition of this nature. Not only are the directors offering a large number themselves, but his Majesty the King, the President (the Duke of Portland), Sir Jeremiah Colman (treasurer), Lady Colman, J. Gurney Fowler, Esq. (chairman), Sir George Holford, C.I.E., K.C.V.O., Baron Bruno Schröder, Monsieur Lambeau (Brussels), and others are all offering cups for various purposes. The Worshipful Company of Gardeners and most of the other horticultural societies, the Veitch Memorial Trustees, and the Horticultural Club offer either cups or gold medals; and most of the larger firms of nurserymen and seedsmen in Britain, as well as several on the Continent, and even in Japan, and the proprietors of the "Gardeners' Chronicle" are contributing cups, and another series of such prizes will be forthcoming from many of the counties. The county cups are likely to have an average value of about £25.

It is felt that the public should have an opportunity of inspecting these numerous cups and plate, and it has therefore been arranged to exhibit them at a meeting of the Royal Horticultural Society, on May 14, in the Society's Hall, Vincent Square, Westminster. They will be on view at the exhibition on May 22, 23, and 24, the first three days of the show.

### Some of the Entries for the Exhibition.

From the entries received all types of carnations will be represented in abundance. The perpetual-flowering section, the Souvenir de la Malmaison type, the border varieties—all will vie with each other in presenting a brilliant show of colour. There are, for instance, four entries in a class for groups of carnations in flower, arranged on spaces of 200 square feet each. The tuberous-rooted begonias, so resplendent at most of the summer shows, will contribute some of the most brilliant colouring ever seen. There are three entries in a class in which each exhibit can claim an area of 200 square feet.

Streptocarpuses—a race of greenhouse plants which has come into special notice during the past ten years—have attracted four entries in a class for exhibits occupying 200 square feet each.

In no division, however, is there more reason for satisfaction than in that for alpine plants and rockeries. Nine entries appear in the class for alpine plants arranged in spaces of 100 square feet, and seven entries in another competition for exhibits occupying 50 square feet. There will be 14 or more great rockeries constructed in the open garden, seven in a class for rockeries of 600 square feet each, and seven in a competition where the space is limited to 400 square feet.

In the cut flower section, sweet peas will figure largely, although most of the flowers will have been grown under glass, in order to be ready for the early date. There are 14 entries in a competition for the "Sherwood" Cup for groups of sweet peas in spaces of 12 feet by 3 feet, and eight competitors for Messrs. Dobbie's cup, in spaces of 6 feet by 3 feet. Four exhibitors will compete in a class for new sweet peas introduced to commerce since September, 1910.

### Boy Scouts and Veteran Soldiers.

Arrangements will be made for employing Boy Scouts as messengers, especially on the first day of the exhibition, May 22, when the finding of the 75 sections of the jury will be communicated to the commissariat immediately each class is adjudicated upon. All members of the jury are asked to be present at the exhibition at 7.30 in the morning, and it is expected that most of the judging will be completed before 11 o'clock a.m. Veteran soldiers in uniform, from the Chelsea Hospital, will be employed as attendants, and ambulance corps will be furnished by the St. John's Ambulance Society. Indeed, all will be done that is possible not only to provide against accidents, but to secure the greatest comfort of the visitors to this great exhibition.

# NOTES OF OBSERVATION.

**Acalypha Sanderiana.**—The required number of plants of this beautiful species may be worked up either by cuttings of the strong young shoots, or by cutting the old stem into lengths of two or three inches, with a plump eye at their apex. Insert singly in thumb pots filled with light, sandy soil, and plunge in a hotbed. When nicely rooted inure to more light and air, and transfer to larger pots. Pot firmly to ensure short-jointed growth and robust leafage. Use a compost consisting of two parts loam, one of flaky leaf-soil, with a good sprinkling of dried cow or sheep manure, sand, and bone-meal. Red spider is very partial to acalyphas, and immediately it puts in an appearance, take prompt action to eradicate it by frequent spongings. The best specimens I have seen had the points pinched out when about nine inches in height, and when new growths were produced three of the strongest were retained.—H. T. Martin.

**Impatiens Holsti.**—This was introduced about ten years ago from German East Africa, by way of the Berlin Botanic Garden, and it quickly became popular. Since then we have had many forms put into commerce, but as an all-round plant the typical Impatiens Holsti remains, I think, unsurpassed. It is of good free growth, and branches so freely as to soon form a well-furnished specimen, while it flowers throughout the greater part of the year. For bedding out during the summer it has proved to be about the best of all these balsams. The colour of the flower is bright vermilion. In Impatiens Herzogi the flowers are larger and with more of a salmon suffusion, but the season of blooming does not seem to extend over as lengthened a period. Not only these two but other tropical kinds have proved themselves decided acquisitions to our indoor flowering plants. They strike readily from cuttings, and seeds are often obtainable.—W.

**Heracleum giganteum.**—This is a noble plant of gigantic proportions, most suitable for grouping beside water, yet succeeding equally well in the bolder parts of the wild garden. So far as the flower heads and individual flowers are concerned, it is surpassed by the Siberian species, H. Mantegazzianum; both succeed in a deep soil that is inclined to heaviness, which should be well broken up before planting, as, once established they call for no further attention. This genus belongs to the natural order Umbelliferæ, and the inflorescence of both species are most suggestive of cart wheels, hence the common name of cart-wheel flower; in like manner, the leaves and roots give rise to the other popular appellative of giant cow parsnip.—T. S.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY
of
MANCHESTER and the NORTHERN COUNTIES.
Founded 1829.

GRAND ROSE SHOW,
and
SUMMER SHOW,
On JULY 19th and 20th,
at the
WHITE CITY and ROYAL BOTANICAL GARDENS,
MANCHESTER.

Schedules and all particulars from Mr. P. Weathers, Secretary, Royal Botanical Gardens, Old Trafford.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

### Midland Daffodil Society.

The annual exhibition of this important and flourishing society was opened at the Botanical Gardens, Edgbaston, Birmingham, on Thursday, April 25, and continued on Friday. It had been apparent for some little time past that, in consequence of the earliness of the season the show would be too late for such a large display of daffodils as have generally been seen at Birmingham, and it therefore occasioned no surprise among visitors when they found there was a considerable falling off in the number of entries, and that only the latest types were staged in anything like good form. One cause for general satisfaction, however, was that glorious weather prevailed, whereas in previous years it has often been of a stormy and unpleasant character. Notwithstanding the absence of some few of the leading lights in the daffodil world, there was a good gathering of experts, among whom we met the Rev. G. H. Engleheart, Rev. J. Jacob, Mr. G. H. Van Waveren, Mr. P. R. Barr, Mr. T. Batson, Professor West, Mr. W. T. Ware, Mr. J. D. Pearson, Mr. C. Bourne, and many others whose names figure prominently wherever daffodil growers foregather. Mr. Robert Sydenham was as active and jovial as ever, and Mr. Herbert Smith, the secretary, was, it goes without saying, courtesy and energy personified.

COMPETITIVE CLASSES.

The biggest class was for a collection of fifty varieties representative of the different divisions, three stems of each variety. Of the three entries staged the best collection was adjudged to be that shown by Rev. J. Jacob, Whitchurch. It was a very creditable exhibit, and included a number of good varieties, among which the pheasant-eyes Horace and Cassandra, and a giant gold trumpet variety named The Doctor, stood out boldly. R. Strauss, a big bicolor, and a pretty pure white, small cupped variety named Hoar Frost, were also interesting. The winner was closely followed by Messrs. Cartwright and Goodwin, Kidderminster, who had nice flowers of Hildegarde, Genial Star, Matthew Arnold, Coventry Patmore among the flat cups, together with Marshall Hall, Princess Ena, Cornelia, and Mrs. H. J. Veitch in trumpets. The third prize was awarded Mr. J. Pope, King's Norton, for good flowers. Only two entries were forthcoming in the class for twelve distinct varieties of trumpets, a class that generally brings out a keen contest. Mr. W. A. Milner, Sheffield, scored, showing Agincourt, Copenhagen, Toski, Poitiers, Trafalgar, Grandee, Falkirk, Monarch, Hastings, Waterloo, Omdurman, and Tel-el-Kebir. The second prize was taken by Mr. J. H. Mallender, Bawtry, on whose stand were flowers of Cherub, Mark Twain, Sir Bedivere, and others. Mr. Mallender had matters all his own way in the class for six incomparabilis varieties, distinct, showing Orangeman, Will Scott, Strongbow, Jas Janson, Deep Dale, and Loge Hill. Mr. H. D. Phillips, Olton, had the best of three entries for six Barri varieties, showing Ptarmigan, Persian Orange, Northern Queen, Rosella, Bullfinch, and Tangerine; the other prizes were awarded to Rev. J. Jacob and Mr. W. A. Milner in this order. For three distinct varieties of triandrus hybrids, three blooms of each, Mr. W. A. Watts, St. Asaph, led with White Swallow, Canaes, and Gwyn; Rev. J. Jacob and Mr. W. A. Milner again being second and third. The Rev. Jacob won both for six varieties of Tazetta and Tazetta hybrids, and for nine true poeticus varieties, distinct.

Mr. Mallender had the best single bloom white trumpet, showing Sybil Foster. Rev. J. Jacob's Puritan scored as the best Barri, and Mr. C. Bourne, Bletchley, won the Leedsi award with Moonbeam, and the single bloom of poeticus with Sonata. The names of J. A. Kenrick, Esq., Messrs. Cartwright and Goodwin, Mr. F. H. Chapman, W. A. Watts, and H. D. Phillips, also appeared among winners for single flowers in various divisions, but competition was limited to an entry or two per class.

The Bourne challenge cup for twelve distinct varieties of daffodils that have been raised by the exhibitor went to Mr. Crosfield, Bridgwater, who staged a collection of interesting flowers, conspicuous among them being an unnamed seedling with a very attractive orange-crimson crown; Mr. W. A. Milner was second in this class. The Rev. J. Jacob won in the novice seedling class for six daffodils that have not been in commerce more than four years, and also the Herbert Chapman poeticus trophy for six true poeticus that have not been in commerce more than four years. The Walter Ware challenge cup for eighteen distinct varieties of obvious Triandrus hybrids was won by Mr. W. A. Milner.

### THE NON-COMPETITIVE EXHIBITS

were this year of greater value than ever, making up as they did very materially for the deficiency of flowers in the competitive classes. Messrs. Barr and Sons, Covent Garden, London, occupied the end of the conservatory in front of the bandstand with a capital lot of daffodils, among which Masterpiece, a variety with chaste white perianth and symmetrical crown of brilliant terracotta, was very striking; Red Beacon, Bloodstone, Czarina (a big cream with lemon-yellow edge), and White Lady, were also good. Quite a novelty in narcissi was staged on Messrs. Barr's stand, bearing the name Gardenia, in which the crown had developed a petaloid character, giving the flower an appearance resembling the gardenia. Messrs. Barr and Sons also showed a fine lot of Darwin tulips, Moonlight, a very large clear yellow, being striking.

Messrs. Robert Sydenham, Lim., Tenby Street, Birmingham, exhibited narcissi, chiefly of the pheasant-eye and flat-crowned sections. Millie Price was one of the most attractive pheasant-eyes in the show. Ball of Gold, a big yellow trumpet, was also good. Some choice tulips were staged by the same firm, who also had St. Brigid anemones, Lily of the Valley, Muscari, and other bulbs in fibre.

A splendid exhibit came from Messrs. Sutton and Sons, Reading, comprising cinerarias of both large-flowered and stellata types, beautiful hybrid Primula obconica, large-flowered calceolarias, fragrant stocks, and well-grown mignonette. Mr. H. N. Ellison, West Bromwich, filled a large table with choice ferns representative of the most useful greenhouse species and varieties. Some fine vases of hybrid gerberas added colour to the exhibit.

Messrs. Cartwright and Goodwin, Kidderminster, contributed a collection of narcissi and tulips, the pheasant-eyes Rudyard Kipling and Childe Harold, and the large golden trumpet Mrs. H. J. Veitch, being particularly good. The Rev. G. H. Engleheart, Dinton, Salisbury, as usual, brought a set of unnamed seedling daffodils that proved a great attraction to the growers present. We usually look for something special in trumpets from this expert raiser, but on this occasion the stand was almost monopolised by small-cupped varieties. Mr. R. F. Felton staged, in conjunction with Mr. Engelmann, Saffron Walden, a stand of perpetual-flowering carnations with a few bowls of those beautiful roses Prince de Bulgarie and President Carnot. The carnations, which were tastefully arranged in Japanese vases, included the rich crimson British Triumph, Sunstar, Rex, a very neat salmon-pink variety, and Salome, a flower of lovely mauve tint lit up with rose. Messrs. Hewitt and Co., Solihull, had a bank of carnations, including La Mode, Lady Northcliffe, Empire Day, and others of recent introduction, the whole being set off by a groundwork of ferns and foliage plants. Carnations also came from Mr. S. Mortimer, Farnham, and a big batch of Spanish irises were staged by Mr. R. de Day, Sutton Scotney, whose exhibit would have been more interesting if the flowers had not been quite so crowded.

Messrs. B. R. Cant and Sons, Colchester, brought a delightful exhibit of roses, among which the Austrian briars, Tausendschon, and other decorative varieties served as a background to hybrid teas of excellent quality. Mr. W. A. Watts, St. Asaph, staged daffodils, tulips, and a number of polyanthus in distinct colours; and from Mrs. E. Lloyd Edwards, Bryn Oerog, Llangollen, came hybrid saxifragas and Aubrietia Lloyd Edwards.

A rockery arranged on a stage across one end of the conservatory was exhibited by Messrs. Bakers, Wolverhampton.

### THE DINNER.

On the evening of the first day of the show a large company, comprising the judges, exhibitors, and a number of visitors were entertained at dinner at the Grand Hotel, by Mr. Robert Sydenham, who has always been the life and soul of the Midland Daffodil Society.

## North of England Horticultural Society.

APRIL 24.

On this date the North of England Horticultural Society held an exhibition of spring flowers in the Corn Exchange, Leeds, and we are pleased to record the fact that the display produced was extensive and of high quality, and the attendance very large. The last fact is of special interest, for last year the interest shown by residents of Leeds in the work of the society was disappointing, and we trust this interest may continue. The exhibition was opened by Mrs. G. R. Lane Fox, of Bramham Park, who, in the course of the proceedings, expressed the hope that the society would stimulate a still greater interest in gardening.

One of the chief features was formed by the contributions of orchids, especially noteworthy being those from Mr. J. H. Craven, Keighley; Messrs. A. J. Keeling, of Bradford; and Messrs. Charlesworth and Co., of Hayward's Heath; the collection from the latter being of special interest. Earl Grey sent from Howick Hall a collection of daffodils, in which nearly a hundred varieties were represented. An attractive group of cyclamen was shown by Mrs. Whitehead, Deighton Grove, York; and Mr. W. Sheepshanks, Arthington Hall, arranged a rock garden that evidenced much taste and judgment. Messrs. W. Artindale and Sons, Sheffield, exhibited alpine plants and cut flowers of various kinds, and from Mr. Engelmann, Saffron Walden, came a beautiful collection of carnations.

The following awards were made:

### ORCHIDS.

Large Silver Medal.—Messrs. Charlesworth and Co., Hayward's Heath, and J. H. Craven, Esq., Keighley (head gardener, Mr. F. Corney), for orchids.

Silver Medal.—Messrs. A. G. Keeling and Sons, Bradford, for orchids.

Diplomas (second class).—To Cattleya Mendeli "The Knowle" var., from J. Hartley, Esq., Morley (head gardener, Mr. Wm. Coupe); and to Odontioda Bradshawiæ "Rawdon" var., from Messrs. Mansell and Hatcher, Lim., Rawdon.

### PLANTS AND FLOWERS.

Gold Medal.—The Right Hon. Earl Grey, Howick, Northumberland (head gardener, Mr. W. H. Lambert), for narcissi, etc.

Large Silver-gilt Medal.—Mr. C. Engelmann, Saffron Walden, for carnations.

Silver-gilt Medal.—Mr. Walter Allsop, Leeds, for alpine garden.

Large Silver Medal.—Messrs. Aldis and Rowntree, Leeds, for Narcissus poetaz, etc.; Mrs. Whitehead, Deighton Grove, York (head gardener, Mr. G. W. Richardson), for cyclamen; the Cookridge Nurseries Company, Leeds, for forced shrubs, etc.

Silver Medal. — Messrs. S. Broadhead and Son, Thongsbridge, Huddersfield, for alpines; Messrs. G. Gibson and Co., Leeming Bar, for herbaceous and alpine plants; Messrs. Wm. Artindale and Son, Sheffield, for alpines and cut flowers.

Large Bronze Medal.—Mr. Alva J. Hall, Harrogate, for alpines, ferns, and shrubs; Messrs. Conways, Lim., Halifax, for alpines and forced shrubs; and W. Sheepshanks, Esq., Arthington Hall, Leeds (head gardener, Mr. O. Wilson), for alpines.

Diplomas (First Class).—Carnation Regina, from Mr. C. Engelmann, Saffron Walden; Viola cornuta Craven Gem, from the Craven Nursery, Clapham, Lancaster (manager, Mr. G. Redman).

Diploma (Second Class).—Carnation Sunstar, from Mr. C. Engelmann, Saffron Walden.

### FRUIT AND VEGETABLES.

Silver Medal.—Mr. W. Dixon, Kirkgate, Leeds, for bees and appliances; and the Four Oaks Spraying Company, for spraying machinery.

At the meeting of the Fruit and Vegetable Committee the following officers were elected: Chairman, Mr. W. Hague, Mearwood Tower Gardens, Leeds; vice-chairmen, Mr. J. Hathaway, Baldersby Park Gardens, Thirsk; Mr. W. H. Dobson, Stapleton Park Gardens, Pontefract; Mr. H. J. Clayton, Wharfe Bank, Ulleskelf, York; secretary, Mr. G. Dunsmore, Throstle Nest Gardens, Chellow Dene, Bradford.

In the afternoon a lantern lecture on "Mendelism" was given by Mr. J. M. Hector, of the University of Leeds, and this, like the exhibition, was well attended.

## National Auricula and Primula Society.

(SOUTHERN SECTION.)

The annual exhibition was held at Vincent Square, Westminster, on Tuesday last. The majority of the classes were well filled, and especially in the alpine section, but the fine exhibits of hardy primulas and polyanthuses we have seen in the past were absent this year. On the whole the exhibits were a success, in spite of the untoward spring.

The premier award for twelve show auriculas, distinct, was won by Mr. J. Douglas, Great Bookham, who staged twelve fine specimens. The varieties were Favourite, Able Liszt, Scarlet Seedling, Acme, Shirley Hibberd, Mikado, Eucharis, Prince Charming, Orpheus, Geo. Lightbody, and George Rudd. Mr. J. L. Gibson, Leatherhead, was second with good typical plants of Shirley Hibberd, Harrison Weir, Richard Headley, George Lightbody, and Mrs. Phillips. Messrs. Phillips and Taylor, Bracknell, were third with a rather weaker display. There were six entries.

In the class for six show varieties, Mr. J. Douglas was placed first with a splendid half dozen. The varieties were Harrison Weir, A. Barker, Prince Charming, Victor, Lavina, and Wheatear. Mr. J. L. Gibson was second, his best flowers being Rifleman, Geo. Rudd, and Smiling Beauty. Mr. W. M. Shipman, Altrincham, was third. (Six entries.)

There were but three exhibitors in the class for four varieties, Mr. A. S. Hampton, Reading, winning first prize with Mrs. Henwood, Dinham, Vanity, and Mikado; Mr. F. W. Price, Beckenham, came second with Mrs. Henwood and Shirley Hibberd as the best examples, while Mr. W. G. Langlands, Epsom, was third. Mr. F. W. Price led for two plants with Shirley Hibberd and Mrs. Henwood, followed by Messrs. A. S. Hampton and W. G. Langlands in the order named.

Mr. Jas. Douglas won first prize for the best single plant of a green-edged variety with Prince Charming, and second with Rifleman; Mr. F. W. Price was third; a good competition. For a single grey-edged variety Mr. Jas. Douglas was second with Richard Headley, and Mr. W. H. Payton third with Acme. The first plant had been removed. Mr. Shipman was first for a white-edged variety, staging Acme; he also was placed second. The best self was shown by Mr. J. Douglas, who staged a fine example of the Mikado, and second with Peggy Gibson; Mr. Shipman third with Mrs. Phillips.

In the class for four show varieties Mr. J. L. Gibson was the only exhibitor, and received the first prize with very fair examples for an amateur.

For twenty-four plants in the alpine section, not less than twelve varieties, Mr. Jas. Douglas secured the premier award with fine plants of Roxburgh, Prince of Tyre, Muriel, Prince Arthur, Golden Eagle, Mrs. J. Douglas, Claude Halcroft, Robert Bruce, Duke of York, and Majestic, as the best examples; but as the labels were evidently not in a position for reading readily, some had to be passed because the names could not be seen. Messrs. Phillips and Taylor were second, having excellent examples of Majestic, Her Grace, Mrs. M. R. Smith, The Idol, Argus, and quite a number of seedlings. Mr. W. M. Shipman was third with some fine plants of Commander, Majestic, Exquisite, Duke of York, Dean Hole, and Mars.

Mr. Jas. Douglas was first again for twelve alpine varieties, having splendid examples of Blue Jay, Prince of Tyre, Argus, Roxburgh, Phyllis Douglas, Robert Bruce, and Muriel. Mr. W. M. Shipman followed with Dean Hole, Majestic, Bluebell, Duke of York, Ilene, Sunrise, and some seedlings. Messrs. Phillips and Taylor were third.

In the section for small growers, Mr. F. W. Price won first prize for six plants with a good half dozen, his best being Argus, Muriel, and Phyllis Douglas; Mr. J. G. Baxter, Beckenham, followed with weaker plants. The class for four varieties was well contested, Mr. F. W. Price carrying off the first honours again with good examples of Phyllis Douglas and Argus; Mr. W. G. Langlands was a good second, and Mr. J. Dupuy, Ilford, third.

Mr. Jas. Douglas was placed first for a single plant with gold centre, with a fine specimen of Muriel, amongst twelve competitors. Mr. F. W. Price won the first place with Phyllis Douglas for a white-centred variety; Mr. J. Douglas being second with Prince of Tyre.

Mr. G. E. W. Herbert, Streatham, won the first prize for six varieties in the novices' class, while Mr. J. L. Gibson had the best six plants in this section, having good examples of Flora M'Ivor, Ulleswater, and Duke of York. Mr. J. Dupuy was a capital second.

The premier show auricula was staged by Mr. Jas. Douglas, the variety Victor, a rich crimson. The premier alpine variety was Mars, staged by Messrs. Phillips and Taylor; while the Jas. Douglas memorial cup was awarded Mr. W. M. Shipman.

Messrs. Jas. Veitch and Sons, Chelsea, staged a nice collection of auriculas, which embraced all sections of the flower. The plants were well grown, and the flowers just right for the date of the show. Primula Unique was also in very fine form, and attracted much attention. From Messrs. Phillips and Taylor, Bracknell, came a nice exhibit of auriculas, chiefly of the alpine type, which were in fine condition; also a box of Primula Sieboldi, making a pleasing combination.

## Royal Horticultural Society.

(Continued from page 354.)

MEDALS.

Gold.—To Messrs. Sutton and Sons, Reading, for early vegetables and salading; to Messrs. George Mount and Sons, Canterbury, for roses.

Silver-gilt Flora.—To Messrs. Sutton and Sons, Reading, for tulips; to Sir Randolf Baker, Bart., M.P., Ranston, Blandford (gardener, Mr. A. E. Usher), for tulips.

Silver-gilt Banksian.—To Messrs. Barr and Sons, Covent Garden, for tulips; to Messrs. R. Wallace and Co., Colchester, for tulips; to Messrs. Wm. Cutbush and Son, Highgate, for shrubs and carnations; to Messrs. Pipers, Bayswater, for a walled and paved garden.

Silver Flora.—To Messrs. Dobbie and Co., Edinburgh, for sweet peas; to Messrs. H. B. May and Sons, Edmonton, for hydrangeas; to Messrs. John Waterer and Sons, Bagshot, for Rhododendrons Pink Pearl; to Mrs. Lloyd Edwards, Llangollen, for saxifragas; to Messrs. R. H. Bath, Wisbech, for tulips; to Mr. H. A. Tracey, Twickenham, for orchids.

Silver Banksian.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Charlesworth and Co., Hayward's Heath, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. Cartwright and Goodwin, Kidderminster, for tulips; to Mr. C. W. Breadmore, Winchester, for sweet peas; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. F. Cant and Co., Colchester, for roses; to Mr. C. Elliott, Stevenage, for alpine plants; to

Guaranteed Gardenalities
FLORA ABUNDA

GUARANTEED GARDENALITIES

(FERTILIZERS, INSECTICIDES, LAWN SAND, SPRAYING FLUIDS, Etc.)

Laboratory Tested from Raw Material to Finished Products.

*PLANTS FEED* with avidity and thrive on the elements of *CARMONA,* the guaranteed *FERTILIZER.*

What the soil lacks Carmona supplies

NITROGEN—PHOSPHATES—POTASH.

One after the other these guaranteed life-giving elements of Carmona become available for plant food in well-timed succession in perfectly regulated quantities. Carmona is all plant food—highly concentrated—and gets to its work immediately and methodically—feeding plants naturally from the roots up.

PRICES: 1 cwt., **20/-**; ½ cwt., **12/6**; 28lb., **7/6.** Tins, **6d., 1/-,** and **2/6.**

## FORTHCOMING ENGAGEMENTS.

SATURDAY, May 4.—French Horticultural Society of London.

North of England Horticultural Society; Conference on "Horticulture in Secondary Schools and Farm Institutes," at Newcastle.

TUESDAY, May 7.—Scottish Horticultural Association.

WEDNESDAY, May 8.—East Anglian Horticultural Club.

Royal Society of Arts.

Royal Gardeners' Orphan Fund Festival Dinner at the Hotel Cecil, 7 p.m.; Sir E. Durning Lawrence, Bart., will preside.

MONDAY, May 13.—United Horticultural Benefit and Provident Society.

TUESDAY, May 14.—Royal Horticultural Society; Committees meet at 12 o'clock; Master's Memorial Lecture at 3 p.m. on "Gardening and Drought," by Professor J. Bayley Balfour, F.R.S., V.M.H.; Scientific Committee at 4 o'clock.

National Tulip Society's Exhibition at the Royal Horticultural Hall.

Devon County Show at Plymouth.

WEDNESDAY, May 15.—North of England Horticultural Society, at Leeds.

THURSDAY, May 16.—Manchester and North of England Horticultural Society.

MONDAY, May 20.—National Rose Society, Conference at the Holborn Restaurant at 5 p.m.; dinner to foreign Rosarians at 7 p.m.

## ANSWERS TO CORRESPONDENTS.

HIBISCUS CULTURE.—Sussex: Please tell me whether the hibiscus is a stove or greenhouse plant, and give me a few hints as to its cultivation. I enclose specimen.—We much regret our inability to help you. The little portion of a leaf sent was quite useless for purposes of identification, though it suggests you have an exceedingly high opinion of our powers in this direction. If you will send us a good specimen, properly packed we will do out best to identify it, and then help you in the matter of cultivation, but it is a waste of your time and ours to send totally inadequate specimens.

HARDINESS OF THE WATER HAWTHORN.—R. C. R., Leighton Buzzard: Please tell me whether the water hawthorn would prove to be quite hardy in the Leighton district of Buckinghamshire? I have profited greatly by the excellent articles on rock and water gardening that have appeared in your pages from time to time, and have been led thereby to add some distinct and interesting features to my garden.—The water hawthorn (Aponogeton distachyon) should prove quite hardy in your district; indeed, it is only in exposed positions much farther north, where very severe frosts are experienced, that it fails to survive the winter. Although it will grow in deeper water, it is advisable to plant it where the depth ranges from 1ft. to 3ft. It is a charming aquatic, its white, hawthorn-scented flowers being very pretty and produced over a very long season. You cannot do wrong in adding Aponogeton distachyon to your list of hardy aquatics.

POINSETTIAS.—P. T., Leicester: When is the best time to start poinsettias into growth for the provision of cuttings?—Remove the old plants from their resting quarters at once, see that they are quite clean, and then place them in an intermediate house, where, under the influence of good light and frequent syringings, they will soon commence to grow. When the new shoots are large enough for cuttings, remove them with a little heel of old wood, and immediately put them into a bowl of fine dry sand, to prevent excessive bleeding. Put the cuttings singly in small pots, in sandy soil, and plunge over brisk bottom heat; if shaded and kept evenly moist they will soon root freely.

LIFE—THE GIFT.—M. E., Swanley: You will very greatly oblige several of your lady readers by quoting in your "Answers" column the inscription on the stone seat in the Kew Arboretum. The seat I refer to is one presented to Kew a few years ago by a number of past and present students of the College for Working Women, in memory of the late Miss Cassell, who for twenty years was superintendent of the college.—There is not time to verify the quotation at the moment of going to press, but we believe it reads: "Life—the Gift. Let us take hands and help this day we are alive together. Look up on high and thank the God of all."

BOTTLES FOR FRUIT BOTTLING.—M. J. L., Malling: I propose to bottle a fair stock of fruit for home use this season, and shall be glad if you can give me any information as to the best style of bottle to use.—Wide-mouthed bottles specially made for fruit-bottling may be obtained through almost any hardware dealer at from 3s. to 6s. 6d. per dozen complete, the price varying with the size and quality of the bottles. Many persons have a decided preference for bottles with glass tops instead of metal tops, and some like the "screw" tops; whilst others prefer the bottles whose tops, covers, or discs are held in position by "spring" clips. When counting the cost of the process of bottling it is well to remember that the same bottles, when once obtained, may be used repeatedly until broken; the chief renewals required are rubber rings, which are used with bottles for rendering them airtight. It is absolutely essential that the bottles should be air-tight. An imperfectly-fitting rubber ring or cover may be sufficient to cause failure after perfect sterilisation; the rings and covers must, therefore, fit perfectly. As this cannot always be guaranteed, there will be an occasional bottle which will not be successful. We have a decided preference for bottles that have a glass top which is held in position by metal caps that are screwed down by means of a thread on the neck of the bottle.

CLIMBERS FOR AN INTERMEDIATE HOUSE.—C. T. T., Ludlow: Will you kindly give me the names of a few useful climbers for an intermediate house of large size?—Suitable subjects are Clerodendron Thompsonæ, Allamanda magnifica, Aristolochia elegans, Thunbergia fragrans, Passiflora racemosa, Stigmaphyllon ciliatum, and Hibbertia dentata.

RHODODENDRON LUSCOMBEI.—S. C. H., Swanage: Is Rhododendron Luscombei a species or a hybrid? It is now in full bloom, but not flowering quite so well as usual. A friend tells me it is a hybrid; I have always considered it an introduced species.—Rhododendron Luscombei is a hybrid raised by Mr. Luscombe about 1880, and the parents are R. Fortunei and R. Thompsoni.

"COUCH" OR "TWITCH."—R. S., Bedford.—A weedy persistent grass, with whitish runners, is rarely absent from one part of my garden. It is, alas, all too common in many gardens and farms, and very well known as "couch" or "twitch." Please tell me the name of it and the best means of extermination.—The terms "couch," "twitch," "scutch," "squitch, "whickens," and "quack grass" are often applied by farmers in a general sense to several perennial weed grasses which creep on or below the surface of the soil. Three species of grass are commonly known by the name "couch": (1) True "couch" or "twitch" (Agropyrum repens, Beauv.; Triticum repens, L.). (2) Black "twitch" or common bent grass (Agrostis vulgaris, With.). (3) Onion "couch" (Arrhenatherum avenaceum, Beauv. var. bulbosum, Lindl.). These are amongst

THE
VERY LATEST
AND BEST IN
HAND PNEUMATIC SPRAYERS.

The "Four Oaks," acknowledged by all users to be far and away the best on the market.

No separate pump. Self contained. A great advance over those kinds with separate pump. Cannot get out of order. The easiest, handiest, and most economical sprayer for greenhouse and garden work and disinfecting.

The "FOUR OAKS" Streetley Pattern.

Capacity, 2 Quarts.
Working capacity, 6 Pints.

Prices:
In Copper - 25/-
In Steel - 17/6

The copper machine is recommended where price is not a great consideration. Is lighter, cleaner, and will not rust.

Sole manufacturers:—
THE FOUR OAKS SPRAYING MACHINE Co.,
Four Oaks Works,
SUTTON COLDFIELD, BIRMINGHAM.

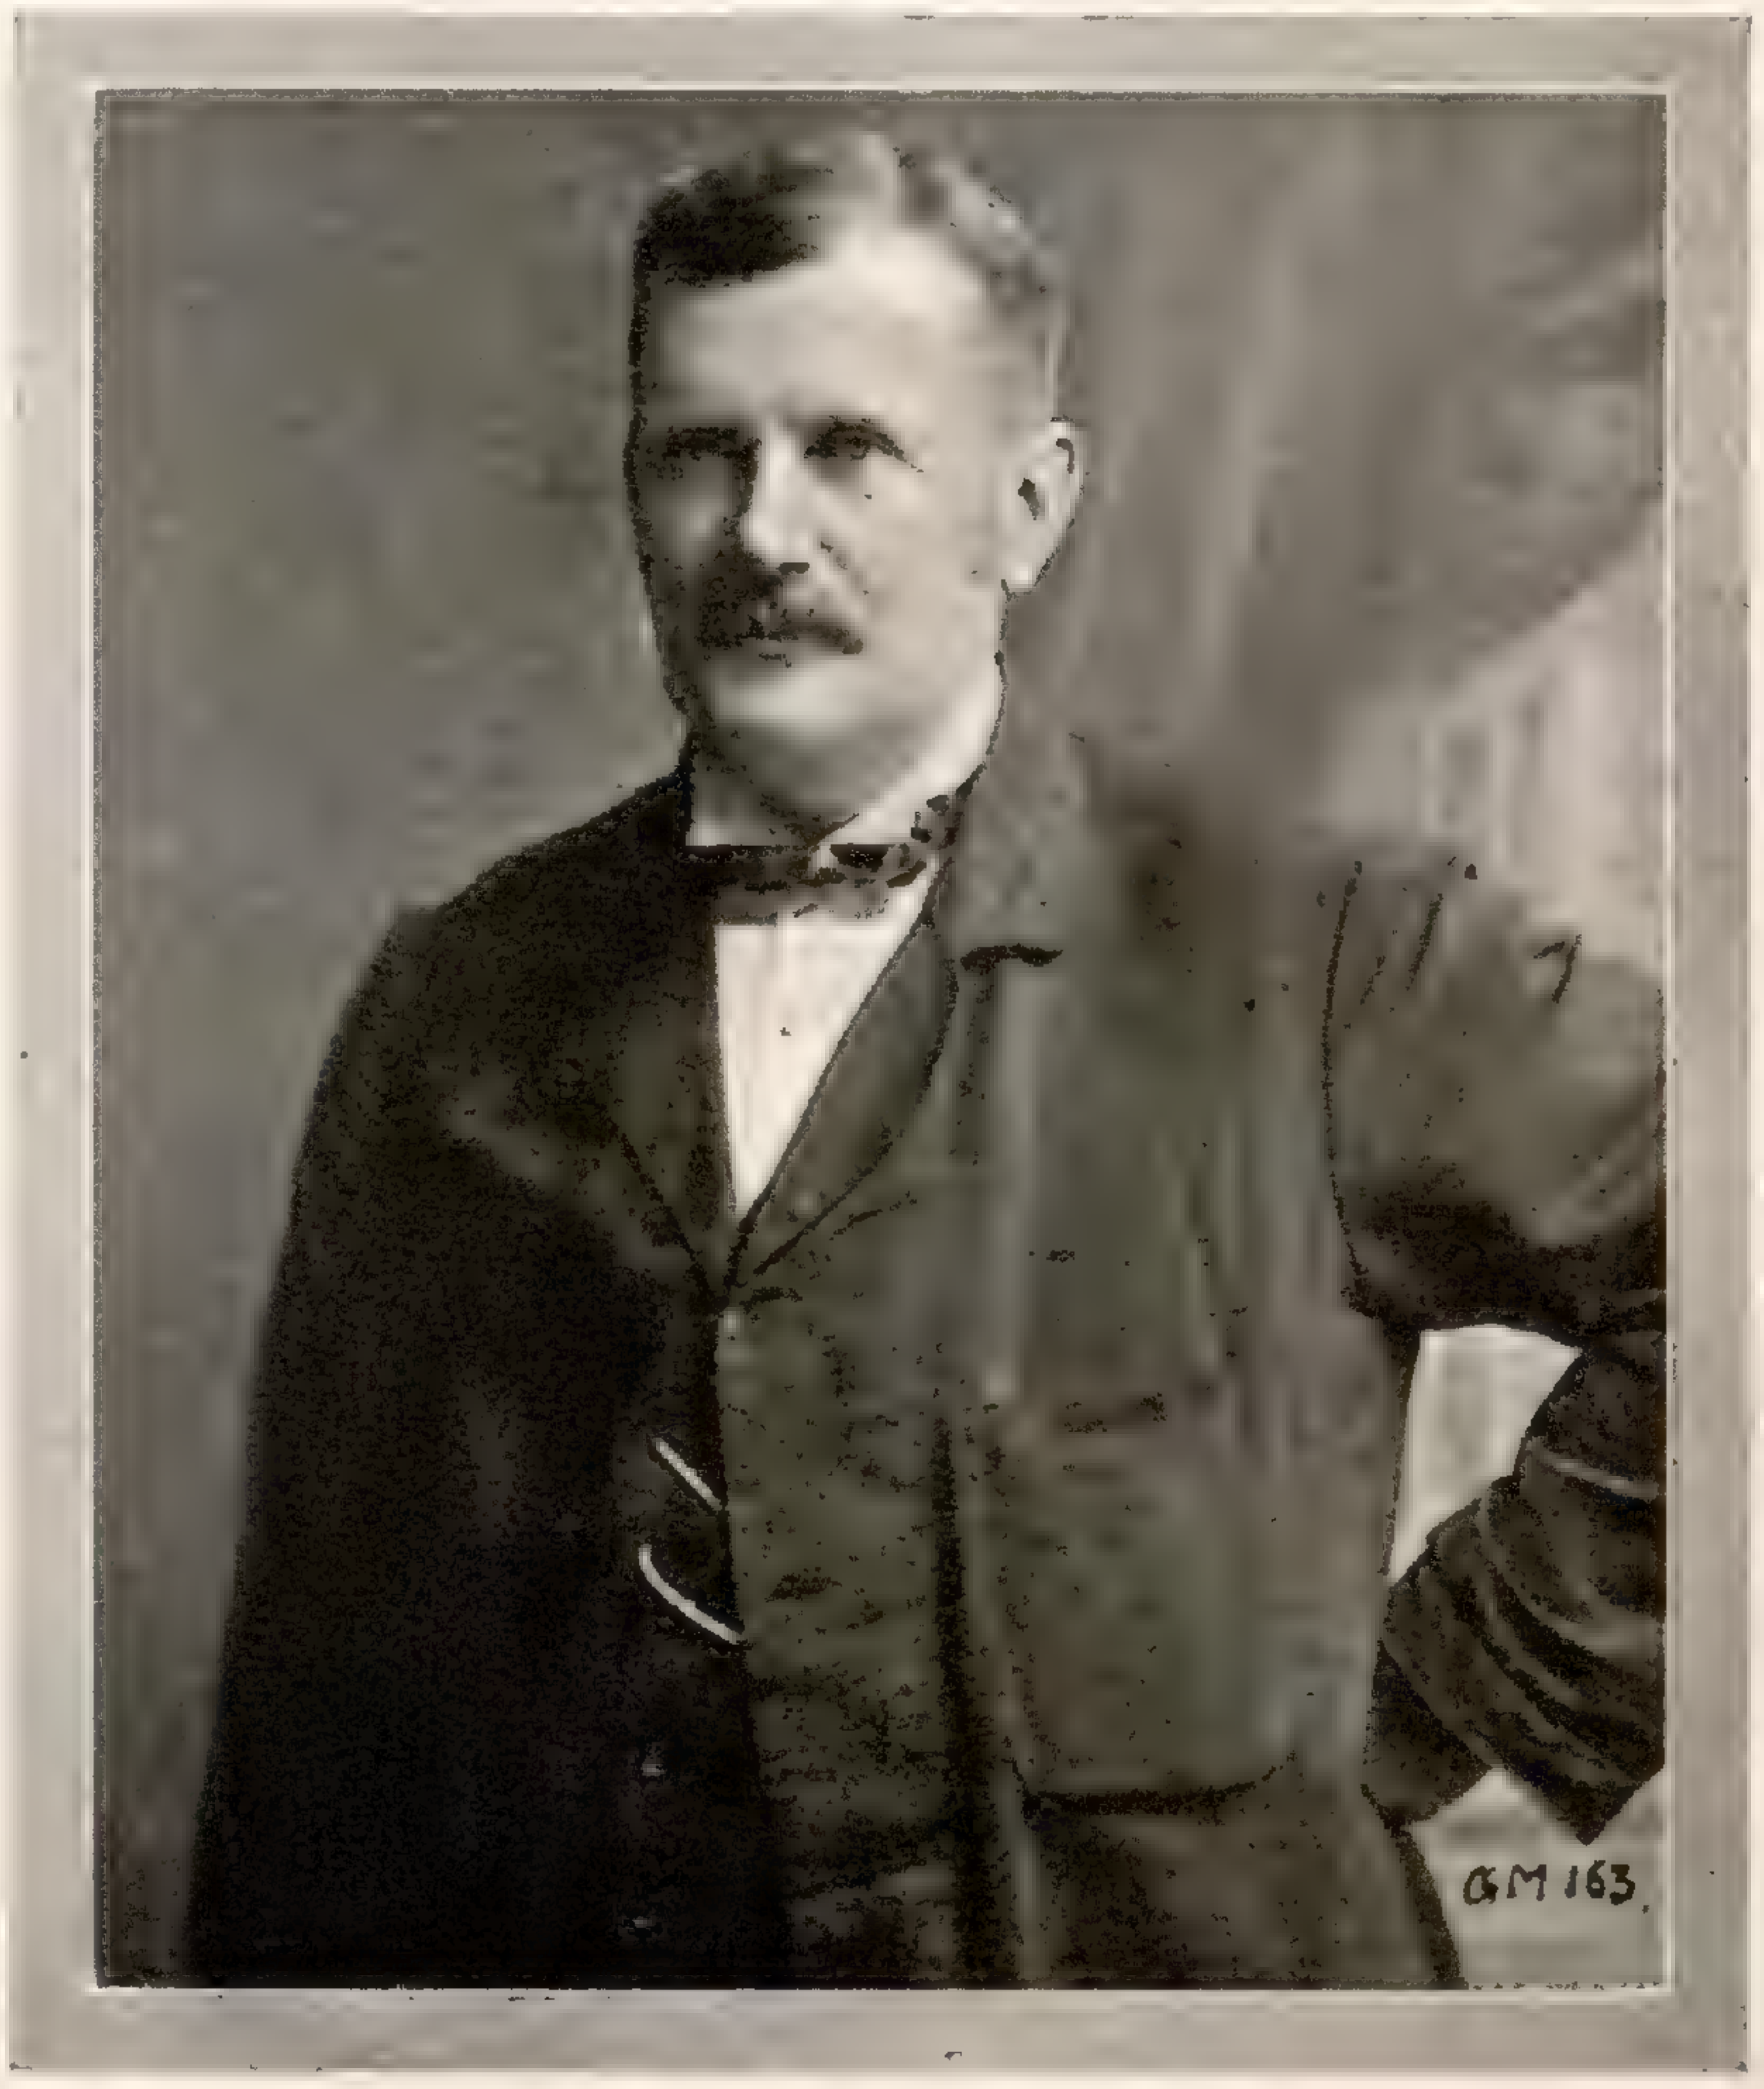
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### The Fern Spore.

When we consider the wonderful diversity of form, and especially of size, exhibited by the existing ferns of the world, ranging as they do from minute grass-like tufts to noble growths, scores of feet in height, borne on substantial trunks and crowned by wide-spreading plumes which rival the boldest palms with their spreading verdure, it is curious to consider that one and all can be engendered from a spore of such minute dimensions as to be individually all but invisible to the unaided eye. In flowering plants we find great diversity in the size of the seed, ranging from very tiny seeds to huge specimens as large or larger than a man's head, such as we see in the immense nut of the Seychelles cocoa palm, but in the fern tribe the spore is always minute, and its size is quite independent of that of the parent fern, the spore, for instance, of our comparatively small Polypodium vulgare being several times as large as that of an Alsophila Canthia Dicksonia, or other tree or trunk-forming fern capable of assuming imposing dimensions. Naturally, however, this difference in size between, say, the huge cocoa nuts and the minute fern spore, involves a great handicap to the latter in the initial stages of existence. The nut, in addition to the fertilised germ it contains, holds also such an immense store of nourishment within its adamantine shell, that its first product is a vigorous root, and this is followed by a huge pinnate primary leaf some feet in length and expanse; in fact, a very robust plant, capable of holding its own from the outset. With the spore, however, it is quite otherwise. Its first growth is all but as microscopic as itself, the eye can only perceive a minute green speck, which is at the mercy of every shower or other disturbing or destroying factor, and obviously must in a million, or rather many millions, of cases to one, fall a prey to some catastrophe, since otherwise the world would be overrun with ferns, and ferns alone. This tiny speck, if it survives to do so, is capable of expanding into a larger growth, little larger, however, than a herring scale, and this in time will bear upon its under side the equivalents of flowers and seed, and through these will reproduce the parental form. Minuteness, however, still prevails, the fern fronds are, perhaps, but half an inch high, the next an inch, and so on in slow progression, so that, as a rule, a robust, thoroughly established plant of full size, even minus a trunk, which is a growth of many years, requires a year or two at least for its development, usually several. During this period, it has, of course, to carry on the struggle for existence in competition with its fellows and with all the other vegetation which invades its habitat, so that even when the risks of the first infantine stage are survived, it is by no means assured of reaching the full specific size. Under natural conditions, millions, as we have said, come to grief for every one which survives, and this leads us to the question of the fertility in spore production which compensates for this waste. The number of spores produced by a large tree fern absolutely defies computation. On smaller ferns, such as a Lady fern, the annual crop has been reliably computed as over a thousand millions upon one plant, and anyone who has had the opportunity of examining the backs of the fronds of a tree fern with an immense crown of a score or more of fronds, ten to twelve feet long, and some feet wide, and has found the backs to be completely covered with tiny spore heaps, each heap representing, say, forty or fifty capsules, each containing as many spores, will speedily recognise the hopelessness of forming any definite idea of the multitude of spores which must be present. From a single such heap, carefully sown in sterilised soil, many scores of plants can be readily raised, a proof that, despite their numbers and profuseness, every spore is gifted with reproductive powers, and contains that precious nucleus enshrined within its tiny embryo cell, which, given the chance, can reproduce the parental form with all its character and peculiarities complete. We have used the word "waste" in this connection, but there is no true waste in Nature, for the vast majority of spores, to be devoid of perfection as regards the reproductive power, would be waste indeed, since when they fell on fertile ground, a chance would be lost, which now is eagerly seized upon, however vain in its ultimate result, owing to external handicaps. When we consider, too, that some of our finest coal consists mainly of the spores and spore cases shed from the ferns and fern allies of the carboniferous age, we obtain another glimpse of the non-existence of "waste" in Nature, as we warm ourselves in the genial glow of their combustion, and by that combustion restore once again to aerial circulation the carbonic acid which has been so long locked up and banked, as it were, for our benefit, and is now available for a fresh lease of vegetative life.



MR. G. CASELTON.

**Mr. G. Caselton** has for so long a period occupied a prominent position among the horticulturists whose activities are more or less closely associated with the Metropolis, that in presenting our readers with his portrait there is no occasion to refer otherwise than briefly to the work he has accomplished. As the superintendent of the horticultural department of the Crystal Palace, at Sydenham, he has contributed in a marked degree to the attractions of this well-known place of public resort, and as the manager of the flower shows he has, by his judgment, tact, and courtesy, added in no small degree to their success. It is now many years since Mr. Caselton succeeded the late Mr. W. Head in the position he now holds, and throughout the period he has annually been successful in providing displays of summer flowers that have given great pleasure to visitors, and reflected much credit upon himself. Recognising the trend of public taste in relation to the garden, Mr. Caselton adopted a much bolder style of arrangement than had previously predominated in the embellishment of the terraces and the more highly-dressed parts of the grounds, and the bold groups of dahlias, fuchsias, roses, phloxes, fine foliage plants, etc., are certainly better adapted to large areas than the style of bedding that was previously in vogue. Mr. Caselton is a member of the committee of the Royal Gardeners' Orphan Fund, and in the discharge of the duties in connection therewith, as in the other movements with which he is associated he evinces the same zeal and judgment as that displayed in his ordinary avocations.

**Certificates at the Royal International Horticultural Exhibition.**—Certificates and awards of merit will be awarded at the International horticultural exhibition, just as they usually are at the shows of the Royal Horticultural Society. An arrangement has been entered into between the Directors of the International and the Council of the Royal Horticultural Society, by which the latter society agrees to regard such awards granted at the International exhibition as the same as R.H.S. awards. Anyone showing plants for certificate must send their entries to Mr. A. J. Gaskell, R.H.S. Hall, Vincent Square, at least two days before the opening of the exhibition.

**Kew Guild Dinner.** The annual dinner of the Kew Guild will be held at the Holborn Restaurant in the Venetian Chamber, on Tuesday, May 28, at 7.30 p.m. The dinner will be preceded by the annual general meeting at 6.45 p.m. Lieut.-Colonel D. Prain, C.M.G., Director of the Royal Gardens, Kew, has kindly consented to preside at the dinner, and, as many Kewites from home and abroad will then be in London for the International Exhibition, there is every reason to anticipate a good gathering. Members who intend being present are asked to notify the Secretary, Mr. Herbert Cowley, South Side, Kew Green, as early as possible.

**R.H.S.'s New Inspector of Fellows' Gardens.**—The work of inspecting the gardens of Fellows of the Royal Horticultural Society, and advising thereon has increased so much of recent years, and has necessitated Mr. S. T. Wright's absence from the Wisley Garden so often, that the Council of the R.H.S. have long felt the desirability of appointing an inspector, who should be entirely independent of the Wisley staff, thus leaving Mr. Wright free to devote his whole time to the society's garden and shows. The very great difficulty of finding an inspector who should not only be as efficient and capable as Mr. Wright, and one who is also in constant touch with a fine garden and all the newest additions to horticulture has at last been overcome by the kindness of Miss Willmott, of Warley, who has consented to her head gardener, Mr. C. R. Fielder, V.M.H., being appointed inspector to the society, and at the same time allowing him to remain in constant daily touch with her celebrated garden at Warley Place. From May 1, Mr. C. R. Fielder, V.M.H., so well and honourably known in gardening circles, has been the Royal Horticultural Society's inspector to visit Fellows' gardens, and to advise thereupon. All requests for the inspector's services should be made to the secretary, R.H.S. Office, Vincent Square, Westminster, S.W.

**Blue Bells at Kew.**—Just now Kew may be said to have an embarrassment of riches, for attractive features reveal themselves on all hands. The gorgeous display of tulips in front of the Palm House, and the equally showy masses of flower in the greenhouse arrest attention by reason of their brilliant and varied colours, but for quiet beauty the blue bells in the woods, especially in the Queen's Cottage grounds, will fully hold their own. In many places they form wide, spreading stretches of blue, which, under the varying degrees of light that filter through the overhanging trees, appear to be of many shades, from a light cœrulean blue to a depth almost approaching purple. This effect is, of course, considerably heightened when the sun shines, as some blue bells are then in full sunshine and others densely shaded. Such an attractive feature well serves to show that from even common British plants as charming an effect can be obtained as when exotic subjects are employed. The conditions at Kew are most favourable to the increase and development of the blue bell, the quiet beauty of which now accounts for the constant stream of visitors to the more remote parts of the gardens.

**The Driest April on Record.**—In an interesting communication to the "Times" of the 2nd inst., Dr. R. H. Mill, the Director of the British Rainfall Organisation, states: "There is no doubt that April, 1912, with .04in. of rain, is the driest April on record at Camden Square, where observations began in 1858, and it is very nearly the driest month, less rain having fallen only in February, 1891, when the amount was .01in. In the whole period there were only five months with less than a quarter of an inch of rain, all of them in the spring, viz., February, 1891, with .01in.; February, 1895, with .12in.; April, 1893, with .24in.; May, 1896, with .14in.; and April, 1912, with .04in. Last month there was an absolute drought of 18 days at Camden Square, commencing on the 10th; though at Mill Hill, and probably at other stations nearer London, the drought commencing on the 10th still continues. While a rigid comparison can only be made with records at the same station, it is interesting to glance at the records of London rainfall before 1858 back to the earliest which have been preserved. The earliest commenced in 1729, and, except for the years 1736-73 and 1780, there had been at least one rainfall record in London ever since. These are sometimes of dubious value, because of unsatisfactory instruments and bad exposure, very often on roofs, as in the case of the Royal Society's record, and in every instance they probably tend to read too low. No April in the whole series appears to have had so little rain as that of 1912, and only 19 individual months are known to have had less than one-tenth of an inch of rain. The . . . only months drier than April, 1912, are August, 1730, December, 1788, July, 1800, September, 1804 (possibly), and February, 1857. Considering the patterns of rain gauge in use a hundred years ago, I think that it would scarcely be prudent to assert the absolute rainlessness of December, 1788, or July, 1800. The absence of rain in September, 1804, and February, 1857, depends on unsatisfactory records, and is contradicted by others on which more reliance can be placed." In a table given in his communication, Dr. Mill states that in April, 1817, the rainfall registered at Greenwich was .06in., and in April, 1840, the rainfall at Chiswick was .06in.

**Canadian Alpine Flora.**—On Tuesday evening next, following the special house dinner of the Horticultural Club, at the Hotel Windsor, Mrs. Henshaw, hon. secretary of the Alpine Club of Canada, will give a lecture to the club members, entitled, "Trails in the Canadian Rockies." The lecture will be illustrated by coloured lantern slides, representing some of the more interesting features of the Canadian Alpine flora. Sir Frank Crisp will preside.

**Gardening and Drought.**—This subject cannot fail to be of the greatest possible interest to all who are engaged in horticultural pursuits for pleasure or for profit, consequently there should be a large attendance at the Royal Horticultural Hall on Tuesday, May 14, when Professor J. B. Balfour, F.R.S., V.M.H., Keeper of the Royal Botanic Gardens, Edinburgh, will deliver the seventh Masters' Memorial Lecture, his subject being "Gardening and Drought."

**Spring Flowers at Madresfield Court.**—Earl Beauchamp very kindly allowed the beautiful gardens and pleasure grounds of Madresfield Court to be thrown open to the public on Thursday for the benefit of the Gardeners' Royal Benevolent Institution. Owing to rain in the early morning fewer visitors than usual took advantage of this opportunity for inspecting the splendidly-kept gardens and the wonderful spring display so skilfully provided by Mr. W. Crump, V.M.H. Tulips, primulas, gorse, flowering shrubs, alpines were very much in evidence; while, under glass, the schizanthuses, carnations, eucharis, peaches, strawberries, melons, and early grapes proved immensely attractive. Earl Beauchamp and Mr. Crump are to be congratulated upon the fine appearance of Madresfield Gardens, and their interest in the Gardeners' Benevolent Institution, while a word of praise is due to the many members of the Worcester Auxiliary, who acted as stewards during the time the gardens were open to the public.

**Flowering of Amherstia nobilis.**—The amherstia has long enjoyed the reputation of being one of the most gorgeous of all tropical trees, and this is fully borne out by a large specimen which is in full flower in house No. 1, close to the main entrance gates at Kew. The tree in question (for tree it is) is planted out in a prepared bed, and so thoroughly has it made itself at home there that it reaches almost to the roof. It has already flowered several times at Kew, yet it is so rarely seen in gardens, and has been at different times so much talked of, that it always attracts a considerable share of attention. One reason that we do not see it more frequently is that it requires a large structure for its development, and that, too, in which a stove temperature is maintained. The long, pinnate leaves, which, just as they are unfolding, droop in a peculiar manner, suggestive of the browneas, are decidedly handsome, but the flowers form the centre of attraction. In colour they are a bright vermilion blotched with gold, and are borne in wide, spreading pendulous racemes from the ends of the branches. One feature which from an ornamental standpoint is not a desirable one, is that the blossoms quickly drop. Amherstia nobilis, a native of Burma, was named in honour of Countess Amherst, and was first introduced in 1837 by the late Mr. John Gibson, who was sent out to India by the Duke of Devonshire. This specimen flowered at Chatsworth some years later, but the first one to bloom in this country is reported to have been a plant in the gardens of Mrs. Lawrence, of Ealing Park. From an inspection of the flowering specimen at Kew one can readily understand the adjectives that have been showered upon the amherstia by travellers, for under the influence of the tropical sunshine the blossoms must be dazzling.

**International Exhibition Cups.**—We have the pleasure of giving on another page of this issue illustrations of two of the many handsome cups that are offered for competition at the Royal International Horticultural Exhibition at Chelsea. The cups illustrated are two that have been presented by the counties of York and Lancaster, and are in every way worthy of the occasion, and the influential committees responsible for the selection of the respective designs. In our issue of the 18th inst., we shall give illustrations of a large number of the other cups that have been presented to the Directors of the International by County Committees and other donors.

**Mr. Wm. Hales,** superintendent of the Chelsea Physic Garden, was elected an Associate of the Linnean Society on Thursday last. We congratulate Mr. Hales on the well-deserved honour.

**Prospects of the Fruit Harvest.**—The prospects of the fruit harvest are at the present time far less satisfactory than could be wished. The serious injury done by the sharp frosts that were experienced on April 10 and 11, and the cold easterly winds that prevailed during the greater part of the month, are now apparent. Much damage was done to plums in Cambridgeshire, Kent, Middlesex, and Worcestershire, and cherries suffered considerably, although to a less extent. Much damage was done to apples, but possibly it may not prove so great as at present is assumed to be the case. Gooseberry bushes have had their prospective crop greatly reduced, but currants appear to have escaped any considerable damage.

**Flower Day in Vienna.**—The Vienna correspondent of the "Standard" writes as follows with reference to the "Blumentag," or Flower Day, which has just been held in the city, followed by a Flower Day in the Prater and some of the suburbs: "For forty-eight hours every one has been 'seeing yellow,' at all events when he looked at a human being. For the flower this year is a yellow narcissus, with pheasant's eye centre, artificial, and, perhaps, not very true to life, but very effective. Flower Day is the equivalent of Hospital Saturday and Sunday in London, only here the pretty girls with the collecting boxes give a quid pro quo in the shape of a flower for every penny, and sometimes for twopence and a frankly admiring look will put it into one's buttonhole themselves. Several thousands of women in their best frocks waylaid all pedestrians, entered cafés, restaurants, banks, and public offices; two young girls even braved the terrors of the 'Gray House,' the Old Bailey of Vienna, and by the evening two million flowers had been sold, and about £10,000 collected in small change, which was carried in a hundred sacks to the bank. Towards evening the difficulty was to find anyone who was not already decorated with the symbol of the day. Cabmen wore it in their hats, carters on their whips, and labourers in the tops of their high boots."

**Open Spaces in London.**—At the monthly meeting of the Metropolitan Public Gardens Association, it was agreed to grant £100 towards the purchase of a site for recreation at Wimbledon on the bank of the Wandle, adjacent to a poor and low-lying district. A scheme for enlarging and rendering more efficient a much-needed playground in Kensal New Town was discussed, and it was agreed that every effort should be made to raise the £3,000 required. It was stated that the laying out of St. Mary's Churchyard, Bow Road; Southwark Cathedral Yard, and the Hospital Garden, Putney, were finished, and that the disused burial ground in Philpot Street, Stepney, would be taken in hand so soon as an agreement had been arrived at for its maintenance.

**Allotments for Prisoners.**—A Parliamentary paper has been issued containing rules made by the Secretary for Scotland for persons undergoing preventive detention in Scotland. The rules provide that persons undergoing such detention shall be divided into three grades—ordinary, special, and disciplinary, and that those in the special grade may have garden allotments assigned to them, which they may cultivate at such times as may be prescribed. The produce of these allotments may be purchased for use in prisons at market rates, and the proceeds credited to the prisoner, or they may be used by the prisoner under regulations approved by the Commissioners.

**Shrewsbury Flower Show Receipts.**—The executive of the Shropshire Horticultural Society had a new experience last year, inasmuch as their efforts resulted in a loss of £540, instead of a substantial profit, as in previous years. This change was not brought about by any lack of energy on the part of the committee and its officers, or a decline in the popularity of the Shrewsbury shows, but was wholly due to the railway strike.

**Presentation to Mr. Wm. Tough.**—A number of friends met Mr. William Tough, head gardener, Arndilly, Craigellachie, N.B., the other day, and presented him with a purse of sovereigns on the occasion of his leaving for America. Mr. Peter Mackay, head forester, in a neat and eulogistic speech, made the presentation, and Mr. Tough feelingly replied. Thereafter a very happy evening was spent in song and story.

**April in the North.**—The month just closed, writes our Aberdeen correspondent, has been the driest April experienced in the north for twenty-four years. The total fall was 0.52in., compared with 0.66 in 1893, and 0.63 in 1891. There were seven days with rain, while in April 1893, there were twelve, and in April, 1891, fifteen. Of sunshine we had a total of 194.3 hours, fairly evenly distributed. The bright, sunny weather during the last week of the month had the effect of transforming parks and gardens from their winter aspect to that of summer. At the end of the first week exceedingly boisterous weather prevailed, accompanied with showers of sleet, snow, hail, and rain. The force of the wind—estimated in some districts as having a velocity of 74 miles per hour—was such that much damage was done to agricultural land, and the snow covered the ground to a depth of several inches, and whitening the trees with the silvery mantle of belated winter.

## BEAUTIFUL BEDDING-OUT.

Soon the summer sunshine will be basking over garden scenes where

> "'Broidered beds of countless hues
> Tempt bee and butterfly."

The pageant of the floral year will be offered, never to be repeated with precisely similar effect, dependent for its success or failure upon the verdict, then the memories, of those who see. Unless new beauties are shown, the record of past summers broken, the gardener will have missed his opportunity.

In a sense, the very flowers are dependent upon the men and women who use them in bedding out; for, unless they are skilfully blended or kept separate, they will live and die unappreciated. The most gorgeous scarlet zonal pelargonium must create a trial for the artistic eye, instead of a beauty, if it is set next to a rosy-magenta petunia. This is an extreme example of inharmonious colour-association, yet not an unknown one; while the habitual planting of red-white-and-blue beds, either with or without a golden edge as frame, in close company with standards and bushes of carmine roses, is another instance of cruel conduct towards blossoms of individual loveliness.

Tender colours are so plentiful that it is surprising why crude ones are not avoided in situations that they do not suit; while a gay white house, whose walls gleam yellow in sunshine, may be surrounded by vermilion and blue, ruddy-bronze and amber, with a Mediterranean-shore-suggesting splendour that warms the heart, the old weather-beaten, red-brick manor house should never be given an entourage of gaudy colours. Its hue is softened by the storms and suns of centuries; its beds and borders should be similarly soft; and, since blossoms are children of a fleeting life, not able to grow mellow, only the more refined should be allowed near the ancestral home. The red of the dwarf calliopsis is suitable; the apricot-salmon or brick-red tints of Nemesia strumosa Suttoni and dwarf nasturtiums, the copper-crimsons of many bedding pansies, the dull orange of begonias, will infallibly please.

Light lavender-blue can be cordially recommended near old red houses, since it supplies a welcome coolness, besides intensifying the richness of the building material. The aster and viola offer the shade; while tall plants of Plumbago capensis may be put out and lightly trained to the walls, either right against them or upon the background of the Virginian creeper, that will blush brightly before the tender greenhouse plant has to be removed. For a subdued mass of this hue the ageratum can be recommended. Varieties of various heights can be built up into a slanting bank against the house, with specimen coleuses or groups of Perilla nankinensis and beet to give relief of dark foliage.

If a house is too dull in appearance, lemon-yellow flowers are best of all to cluster about it; white will not be pleasing except during strong sunshine, which really turns it into cream. Generally the yellow can be well combined either with blue-violet or royal and indigo-blue; but it also may merely deepen into orange, and then pass on into the darkest shade of orange, which is scarlet. Some silver foliage can be advised to give relief in this case; it is a mistake to so concentrate any colour that the spectator from a few hundred yards sees the bed or border only as a brilliant splash. The elegance of a plant cannot be appreciated when it lives as a member of a pressing crowd. The perfection of a flower-hue cannot be loved as it should unless it can be seen with the complement of leaf and stem tints that were its birthright.

To return to the consideration of tender colours, we recognise at once that they are yielded by the mauvy, rose, purple-crimson nicotianas; by cream, peach-blossom, mauve, and dull rose stocks. The scabious is obtainable in shades of crushed-strawberry. The salpiglossis shows a glorious ruby-red, as well as a purplish-blue that is a vastly superior shade to the gentian or cornflower, from an artist's point of view.

Maroon or claret flowers or foliage banked up against the crudest of red villas will subdue the garish appearance; while, if silver-green foliage is present also, a softer effect will be enjoyed. A plea should also be put in for the grouping of different colours in house-front borders, instead of the stiff ugliness of the straight rows of various heights, ending in the unbroken edging, usually of lobelia or miniature sweet alyssum. Why should our edging be continuous in colour, when lengths of rose, pale blue, cream, carmine, deep blue, lemon, pale pink, and mauve can succeed one another, affording the charm of a rainbow harmony, and permitting a collection of different plants to be exhibited.

Then what a satisfaction it is to come upon a lawn, the beds of which are filled so as to supply a selection of heights among themselves, not just a selection of heights in each bed. The stately Nicotiana macrophylla gigantea, with its noble leaves and purple blooms, may fill a large round or square; while some of the oblongs, stars, crescents, or diamonds can be made beautiful without the employment of any plant taller than a viola. Variety in habit of growth should also be aimed at. One cause of the stiffness or the monotony of bedded-out gardens is the use of too many stubby plants, such as the zonal pelargonium, calceolaria, and fuchsia. There should be the stateliness of the Lilium auratum, canna, or gladiolus; the waving light-stemmed grace of poppies; the branching luxuriance of gazanias, verbenas, ivy-leaved pelargoniums, and lesser favourites such as eschscholtzias and mignonette. For, only by taking all the qualities of our bedding plants into consideration, and combining them so as to mitigate their demerits, can we gardeners claim to have made the best use of our tools. M. H.

## BOUVARDIAS.

Strictly speaking, bouvardias are greenhouse plants, but to obtain good results they must be started in heat, and remain in a genial temperature for several weeks, in order to build up strong plants before transfer to frames or cold pits for the summer. The stock plants should be turned out, and a good portion of the exhausted soil be removed. Shorten the strongest roots, and place in pots of as small a size as will hold the plants. A compost I find suits them well consists of two parts loam, one each of leaf-soil, and decayed manure, and sand. Place in a temperature of 65 or 70 degrees, and keep well syringed.

When the young shoots are two or three inches long, pinch out the points. To increase the stock some of these young shoots may be taken off with a heel and inserted in small pots. Another method that answers well is to cut the strongest roots into inch lengths, and lay them in a pan of sandy soil, slightly covering them.

H. T. MARTIN.

Warren Wood Gardens.

## HELIOTROPIUMS.

These sweet-scented flowers are always appreciated, whether grown in the flower beds during the summer or in pots, either in the greenhouse, conservatory, or dwelling house. As summer bedding plants they are much in evidence, as no garden seems complete without them.

It is not, however, as bedding plants that they are most appreciated, but as decorative subjects for autumn and winter flowering. Most people have seen how well heliotropes will grow when planted out in a light rich soil, and how profusely they bloom during the autumn previous to being cut down by the frost, yet but few can realise the wealth of bloom they will give during the dull months of winter. True, the plants require rather more heat than they usually receive during the cold weather to flower them to perfection, but when well grown they repay for this extra care. If the plants are healthy, and covered with their trusses of sweet-scented blossom, they are sure to be prized. But to be useful, the plants must be vigorous, otherwise the flowers will be poor. In order to have a wealth of bloom through the winter months it is necessary to have some large and well-established plants. If such can be grown up pillars, along rafters, or against a wall, where the young growths are allowed to extend themselves at will, fine trusses on long growths may be gathered therefrom. But to produce plants of this class takes time, so that propagation should be commenced at once where this has not already taken place.

The young growths will root readily enough if inserted in a light sandy compost, and placed in brisk heat. When rooted they should be potted singly, and grown in a temperature of from 60 to 65 degrees. At this stage the shape the plants are to assume must be decided. If for planting out they should not be pinched until they are from six inches to a foot high, according to the position they are intended to occupy, as it is seldom a quantity of shoots are required near the ground; on the other hand, if required for decorative purposes in pots, the nearer the plants are to the soil the better. Should they be intended for standards they must be kept to a single stem until the desired height is attained, when growth must be stopped to induce a bushy head.

As the pots become filled with roots the plants should be transferred to others, a couple of sizes larger, using a light rich compost, and not potting too firmly. As plants of this class make rapid growth they require ample root room if they are to give satisfaction. Potting heliotropes is quite different to potting hard-wooded plants. If they have grown satisfactorily they should be large enough to occupy their flowering pots by August, after which they should not be stopped. During the summer months stand them on a bed of ashes in a sunny position, but sheltered from rough winds. See that they never suffer for want of water, and as the roots fill the pots give weak liquid manure two or three times a week. About the middle of September they should be housed, but it is not well to grow them in too high a temperature; therefore if the weather is hot, as sometimes is the case, keep the ventilators open as wide as possible in order to keep the plants sturdy, but as the nights get colder it will be necessary to apply a little fire heat to keep up the requisite temperature, or the flowers will not expand freely, neither will they be of that fresh appearance that is so desirable.

As winter approaches a temperature of from 50 to 55 degrees should be maintained, with a rather dry atmosphere, in order to prevent the flowers from damping, and to keep the growth as sturdy as possible.

Heliotropes that are planted out should not be tied in closely, as this would cause them to lose their leaves, and prevent them flowering as profusely as one would wish. After flowering, both standards and those planted out, should be allowed a rest, as they will grow more vigorously again when the days are longer. Standards should be cut back a bit, repotted, and placed in a warm house to induce them to make young growths. If such plants are too large for indoor use the pots may be plunged in the flower beds during the summer, when they will make a fine display. Those growing close to the roof or on walls should have their shoots shortened, and be thinned so as to make room for the young growths, which should be encouraged as much as possible by the aid of liquid manure during the growing season. P. G.

## SOYA BEAN CULTIVATION IN SCOTLAND.

Colonel Johnston of Lesmurdie, Elginshire, ably seconded by his head gardener, Mr. Smart, was successful last season in producing a number of plants of a very fair size, and in reaping a crop of the soya bean (Glycine hispida). This is not by any means the first occasion on which Colonel Johnston has been successful in experimenting on tender plants, his interest in plant life being very keen and extensive. This season the Colonel is sowing alongside a plot of imported seed, the seed he himself produced last year, in order to ascertain if any degree of acclimatisation has been acquired by association with the conditions attached to his district. Of course, it has to be remembered that last season was an exceptionally favourable one, and one which is not likely to occur again soon, but it is hoped the partial acclimatisation may have imparted a degree of hardiness to the seed produced at Lesmurdie last year, which may enable them to withstand less favourable conditions. As is well known, this bean requires warm weather for its development, otherwise it makes but slow progress, and may not mature even in the space of five months. This fact was illustrated in the experiments carried out in Nairnshire in 1910 with the soya bean by the North of Scotland College of Agriculture.

That season was wet, cold, and unsettled, yet the plants developed a good display of foliage, and attained the flowering stage, but they failed in producing pods. This was simply brought about by the season, owing to the lower temperature, being rather short to permit of ripening, or it lacked sufficient or continuous warmth for the sufficiently vigorous growth of the plant. Hence last summer, being warm and forcing, the Lesmurdie experiment proved most successful.

The bean can be cultivated on a wide range of soils, but it is somewhat fastidious about climate, and is sensitive to cold and frost. In the North of Scotland the climate is too uncertain and generally too cold and dull for its liking. This, however, is not to deter Colonel Johnston from following up his last season's success, and his efforts will certainly be watched with much interest. W. K.

**Veronica diosmæfolia.**—Of the different shrubby veronicas now in our gardens this stands out markedly from the numerous forms of Veronica speciosa, inasmuch as the flowers are borne during the spring and early summer months. Grown in a five-inch pot, it forms a neat little bush, with branches which are somewhat horizontally disposed, clothed with small pointed leaves, and plentifully sprinkled with spikes of lilac-coloured flowers.—W. T.

## STIMULANTS FOR FERNS AND FOLIAGE PLANTS.

It is frequently found difficult to secure well-grown plants to fit small vases. The soil in the pots becomes a mat of fibrous roots, and, when a larger pot cannot be employed, feeding with some kind of liquid manure is imperative, if vigorous growth is to be maintained. For this purpose liquid manure from the farmyard is sometimes used, but in a very weak condition. Unfortunately, its odour is objectionable in a dwelling room, and besides it contains too much potash for many subjects. Peruvian guano is also a ready fertiliser for feeding ferns and foliage plants, and, although it may be used with advantage for plants in a greenhouse, its odour is equally unpleasant in the house.

Where leaf production is the aim of the cultivator, I know nothing better than sulphate of ammonia and nitrate of soda. For plants that like a percentage of lime in the soil, sulphate of ammonia will give the best results, as the lime present will convert the ammonia sulphate into nitrate of lime—an excellent nitrogenous plant-food. By far the largest number of green foliaged plants, however, do not like lime, and for these the best stimulant is nitrate of soda. Palms, asparagus, azalias, cypress, aspidistras, isolepis, smilax, selaginellas, and most ferns quickly respond to its application. Being readily soluble, and immediately available, it usually makes its influence apparent in a brief space of time, especially if the plants have been starving for want of food. Asparagus is a seaside plant, and likes plenty of sodium; and I have had good results by supplying carbonate of soda (washing-soda) to large specimens.

In all cases it is advisable to exercise great care in the use of liquid manures of a concentrated nature, like sulphate of ammonia and nitrate of soda, as the application of a strong solution may prove more inimical than beneficial to the subject treated. The "feast and then a fast" system of feeding is also a little crude, as the plant has more than it can manage at one time, and is starving for food the next. When help is necessary, it is better to start with a very weak liquid manure, use it every time the plant needs water, and increase its strength with time and the plant's requirements.

For ferns and selaginellas the strongest solutions of nitrate of soda and sulphate of ammonia should never exceed ½oz. to the gallon of water. About half that amount will be safer, and generally ample for all plants of this class. Farmyard liquid manures and guanos, too, are often very caustic in character, and, unless very much diluted when applied, may do more harm than good to the growths they are employed to assist. The root hairs are the feeding organs of plants in the soil, and are exceptionally sensitive to anything of a burning nature. A too-strong dose of a caustic solution of manures will destroy the root hairs, and the plant will have to wait the development of others before it can obtain its necessary supply of food. It is more often in connection with the use of farmyard manure and guano that mishaps occur than with chemical fertilisers, as the former vary so much in the percentage of the plant food constituents they contain that it is difficult to gauge their strength.

Another item in connection with these organic manures to be remembered is that, if used for a certain period on the same soils, they will produce organic acids. To neutralise these, lime will have to be employed, and, as this would kill most ferns, it is safer to stick to nitrate of soda instead. With its known strength, cleanliness of handling, freedom from unpleasant smell, and its stimulating properties, nitrate of soda has no equal as a food for ferns and plants grown for their green foliage. It can be used either in the dry state or in solution; but the latter is decidedly the better method, as it reaches all the roots in the strength at which it is applied. When sprinkled on the surface of the soil in a pot in a dry state, the roots near the top are apt to get more than is good for them, and those below go hungry. **Hibernia.**

THE LANCASHIRE CUP.
Offered for competition at the Royal International Horticultural Exhibition by the County of Lancaster.

THE YORKSHIRE CUP.
Offered for competition at the Royal International Horticultural Exhibition by the County of York.

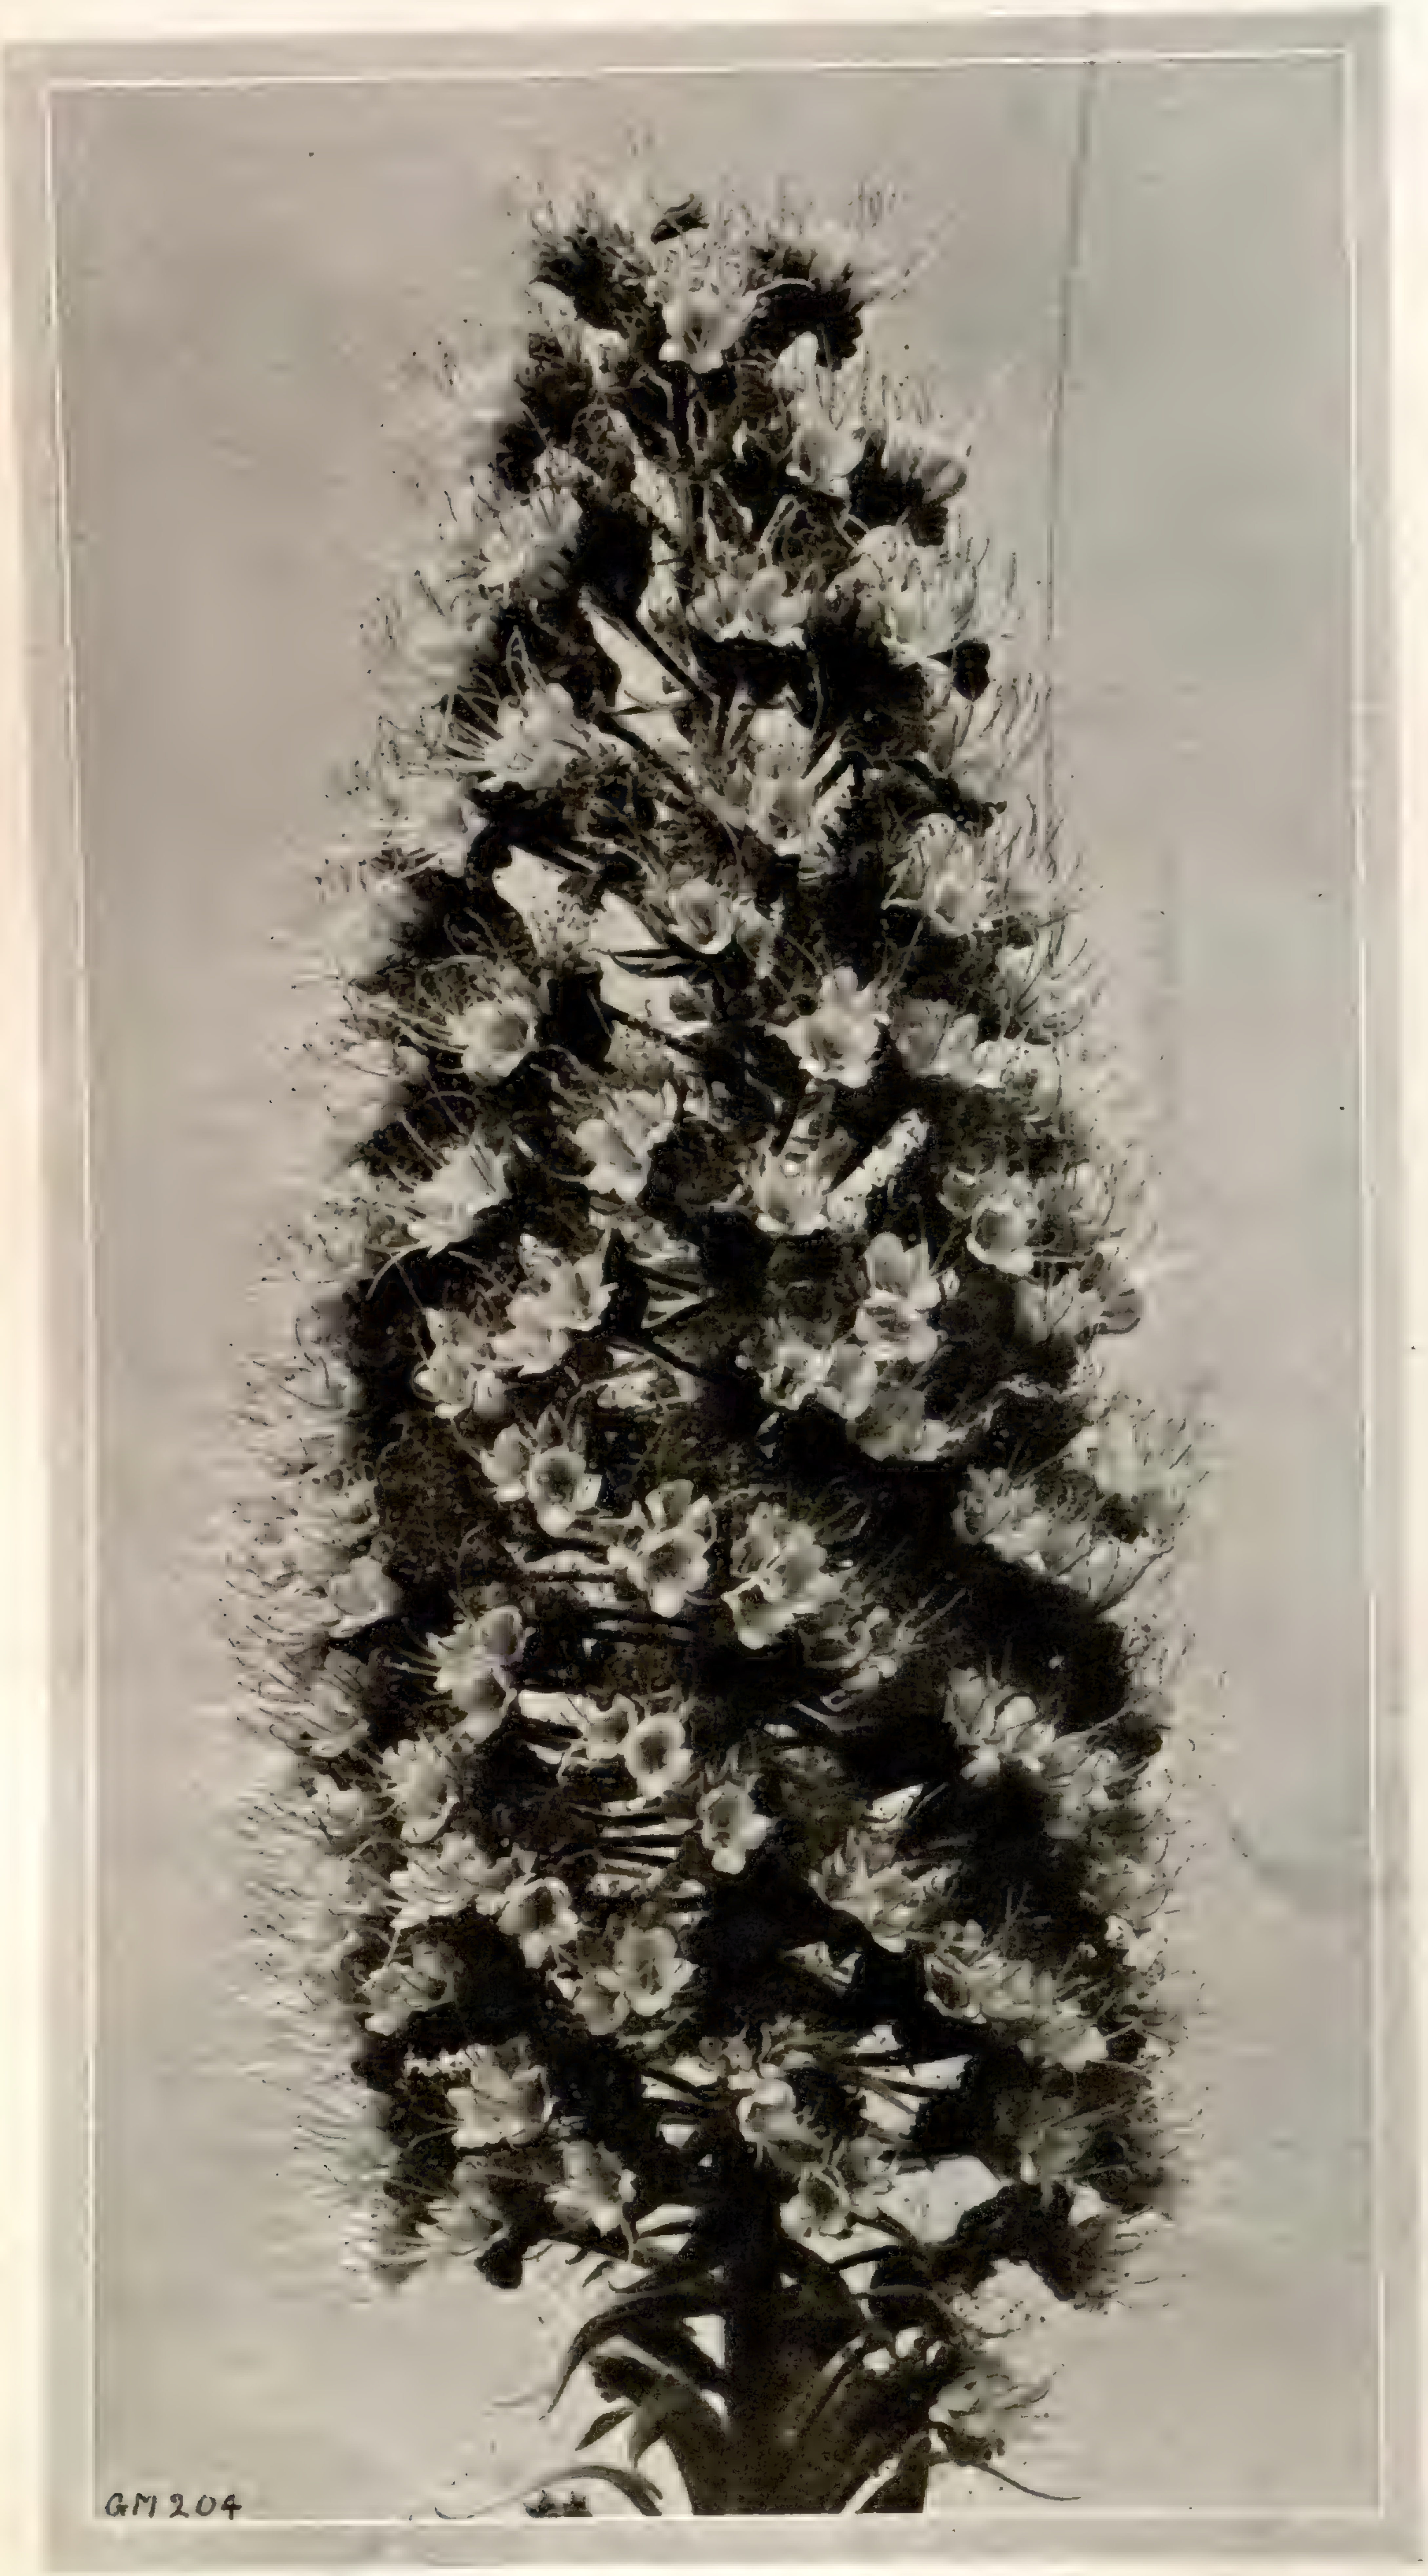
---

**Thunias** will now be starting freely into growth, and will succeed under the same conditions, and in the same kind of compost as calanthes, with the exception that thunias like a sunny position in the warmest house. They may be grown singly in pots, or made up into specimens, placing five or more bulbs in a seven or eight-inch pot. Their requirements in respect to drainage are similar to calanthes, and water must be given with the greatest caution until the flower spike appears at the apex of the newly-made stems. Thunias often fail to flower satisfactorily, and the reason in many cases is an overabundant supply of water in the earlier stages of growth; after the flower buds are formed in the new growth, an abundant supply is necessary, and the plants then may be watered alternately with clear water and weak liquid manure. On hot days the plants may be syringed overhead with advantage, as they are subject to attacks of red spider, especially if kept in a rather dry atmosphere.—J. T. Barker, The West Hill Gardens.

## NEW PLANTS, ETC.

### ECHIUM TRUNCATUM.

This handsome echium bears splendid spikes of deep blue flowers, and if it can be easily managed it should prove a popular greenhouse plant. The first spikes shown were two feet long, thickly studded with blue flowers, so as to form a dense brush-like inflorescence. A.M., R.H.S. W. W. Astor, Esq., Cliveden, Taplow.



ECHIUM TRUNCATUM.
A fine greenhouse plant, bearing tall, dense spikes of rich blue flowers. A.M., R.H.S., April 30. W. W. Astor, Esq., Cliveden, Taplow.

### ARAUCARIA EXCELSA ELEGANTISSIMA AUREA.

A very elegant form of the Norfolk Island Pine, with a yellowish tint added to its light green colouring, the yellow shade being most emphasised in the young growing tips of the branches and branchlets. A.M., R.H.S., April 30. Messrs. Thos. Rochford and Sons, Broxbourne.

### LEWISIA HOWELLI.

An uncommon plant with a low rosette of soft green leaves, from which rise little inflorescences suggestive of a statice, but bearing rounded flowers of greenish-yellow hue, marked with brownish purple. A.M., R.H.S., April 30. Mr. Maurice Prichard, Christchurch.

### TULIPS.

Grenadier.—A magnificent tulip of large size, broad-petalled, long-stemmed, and of rich orange-scarlet colouring, with a broad yellow base. A.M., R.H.S., April 30. Messrs. Walter T. Ware, Lim., Inglescombe, Bath.

Velvet King.—A stately Darwin tulip of perfect shape, and with broad, rounded petals of a dark, blackish maroon-purple shade. It may well be included among the "black" tulips, as it is intensely dark, and of smooth velvety appearance. A.M., R.H.S., April 30. Messrs. Barr and Sons, Covent Garden.

### CATTLEYA SCHRODERÆ GLEBLAND.

A beautiful variety of an old favourite and fragrant cattleya. It was like a first-rate form of the type, with the yellow throat deepened and expanded into a disc of deep orange-yellow, that left only a fringed border of soft rose-pink round the lip. F.C.C., R.H.S., April 30. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

### ODONTOGLOSSUM URO-SKINNERI BURFORD VAR.

A large-flowered and effective variety of a species not often found in cultivation nowadays. The lip is the dominant feature, and this is bright rose colour with mottling of a paler, almost white, shade. F.C.C., R.H.S., April 30. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

### CHEIRANTHUS MUTABILIS KEELEY'S VAR.

A sturdy, good-habited wallflower with narrow leaves, and closely-set spikes of flowers, that have rose and purple colouring, but vary a good deal in shade. The colour will not appeal to everyone, but the plant is sure to find lovers among rock garden enthusiasts. A.M., R.H.S., April 30. Mr. R. W. Rickards, Usk Priory, Mon.

### CINERARIA POMPADOUR.

The title of Pompadour has been given to a strain of cinerarias belonging to the large-flowered florists' type, in various distinct shades of colour with another colour added, in the shape of longitudinal and regular stripes down each ray-floret. The strain has attracted a great deal of attention wherever exhibited. A.M., R.H.S., April 30. Messrs. Jas. Veitch and Sons, Chelsea.

### DEUTZIA LONGIFOLIA.

This is a very pretty, graceful, and free-flowering shrub, one of Mr. E. H. Wilson's finds in China. The neat flowers are of a soft pink or deep blush hue, borne in little dense spikes along the sides of the branches after the fashion of D. gracilis, but the clusters are not so lax as in the old species. A.M., R.H.S., April 30. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley, Essex. (See illustration, p. 353, in our issue of May 4.)

### CELSIA CRETICA CLIVEDEN VAR.

In some measure this is even more beautiful than the type, which, by the way, is a charming greenhouse plant. The newcomer has unusually tall spikes, suggesting a fine verbascum, but with large, well-expanded light yellow flowers. A fine addition. A.M., R.H.S., April 30. W. W. Astor, Esq., Cliveden, Taplow.

---

**Tritonia Prince of Orange.**—This pretty little South African bulbous plant forms a delightful feature in the greenhouse, the rich orange-coloured flowers being borne in great profusion. Perhaps some day these smaller bulbs, such as the tritonias, ixias, sparaxis, babianas, and others of this class, may be grown more than they are now. —S. W.

## GARDENS OF ANNUALS.

Grow hardy annuals as well as they can be grown, and no flowers outrival them. It is because we are all used to seeing overcrowded "patches" of godetias, salpiglossis, calendulas, clarkias, Shirley poppies, and candytufts, that we have come to look upon them with slight favour. Take Godetia The Bride as an example; the plants will be more than 2ft. tall, of shrubby branching habit, the long leaves fine, the white, crimson-blotched flowers enormous, of silken texture, if the seedlings have been pinched out once, and each plant has 18in. of space in which to develop.

A splendid garden may be created without a perennial, shrub, or rose tree in it; giant sunflowers, hybrid mulleins, and Verbascum phœniceum will supply the shrubberies, and an undergrowth can be provided by the lesser sunflowers and the feathery green Artemesia annua, which becomes covered with a golden florescence. For other tall masses there are the giant double poppies, so beautiful in their shades of blush, cerise, and mauve, in addition to more ordinary tints. Annual lupins, blue, white, or rose, can be had 2½ft. high, carpeted around by the little perfumed blue and white Lupinus nanus.

Some gardeners are of opinion that lawn beds require sub-tropical plants in order that they may produce a handsome effect, but the idea is erroneous. The varieties of maize or zea, offer just as fine displays as can be gained, from delicate subjects, which cold winds often shrivel, and rain followed by hot sunshine, often scorch. Begonias are succesfully rivalled by a new variety of dianthus, named Lucifer. The fringed flowers of this hardy annual are an extraordinarily bright orange-scarlet, measuring 2in. individually from tip to tip. To secure a unique bed it should be alternated with Omphalodes linifolia, a silver-leaved white-blooming annual of wonderful charm.

Other lawn beds may glow orange with the new Eschscholtzia gorgeous, though the crimson-and-gold Mandarin is hard to beat. While a vestige of summer lasts the plants, with their fernlike gray foliage, will produce fields of flowers, indifferent to scorching drought, undeterred by seasons of flood. To see the full elegance of the eschscholtzia, seedlings should be thinned out till they stand a foot apart, then the leaves will spread gracefully over the soil uncrushed by any neighbour.

Rosy larkspurs, in a lawn bed, offer a colour that is only approached by cerise salpiglossis or some dahlias. The yield of bloom, too, is enormous, and there will not be any cessation if seed-forming is prevented.

Pillars of climbing nasturtiums should be included in the garden of annuals. The rougher the wood the better, as the tendrils cling readily to excrescences of bark. Silver birch trunks, with the bark left on, have the loveliest effect of all. It should be recollected that climbing nasturtiums need not be of mixed colours, though the variegated-leaved strain should be employed for some trellises or fences; scarlet, crimson, yellow, black-maroon, and cream can be obtained separately, or the attractively spotted kinds. Climbing convolvuluses or ipomæas may be employed in the same style, though, on account of their dense foliage, they are supremely useful for training up strings to hide unsightly walls or fences. These may be sown in rose, carmine, blue, striped, crimson, lilac, or white. Then the value of the dwarf Convolvulus minor should not be overlooked. For a bed the variety Rose Queen has a perfect appearance, or a beautiful show may be gained from the white form alternated with Calendula Prince of Orange.

Shade in the annual garden is not difficult to cater for. The red-rose or the white Centranthus macrosiphon will be found as willing to thrive as the taller pink or white Lavatera trimestris, and both plants possess those vivid grass-green leaves that do so much to brighten shadowed stretches of ground. A bed of either of these can be given a seed-scattered carpet of the tiny lilac annual Ionopsidium acaule, which will not thrive in hot sunshine. Silene pendula compacta, rose, crimson, or white, calendulas, common white candytuft, tall blue, pink, white, or maroon cornflowers may also be safely used.

Especially showy annuals, owing to their colours, are the carmine candytuft, the terra-cotta-crimson Calliopsis bicolor nigra, or the dwarf Crimson King, Clarkia elegans Purple King, Godetia Lady Satin Rose, and the dazzling scarlet Tulip Poppy. One great merit of the annual garden is that it can be entirely cleared each autumn, bulbs be used for the spring display, and these removed in time for another season's exhibition of what the hardy annual can achieve when reverently cultivated and carefully chosen.

M. H.

TULIP GRENADIER.

This splendid May-flowering tulip is rich orange-scarlet, with yellow base. Flowers much below natural size. A.M., R.H.S., April 30. Messrs. Walter T. Ware, Lim., Inglescombe, Bath.

## PRUNUS PERSICA VAR. MAGNIFICA.

The various double-flowered forms of the peach (Prunus persica) are well worth attention when selecting dwarf trees for gardens situated in the Midlands and Southern Counties, for they are very showy, and last in flower for a long while. Pink, white, and red-flowered varieties are to be had, but the red ones are perhaps the most ornamental, while they have the advantage of adding a rich touch of colouring to the garden, and affording a beautiful contrast to the groundwork of yellow and white narcissi, which blossom at the same time. Two red-flowered forms are in advance of others; they are P. persica fl. rubro pl., and P. persica var. magnifica, the latter, perhaps, being the more showy of the two. Anyone who possesses a few plum stocks may raise a stock of this and other varieties by budding them in the ordinary way in July. Three years after budding, really good, well-flowered trees may be obtained, which will be found useful for garden planting or for placing in pots to use for greenhouse decoration during the months of January, February, and March.

D.

## THE WESTFIELD ORCHIDS.

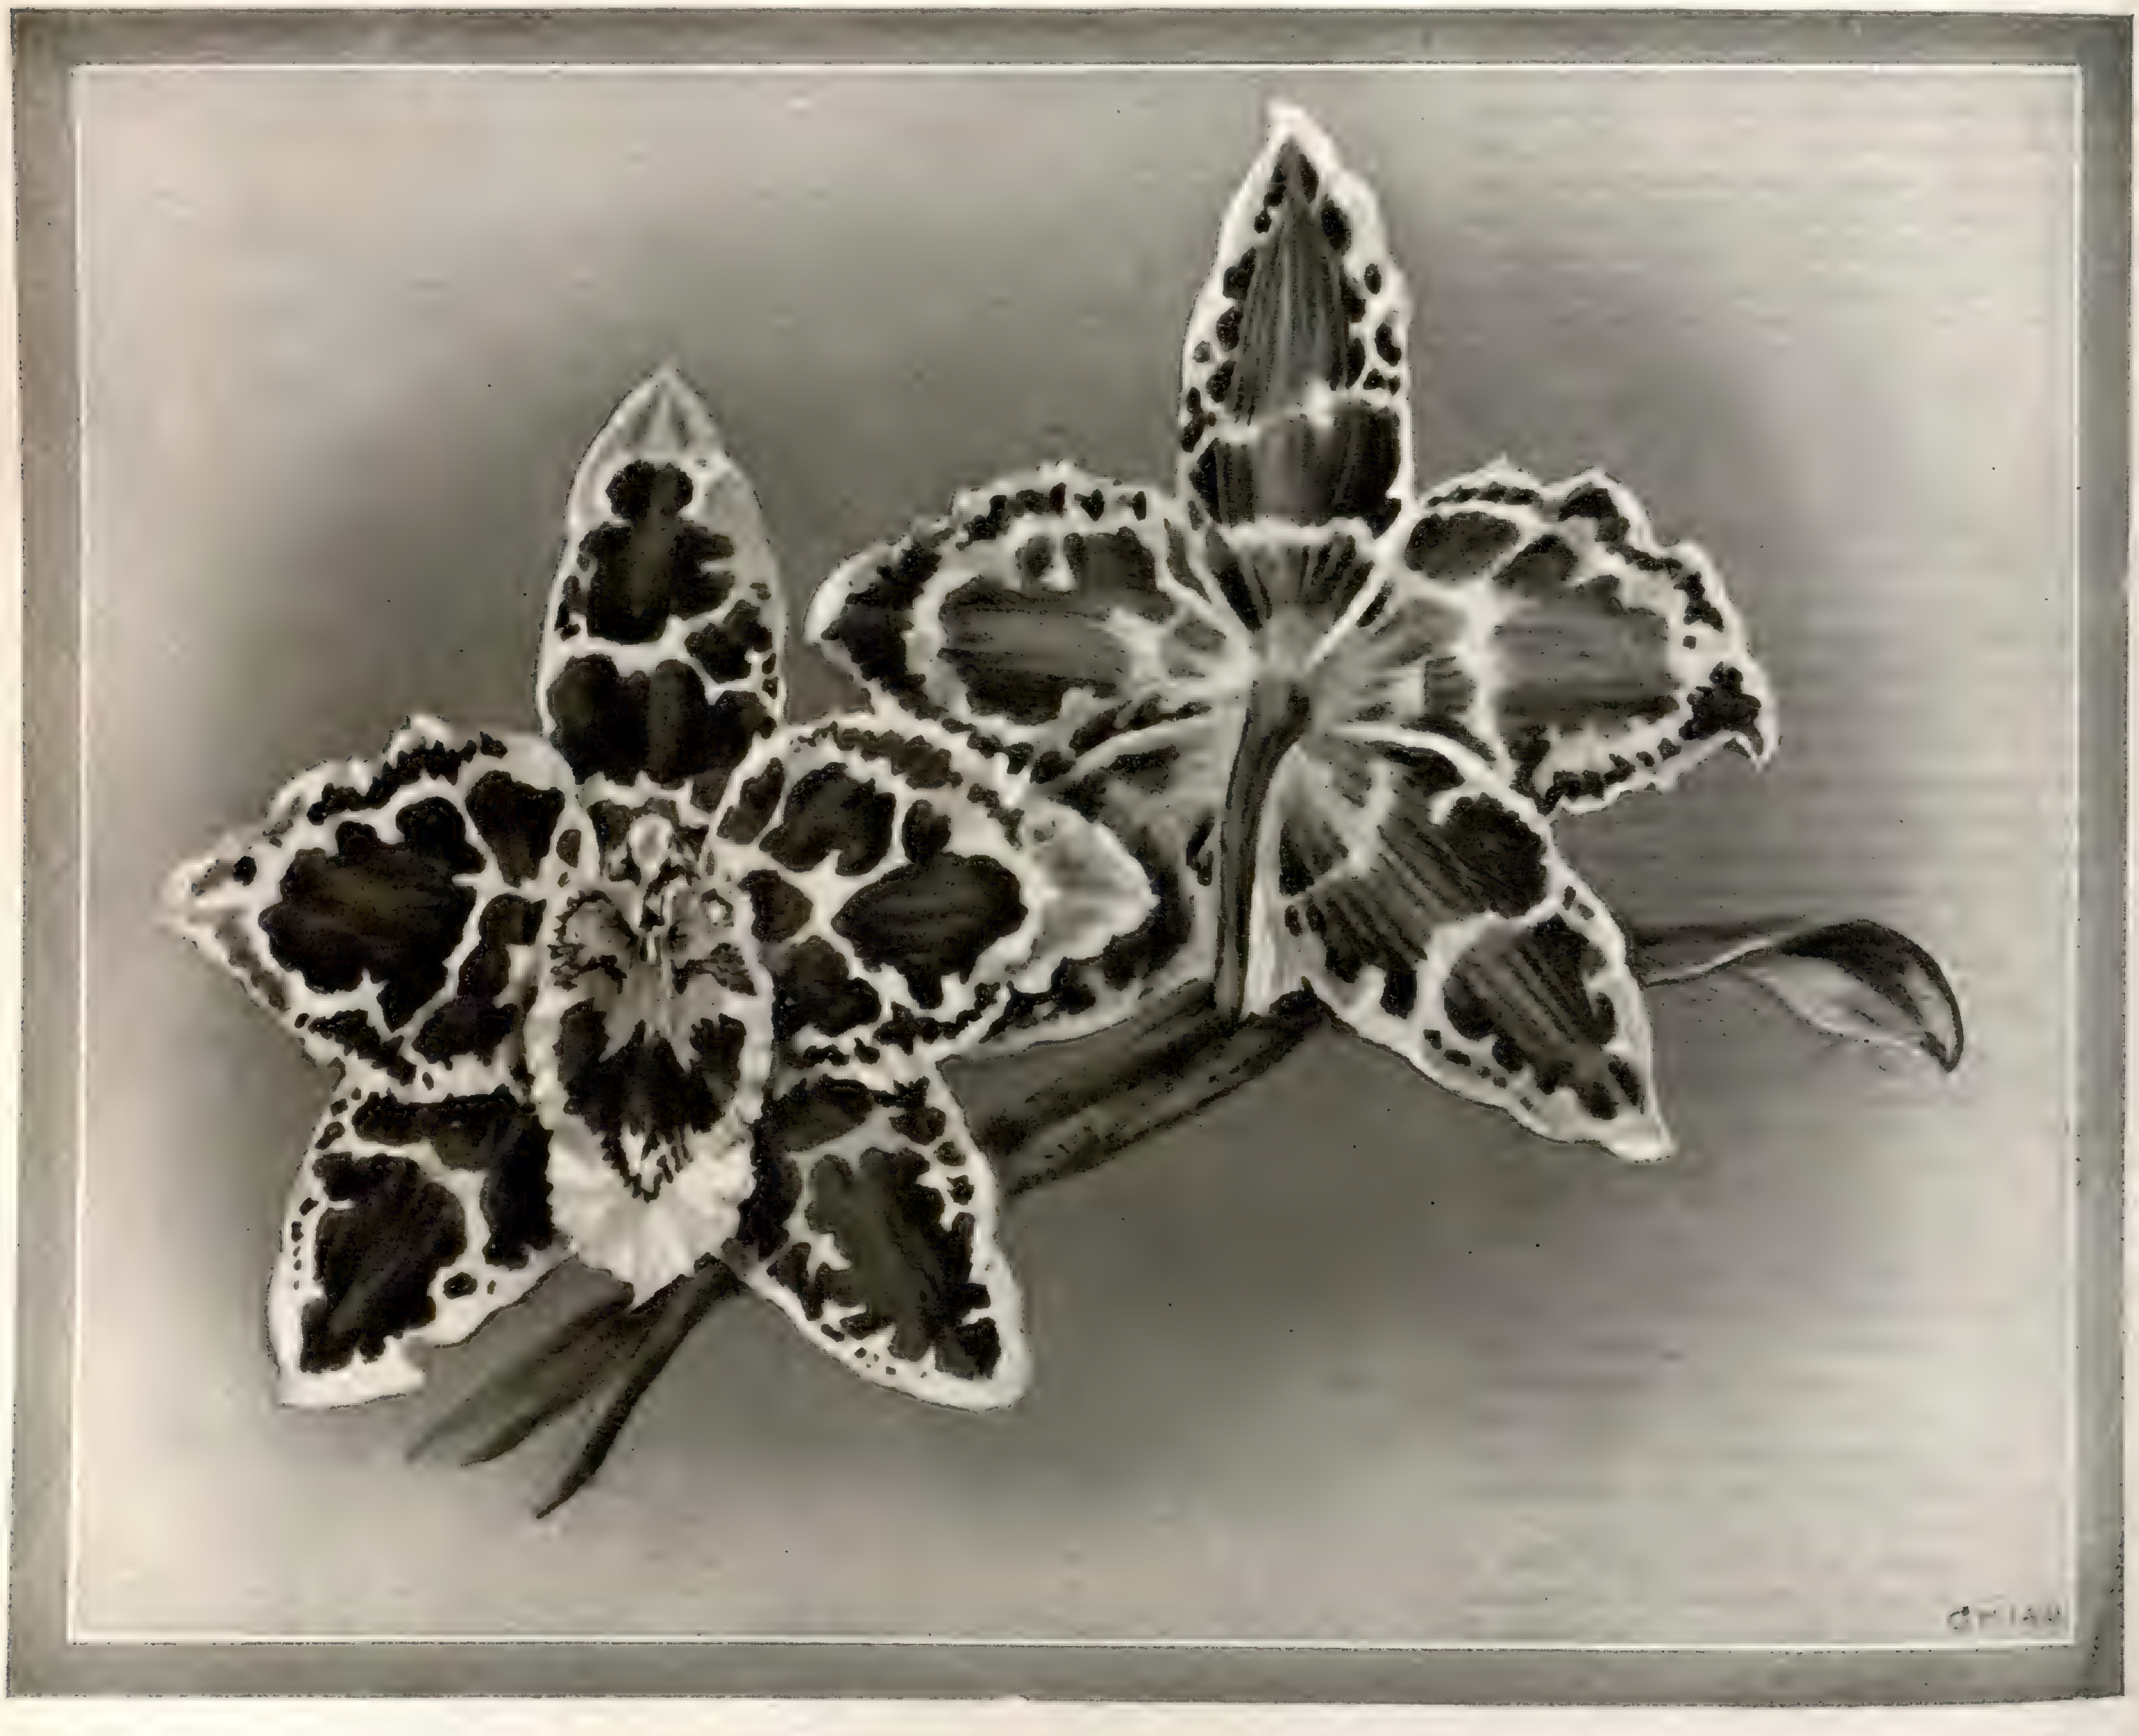
Many years ago Mr. Francis Wellesley, J.P., of Westfield, Woking, had a very interesting collection of orchids, and this collection included a large number of rare and beautiful hybrids and varieties. About the same time Mr. Wellesley had one of the finest collections of show carnations and picotees to be found in the country, and his wonderful successes on the show table with these flowers is well remembered. Then came a time when the owner of Westfield, acting on medical advice, entered his orchid houses but rarely, and, as it is difficult to maintain enthusiasm over things one cannot see or enjoy, the fine collection was disposed of.

Fortunately, after a few years, the medical taboo was removed, and Mr. Wellesley immediately entered once more into the cultivation of orchids, and gradually formed a new collection of these most interesting plants. Mr. Wellesey's enthusiasm for orchids has steadily increased, but it is tempered with excellent judgment and a keenness of discrimination that have made the present collection more valuable, interesting, and beautiful than the previous one.

Cypripediums are especially fine at Westfield, and one has to come here to see many of the finest that have yet been raised in this popular genus. C. insigne Francis Wellesley is a famous variety well represented, and the remarkable C. Royal George is growing finely. This latter gained a First-class Certificate from the Royal Horticultural Society on October 10, 1911, just before it passed into the Westfield collection from Messrs. Armstrong and Brown's establishment at Tunbridge Wells. It is a marvellously fine hybrid, as the accompanying illustration indicates. Shape, size, pose, and colouring all go to make this one of the very finest of cypripediums. The white dorsal sepal is rather over three inches broad, beautifully tinted with rose and veined with purple, while the broad petals are greenish-yellow and purple-brown. C. Harrisianum superbum and C. Minos Youngi were the parents of this wonderful hybrid.

Of C. Thalia, Mr. Wellesley has some splendid varieties, notably the handsome C. T. Mrs. Francis Wellesley and C. T. The Baron; indeed, of high-class hybrids with C. Fairrieanum parentage there are many fine plants at Westfield. C. Baron Schroder is in capital condition, and C. Elatior, a cross between C. Baron Schroder and C. Leeanum, produces fine flowers. C. Waterloo, one of the largest of cypripediums, is thriving at Westfield, and when in flower its big white, purple-based dorsal sepal is most effective. The beautiful C. Octæus Langleyensis is growing apace, and the very fine C. San-Actæus Westfield variety flowered splendidly this last season, and promises well for the future. Smaller, but of exquisite shapeliness and colouring, is C. Little Gem; this and C. Wellesleyæ are great favourites with Mr. Wellesley. The last-named is the result of crossing C. Venus with C. insigne King Edward, and, as may be imagined, it is a very refined and chaste flower. C. Duke of Argyll is a bold and striking hybrid from C. Leeanum giganteum and C. Druryi, and one that ranks with the best. C. Lady Northcliffe, from C. Hera Burford var. and C. Ville de Paris, should become famous, as it is a very distinct hybrid. It would be an easy matter to give a catalogue of notable cypripediums to be found at Westfield, all in capital condition, under the care of Mr. W. Hopkins, the skilful head gardener, but these must suffice for the time being. There is one plant, however, that beats Mr. Hopkins, and it is a tiny seedling of C. Fairrieanum parentage. It is about ten years old, has three wee leaves and one growth, and has been in much the same condition as at present for many years. It seems to resent special care and attention, threatening to die if disturbed, but when left severely alone it just keeps alive, and so, because of its extraordinary behaviour, it is allowed to live.

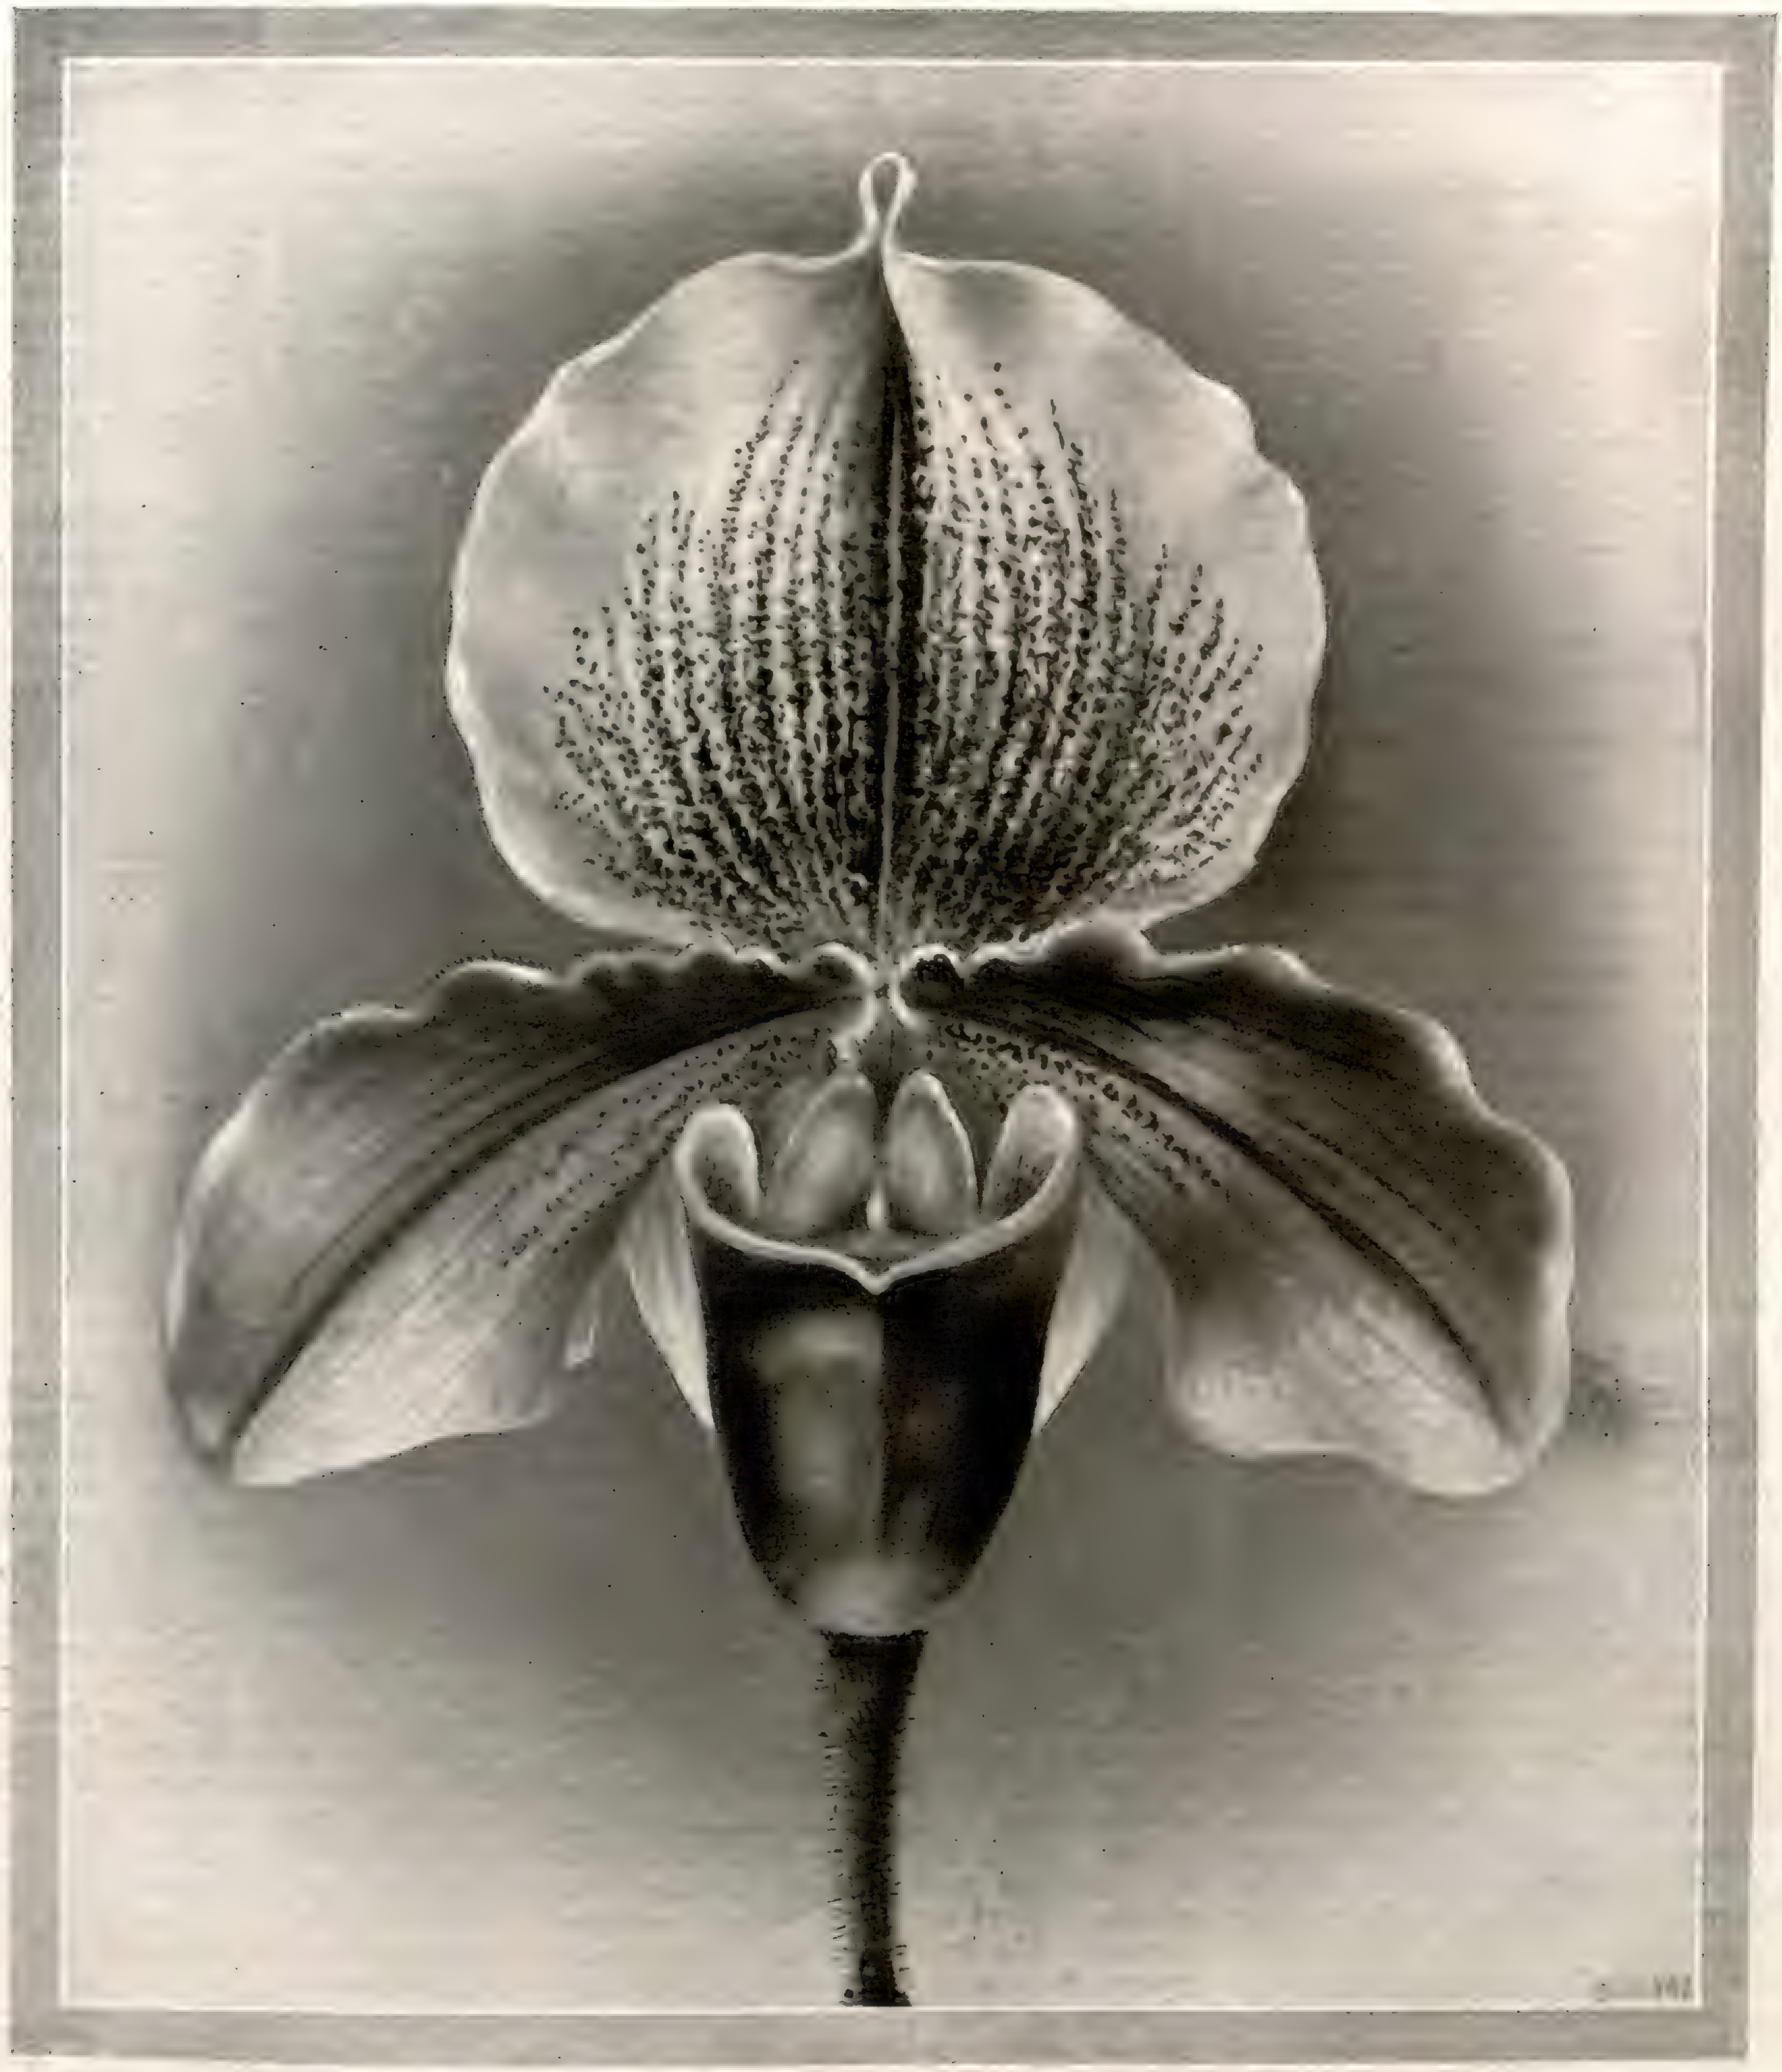
Besides cypripediums the cattleyas are a goodly set at Westfield, the varieties of C. Mendeli being superb. C. M. His Majesty is one of the finest, and one part of the original plant was presented to



ODONTOGLOSSUM ARMSTRONGÆ.
A unique odontoglossum with bluish-purple markings. It is of unknown parentage; in the Westfield collection.

Queen Alexandra by Mr. Wellesley a few years ago. C. Trianæ Purity is a lovely cattleya. C. Freya Mrs. Sassoon carries the hallmark of the R.H.S., as also does Lælio-cattleya Morningtoniæ, a glorious and first-class white and purple hybrid. Brasso-cattleya Wellesleyæ, a lovely white hybrid between Brassovola glauca and Cattleya Mossiæ Wagneri, may lack size as compared with hybrids from Brassavola Digbyana, but it is of exquisite beauty nevertheless. There are many other rare and beautiful lælio-cattleyas and brasso-cattleyas in the collection, and there are a few odontoglossums, these latter including O. Armstrongæ, which Mr. Wellesley purchased in 1909 for a very large sum. It is a unique plant, bearing very large grandly-marked flowers, the purple colouring quite approaching the "blue" shade for which many hybridists have been endeavouring to obtain.

Westfield is finely situated as regards light and air, and is a charming little estate set in a ring fence in the middle of a broad Surrey common. The garden is famous for sweet peas as well as for orchids, and it contains a fine set of climbing roses, some pretty rock gardening, and some rare old hollies, while, inside the comfortable old house, Mr. Wellesley has the finest collection of silhouettes in the kingdom, and a remarkably fine collection of miniature paintings as well.



CYPRIPEDIUM ROYAL GEORGE.

A remarkably fine hybrid in the Westfield collection. The colouring is white, purple, brown, and greenish-yellow.

---

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

## LOOSESTRIFES.

The name of "loosestrife" will recall memory pictures of those two sterling groups of plants, Lythrums and Lysimachias, and certainly they are well worthy of being bracketed together under the popular old-world name, seeing that they are so often utilised together in garden scenery.

One favours the inclusion of the better species and varieties of both groups for planting watersides, and their natural love for moist places, together with their showy appearance when in blossom, should recommend them to the planter who is in search of varied subjects for the waterside margins, the bog garden, and the cool spots of the wild garden. Even in the herbaceous borders the best forms are not out of place, and, provided that the planting site is comparatively moist, they will compare favourably with other border perennials.

Of the Lythrums I would especially advocate the use of the fine forms of L. salicaria, the well-known native plant which creates such glowing beauty masses throughout late summer. The type, as may be generally noted, possesses blossoms of a reddish-purple colouring, but decidedly better effects can be obtained by the use of roseum, a bright rosy variety, and superbum, which is very near to it. Both make grand bushy subjects which are invaluable in the water and bog garden, especially as the summer flowers are decidedly on the wane when they are in their beauty.

L. Græfferi, with its dwarf, floriferous habit and bright rosy-pink blossoms, is adapted for positions requiring dwarfer subjects than L. salicaria; while the pretty L. alatium, with its bushy growth, short dark green leafage, and rich purple colouring, seems to be more at home in dryish places than its companion species. It even does well in the rock garden provided it can have sufficient soil for root development. The rosy-purple L. virgatum, with its branched habit of growth, and its medium height, is also worthy of note, and, like its kindred, is very effective. Certainly there is a need for the brightness of the Lythrums.

Of the Lysimachias a few notes must suffice, but from the bright golden vigorous L. vulgaris, with its tall strong spikes of blossom, to the lowly creeping L. Nummularia, which is largely used in many gardens, especially old-fashioned ones, they are diverse in form and habit, and certainly not devoid of interest. L. clethroides, with its graceful spikes of milk-white blossoms, is eminently serviceable, but a trifle neglected. Another good white is L. ephemerum, with its erect, leafy stems and terminal heads of dark-centred white blossoms. The two white-flowered Chinese species, L. Fortunei and L. barystachys (the latter a dwarf species with dense racemes) are both decidedly worthy of note, and add to the interest of the moist spots of the garden.

Good yellow Lysimachias include the native L. vulgaris, a useful wild garden moisture lover; L. thyrsiflora, another fine native, with grand panicles of golden blossom (a fine waterside plant); L. v. verticillata (or punctata, as it is sometimes called), a glowing bright yellow; L. v. quadrifolia, with its showy blossoms, and leaves in whorls of four; L. v. japonica, a notable Japanese species with grand blossom spikes, and L. davurica, a Siberian gem, which seems to have much in common with our own L. vulgaris. These gleaming gold and yellow Lysimachias give a bright glint of colour to the waterside and bog garden during late summer, and they are also serviceable for border planting, giving a display when many other subjects have finished their reign.

The dark purple L. atropurpurea gives a welcome change of colour to the preceding species. It is an elegant plant and deserving of notice among garden lovers. As for the creeping L. Nummularia, and its variety aurea, they are splendid for carpeting low, moist banks in the wild garden.

P. S. Hayward.

---

**Rhodanthe Manglesi.**—This used to be regarded as rather a difficult subject to grow, but any obstacles in this respect seem now to have been overcome, as charming pots of both the pink and white forms may be seen in the summer hawked in the streets of London. By some market growers they are cultivated in immense quantities.—T.

## FLORAL MONSTROSITIES.

It would be an interesting study, not without educational value horticulturally, to look through a florist's catalogue of ten or twenty years ago, and see how many of the new introductions and varieties therein described are still given a place in the nurserymen's lists of to-day. Many do not realise how largely commercialism enters into the matter, for florists must have novelties to offer, if they are to be in the forefront of their profession, and when a new plant has been brought out it must be boomed to get a sale for it. It is similar also, in some respects, to the fashions in dress—new designs are brought out so that people must get them if they are to be in the fashion, and new varieties of flowers, fruits, and vegetables are constantly being introduced and made well known, with the result that gardeners are persuaded to try them in order to be up-to-date, or a little ahead of their neighbours. Anyone visiting a Temple Flower Show must have been struck by the number of flowers of little merit, but often labelled as new. To pursue the above simile a little further, as pictures of the fashions of twenty or thirty years ago do not always call forth admiration to-day, let us, when ordering plants, try and detach ourselves from the present, and look at the specimens from a disinterested standpoint, and try to assess their value. Unfortunately,

### The Fascination of Novelties

is so great for many of us that it often blinds our judgment as to what is really most beautiful. It would be a good thing if we could form a calm unbiassed judgment in regard to modern popular flowers, with a view to deciding which really do deserve to be grown for their own sake, apart from fashion, and which ought to be relegated to oblivion. If the succeeding generation should turn out to be characterised by a more intense love of natural beauty than the present possesses in the mass, what will they think of pictures of begonia blossoms nearly as large and round as tennis balls, snapdragons with stunted little pyramids of blossom, wallflowers little better, and plants of various sorts with all their energy devoted to the production of one or two big blossoms where there should be a dozen or more?

One often regrets that the florists' art should be misdirected to the spoiling of good flowers. Surely the glory of the wallflower, which is hardly second to its scent, consists in its crimson, brown, and golden colours, and yet we have been given shades of dingy purple, magenta, and washed-out yellow, and it is scarcely possible to raise a packet of seed without finding some plants tainted by these, to me, wretched strains. We have none too many easily-grown flowers in the garden of a warm glowing crimson, free from magenta and purple tints, but the gaillardia is one of them, and yet florists have raised varieties in which the principal colour is a pale yellow, with a faded band round the disc, as well as double forms of nondescript character. Of clear blue flowers we have still fewer, and yet the delphinium has been so much crossed with varieties having mauve and purple in their composition that, in raising a batch of seedlings now from the best mixed seed, it is almost the exception to get a variety of a pure blue.

The mistakes which florists make with regard to many flowers seems to be owing to a want of

### A Sense of Proportion

in assessing the relative value of a plant, and the blossoms it produces. The plant should be beautiful, as a whole, the form of the plant, as well as its foliage, acting as a foil to show off the beauty of the flowers. Instead of this, the plant has been regarded as of quite subsidiary importance, and simply as a flower-producing organism. When flowers are considerably increased in size and quality, while the height or vigour of the plant remains unaltered, the balance of Nature is often destroyed, while, when the natural growth of the plant is at the same time diminished to a dwarf and compact form, the result is sometimes little short of a deformity. The double zinnia is an instance of the first, especially when the plants are of a "fine dwarf habit," and when to this is added that type of the double flower in which some of the petals stand up above the others, we have a plant which in its total effect comes about as near to ugliness as man has yet succeeded in producing in this line.

Of the second class the four or five-inch snapdragons may be taken as an extreme instance. The beauty of the snapdragon is its stately spikes of finely-formed flowers, not too tightly pressed together up the stem, but in the stunted form all this is gone. The dahlia is an instance of the development of a flower with the exhibition table as the main object in view, the result being now that many of the finest varieties we see at a show are almost useless for the garden, the stems either being too short to hold the blossom above the foliage, or too weak to support the weight of the flower.

Some of the worst results of the florists' art are to be seen in

### The Doubling of Flowers.

Some go to the extreme of objecting to all double flowers, but this position cannot be defended, for many flowers are obviously improved by it, the single type often being insignificant or lacking in effect, and having no great beauty of form to recommend it, as is the case with stocks and carnations, where few will be found to admit that the single forms are better worth growing. But when it comes to single flowers of perfect form, then doubling is the florists' method of marring Nature's perfect work. Think of the beauty of form of the Madonna lily, the Tiger lily, the Canterbury bell, the peach-leaved bellflower, the day lily, and even the violet, nasturtium, and primrose, and the idea of spoiling the form of the flower by inserting one or more deformed corollas within their perfect shapes seems little short of sacrilege. The double tulip, too, when compared with the graceful outline of the closed, or partly opened, bud of the old-fashioned Golden Crown, is found sadly wanting, and when used for bedding is little more effective than balls of coloured paper.

We are even threatened with double sweet peas, but it is to be hoped that public taste will give no encouragement to the experts in this respect, and it is to public taste than we must look, as the nurseryman is dependent upon it for his custom. There is undoubtedly a set to-day against double flowers, as evidenced by the ever-increasing numbers of single decorative roses and chrysanthemums, and if buyers will subject all novelties to the test of beauty, rather than fashion, the number of undesirable novelties in every catalogue will be considerably reduced, and doubtless the nurserymen will be as glad as their customers.

Alger Petts.

## HARDENING OFF.

There is always at this season of the year much overcrowding in the houses where a quantity of summer bedding plants have to be raised, and even in well-appointed establishments where there is not this extra demand on the space under glass, the houses are usually fully occupied, as the weather is too treacherous to expose plants suddenly to the external temperature of our climate. Therefore it becomes necessary to make some preparations for "hardening off," as it is termed. There are many contrivances, and much labour is expended to overcome the difficulty, and often after every precaution has been adopted that one can think of, much damage is sometimes done through the carelessness of someone. Hardening off must be done gradually if it is to be successful. I have seen plants that were the picture of health ruined through a too sudden exposure to a lower temperature, or by being transferred from a shady place to an exposed position in the full sunlight.

When it becomes necessary to harden off the plants, a suitable place must be provided for them, and this very often entails an amount of labour that none but those who are thoroughly acquainted with the conditions of the place can understand; very often plants have to be moved two or three times before they finally become sufficiently hardened to withstand the outside conditions. For example, a batch of plants may be in a late vinery where the temperature is gradually being raised, and the foliage begins to overshadow the occupants beneath. To remove such plants to an exposed place would give them a serious check; but often, in order to provide a suitable place for them, another batch has to be shifted, and those from the said vinery put in their place, and these again, in time, have to give place to others that are more tender. By this it will be seen that hardening off a large number of plants is no light task, even in gardens fairly well provided with suitable accommodation; while where this is not forthcoming the difficulties are manifold.

In some gardens suitable temporary frames may be made, while in others hedges are so arranged that after the plants have been somewhat accustomed to the lower temperature and the full sunlight, they may be transferred to their shelter until they are finally planted. There are many plants that flourish in the shade; in fact, they do much better in such positions than in the full sunlight, and these when taken from under glass should be stood in the shade of trees or similar places, and be protected from winds by suitable screens. At one time many plants that needed stove temperature in winter were employed to decorate our gardens during the summer months; but most of these have now fallen into disuse, as it was not safe to expose them until June, and to prevent their being injured by the cold winds in the autumn they were housed again quite early. But there are still many tender plants employed which necessitate the process of hardening before transfer to summer quarters, and these should be gradually accustomed to a lower temperature than that in which they have been grown, either by admitting more air and light to them in their present positions, or by shifting them to other quarters where this can be afforded. H. C. P.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, writen for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## PRIMULA PALINURI.

In observing this primula, a point of interest to the botanist is the thickness of its underground stem or rhizome, which is elongated to a considerable length, so as to spread itself over an extensive area. The rhizome is of a woody nature. To bring it to the highest point of development, the species should be grown as a pot plant under glass, where it flourishes and flowers well; but if this is impossible and it has to be grown in the open air, a warm nook in the rockery facing west should be chosen.

The leaves are of large size, being both long and broad. They are light green, but of an intense shade. They are fleshy, pliable, serrated at the margin, and quite devoid of farina. In shape they are obovate or oblong, tapering off gradually to a peticle which varies considerably in length, sometimes being very long. The scape is erect, and towers well above the enormous leaves, bearing at its summit an umbel of flowers which vary in number considerably, reaching in some cases a maximum of forty. The flowers are borne on pedicals, the surface of which is thickly covered with a white mealy powder. The bracts offer the same characteristic, and the outer ones are leafy and rather large, the inner ones, however, being much smaller.

PRIMULA PALINURI.
An interesting species with yellow flowers.

The flowers are all produced on one side of the scape, and present a drooping appearance. The calyx is covered with the same mealy powder, and is cleft to almost half its depth. It is bell-shaped, and the lobes have sharp points. The corolla stands out well beyond the calyx, as the illustration shows, and is of an intense golden-yellow colour. Primula Palinuri does not bloom until it has attained a good size, but the flowers when produced are fairly abundant.

In the cultivation of this plant one must bear in mind that it thrives best in a loamy soil, to which some peat and sand have been added. Those who wish to be successful with it in cold districts should keep it under glass during the winter months, in an airy situation, with plenty of light. P. Palinuri emits a strong cowslip odour. It flowers in April, and its home is Southern Italy, in the province of Salerno. The illustration represents a plant from my cold frame which was flowering in the early half of April.

Morelands, Duns. John Macwatt.

## SCARLET RUNNER BEANS.

The popular runner beans can be grown successfully in any good garden soil, but if they are given liberal treatment, and three small sowings are made at intervals, instead of one large one, an abundant supply of fine tender pods will be available until frost arrests growth. Of late years, several improved varieties have been introduced to the public, especially as regards those belonging to the dwarf-growing section, and those intermediate between the dwarf and the runner varieties. Long, shapely, and small-seeded pods are now obtainable, and these are finely-flavoured; also, they are in most cases more prolific than the older kinds. A very early and improved form of runner bean is Hackwood Park Success, which was raised by Mr. Bowerman. The pods are produced in clusters on this variety, most of them being 9 or even 10in. long, and perfectly straight and handsome in appearance. The Emperor is another improved variety of scarlet runner, producing 12 to 15in. pods, fine and straight, and of a fine green colour. For exhibition purposes, this kind is difficult to surpass, while Jubilee Runner produces even larger pods than the Emperor. Prizewinner and Best-of-All are two other fine runner beans, suitable alike for exhibition, or for ordinary table purposes.

### Soil Conditions.

Whenever possible, the ground for runner beans should be prepared in the autumn by bastard trenching and heavy manuring, being left in ridges during the winter. A rich rooting medium is essential for beans, as also is an abundant supply of water during the time the plants are in full bearing. Beans are sometimes grown successfully in trenches on heavy clayey soil, but generally they do best in a well-drained, deeply-worked, light, and rich loamy soil. Poor and shallow soils are unsuitable for runner beans, the best land being that which has been highly cultivated for a preceding crop.

A gross feeder and a quick grower, the scarlet runner needs an abundant supply of nutriment, and therefore careful attention must be given to the manuring and watering of the ground. It is, moreover, a somewhat tender subject, and quickly injured by the least frost, for which reason, many exhibition growers prefer to raise the plants under glass, either singly in small pots or in boxes. Plants so grown must be thoroughly hardened off before planting out, the latter work being commenced about the end of April or the beginning of May. By keeping the plants close to the glass, a sturdy, vigorous growth can be easily encouraged, and the slight check caused by transplanting will make them bear much earlier than those plants sown in the open ground. Further, there need be no fear of slugs, which sometimes work havoc with sowings in the open.

### Sowing.

Too early sowings of runner beans are not recommended, since the plants, being tender, are very easily injured by cold or excessive moisture. A very good plan is to prepare trenches in the same manner as for celery, taking out, say, from 1 to 2ft. of earth and 2ft. in width, forking over the bottom very thoroughly as the work proceeds. Then, the trench should be filled in with well-decomposed farmyard manure to a like depth, and left in this condition for about a week before planting, the best soil obtainable being placed on the manure to a depth of 4 or 5in. Then, if the plants have been raised under glass, two lines should be set out in each trench at 12 or 15in. apart, each plant being planted very firmly and well watered in. In ordinary bean culture, where it is not deemed advisable to give liberal treatment, the sowings may be made during the first week in May, other sowings for later use being made from the end of May up to the third week in June. Single or double rows in drills may be sown, but clumps and circles are favoured by some growers. The drills should be about 4in. deep, and for a double row the seeds placed 7in. apart.

At Hackwood Park, I have seen the plants 1ft. apart in single rows, growing with the vigour of hops, and considerably higher than the latter. Market gardeners sow the dwarfer beans in rows from 3 to 3½ft. apart, and from one to three bushels of seeds are usually required to the acre. Towards the end of April, they roll and harrow the area, and if staked or climbing beans are to be raised, rows are marked out 5ft. apart; dwarf plants require lines only 3½ft. apart.

### Staking and After-Culture.

As soon as the plants are through the soil, the hoe should be set to work, and the seedlings thinned out to the required distances apart, all weeds being kept under as far as possible. Down the centres between the rows, the ground should be well stirred whilst the plants are young, and a slight earthing-up may be given early in the season, so as to afford them some amount of protection. Hazel sticks, about 10ft. long, and placed about 15in. apart, with a horizontal stake fixed about 6 or 7ft. from the ground, midway between the two rows, will be required for the runners. The staking must be done at an early stage, or the runners will become entangled, and will not then attach themselves to the stakes.

Many growers fail to give a sufficient length of support to runner beans, usually contenting themselves with the long brush sticks that are used for staking peas. These are not long enough, however, and it will generally be observed that the plants double over at the top and so exclude air and sunlight from the middle, which affects the bearing of the plants considerably. It is not too much to allow a height of from 10 to 15ft.

Runner beans will need plenty of water during the cropping season, and considerable benefit will be derived from repeated applications of weak manure water. Soot water is an excellent fertilising medium for this crop, especially in dry weather, and a small quantity of bonemeal mixed with farmyard manure, and used as a mulching between the plants as soon as they commence to crop, will be useful in stimulating the plants to fresh energies.

J. C. NEWSHAM.

## NOTES FROM KEW.

### Greenhouse Flowers.

There is at the present time an exceptionally fine display of flowers in the greenhouse at Kew, for not only are the usual occupants of that structure in good condition, but there is quite a host of other subjects less generally met with.

Begonias, cinerarias, schizanthus, carnations, cytisus, primulas, cannas, mignonette, stocks, hippeastrums, etc., one looks for as a matter of course, but beside those, out of a vast number of different flowering plants, the following are especially noteworthy: Coreopsis Granti, a beautiful Composite, introduced about ten years ago from Central Africa. It forms a bushy plant from fifteen inches to eighteen inches in height, and has golden-yellow flowers a couple of inches or so in diameter. Dimorphotheca Ecklonis, another Composite, of loose growth, with large daisy-like flowers borne on long stems, the ray florets pure white, with a beautiful purplish-blue disc. The Bottle Brush flower, Metrosideros floribunda, or Callistemon salignus, which seems to increase in popularity year by year. Impatiens Oliveri, of which a huge specimen is always in bloom. Strelitzia Reginæ (Bird's Tongue Flower), whose striking inflorescences are borne at nearly all seasons. Rondeletia cordata, a pretty evergreen shrub, with heads of laurestinus-like pink blossoms. Lilium candidum, which, since the retarding of Lilium longiflorum has become so universal is now seldom seen forced into bloom. Dwarf polyantha roses, Calceolaria violacea, with small, curious, helmet-like flowers, white, dotted with purple. The bold-growing Celsia cretica, and the smaller-growing Celsia arcturus, both with yellow flowers. Crinum Powelli album, which is anticipating its usual season of blooming by some time; and Arctotis aspera and A. aureola, two South African Composites, with marigold-like flowers, in aspera straw colour, and in aureola rich orange-yellow.

Climbers include among their number the singular Abutilon insigne, its crimson flowers are veined with black; and the bright yellow-flowered Golden Fleece, the best of that colour. Another climber worthy of special mention is the South American Lathyrus pubescens, with lilac-coloured flowers, which, a failure in many gardens, flowers remarkably well at Kew. As a basket plant Oxalis floribunda is just now very beautiful, its rich rose-coloured flowers being borne in great profusion.

### Azalea Vuylstekeana.

This is very effective grown as small bushy plants, on their own roots, in the same way that we have been accustomed for the last few years to see Azalea Hexe treated. In A. Vuylstekeana the flowers, which are of a medium size, are of an intense bright crimson colour. Unlike A. Hexe, which is also well represented at Kew, the flowers of A. Vuylstekeana are single. Both, however, are of a dwarf free-flowering habit.

### Rehmannia kewensis.

Of this hybrid rehmannia, which was raised at Kew, there is a group of several plants, and, pretty as they are in themselves, they also suggest various possibilities by crossing with the other kinds that we have now in our gardens. A hybrid between Rehmannia angulata and R. Henryi is known as R. Briscoei. As a garden plant, however, it is not the equal of R. kewensis, whose parents are R. Henryi and R. chinensis. In R. kewensis the growth is free, several flower stems being thrown up from the base, which is well furnished with foliage. The flowers are yellowish, with a dark crimson blotch on the interior of the upper segments. There appears, however, to be a certain amount of individual variation in the tone of the flower, but in all of them the crimson blotch forms a very notable feature. The most vigorous specimens are about three feet in height.

### Echium Wildpreti.

Considering what a striking feature this forms annually in the greenhouse at Kew it is a matter for surprise that it is not more generally grown in gardens. While some of the echiums are of a shrubby character, this is of biennial duration, forming, in the first year, a dense rosette of long narrow silky leaves. From the centre of these a spike is pushed up in the second season to the height of a yard, or thereabouts. This is for the greater part of its length closely packed with blossoms, which are of a peculiar shade of reddish-pink, suffused with blue. A shrubby member of the same family, namely, Echium fastuosum, with blue flowers, attracted a good deal of attention at the meeting of the Royal Horticultural Society on April 16.

### Scutellaria Mociniana and S. violacea.

These two species of scutellaria are very noticeable among the many beautiful flowering plants in the intermediate portion of the T range. The best known of the two—S. Mociniana—is an upright-growing plant, with crowded heads of tubular-shaped flowers, in colour scarlet and yellow; while S. violacea has numerous weaker branches, and the spikes of deep violet-purple flowers are very freely borne.

### Clerodendron myrmecophilum.

It is now just eight years since this clerodendron was given a First-class Certificate by the Royal Horticultural Society, but it had flowered at Kew a year or two previously to that date. In the intermediate portion of the T range it is just now in good condition, and at once attracts attention, not only by the arrangement of the flowers, but by their uncommon colour. Unlike those members of the genus that are quite vigorous-growing climbers, this species is of quite erect growth, and flowers well when from eighteen inches to two feet in height. The leaves are long and lanceolate in shape, while the upright flower panicle forms nearly one-half of the upper part of the plant. The blooms are disposed in regular whorls. They are about one and a-half inches across, and of a bright orange-amber colour. The stamens, which are long, and red in colour, form a striking feature of the flower. This clerodendron is a native of Singapore, and for its successful culture it needs ordinary stove treatment. Though some years since its introduction, it is not very generally grown in gardens and nurseries.

### Ornithogalum arabicum.

One sometimes hears complaints that this ornithogalum refuses to flower in a satisfactory manner, but at Kew it does not seem to present any difficulty in this respect, as is shown by the numerous examples now in bloom in the cool portion of the T range. The tall spikes of large white, wax-like flowers, each with a dark centre, are very striking, and extremely valuable for various decorative purposes

K.

## HIPPEASTRUMS.

The gorgeous flowers of the hippeastrums are well known to many outside the circle of those engaged or interested in horticulture, as very creditable displays are to be seen in the winter gardens and other glass structures connected with some of the public parks and gardens throughout the country, thus giving thousands of people the opportunity of enjoying their brilliance.

Many of us have the opportunity each season of seeing fine examples of the cultivation of these plants at shows, or at establishments where a collection of hippeastrums is a special and valuable feature. In many such places specially-constructed houses are devoted entirely to hippeastrums, and these offer every facility for ventilation, bottom heat, plunging, etc. But every grower is not in the enviable position of having these facilities, and has to make the best use of less convenient arrangements.

It is most gratifying to notice what good results are often attained without special advantages, though, on the other hand, some very indifferent results are sometimes met with, usually through sheer neglect. In some instances, once the plants are out of flower they are stood in any out-of-the-way corner, and left to take care of themselves, consequently they become dried off at a season when they ought to be in full growth, and when they should be undergoing a resting period it is not infrequent to find them quite producing premature flowers.

The cultivation of hippeastrums is comparatively easy, but a few important points in connection with it have to be borne in mind, and, providing these receive due attention, the result will be that a very small percentage of bulbs, once they reach the flowering stage, will fail to produce their flowers annually, and continue to do so for several years. It is very essential that the bulbs shall receive good treatment during their growing season, and every encouragement should be given them at that period to make vigorous leaves, which, when completed, must be gradually and thoroughly ripened off. To accomplish this the plants, when out of flower, require a position near the glass in a house where a moist atmosphere is maintained, with a night temperature of 60 deg. to 65 deg., air being admitted on all favourable occasions through the day. Close the house in the afternoon before the sun is entirely gone, thoroughly damping it down and spraying the foliage at the same time. The increased temperature, with plenty of moisture resulting from this practice, is very beneficial to the plants.

These conditions will prevail in a vinery in which the vines have passed out of flower, and if the structure be a three-quarter span, with the vine rods not extending beyond the ridge of the roof, and provided with a shelf fixed to the back wall, about 2ft. 6in. from the glass, this latter will be found an ideal position for the hippeastrums, as they will revel in the moist atmosphere maintained for the welfare of the vines. Usually such houses face southwards, and when this is the case no shading need be provided for the plants, as they will be on the north side of the house, and the foliage of the vines will break the sun's rays through the hottest part of the day. Once growth is active, and providing the bulbs are not overpotted, they will require watering frequently, with occasional applications of soot water and liquid manure; if carefully used blood manure forms a good fertiliser. By the time the atmosphere of the vinery has to be kept drier on account of the fruit showing signs of ripening, the hippeastrums will be well advanced in growth, and the change in the atmosphere will be in no way detrimental to them, but will assist in hardening the foliage; feeding can still be continued for some little time; indeed, until about the middle of August, when they will begin to show signs of ripening. When this change comes about, gradually reduce the water supply. The vinery at this season will be kept dry, and freely ventilated during all fine weather, a condition very essential to the hippeastrums at this period to ensure the bulbs becoming thoroughly ripened.

If such a position as the one described cannot be provided, a warm greenhouse or palm house will be suitable through the growing season, provided the plants are kept near the glass, and not in a too shady position. Under these circumstances they will require a more airy and drier house for ripening, as a close moist atmosphere, even when water is withheld from the roots, excites growth. When the ripening process is completed, and the foliage has died down, the pots containing the bulbs can be stored in any cool, dry place, where they may remain until early in January; it will be then necessary that the bulbs should be turned out of the pots, and the soil shaken away from the roots, which should be quite inactive at that time of the year. If any offsets have formed, these should be pulled away from the parent bulb, if far enough advanced to support themselves, and then all dead or decaying roots must be cut away. For potting, use a compost consisting of three parts good fibrous loam and one part leaf-soil, with a plentiful addition of grit or coarse silver sand; if only very heavy loam is available, add one part of peat to the compost. Put the bulbs singly in well-drained pots, press the soil firmly round them, but only the lower half should be covered with compost. Overpotting must be strictly guarded against; a 6in. pot usually suffices for the largest bulbs, while a 5in. pot will be found quite large enough to accommodate bulbs of average size. The offsets can be potted singly into 60-size pots.

When potting has been completed, stand the pots containing the bulbs in a cool, dry house until they are required for starting; then they can be taken into a moderately warm house with a moist atmosphere, and here they will require but little water at the roots until they have pushed up their flower scapes a few inches in height, and then only sparingly until root action is quite brisk. A careful watch must be kept for any trace of slugs at this stage, as they are very partial to the young foliage, and if allowed to continue their depredations for only a short time they will cause much disfigurement to the leaves and flower scapes.

When in flower hippeastrums are excellent subjects for the conservatory and for indoor decoration, and if, while being used for these purposes, they are not carelessly watered or subjected to cold draughts, they will not derive any injury whatever.

Hippeastrums are liable to attacks of red-spider and thrips during hot dry weather, but if the foliage is kept well syringed, such pests will be held in check, otherwise sponging with some insecticide must be resorted to. Mealy bug at times becomes troublesome, and is difficult to eradicate when once established, as the scaly coverings of the bulbs offer a harbour for it; affected bulbs should be thoroughly looked over and cleansed of this pest while in a dormant state. Basal rot and bulb mite sometimes appear, and are usually the result of over-watering and bad management. T. B. Field.

Wych Cross Place Gardens.

## JAPANESE OR TREE PÆONIES.

The land of the Mikado is responsible for a host of exceedingly beautiful subjects which adorn our gardens, including the Japanese pæonies. As distinguished from the herbaceous section, they assume a shrubby or tree-like habit, the wood being of a fairly hard texture, and, further, it is idle to expect these plants to flourish unless they are given sheltered spots, secure from cold and biting winds. In the North of England, and bleak districts generally, it is found necessary to protect the plants with straw, reed mats, etc., during severe winters, and to prevent damage to the young growths from spring frosts.

The Japanese or Tree Pæonies are by no means fastidious as to soil, and I have failed to note any appreciable difference in their behavious when cultivated in light and porous or heavy and tenacious ground. They do, however, demand manurial assistance on a liberal scale, including a mulch of manure in early summer. It may be said that their value as decorative material for the conservatory in early spring is fully recognised by professional gardeners, and, as a matter of course, they are cultivated in pots for this purpose. The chief points in their management in pots are to afford sufficient pot-room to allow for unrestrained development, to employ turfy maiden loam, enriched with manure, and rendered porous by the addition of sand, and to pot them in early autumn if intended for flowering the following spring. They do not lend themselves to being forced into bloom in winter, but they may be brought along gradually in a cool house so as to be available in early spring. It will occur to the cultivator to syringe the plants overhead twice daily, dating from the time they are brought inside, and until the flowers appear, and it is hardly necessary to point out that after flowering they must be allowed to remain in a cold pit until danger from frost is past, when they should be plunged in coal ashes or fibre in an open position in the resêrve plot.

Propagation is easily effected by grafting, the operation being carried out in summer. A non-flowering shoot is grafted upon a strong root of the herbaceous species. After the operation has been completed the soil must be brought above the union when potting, and if placed in a propagating case a union is readily formed. Layering is a simple method, and if a pot plant is slightly tilted when plunged, a number of fine growths can be layered and converted into independent plants. Something must be said as to varieties. The type of Pæony montana is rosy-lilac in colour, and semi-double, and amongst the numerous varieties the following are of merit: Margaret Gerard, flesh colour; Snowflake, of great beauty; General Baden Powell, brilliant scarlet; The Sultan, crimson; Yokohama Beauty, white outer petals and a primrose centre; Edward VII., a combination of purple and crimson; Triomphe de Malines, violet; Ne Plus Ultra, lilac and white; M. Kleyer, rosy-salmon; Captain Champion, white; and Hessiana, white, with crimson stripes, form a selection of exquisite colouring and beauty. Walter H. Aggett.

**Cineraria Feltham Beauty, Dark Blue.**—This is a particularly striking form of cineraria, which gained many admirers at one of the April meetings of the Royal Horticultural Society. The Feltham Beauty strain, while it is of neat, compact habit, is less formal than the florists' varieties. In this form the flowers are of a rich deep blue, a tone of colour which is always much appreciated.—K.

# WORK FOR THE WEEK.

### STOVE PLANTS.

CALATHEA.—This genus contains many handsome ornamental-foliaged plants well worth growing in a general collection of stove plants. If not already divided, and repotted, the work should now be done. Given liberal cultivation they increase rapidly, and it is advisable to divide the crowns at least once in two years. A suitable compost consists of three parts fibrous loam, to one each of peat and leaf-soil, adding sufficient sand and small pieces of charcoal or broken pots to ensure a sweet and open medium. Ample and well-placed drainage must be provided, and clean pots be used. For the first few days after potting but little water will be required, as frequent syringings will suffice. As new growth is made, copious supplies of water combined with a humid atmosphere will be necessary. The plants revel in a rather dense shade, therefore they may be grown beneath climbers. Clear rain-water should always be used for overhead syringing as the leaves will be stained and disfigured by spraying with pump water.

ALOCASIAS.—These somewhat resemble the above, and require much the same kind of treatment, with, perhaps one or two exceptions, viz., the compost should consist mainly of peat used lumpy, and plenty of chopped sphagnum and pieces of charcoal. If one has really good fibrous loam, a small quantity incorporated with the other materials is advised. The receptacles should be nearly half-filled with clean crocks, and the plants set well up, so that the crowns are a few inches above the rim.

BEGONIA GLOIRE DE SCEAUX.—Cuttings of this handsome winter-flowering begonia should be struck as soon as they can be obtained from the base or stems of the old plants. If a heel of the old wood can be taken with them so much the better. Insert singly in thumb pots filled with light sandy soil, and plunge in a half-spent hotbed until rooted. The next shift may be into large 60's or 54's, and finally into large 32's. This begonia is a gross feeder, and when well-established requires frequent applications of liquid manure. Keep the young plants growing freely, yet sturdily, by ventilating the house or pit on fine days. Watch closely for the rust that sometimes attacks the plants. An occasional mild fumigation with a vaporising compound will generally ward off this if taken in hand at once.—H. T. Martin, Warren Wood Gardens.

### THE ORCHID HOUSES.

CYMBIDIUMS.—Such species as Cymbidium eburneum, C. Lowianum, C. Hookerianum (grandiflorum), C. Traceyanum, C. insigne, and others, as well as the hybrids raised from them, are all excellent orchids, which thrive well in a cool part of the intermediate house; if shaded from strong sunshine. Any which have become root-bound may be repotted soon after they have passed out of bloom, but unless this appears really necessary, they may be left undisturbed for several years. The receptacles should be about one-third filled with clean crocks for drainage. For compost I use equal portions of good turfy loam, peat, osmunda fibre, and sphagnum moss, and remove all the fine particles. The compost should be used in a fairly rough condition, and be pressed down among the roots with moderate firmness. Sufficient space should be left below the rim to allow of thorough watering, as well-established plants require copious supplies. After repotting, the greatest care and attention must be paid to the application of water, and none must be given unless it is necessary to prevent the bulbs shrivelling. Should the compost become very wet before the plant is re-established, much harm will accrue. C. devonianum is quite distinct in its habit and mode of flowering, producing its flower spikes like a Stanhopea, therefore it is best grown in shallow teak-wood baskets, suspended from the roof. The dwarf-growing C. tigrinum is best grown in shallow pans, and may also be suspended from the roof. During the summer months cymbidiums appreciate a moderately cool, moist atmosphere, therefore it is necessary to damp well between the pots once or twice a day, and when the weather is bright and warm, a light spraying overhead occasionally during the daytime will assist in keeping them clean and healthy. Heavy sprayings or syringings are detrimental. Give shade from strong sunshine, and keep watch for red spider.

MEXICAN ODONTOGLOSSUMS. — O. Rossi is only one of many interesting subjects from Mexico; there are O. nebulosum, O. Cervantesi, O. cordatum, O. Humeanum, O. Insleayi, O. maculatum, O. Reichenheimi, O. madrensis, and the beautiful O. citrosmum. To be successful with these a slightly higher temperature is necessary than that provided for O. crispum. During the winter months they must be rested and kept drier than is advisable for O. crispum. The temperature should not fall much below 55 degrees, and watering must be done with care, giving only sufficient to keep the pseudo-bulbs plump and the plants healthy. The compost advised for O. crispum will answer. The larger growers are best grown in ordinary flower pots, but the smaller growers succeed best in shallow pans suspended from the roof. The odontoglossums from Costa Rica and Guatemala embrace O. grande, O. Schlieperianum, O. pulchellum, O. bictoniense, and O. Œrstedi. The former is one of the most gorgeous of odontoglossums, and enjoys an average temperature of 60 degrees, but when in flower a drier atmosphere should prevail, thus prolonging the life of the blooms. This and the Mexican species should all be repotted when the new growth is three to four inches in height and about to push forth new roots. With the exception of O. grande all may be accommodated at the warm end of the cool house, but the latter species is best grown at the cool end of the intermediate house. They must not be densely shaded, but the other extreme must be carefully avoided.—J. T. Barker, The West Hill Gardens.

### FRUITS UNDER GLASS.

LATE VINES.—The growths of late vines have developed very rapidly, chiefly owing to the continuous sunshine which we have experienced for some weeks past; artificial heat should be dispensed with during bright sunny days, but it will be required moderately at night to maintain the proper temperature. Pay particular attention to pollination of the bunches when in flower, especially such varieties as Mrs. Pince, Lady Downes, and all the Muscats. Watering the borders is necessary, damp down the house frequently, and stop and tie in the laterals, as recommended for earlier houses.

FRUITING POT VINES.—The fruits will be ripe, and ready to send to the table for dessert, so admit plenty of air, both at the top and side ventilators, and maintain a dry atmosphere in the house at all times. The vines will require to be watered with tepid water several times a day. Any leaves affected by red spider should be immediately sponged with soapy water. Endeavour to keep the foliage clean. Shade the glass lightly by syringing over it a thin solution of whitening and linseed oil.

YOUNG POT VINES.—The plants should be shifted into their final pots without delay; use 11in. or 12in. pots for this purpose, which must be clean and well drained. Cut off three or four of the lower leaves, to allow the top of the root mass to be several inches below the finished surface after the final potting has been accomplished. Stake and tie the plants, and follow the cultural details given in a previous calendar.

CUCUMBERS.—These have been in full bearing for some time, and repeated top-dressings, with good rich loam and decayed manure, will be essential to maintain them in a good healthy, fruitful condition. Carefully attend to the thinning and regulating the young growths, to avoid overcrowding. Remove all leaves that show signs of decay, and frequently syringe the plants. Make a sowing of seeds towards the latter end of this month, to provide plants for fruiting in the late summer and autumn months.

TOMATOES.—The plants are carrying heavy crops of fruit, so do not, on any account, allow the roots to suffer for want of water, but at the same time avoid using much stimulating manure as this induces a thick soft unfruitful growth. Gather fruits when ripe and continue to pollinate the flowers daily.—Henry R. Farmer, Cardiff Castle Gardens.

### THE FLOWER GARDEN.

BORDER CHRYSANTHEMUMS.—Those that were rooted from cuttings early in the year have now become sturdy plants in small pots, and can be planted out if sufficiently hardened. When whole borders are devoted to them they make a showy display in the late summer and autumn, and large groups in the mixed borders are especially effective. These subjects are very useful to follow Sweet Williams, and when required for such a purpose, they must be grown in larger pots until required.

PENTSTEMONS.—No time should be lost in planting these in their permanent quarters, as they are now sturdy plants, while those raised from seeds this year are growing rapidly, and can be planted out a little later. Pentstemons well repay liberal treatment, and when planted on rich ground, produce very fine flower spikes. Allow 18 inches each way between the plants, and guard against slugs; an effective method is to place finely-sifted coal ashes around them. Besides occasional thorough waterings, pentstemons, in common with other flowering plants, derive much benefit by being sprayed over regularly in the evenings of hot sunny days.

ROSES.—Owing to the very bright weather experienced some roses, and especially those growing on walls, are likely to bloom early this year. As greenfly will probably be troublesome, it is advisable to spray with quassia during the evening, in order to eradicate the pest, or it may cripple the young growths and spoil the buds. After using quassia it is desirable to use clear water the following morning. Do not allow any of the plants to suffer for lack of moisture at the roots, and occasional applications of liquid manure can be given with beneficial results, while, in some instances it will be an advantage to apply a mulch of short manure. Remove any briars that appear, and keep the surface soil of rose-beds regularly stirred with the hoe.

SEASONABLE WORK. — All bedding plants must be placed in cold frames to harden off, where they can be freely ventilated, while some of the more hardy ones can be stood in the open, provided that protection can be given from frost. Dahlia tubers may be planted out where they are to bloom if desired, but we prefer to start them in gentle warmth and plant out in June. Antirrhinums should be planted in their permanent quarters as soon as possible. Sweet peas must be staked, and for a late supply seeds should be sown at the present time in the open. Thin out annuals as they become large enough, and keep the seedlings free from weeds. Newly-planted shrubs and plants require frequent waterings at the root as a result of the dry weather, while in many cases a suitable mulch will help to retain moisture about their roots.—J. Gardner, Batsford Park Gardens.

**Spiræa arguta.** — The shrubby spiræas are such a numerous class, that in most gardens selections rather than collections are aimed at. This early flowering form is entitled to a place among the very best. It reaches a height of 4 to 5 feet, has slender arching branches, and bears in April a great profusion of pure white flowers.—T.

## TULIPS AT TAPLOW.

The progress shown in the raising, selection, and cultivation of late-flowering tulips during the past few years is only a few degrees below that indicated by the daffodils, but it is probable that the cultivation of these glorious flowers is spreading faster in private gardens than is that of daffodils. On every hand one hears of extensive orders for bulbs of May-flowering and Darwin varieties, and the very keen interest in these groups is evidenced at every meeting of the Royal Horticultural Society from late April to the end of May. Further, at every nursery where bulb growing is a special feature, the area devoted to tulips increases each succeeding year. Small wonder that it is so, for, following the daffodils and Dutch tulips, and coming into bloom before the herbaceous borders are gay, late tulips fill a place that would otherwise be vacant.

These tall tulips have a stately grace peculiarly their own; they are fine for beds or borders, and valuable for indoor decorations. They are of easy culture, and their large substantial blooms last quite a good time in full beauty. And when one comes to the subject of colour, words fail to convey either the delicacy of tint or the barbarian gorgeousness to be found in a moderate selection, while a large collection of varieties planted in good blocks provides a feast of brilliant beauty that is perfectly dazzling. Such a feast may now be enjoyed at Taplow, where Messrs. Barr and Sons have established themselves in a new home. The main line of the Great Western Railway passes by the side of the nursery, and passengers thereby have grown enthusiastic over the wonderful picture spread out before them by the Messrs Barr.

A few minutes' walk from Taplow Station and one is in the midst of splendid blocks of such beautiful tulips as the pink Clara Butt, Inglescombe Yellow, the bright Inglescombe Pink, the blue-tinted Rev. W. Ewbank, and the masterful red Pride of Haarlem. Sunlight is a trifle small as compared with the great goblet-shaped Mr. Farncombe Sanders, but its scarlet hue is most effective, while those who love the softer tints will find the elongated, egg-shaped Moonlight a delightfully soft pale yellow. Sunlight was collected at the same time as retroflexa major, the latter a light yellow with reflexing pointed petals—a distinctly artistic tulip.

Don Pedro is a rich bronze and brown variety that, like others of somewhat similar colour, such as Louis XIV., is magnificent in association with the rich salmon hues of mollis azaleas. The darker sorts, like Sultan, are also capital for similar planting. Shahzada gives a most distinct mahogany-red tint, and is rather dwarf. Mrs. Moon is still one of the most graceful of yellow tulips, while Black Chief forms a striking contrast with it. White Swan is probably the finest of late white tulips, and a mass of it is perfectly dazzling in the spring sunshine. Orange Beauty, old gold and rose, is a rich warm tone, and Panorama, bronze and gold, is a gay giant. Caledonia and Scarlet Glow and Inglescombe Scarlet are very brilliant, the two latter especially so. Cassandra provides a rich cerise hue, while Picotee, with its rosy edge pointed petals of creamy-white, is already a great favourite. Margaret is perfectly lovely, and Mrs. Krelage gives light blue tinting that makes it a charming tulip for massing or for showing up the deep pink and other rich hues. Jaune d'Oeuf, Baron de la Tonnay, Salmon King, Queen of Roses, the dusky Sultan, and even more intense Velvet King, all have attractions that cannot be overlooked when selections are being made, nor may one forget Scarlet Emperor, or the delicate beauty of Norah Ware and Loveliness; but where all are so beautiful each has a claim upon some taste, or a value for some purpose. We are thankful to those who have created so many wonderful flowers, and grateful to Messrs. Barr for growing and displaying them so grandly at their new place at Taplow.

ROYAL SHOW

DONCASTER,
July 2nd to 6th, 1912.

73rd ANNUAL EXHIBITION of Horses, Cattle, Sheep, Pigs, Poultry and Farm Produce; Jumping, Sheep Dog Trials, Horse-Shoeing and Butter-Making Competitions, Agricultural Education, Forestry and Horticulture.

HORTICULTURE
ENTRIES CLOSE MAY 31st
(Live Stock entries close May 20th).

Prize-sheets and Entry Forms will be forwarded on application to
THOMAS McROW, Secretary.
Royal Agricultural Society of England,
16. Bedford Square, London, W.C.

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY
of
MANCHESTER and the NORTHERN COUNTIES.
Founded 1829.

GRAND ROSE SHOW,
and
SUMMER SHOW,
On JULY 19th and 20th,
at the
WHITE CITY and ROYAL BOTANICAL GARDENS,
MANCHESTER.

Schedules and all particulars from Mr. P. Weathers, Secretary, Royal Botanical Gardens, Old Trafford.

RICHMOND HORTICULTURAL SOCIETY.

THIRTY-EIGHTH ANNUAL SHOW.
26th JUNE.

Spaces to Let for Horticultural Sundries. Schedules, entry forms, and full particulars from W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—APRIL 30.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. J. T. Bennett-Poë, W. Hales, A. Worsley, J. Fraser, J. O'Brien, J. W. Odell, G. Wilson, C. E. Shea, E. M. Holmes, and F. J. Chittenden (hon. secretary).

HYBRID SAXIFRAGES.—Mr. J. Fraser reported on the saxifrages from Dr. Blaxall, of Edgware, shown at the last meeting, as follows: The two saxifrages were hybrids between S. granulata and either one of the group of S. muscoides Rhei or S. decipiens. All the characters of the hybrids were different from those of either parent. No. 1 had the stamens more or less imperfect, the petals shortened, the flower flattened, and the disc greatly enlarged. The stem was shortened, forming a compound corymbose cyme. The leaves were deeply lobed on the tripartite plan, much divided and with more acute lobes, not rounded as in granulata. The basal leaves formed a rosette, with short, broad, flattened petioles, these characters being derived from the dactyloid parent. The bulbils at the root and in the axils of the basal leaves were in a more or less leafy condition, and some of them had developed into leafy branches, especially in No. 2. The styles of both were divaricate, as in the dactyloid parent, not erect-patent as in S. granulata.

ALBINO FORM OF ORCHIS MASCULA.—Mr. Gurney Wilson showed an albino form of Orchis mascula collected by him in a field in mid-Sussex.

JACK FRUIT.—Mr. O'Brien showed on behalf of J. S. Bergheim, Esq., of Belsize Court, Hampstead, a Jack fruit (Artocarpus) brought by him from Brazil.

ARSENIC IN DRAINAGE WATER.—Dr. Voelcker remarked on some water, he had recently received for analysis, which had come from a stable and had been reputed to injure plants. He had found it to contain an appreciable quantity of arsenic, which was, no doubt, the cause of the injury. He had found that many plants would absorb a certain amount of arsenic from the soil without any appreciable injury, but in this case the quantity had been too great. Mr. O'Brien made the following remarks, which suggest a probable source of the arsenic: "I remember to have often heard of those in charge of horses giving them small doses of arsenic to improve their condition, and many a good horse has died suddenly from 'heart trouble' in consequence. Of course, it is done secretly. But if done at all it would account for the presence of arsenic in the stable. If pure arsenic cannot be had, on account of the restrictions, might not the knowledge that it is present in weed-killer cause small doses of that to be mixed with the food, and the surplus thrown on the floor? The arsenic must have got in somehow, and this is as likely a way as any. But to kill plants it must have been strong."

ORANGE WITH YELLOW STRIPE.—Mr. Holmes reported that he had examined the orange shown at the last meeting, which had a narrow yellow stripe down one side passing from base to apex, and could find nothing inside the fruit in connection with it. He suggested that it was probably a hybrid between the orange and the grape fruit.

SCILLA HISPANICA WITH LONG BRACTS.—Mr. Worsley showed from his garden an inflorescence of Scilla hispanica analagous to the variety bractiata of Scilla nutans. The bracts were many times longer than the pedicels.

TULIP WITH DISPLACED PERIANTH PIECE.—Mr. Shea showed a tulip with a displaced perianth lobe a few inches below the flower, which had but five perianth pieces.

PARROT TULIP.—Messrs. Barr, of Taplow, showed a new break, Sensation, the colour in the specimen not yet fully developed; with age the white becomes very solid and pure. As far as he had been able to discover from investigations made in Holland, this break suddenly appeared in a bed of the Dutch Breeder Tulip known as Reine d'Espagne (of which a specimen flower was here exhibited) in the nursery of a small Dutch grower. It is, of course, much dwarfer than its Breeder parent, and also propagates more slowly. A Botanical Certificate was recommended on the suggestion of the Narcissus Committee to this plant, which had none of the horn-like excrescences usual in parrot tulips, and had a stem like that of the Darwin tulips.

DOUBLE PRIMROSE.—A double primrose found growing wild was exhibited from an unknown source.

IRISES.—Mr. W. Rickatson Dykes, of Farncombe, sent irises, with notes as follow, making clear the origin of I. florentina and I. albicans: I. germanica "L. var."—This variety is one that is largely grown for producing orris root in the neighbourhood of Florence. Its stem is more slender than that of the varieties usually grown in England. It is probably the form of which I. florentina is the albino. I. florentina.—This is an albino form of a variety of I. germanica. Compare the spathes and the inflorescence. I. Madonna, Sprenger.—A comparatively recent introduction from Arabia. Compare its flowers, spathes, and inflorescences with those of I. albicans. There can be little doubt that it is the purple form of which I albicans is the albino. I. albicans, Lange. — Contrast the flower, spathes, and inflorescence with those of I. florentina, and compare them with those of I. Madonna, of which it is the albino form. I. albicans and I. Madonna both come from the Yemen in Arabia, and the former, used as a graveyard ornament, has spread wherever the Mahommedans have penetrated. I. Reichenbachi, Heuffel. — This iris, of which both purple and yellow-flowered forms can be raised from the same capsule of seed, is the common dwarf iris of the Balkans, corresponding to I. chamæiris in Southern France and Northern Italy. N.B. —The sharply-keeled spathes, as contrasted with those of I. chamæiris, I. balkana (Jka), I. serbica (Pane), I. bosniaca (Beck), I. Skorpilli (Velen), are some of the many synonyms of this iris. I. chamæiris, Bertolini.—This is the common dwarf iris of the South of France and of Northern Italy. It is easily distinguished from I. pumila by its visible stem and short tube, and from I. Reichenbachi by the spathes, which are not acutely keeled. The flowers are very variable in colour, and this variability has given rise to numerous synonyms, e.g., I. italica (Parl.), I. lutescens (Lom.), I. olbiensis (Hénon), I. virescens (Delarb).

## National Auricula Society.

### MIDLAND SECTION.

The thirteenth exhibition of auriculas and primulas was held at the Botanical Gardens, Edgbaston, on Wednesday and Thursday, May 1 and 2. There was a very fair attendance on the opening day, when, in fine weather, Mr. and Mrs. Neville Chamberlain opened the show. Mrs. Neville Chamberlain was presented with a bouquet of carnations (by Miss Stevens, the daughter of the late secretary), and was afterwards shown the principal flowers by the secretary and chairman of the society.

There were a goodly number of exhibits, though the quality was not up to the average; the early season was the means of bringing the best flowers out a fortnight before their proper time.

There were some excellent honorary exhibits, one from Messrs. Young and Co., of Cheltenham, called for special praise, the carnation blooms being very fine and well arranged; a silver-gilt medal was awarded. An award of a silver-gilt medal fell to Messrs. A. R. Brown, Lim., King's Norton, for a nicely-grown collection of pot roses. Mr. H. N. Ellison, West Bromwich, was awarded a silver-gilt medal for a very fine collection of ferns and gerberas. W. Byng Kendrick, Esq., Edgbaston (gardener, Mr. J. Webb), was awarded a silver-gilt medal for a very fine exhibit of calceolarias, the beautiful plants receiving a large share of attention from the visitors. Mr. Arthur Edwards, of Nottingham, was awarded a silver medal for table decorations, and C. Winn, Esq., Selly Hill (gardener, Mr. T. T. Sheppard), gained a silver medal for a group of schizanthuses.

A First-class Certificate was awarded to Mr. R. Holding for a gold-centred alpine auricula named Mrs. Neville Chamberlain.

The Botanical Society's medals for the highest number of points gained in open classes were won as follows: Silver medal, Mr. W. M. Shipman; bronze medal, Mr. C. Winn; the Auricula Society's silver medal, Mr. C. Winn; and the Brooks' silver medal, Mr. T. M. Eglington.

### SHOW AURICULAS.

For eight show auriculas, Mr. W. M. Shipman, Altrincham, was first, with Rev. F. D. Horner, Orient, Seedling, Acme, Henry Wilson, Molly Shipman, Geo. Lightbody, and Harrison Weir; Mr. Chas. Winn, Selly Hill, second, with Henry Wilson, Rifleman, Richard Headley, Gerald, Shirley Hibberd, Mrs. Henwood, Marmion, Olympus; Mr. W. H. Parton, Moseley, third. For six show auriculas, Mr. W. H. Shipman led with A. Barker, Letetia, Miss Willmott, Ruby, Shirley Hibberd, and Acme; Mr. Charles Winn came second, and Mr. W. H. Parton third.

First prize for four show varieties fell to Mr. G. J. Savory, Rotton Park, Birmingham, for Mrs. Henwood, Richard Headley, Henry Wilson, and Shirley Hibberd; Mr. J. D. Williams, Smethwick, second; and Mr. C. Reeves, Handsworth, third. For two show auriculas, Mr. R. Holding, Bournville, led with Harrison Weir and Richard Headley; Mr. G. J. Savory second, with Shirley Hibberd and Geo. Lightbody; Mr. H. W. Miller, Handsworth, third.

In the single plant classes, Mr. E. Danks, Handsworth, led for a green-edge with Henry Wilson. For a grey edge, Mr. W. M. Shipman scored with Geo. Lightbody. The best white edge was Acme, from Mr. W. M. Shipman. Mr. G. J. Savory showed the best self, Mikado; while for a yellow or buff self Mr. F. Grazebrook scored with Daffodil.

The class for two show auriculas (maiden growers) found Mr. J. D. Williams first, with Mrs. Henwood and Shirley Hibberd; Mr. T. Hughes, Handsworth, second, and Mr. F. Willis, Balsall Heath, third. For three show auriculas, dissimilar (local growers), Mr. G. J. Savory led with Mrs. Henwood, Shirley Hibberd, and Olympus; Mr. H. J. Spencer second, and Mr. J. Freeman third. Mr. J. D. Williams led for three show auriculas (young amateur growers) with Mrs. Henwood, Shirley Hibberd, and Harrison Weir; Mr. G. S. Yeomans, Hollywood, second, and Mr. F. J. Twist, Handsworth, third.

The premier show auricula was Shirley Hibberd, shown by Mr. W. H. Parton.

### ALPINE AURICULAS.

For eight alpine auriculas Mr. W. M. Shipman was first with Argus, Charmer, Commander, Ilene, Majestic, Lucrece, Sunrise, and Janet; Mr. C. Winn second, and Mr. T. M. Eglinton, Birchfields, third. For six alpine auriculas, Mr. W. M. Shipman led with Majestic, R. C. Cartwright, Mars, Seedling, Exquisite, and Phyllis Douglas; Mr. T. M. Eglinton second, and Mr. R. Holding third.

Mr. C. Reeves was first for four alpine auriculas with J. F. Kew, Miss Baker, Exquisite, and Majestic; Mr. H. W. Miller came second, and Mr. G. J. Savory third. For two alpine auriculas Mr. H. W. Miller scored with Majestic and Unexpected; Mr. E. Danks second, and Mr. A. Lawton third.

In the single plant classes Mr. T. M. Eglington scored for a gold centre with Duke of York. For a light centre Mr. W. M. Shipman led with Phyllis Douglas; and for a single laced variety, Mr. T. M. Eglington came first with Seedling.

For two alpines, maiden growers, Mr. J. D. Williams won with Majestic and Winifred; Mr. F. Willis second, and Mr. G. S. Yeomans third. For three alpines, local growers, Mr. T. M. Eglington led with Argus, J. F. Kew, and Golden Acme; Mr. W. H. Parton second, and Mr. H. W. Miller third. For three alpines, young amateur growers, Mr. J. D. Williams was first with Mabel, J. F. Kew, and Duke of York; Mr. T. J. Twist second, and Mr. F. Willis third.

The premier alpine auricula was Charmer, shown by Mr. W. M. Shipman.

### SEEDLINGS.

In this division Mr. E. Danks led for two show varieties, with Raven's Plume and Mrs. Edwards. Mr. W. M. Shipman had the best green edge, named Cleveley Gem. Mr. E. Danks won for a grey edge, with Mrs. A. W. Johnson. Mr. H. W. Miller had the best white edge, Queen of the Snows, and the best seedling self was Raven's Plume, shown by Mr. E. Danks. The premier show auricula seedling was Cleveley Gem from Mr. W. M. Shipman.

In the alpine section Mr. Danks had the best four seedlings, and Mr. N. Robinson the best pair. For a gold-centred seedling Mr. R. Holding scored with Mrs. Neville Chamberlain, and for a light-centred seedling Mr. E. Danks scored with Saturn. The premier seedling alpine auricula was Mrs. Neville Chamberlain, shown by Mr. R. Holding.

## Southampton Gardeners' Society.

The monthly meeting of the above society was held in the Highfield Institute on Thursday, 25th ult., when there was an excellent attendance. The Hon. Secretary called the attention of members to the facilities for reduced tickets of admission to the International Horticultural Exhibition in London from May 22 to 30. It was also stated that the committee had decided to devote a short period at the close of the ordinary business at the monthly meetings to the discussion of subjects of general interest. Four new members were elected.

Mr. W. F. Copeland then gave an interesting and instructive lecture on the hybridisation of daffodils, tracing the history of species, explaining the methods of cross-fertilisation, and concluding with some hints of practical utility. The paper was listened to with great interest, and a discussion followed in which Messrs. Molyneux, Cleverly, Andrews, Silcock, Verdon, and the Chairman (Mr. Greenaway) took part.

Mr. Copeland having answered several questions, a most hearty vote of thanks was accorded to him on the proposition of Mr. Molyneux, seconded by Mr. S. G. Kimber. Thanks were also given to those who had brought exhibits.

## Sparkhill Horticultural Society.

The annual narcissi and auricula exhibition of the above Society was held in the Large Hall of St. John's Schools, Birmingham, on Saturday, April 27.

Owing to the early season the majority of the daffodils in the Midlands were over, and the competition in these classes was poor. Auriculas, however, were shown in fine form, especially in the alpine classes, and, as the competition was extremely keen, many meritorious exhibits which would usually have held their own in a strong class, failed to obtain a place.

In the class for eight bunches of narcissi, six distinct, not more than five blooms in a bunch, Mr. E. J. Keeling, Small Heath, was first with a good collection; the most tasteful arrangement of narcissi to occupy a space not exceeding 4ft. by 2ft. 6in., also obtained for Mr. E. J. Keeling the first place. He had a very light and pretty arrangement, principally of poeticus varieties. Mr. F. Anderson, Moseley, was second, with a collection in which the trumpet varieties appeared rather too heavy. For six bunches of narcissi, Mr. Keeling was again first; and in the class for three bunches of narcissi he once more won easily, with Mr. Anderson second.

For three show auriculas, distinct, Mr. H. J. Spencer, Four Oaks, Sutton Coldfield, was first with Acme, Olympus, and Shirley Hibberd; Mr. H. W. Miller, Handsworth, second with Harrison Weir, Shirley Hibberd, and Ruby; Mr. E. Saunders, Sparkhill, third. For three alpine auriculas, Mr. Miller obtained premier honours with fine plants of Majestic, Unexpected, and Thetis. The second prize entry comprised Thetis, J. F. Kew, and a well-grown Argus. Mr. J. Freeman, Sparkhill, was third. The premier award for three seedling alpine auriculas was made in favour of Mr. Miller, who had Richard Holding, which received a F.C.C. at the Midland Auricula Show last year; Annie Crisp, a fine light centre; and Golden Rain. Mr. J. Freeman, Sparkhill, second. For one seedling show auricula Mr. A. Gilbert, Handsworth, was first, with Mi- Barnsley, a smooth, well-formed self; Mr. H. W. Miller second.

The above classes were restricted to members of the Sparkhill Society; but, in addition to this, the National Auricula Society (Midland Section) offered prizes in a class for three show auriculas, and one for three alpine auriculas. In the first of the two classes, Mr. G. J. Savory, Rotton Park, Birmingham, was first with Mrs. Henwood, Richard Headley, and George Lightbody; Mr. J. Freeman second, and Mr. T. M. Eglington, Handsworth, third. The competition in the second class was exceptionally strong, and the first prize was awarded to Mr. J. Freeman for splendid plants of Phyllis Douglas, Unexpected, and Thetis; Mr. H. W. Miller was second; and Mr. G. J. Savory was third. The premier auricula in the open classes was Richard Headley, shown by Mr. G. J. Savory; and the premier in the members' classes was Majestic, exhibited by Mr. H. W. Miller. The society's medal for the member obtaining most points in the daffodil classes was awarded to Mr. E. J. Keeling; and the medal for the most points in the auricula classes to Mr. H. W. Miller.

At a meeting held after the show the Chairman announced that over 150 new members had joined the Society during April, a good augury for the future of this flourishing society.

## General Bulb Growers' Society of Haarlem.

The following awards were made at the recent meetings of the Narcissus and Floral Committees of this society:

### FIRST-CLASS CERTIFICATES.

Narcissus Vulcano. — Double flowers, sulphur-yellow, in the centre orange-red, a cross of Poeticus ornatus and Double van Sion.

N. South Pole.—Perianth white, very large; trumpet clear sulphur-yellow and white, finely recurved at the mouth, raised from seed.

N. Bedouin.—Perianth cream-white, cup yellow, with an orange-red border.

N. Campernel rugulosus maximus.—Perianth and trumpet pure golden-yellow.

N. Sunrise.—Perianth white, cup golden-yellow, margined orange-red.

N. Great Warley.—Perianth white, trumpet of a clear citron-yellow; flowers of large size.

### AWARDS OF MERIT.

N. Solo.—Perianth and trumpet pure yellow; raised from seed of Golden Spur.

N. Thackeray.—Flower very large, perianth and trumpet golden-yellow, trumpet long, finely recurved; raised from seed.

N. March Glory.—Flower very large, clear yellow, perianth flat, trumpet finely recurved; raised from seed.

N. Plenipo.—Double, flower sulphur-yellow, a cross between Poeticus ornatus and Double van Sion; raised from seed by Rev. G. H. Engleheart.

N. Isis. — Type Englehearti, perianth creamy-white, cup broad and flat, citron-yellow, margined orange-red; raised from seed.

N. Holbein.—Perianth creamy-white, cup citron-yellow; raised from seed.

N. Colossus.—Perianth clear yellow, trumpet dark yellow; raised from King Alfred.

N. poetaz Laurens Koster.—Perianth white, cup yellow; obtained from seed of N. poeticus.

N. fl. pl. Glacier.—Double, citron-yellow, with a small clear yellow margin at perianth and trumpet.

N. St. Bavo. — Double, creamy-yellow; raised from Golden Spur.

N. Tresserve.—Perianth creamy-yellow, trumpet pure yellow; a hybrid of Emperor and Golden Spur.

N. Golden Lion.—Perianth and trumpet golden-yellow, perianth very regular, trumpet short, finely recurved; raised from seed, in form identical with Glory of Haarlem.

N. poetaz Albert Vis. — Perianth white, cup orange; raised from one of the polyanthus varieties; from a cross between the variety of Poeticus known as King Edward and Staten General; good for forcing.

N. Mount Erebus.—Type Leedsi; perianth pure white, cup light citron-yellow, changing to ivory-white.

N. polyanthus No. 67.—Perianth clear yellow, cup orange; raised from seed.

Freesia Tubergeni Robinetta.—Flowers dark carmine, spotted yellow; raised from seed.

F. Tubergeni Gem.—Flowers lavender-blue, changing to white, spotted yellow; raised from seed.

# THE USE OF LIME.

At the recent meeting of the Midland Farmers' Association, Mr. Walter E. Collinge gave an instructive lecture on the use of lime in the cultivation of farm and garden crops, of which the following is a summary.

Lime is a necessary constituent of plant food, but the greatest service it renders from a manurial standpoint is that it unlocks the insoluble reserves of nitrogenous and potassic material in the soil, and renders them available as plant food. In liming experiments made at Rothamsted, where potash had been previously applied, a great increase was brought about in the proportion of leguminous plants. A dressing of lime was found to be necessary for grass land on most soils in order to neutralise the acidity produced by decaying vegetation, and to enable the manures to exert their full effect.

## Changes Caused by Lime.

Lime changes many poisonous compounds which are present in the soil and renders them practically harmless to plant life. It is now generally recognised that a fertile soil must contain a rich, fresh humus; but if carbonate of lime and magnesia are deficient, the humus becomes sour, and the soil unfertile, and in a condition favourable to the production of disease. The physical or mechanical effects of lime on certain soils is most marked, thus stiff soils, after being limed, permit of a quick passage of water. Such soils, unlimed, become waterlogged, excluding the air, which is necessary for the proper and healthy development of plant roots, whilst in times of drought they readily cake, increasing the difficulties of tillage, and are ill-adapted to plant growth. It may be taken as generally conclusive that where the following features obtain, liming may be followed with advantage; (1) On soils relatively rich in iron, and requiring phosphatic manures; (2) where soils are acid; (3) in soils deficient of lime or magnesia; (4) where clover fails; (5) where "finger-and-toe" disease is present; and (6) when clayey soils become too adhesive.

## When and How Often to Apply Lime.

The frequency with which liming should be practised depends upon a variety of conditions—e.g., the amount applied; whether slaked or unslaked; the nature of the soil; the crops grown, etc. Dr. Fream, an eminent authority, has pointed out that for light lands very light dressings, made more frequently, give the best results, but that the dressing should be increased, the deeper the surface soil. He further points out that for correcting plasticity of a heavy clay, or acidity of a soil, or in preparing new land, rich in humus, the first dressing need not exceed 100 bushels per acre, although as much as 500 bushels are often used. As to the proper season, this must depend to a large extent upon the crop. For "finger-and-toe" disease the application is best made in the winter or spring, twelve months before the sowing of the crop.

## Biology of the Soil.

Slowly, but surely, we are beginning to realise in this country that the biological study of soils and soil organisms is a most important one. We know that complicated chemical process known as nitrification is aided by the presence of lime in the soil; that the decomposition of organic matter, and the production of carbonic acid, are also greatly accelerated by the same material.

The utilisation of atmospheric nitrogen by certain plants is greatly facilitated, particularly upon sour soils, and in the case of clovers. In the past we have spoken of the soil as a chemical laboratory, but it is something more—it is a medium teeming with bacteria, fungi, and minute animal life, the inter-relations of which we, as yet, only very imperfectly understand.

## The Influence of Lime on Certain Plant Diseases.

In the application of chemical manures, and other so-called artificial dressings, far too little attention has been given to the action these substances have on plant diseases, and the same remarks are equally true when applied to lime, for, on the one hand, the presence of lime tends to favour the production of disease, and on the other it is capable of materially lessening, if not preventing, disease.

It has long been recognised that the fungus disease known as potato scab is favoured by the presence of carbonate of lime in the soil. The explanation that has been offered is that the decomposed lime makes the soil alkaline, or to some influence which it, with the compound, carbonic acid, exerts upon the development of the fungus. On the other hand, it is equally generally recognised that the disease known as "Finger-and-toe," "Club-root," "Anbury," etc., is lessened by the use of lime. Mr. Collinge then gave an account of potato scab, "finger-and-toe," and other diseases, and a review of the deservedly well-known Cockle Park experiments.

## A Hint.

In 1909, Mr. Collinge pointed out that a combination of lime followed by a dressing of sulphur, might possibly give much better results than had hitherto been obtained. Experiments he made showed that the action of dressings of slaked lime only tended to correct the acidity of the soil and improve the physical condition, thus removing some of the conditions favourable to the reproduction and spread of the fungus.

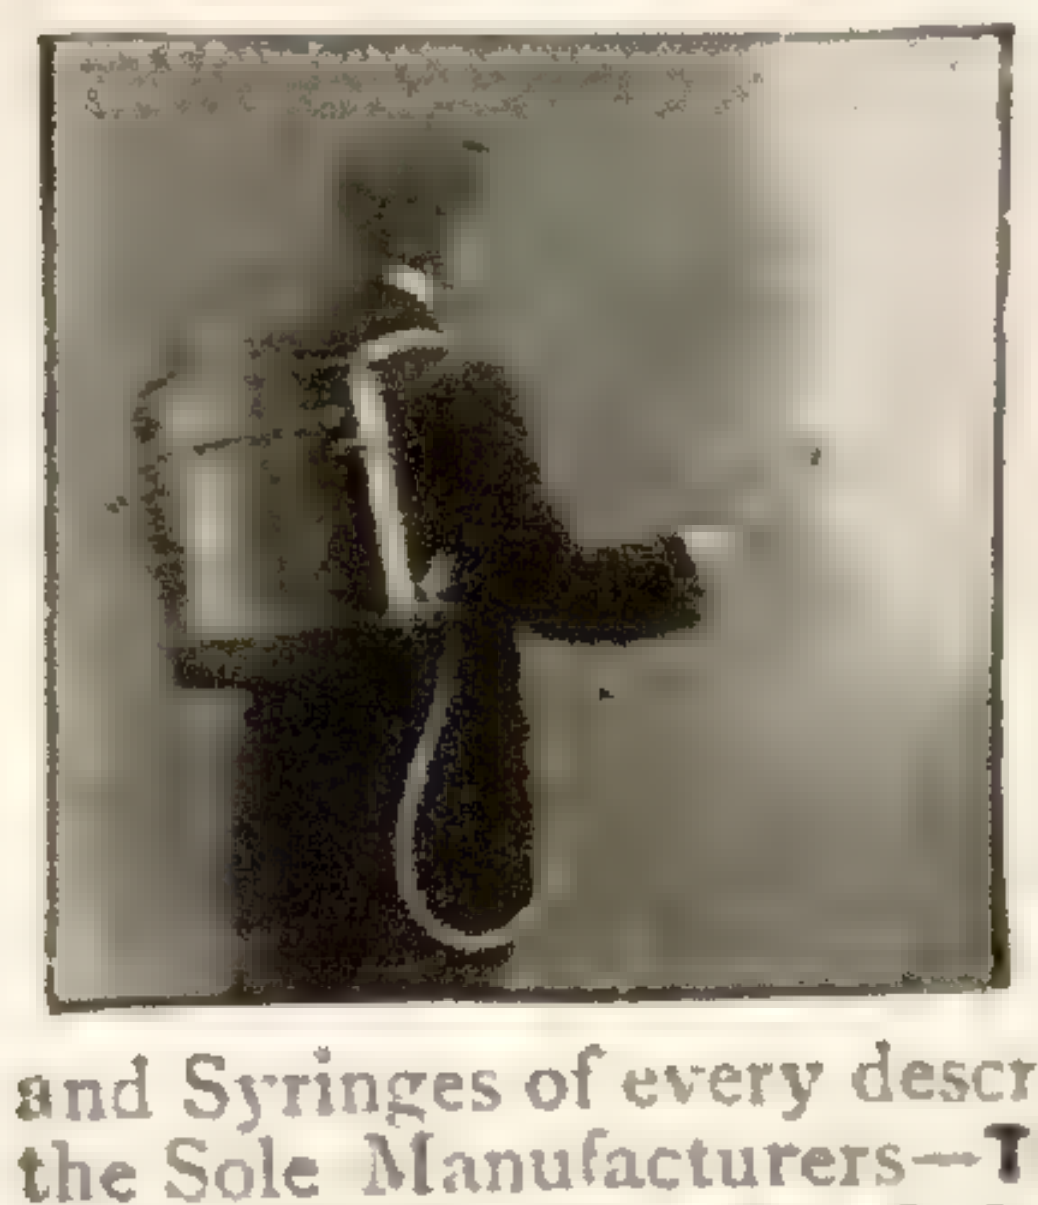
In the autumn of 1909, ground was treated with a dressing of 15 cwt. of ground, unslaked lime. It was put on with a manure-distributor, and ploughed in. In the spring the same land was given a dressing of flowers of sulphur, 5 cwt. to the acre. An excellent crop of swedes was lifted the following autumn, and the roots were practically free from disease, as in only one corner of the field was any disease noticeable, and this very small.

On this small patch there was a considerable amount of heavy clay, which was in a very wet and sticky condition, and, quite apart from the fungus disease, badly required liming. A part of this, about one-sixth of an acre in extent, was again treated with ground, unslaked lime at the rate of 12 cwt. to the acre in the autumn, followed in the spring with sulphur as previously. When the swedes were lifted in the autumn of 1910 no trace of the disease could be found, and the physical condition of the soil had wonderfully improved.

**Spraying**

The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested

**"FOUR OAKS"**



which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-**. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 C, SUTTON COLDFIELD.**

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PHOTOGRAPHS OF POWIS CASTLE GARDENS.—J. M., Durham.—Would you be kind enough to inform me where I can obtain photographs of Powis Castle Gardens? Several views in these famous gardens have appeared in the GARDENERS' MAGAZINE, and as I was employed at Powis, I should very much like to obtain photographs to keep as a matter of personal interest.—Mr. H. N. King, 4, Avenue Road, Goldhawk Road, London, W., has a series of photographs of Powis Castle and gardens, and no doubt you could obtain copies.

EFFECT OF RECENT WEATHER ON TULIPS.—A. A., Romford: My Darwin and May-flowering tulips are in full bloom, and about a fortnight before their usual time. The stems are not so tall as usual, the flowers are scarcely so large as in previous years, and the leaves, as you will see by the enclosed specimen, seem to have been slightly bleached. Will the variable weather of this spring have any ill-effect upon the bulbs?—In most gardens the Darwin and May-flowering tulips have been forced into bloom early by the brilliant sunshine of April, consequently they are not so fine or long-stemmed as usual; the absence of warm rains also militated against full size and height. The bleaching of the leaves is due to frost and cold winds, and is likely to prevent the formation of full size and otherwise well-developed bulbs. Hoe among the plants, give a watering if necessary, and a light mulching of manure, so that the leaves and stems may be kept green and useful to the bulbs as long as possible.

TRANSPLANTING BAMBOOS.—N. T. W., Chipping Norton.—What is the best time to transplant bamboos, and to divide them if necessary?—May is by far the best time of the year for bamboo planting, and the earlier in the month the work can be performed the better. The sites should be well prepared and manured previously, and some short manure should be ready to hand for mulching directly after planting. Unless the soil is moist, as after showery weather, it is very desirable to give the clumps a good soaking the evening previous to lifting. Lift carefully, divide by means of a strong knife, and replant without allowing the roots to become dry from exposure. Water in and syringe overhead frequently if the weather remains dry and bright.

GHOST MOTH CATERPILLAR.—E. B. C., Farnham.—I enclose a pinkish caterpillar, with a red-brown head and some blackish dots on the upper part of its body. It seems to work underground, and do harm to roots. Kindly tell me what moth it belongs to, and how to get rid of it.—The specimen is a caterpillar of the Ghost Moth; the male moth silvery-white and grey; the female yellow, with brownish markings, and grey hind wings. The moths fly in June and July. The courtship of this species has been described by Chapman. The moths fly in the gloaming. The male, ghost-like and conspicuous by the silvery-white colour in spite of the dusk, chooses a place and hovers for a short time backwards and forwards, "swaying like a pendulum over a surface of about a yard" (Barrett) in order to attract the female. Sometimes the male is alone, sometimes there are several males in company. The female, non-fertilised, flies towards a male and intentionally touches or knocks up against the male, which at once ceases its swaying and drops to the ground, where pairing takes place. The fertilised female flies about over the grass, discharging her eggs as she flies. From the egg hatches the caterpillar, which feeds from July till the next April or May at least, when pupation takes place. As with the last species, the pupa leaves the cocoon just before the emergence of the moth, and by means of its spines wriggles to the surface. The Board of Agriculture points out that Vaporite has been used with some success against swift caterpillars, while in a confined area where the caterpillars are at work the use of bisulphide of carbon injected into the soil would destroy them. Pieces of potato tuber placed here and there some inches below the surface of the soil, in marked places, will serve as traps. The working of the soil where the crop allows, and the turning up of the caterpillars (or in spring of the chrysalids) to the birds is a useful measure, or the caterpillars can be collected. In some cases, e.g., with daffodils, should the pest be abundant, the bulbs should be lifted and replanted. Birds and moles devour the caterpillars, which are also destroyed by two species of parasitic fungi, viz., Cordyceps militaris and C. entomorrhiza.

### NAMES OF PLANTS.

W. P. C., Rochdale.—1, Cymbidium eburneum; 2, Lælio-cattleya elegans.

M. E. F., Dartford.—1, Echeveria secunda glauca; 2, Asparagus Sprengeri.

C. C., Matlock.—1, Saxifraga hypnoides; 2, S. decipiens; 3, Iberis sempervirens; 4, Berberis Darwini.

E. S., Beckenham.—Not good specimens; probably Dendrobium densiflorum. How are the flowers produced?

H. S. D., Monmouth.—1, Pyrus Ringo; 2, Erysimum Perofskyanum; 3, Cytisus præcox; 4, Orobus vernus; 5, Tulipa primulina.

### CATALOGUES RECEIVED.

DICKSONS, CHESTER.—A useful, well-arranged list of bedding plants, annuals, dahlias, etc.

BEES, LIM., LIVERPOOL.—A comprehensive catalogue for the time of year, ranging from bedding plants, dahlias, and chrysanthemums, to tools, fertilisers, and garden clogs and gloves.

Robinsons' Guaranteed Gardenalities

Always pay their way, and make up their cost, time and time over again. What they claim to do is always achieved—hence they are used by experts everywhere. Try them this year, and note results. You will be delighted, for they never fail to do good work.

"CARMONA" FERTILIZERS ARE INDISPENSABLE.

Here you have the finest fertilizer which science can offer. It imparts full vitality to your plants and trees. Makes them strong and vigorous, gives them productive power, and this is what you want.

Robinson's cater for all fertilization needs, and make up many varieties. Whatever you want in this direction they can supply.

Sweet Pea Culture is so popular that they draw special attention to their **"Carmona" Sweet Pea Fertilizer.** This should be used by all growers and exhibitors.

**"Carmona" Fertilizers** are sold in all quantities. Note bulks and prices:—
1cwt., **20/-**; ½cwt., **12/6**; 28lb., **7/6**; 14lb., **4/6**; 7lb., **2/6**; **1/-** and **6d. Tins.**

*Of all Seedsmen and Agents, or write direct.*

THE SHOW OF THE YEAR. £350 IN CASH PRIZES.

Robinson's are holding a grand show on August 28th and 29th, this year, at the **Botanical Gardens, Edgbaston, Birmingham,** and all purchasers of **"Carmona" Fertilizers** are offered free entry, for each packet contains an entry "fee" coupon. **£350** will be given away in cash prizes, and also many Championship Medals will be awarded. This Show is open to you. The Show Schedules are now ready, and will be sent free on application.

INSECT ABOMINATIONS.

These are detested by every gardener, for they ruin one's best efforts. Half-hearted measures are no good. Don't play with insects, but **get rid** of them. You can exterminate them all, if you are wise enough to use the finest Insecticide on the market, **CLIFT'S FLUID INSECTICIDE.** Give your plants freedom from insects, it makes for success. Bulks and prices as follows:—

40 galls., **4/6** per gall.; 20 galls., **5/-** per gall.; 10 galls., **5/3** per gall.; 5 galls., **5/6** per gall.; 1 gall., **6/-**; ½ gall., **3/6**; 1 pint, **1/-**.

*Of all Seedsmen and Agents, or write direct.*

OTHER USEFUL GARDENALITIES.

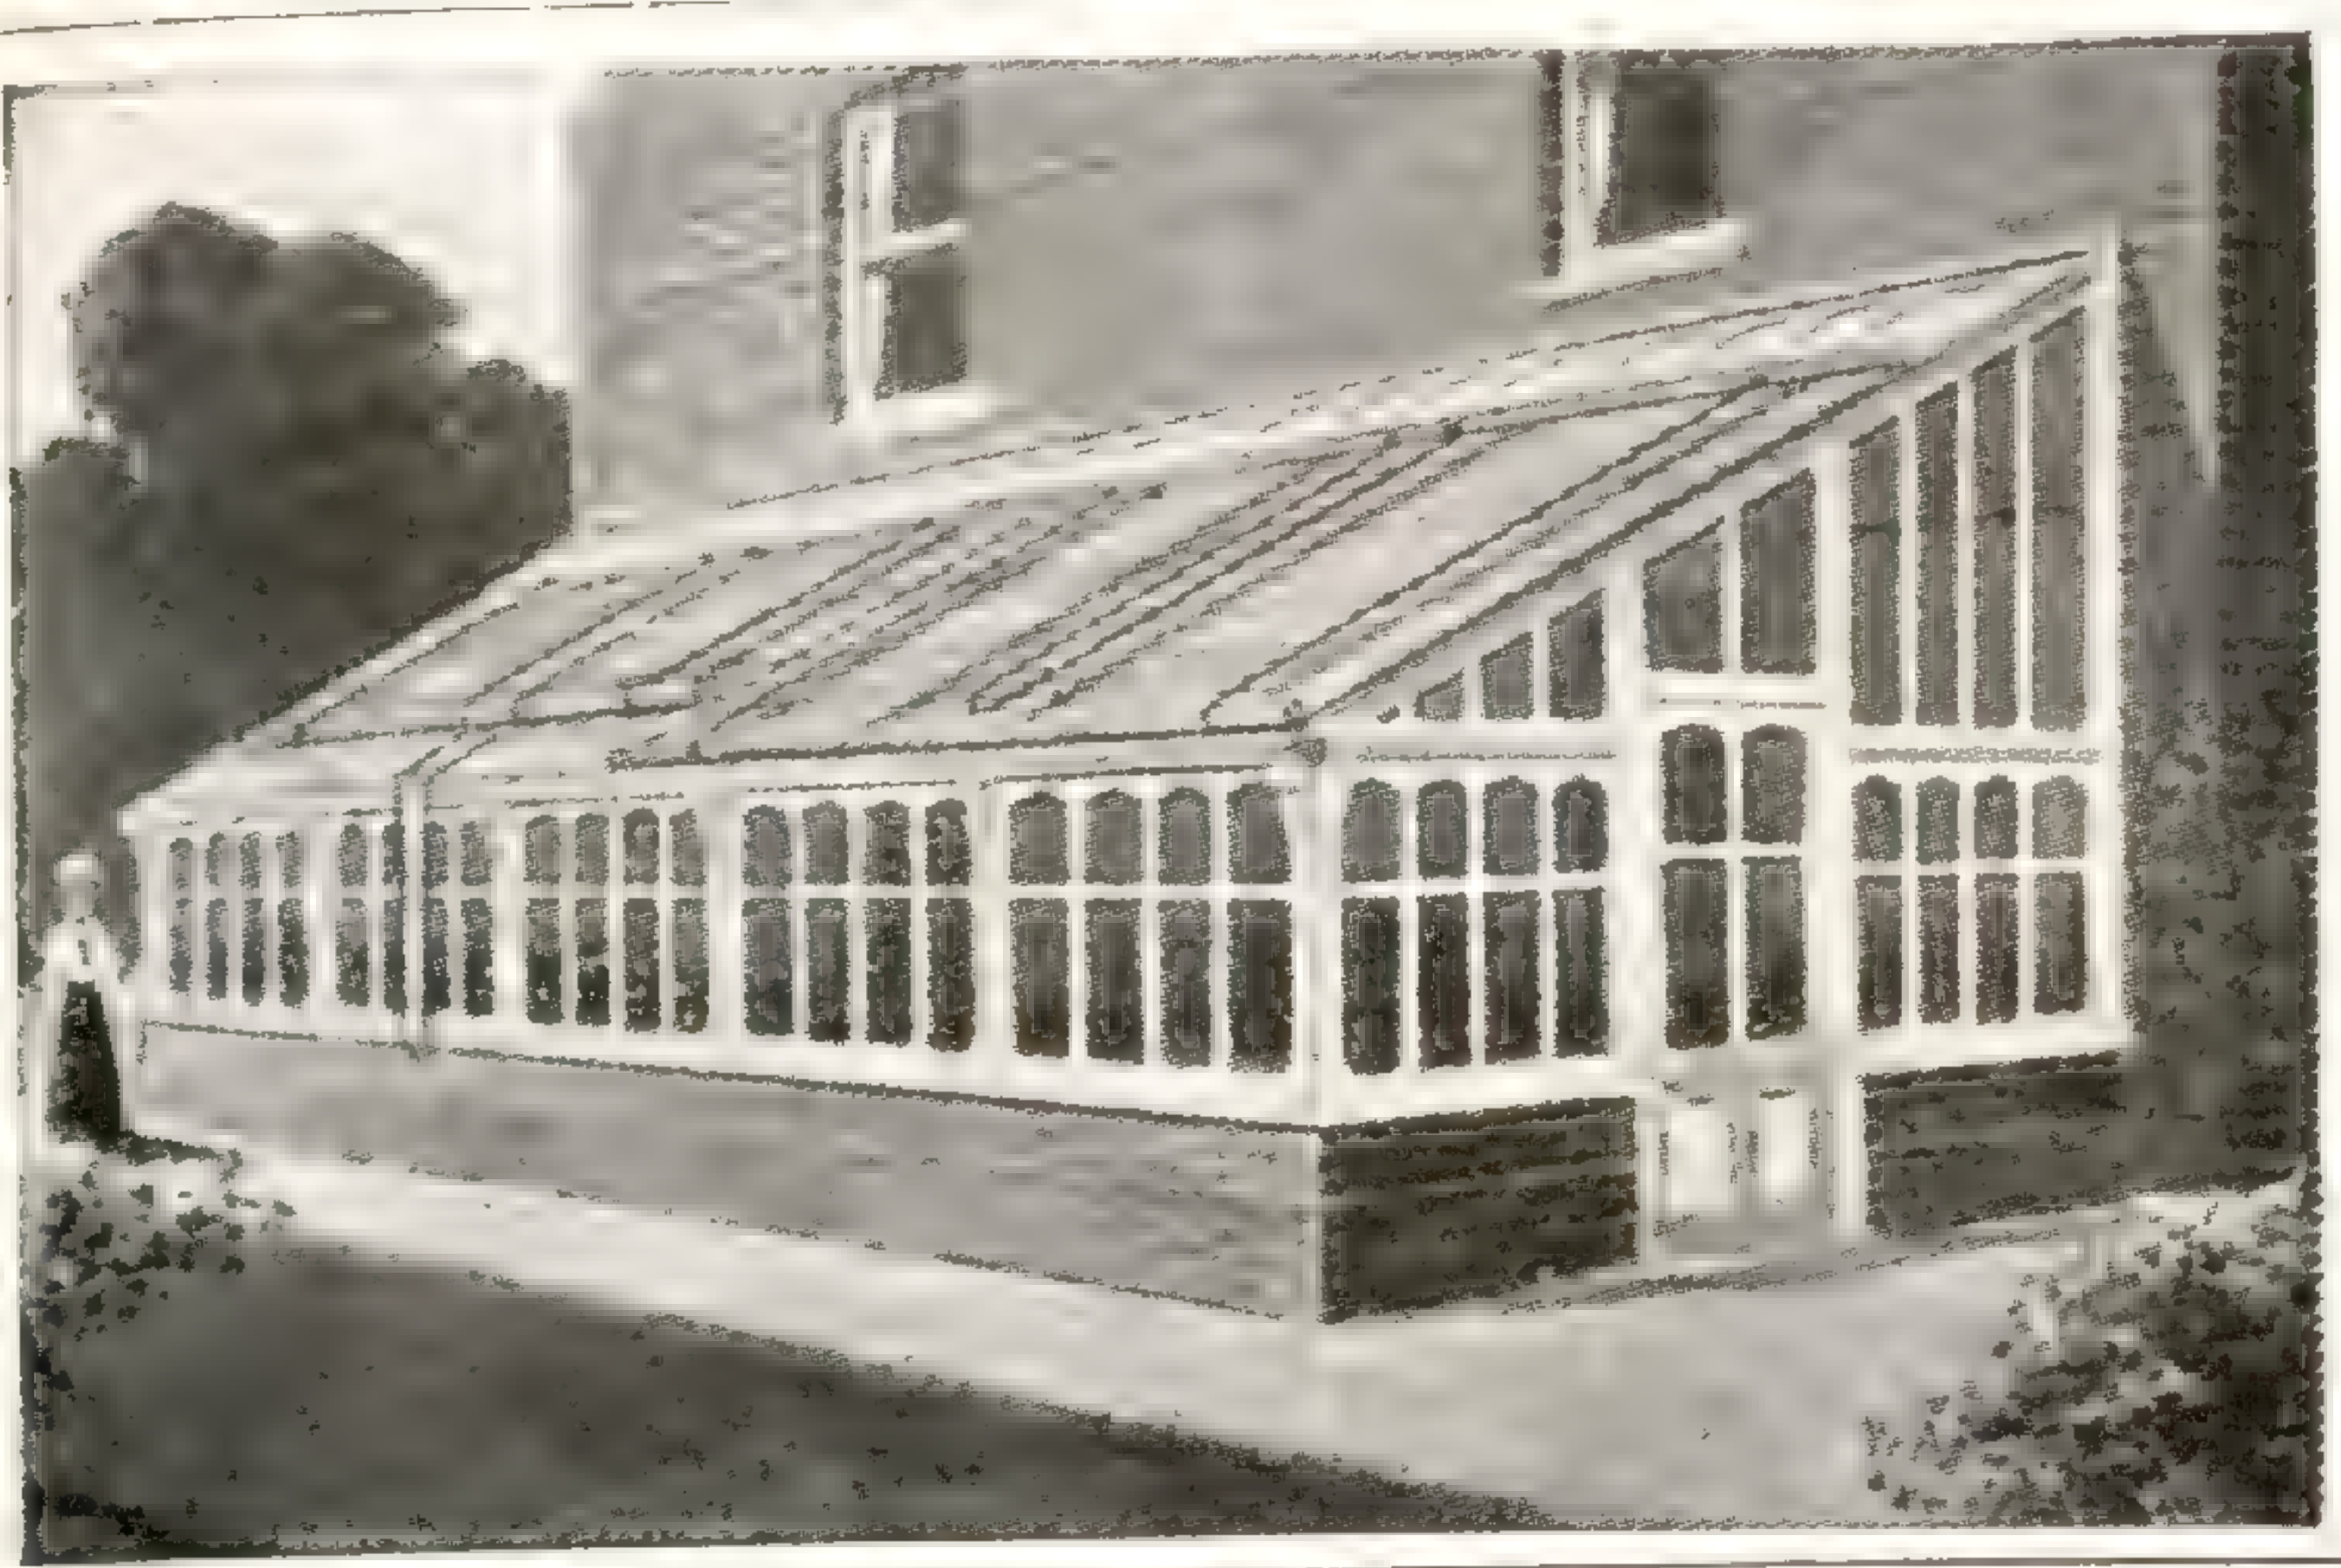
Note these, for you may want them. **"Eradiweed"** guaranteed cent. per cent. **Weed Killer.** Sure and certain. **"Velvas" Lawn Sand**—just the sand needed. Robinson's send on all details, lists, etc., free of charge, and also include as a gift two valuable gardening books, which you will appreciate. (1) Robinson's "Guaranteed Gardenalities Booklet," and (2) Robinson's "Garden Enemies" Booklet. These are brimming over with serviceable gardening hints and advice. Address your p.c. or letter to:—

ROBINSON BROS., LTD., WEST BROMWICH, STAFFS.

Guaranteed Gardenalities

FLORA ABUNDA

**BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.**



**WOOD LATH AND SCRIM BLINDS**
IN EVERY VARIETY
For Shading CONSERVATORIES, GREENHOUSES, &c.

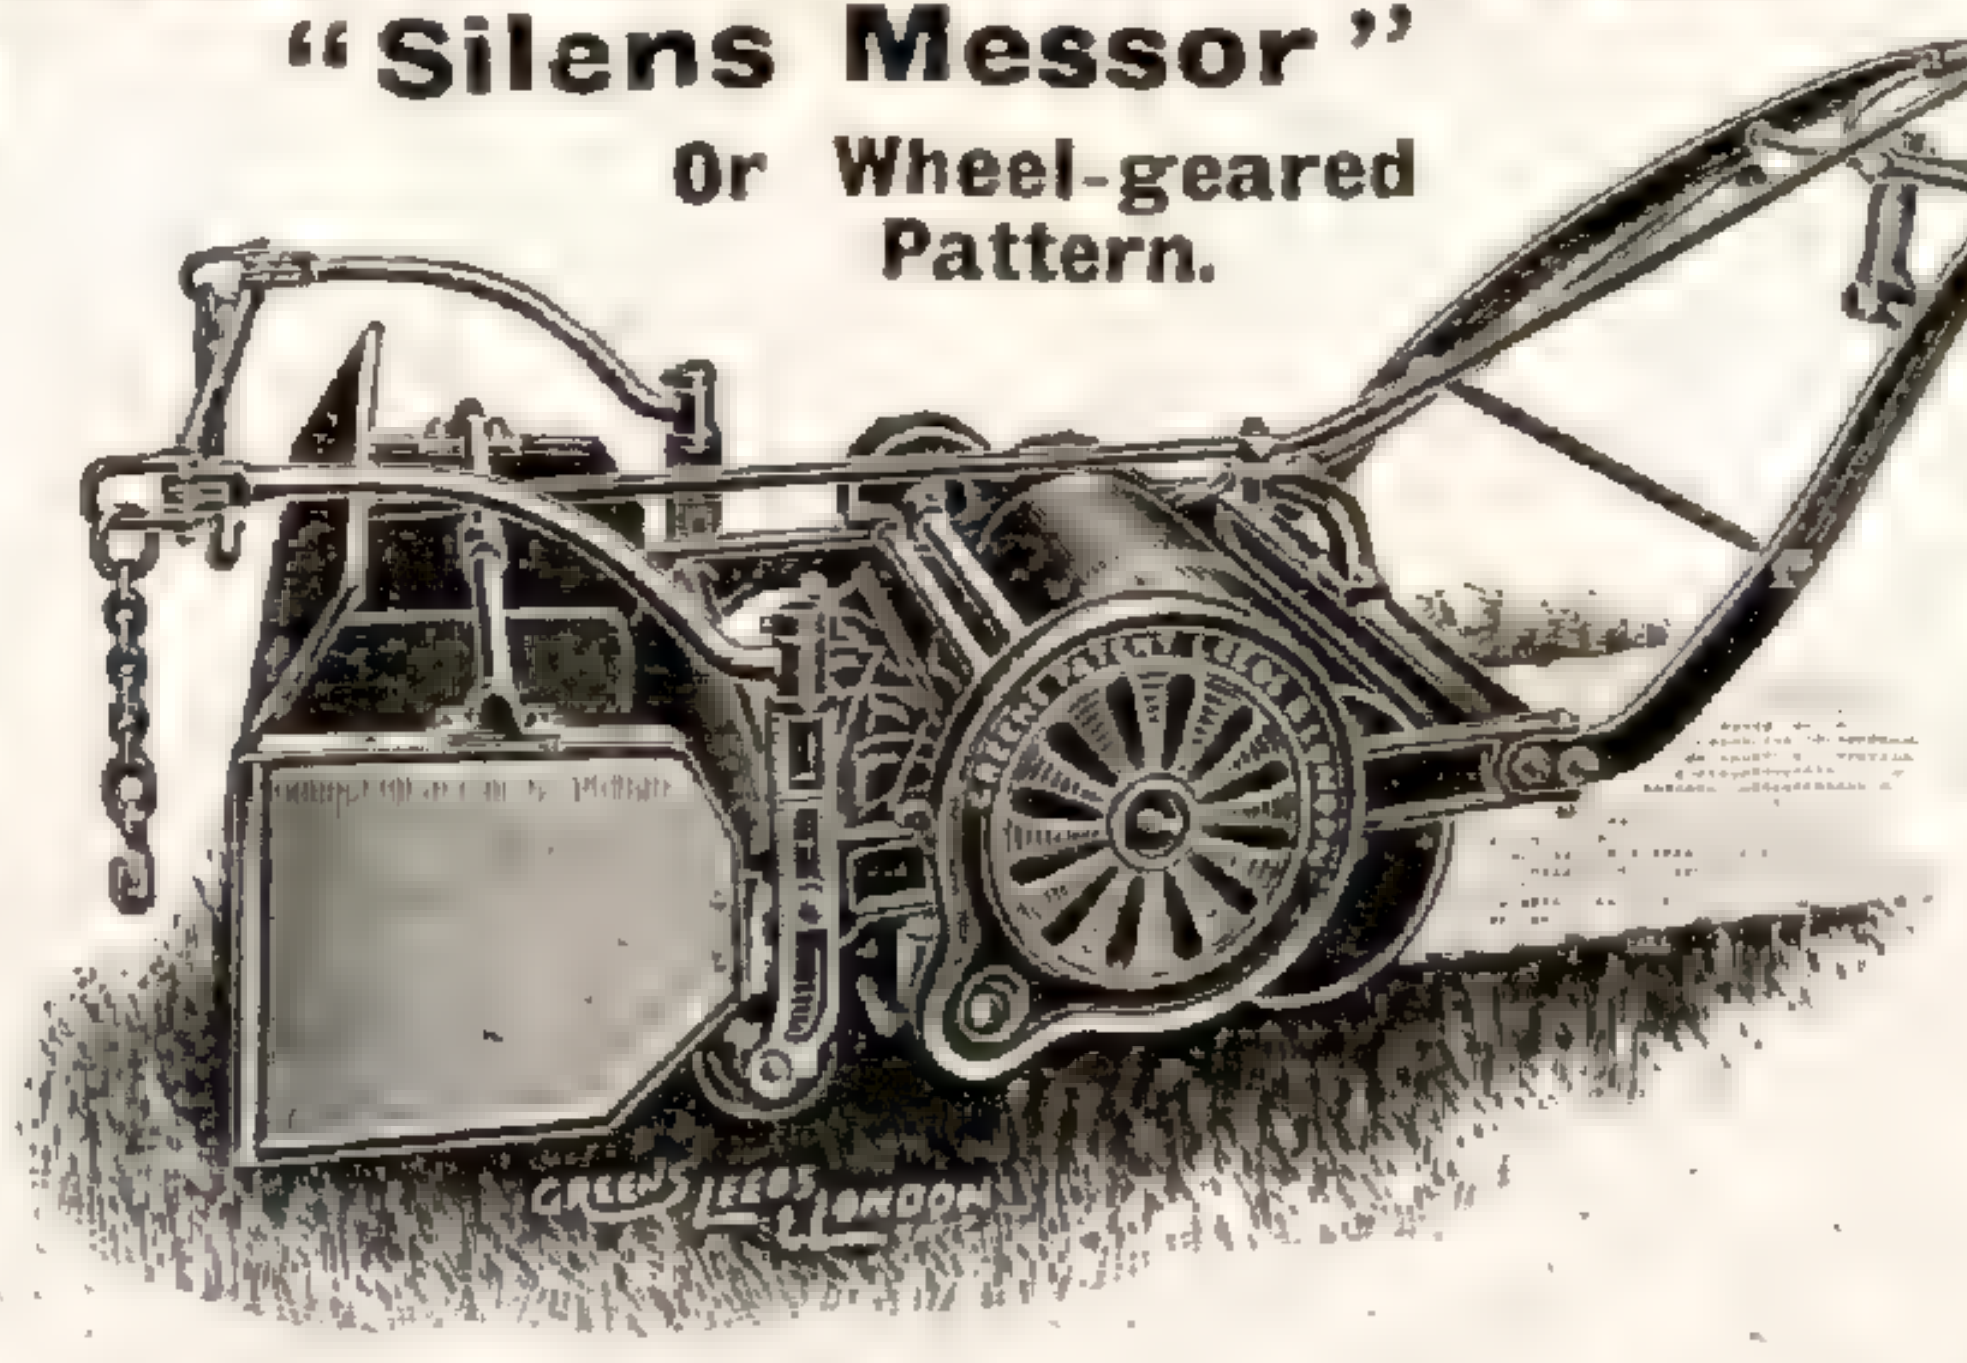
Hundreds of Thousands in Use.

*Highest Awards, Royal Botanic Society, Royal Horticultural Society, and numerous others.*

**GREEN'S "SILENS MESSOR" LAWN MOWERS.**

May be had from any Ironmonger or Seedsman in the United Kingdom.

**PONY AND HORSE MOWER. "Silens Messor"**
Or Wheel-geared Pattern.



Motor Lawn Mowers and Rollers made in various sizes.

**GREEN'S GARDEN ROLLERS.**

Please write for Illustrated Price List No. 1. Free.

**THOMAS GREEN & SON, Ltd., Smithfield Ironworks, Leeds, and New Surrey Works, Southwark St., London, S.E.**

"KATAKILLA"
WASH
PATENT
NON-POISONOUS.
FREE FROM
NICOTINE,
ARSENIC, COPPER,
OR OTHER DANGEROUS POISON.
Measure for "KATAKILLA" WASH

**NON-POISONOUS.**

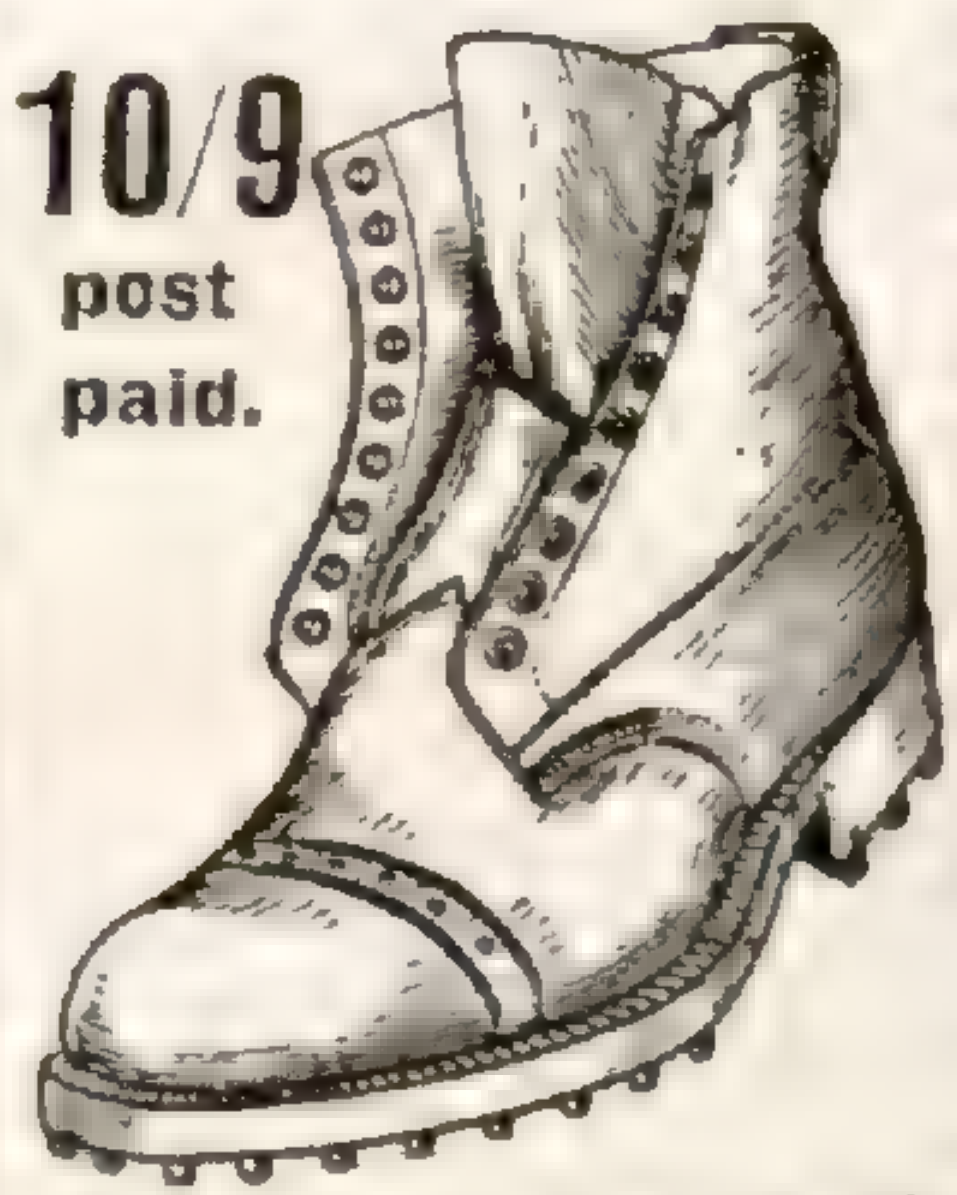
FOR CATERPILLARS OF ALL KINDS, GREEN AND BLACK FLY, PSYLLA, RED SPIDER, and practically all Garden Insect Pests attacking Fruit Trees, Vegetables, Roses, &c., &c.

In Tins 1/3, 2/6, & 5/6 each.

*From all Seedsmen, Nurserymen, & Florists.*

DIRECT from SCOTCH MAKER to WEARER

**Norwell's 'Perth' Boots**



**10/9 post paid.**

GARDENERS must be snugly shod during the bad weather. Our special gardener boots are the result of many years' experience—we know exactly the boot for you. The men who make these boots are specially trained to make boots for outdoor service. This garden boot of ours has many good points. The uppers of home-tanned, hand-dressed curried hide, wear like pinwire, and being bark-tanned, "not cured," keep the feet warm, dry, comfy

**Try a pair to-day at 10/9, post free.**

*Also send for Catalogue No. 2 and Self-measurement forms.*

**D. NORWELL & SON, PERTH, SCOTLAND.**
Established over 100 Years.

*Trust the Man Behind the Boot.*

**PROTECT YOUR GARDENS** —I DO NOT REQUIRE PAYMENT UNTIL YOU HAVE SEEN AND APPROVED OF THE NETTING.—Netting, good strong, stout, small mesh, will not rot, THE VERY BEST, as supplied to the ROYAL GARDENS by ME, 25yds. by 1yd., 1s.; by 2yds., 2s.; by 3yds., 3s., and so on; any length or width supplied. Orders over 5s. car. paid. List and samples free. Commoner and tender netting, as sold by others, 60 sq. yds. for 1s. — H. J. GASSON, Net Works, Rye. Est. 126 years.

PEA TRAINERS, The "Paragon" and "Peafold" (patent), made 4ft., 5ft., and 6ft. high, and any length. Prices from 8s. 6d. per set, carriage paid. Write for leaflet. THE PEA TRAINER CO., Bridge Street, Banbridge.

GARDEN NETTING (best tanned only).—25 yds. x 8 yds., 50 x 4 yds., 100 x 2 yds. 8s each; 25 x 4 yds., 50 x 2 yds., 100 x 1 yd., 4s. each. All other sizes made at ½d. square yard. EVANS. 14, Beresford Road, Lowestoft.

BIRDS SCARED.—Rotless, Tanned Netting. Small mesh, very superior. As supplied by us to the Royal Gardens. SATISFACTION GUARANTEED, or cash refunded. 100 by 1yd., 3s. 9d.; 2yd., 7s. 6d.; 3yd., 11s. 3d.; 4yd., 15s.; 50 by 6yds., 11s. 3d.; 25 by 8yds., 7s 6d.; carriage paid. Any length and width supplied. Cheaper quality. 50yds., 1s. POTTER BROS., Dep. M, Frankwell Works, Shrewsbury. Estd. 57 years.

**When answering Advertisements please mention "Gardener's Magazine."**

# OBITUARY.

### MR. WILLIAM MORRISON.

We regret to announce the death of Mr. William Morrison, retired gardener, at his home in Park Street, Huntly, Aberdeenshire. A native of Old Deer, Aberdeenshire, Mr. Morrison went as gardener in 1876 to the late Duke of Richmond and Gordon, at Huntly Lodge, Huntly, one of the ducal seats. There for over thirty years, he was honoured and respected, and enjoyed the absolute confidence of his noble employer. In the horticultural world Mr. Morrison was recognised as an authority of no mean order, and his services were much in request as a judge at flower shows, where his decisions invariably gave the greatest satisfaction. After a long and healthy life of 78 years, with hardly any illness, the end came suddenly. He was at church on Sunday, and on the following Wednesday he passed away. Never, surely, was the silver cord so tenderly loosed. A deeply religious man, Mr. Morrison took a warm interest in all matters connected with the Strathbogie United Free Church, where for a long time he was senior office-bearer. The funeral took place on Saturday at Allenvale Cemetery, Aberdeen, and was attended by a large number of the general public. The chief mourners were his two surviving sons, Mr. William Morrison, Wishaw; and the Rev. James H. Morrison, pastor of the United Free Church, Falkland; and his son-in-law, Mr. Esplin, Leysmill, Arbroath.

### MR. ALEXANDER M'LEAN.

A general feeling of regret will be felt by all who knew Mr. Alexander M'Lean, nursery manager, Dumfries, at the announcement of his death, which took place on May 2. Mr. M'Lean was in the employment of Messrs. Imrie and Sons, Ayr, for a considerable time, and leaving them was engaged to take charge of the department for forest trees in the nurseries of Messrs. Dicksons, Lim., Chester, a post he held for some time with much ability, until he resigned to take up that of nursery manager to the important firm of Messrs. Kennedy and Co., Dumfries, which he held at the time of his death. He was an able craftsman, and had a wide knowledge of the nursery trade and its requirements. Much sympathy will be felt for his family in their bereavement.

### MR. JAMES BOX, F.R.H.S.

It is with much regret that we have to record the death of Mr. J. Box, F.R.H.S., the proprietor of the Lindfield Nurseries, which recently occurred at his residence, Broomfields, Lindfield, in his 72nd year. Mr. Box specially distinguished himself as a cultivator and exhibitor of hardy flowers and sweet peas, and had received many awards for his exhibits at the meetings of the Royal Horticultural Society and the principal exhibitions in the South of England. Mr. J. Box has suffered from ill-health for a considerable period, and was usually represented at the exhibitions by his son, Mr. Gibbs Box.

**Aubrietias from Midlothian.**—Mr. F. Baillie, of Stenhouse, Liberton, Midlothian, sends us specimens of his excellent strain of aubrietias. The several varieties have large, well-formed flowers, and the colours include rich blue, mauve, rose-fawn, and lavender.

**Tropæolum tricolorum.**—It is a matter for surprise that this good old tuberous-rooted tropæolum is not more grown, for a greenhouse temperature is all that it requires. The profusion with which the blossoms are borne, and their strange combination of orange-scarlet and black, or nearly so, are sure to arrest attention. It should be potted early in September, and great care must be taken that the young shoots are not injured in any way.—T. W.

# MARKETS.

## COVENT GARDEN.

### Flowers.

Tulips, roses, and carnations are plentiful, and there is a good demand.

# The "Westfield" Collection of Orchids.

## ABSOLUTELY UNRESERVED SALE OF

# Rare & Valuable Duplicate Plants

## FROM THIS WELL-KNOWN COLLECTION.

---

# Messrs. Protheroe & Morris

are favoured with instructions from FRANCIS WELLESLEY, Esq., of WESTFIELD, WOKING, to SELL BY AUCTION at their CENTRAL SALE ROOMS,

## 67 & 68, CHEAPSIDE, LONDON, E.C.,

***ON FRIDAY NEXT, MAY 24th, 1912, AT ONE O'CLOCK.***

**A number of Choice and Rare Cypripediums, comprising:—**

Cypripedium Royal George, F.C.C., R.H.S.
,, San-Actæus, Westfield variety, A.M., R.H.S.
,, Waterloo, A.M., R.H.S.
,, Duchess of Argyll
,, Wellesleyæ
,, Memoria Mostynii Superbum
,, Thalia The Baron

Cypripedium Victor Hugo, F.C.C., Paris
,, Charlesworthii Memoria Douglassii
,, Germain Opoix Imperialis
,, Lady Gainsborough
,, Elatior Rex, A.M., R.H.S.
,, Little Gem, Westfield variety
,, The Premier

**together with the finest Cattleya species in cultivation, viz.:—**

Cattleya Mendelii His Majesty The King, F.C.C., Temple Show, 1909
,, ,, Majestica
,, ,, Golden Queen
,, ,, Lord Justice
,, ,, Thalia
,, ,, Miss Bradshaw
,, Mossiæ Alba Rosalind
,, ,, Alba Peter
,, ,, Alba Bansha
,, ,, Bronze Queen
,, ,, King Emperor
,, ,, King Edward VII.
,, ,, Michael
,, ,, Duchess of Norfolk
,, ,, Lady Northcliffe
,, Labiata Alba Miss E. Harting
,, ,, Alba The Empress
,, ,, Alba Lady Leese
,, ,, Her Majesty The Queen
,, Freya Mrs. F. Sassoon, A.M., R.H.S.
,, Gaskelliana Alba Queen of the Earth
,, ,, Armstrongiæ
,, ,, Delight
,, Trianæ The Premier, F.C.C., R.H.S.

Cattleya Trianæ F. W. MacBean
,, ,, Alba Purity
,, ,, Alba, Gauds variety
,, ,, Marie Feodorovna
,, Fabia White Queen
,, Schroderæ Alba Mrs. Francis Wellesley
,, ,, W. J. Mills
Lælia Purpurata Alba The Empress
,, Cattleya Morningtoniæ, F.C.C., Temple Show, 1911
,, ,, Mrs. W. Hopkins, A.M., R.H.S.
,, ,, Epicasta The Premier, A.M., R.H.S.
,, ,, Mrs. Henriquez
,, ,, Aphrodite White Queen
,, ,, Denganii, A.M., R.H.S.
,, ,, Ophir, Westfield variety
,, ,, King Manuel, A.M., R.H.S.
Brasso-Cattleya Mrs. J. Leemann, Westfield variety
,, ,, Wellesleyæ, A.M., R.H.S.
Brasso-Lælio-Cattleya Veitchii, F.C.C., R.H.S.
,, ,, ,, King Emperor
Odontoglossum Armstrongiæ
,, Crispum Mrs. Francis Wellesley
,, ,, Mrs. W. Mostyn
,, ,, Dicksonianum
,, Adrianæ Mrs. Francis Wellesley

In the case of certificated or A.M. Varieties the Vendor guarantees that these are the originals or parts of the originals. Paintings will b produced of every plant in the sale, and these will be on view at the Sale Rooms on the morning of sale. Catalogues free on application.

VOL. LV.—No. 3,055. SATURDAY, MAY 18, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Utility of International Exhibitions.

We are now within some four or five days of the opening of the great horticultural exhibition at Chelsea, which will unquestionably surpass in comprehensiveness and magnitude the most noteworthy of the shows of a similar character that have been held, not only in this country, but in any part of the world. As we wait with pleasurable anticipations the unlocking of the gates by which access is obtained to the Royal Hospital grounds, and the enjoyment to be derived from the many, varied, and wondrously beautiful objects that will represent the gardening art at its best, it may be of some advantage to consider whether exhibitions of an international character possess a sufficient degree of utility to justify the expenditure of time, energy, and money involved in bringing them to a successful conclusion. There has long been some difference in the views that obtain with regard to the utility of such exhibitions, and this divergence may be expected to continue, in a lessened degree, for some considerable time hence. This difference in the views held with regard to the question is by no means confined to those who are concerned with exhibitions devoted to the products of private gardens and commercial horticulture, but is found in a somewhat more pronounced form among those who are connected with the various manufactures that contribute so materially to the prosperity of the great centres of commercial activity in this country. Many we know consider international exhibitions of the highest importance to the industries with which they are specially associated, while others are not fully persuaded that they are a decided benefit; or, it may be, hold the view that they are more or less hurtful. There is, of course, no great difficulty in understanding that an international exhibition, which brings prominently before the community of a country in which it is held the manufactures and products of other nations, may not bring about results that are beneficial to a goodly number of individuals. But in considering a question of this kind it is necessary to take into account the community rather than the individual, and determine whether the advantage to the former is sufficient to counterbalance any disadvantage at which individuals may be placed in the course of their ordinary avocations. It is not, in this connection, difficult to imagine a case where an international exhibition will bring into prominence some product or appliance that is so far superior to the one previously in demand as to quickly supersede it. In such cases the home producer has to make such changes in his method of procedure as will enable him to meet the competition to which he is thus subjected, or submit to a reduction in his business, in either case suffering some pecuniary loss. Although not specially associated with international exhibitions, the early importations of American apples may be referred to as affording an excellent illustration of the manner in which the producer and the community may be affected in different ways by the introduction of something of a superior character from a quite different part of the world. Until some thirty years ago the English markets were almost wholly dependent for their supplies of apples upon the produce of farm orchards, and of miserably poor quality was the greater proportion of the fruit. Nothing was done by the owners to bring about an improvement in the quality of the supplies; and when the large, highly-coloured apples of American orchards were exhibited in the markets and shops all over the country, they at once superseded the fruit that had previously been considered good enough by the growers. A considerable

CYMBIDIUM WOODHAMENSIS FOWLER'S VARIETY.

Flowers bright yellow, tinted green. F.C.C., R.H.S., May 14. J. Gurney Fowler, Esq. (gardener, Mr. Davies), Glebelands, South Woodford.

loss was inflicted upon the owners of worn-out orchards, for the result was a revolution in apple culture, which greatly improved the quality, and enormously increased the quantity, to the gain of the community. So far, the general aspect of international exhibitions has had reference made to it, and it has been briefly shown that while they may have a disturbing effect upon some industries and individuals, their influence in relation to the community at large is highly beneficial. If this be true of international exhibitions of a general character, and we have no doubt upon the point, it is doubly so in the case of those wholly devoted to the products of the garden, orchard, nursery, and market establishment. International horticultural exhibitions have but little disturbing influence, directly or indirectly, upon the industries immediately associated with horticulture, but they have a highly stimulative effect upon horticulturists in their desire to become fully acquainted with all that is best in the art in which they are engaged. They also enforce the great lesson with singular power that the gardening community does not belong to any nation or people, but forms a great brotherhood undivided by any boundary of sea or land, and imbued with one desire, and that to increase the beauty and the productiveness of the world at large. In visiting an exhibition that is international in its scope and purpose, we meet men from countries different to our own, but possessing precisely the same sympathies as ourselves, taking much the same interest in the various classes of plants as we do, and equally ready to give, and obtain, information on the questions that are continually arising, and perplexing even those with long experience. These exhibitions possess a high degree of utility, from an educational standpoint, and every gardener, whatever may be his present position, should take advantage of the opportunities he may have for visiting them, and certainly those who are engaged in commercial horticulture should not fail to visit such exhibitions, and learn some at least of the many object-lessons that are so attractively presented to the notice of visitors. The ordinary flower show must be of a very commonplace character if it does not afford some lesson worth learning, but a great international gathering such as that at Chelsea, will afford a splendid opportunity for becoming acquainted with all the most recent introductions of special merit, and of seeing them at their best; and also of obtaining information of value relating to cultural practice, and the best methods of presenting plants, fruits, flowers, and vegetables to public notice. At Chelsea there will also be an excellent opportunity for the study of design in rock and water gardens, for the work now in progress suggests that these will be of quite exceptional excellence, if not surpassing all previous efforts at public exhibitions. But one international horticulticultural exhibition has been held in this country, and that nearly half a century ago, therefore it is not easy to give proofs of the value of exhibitons at which the competition is open to the whole world, that have been obtained from experience gained at home. Proofs, however, are not wholly wanting, for it not only had an enormous influence for good upon horticulture generally, but it stimulated in a remarkable degree the formation of societies in the provinces for the encouragement of the gardening art. In 1866, the year of the exhibition, there were comparatively few provincial societies of any considerable importance, and during the next twenty years many hundreds were formed, that did, and a large proportion are still doing, excellent work. On the Continent, where many international gatherings have taken place during the past thirty or more years, their utility is fully acknowledged. It would be of interest to give the views that have been expressed by some of the leading authorities on the Continent on this point, but it must for the present suffice to say that they are in full accord with our own.

---

**Directors of the Royal International Horticultural Exhibition.**—In the present issue we have the pleasure of giving a page illustration containing the portraits of the directors of the Royal International Horticultural Exhibition. We regret that the whole of the members of the executive were unable to be present when we had the photograph taken, and we have, as far as practicable, given separate portraits of those members who were unavoidably absent. The majority of the directors are so well known to our readers that there is no occasion to make special reference to them or their work in the several departments of horticulture in which they are engaged.

**High Temperature on May 11.**—The temperature in the Metropolis on Saturday, the 11th inst., was 16 degrees above the average, the reading at South Kensington being 79 degrees, but an equally high temperature has been registered at the London stations during May in several recent years. At Margate, Nottingham, and Oxford the maximum temperature was 77 degrees, and at Yarmouth the thermometer in the shade rose to 81 degrees. The latter was the highest temperature in May that has been registered the past forty years. On the following day some high temperatures were recorded in the South of Europe, the thermometer reading 95 degrees at two or three stations.

**Royal International Horticultural Exhibition Conferences.**—Two important conference will be held during the International Exhibition at Chelsea on subjects connected with horticulture. Both will be presided over by the Rt. Hon. A. H. Dyke-Acland, chairman of the Science and Education Committee, and will be held in the Recreation Hall of the Chelsea Royal Hospital. Admission is free, and all interested in the subjects are cordially invited to attend. Those attending the exhibition may enter the conference hall from the exhibition grounds (gaining re-admittance to the exhibition by the same means). Those not attending the exhibition may enter the conference room from the Royal Hospital entrance. The first conference will be on Thursday, the 23rd inst., at 2 p.m., the subject being "Horticultural Education," speakers: Prof. L. H. Bailey, Cornell University, U.S.A., on "Horticultural Education in America"; Herr K. Weinhausen, of Berlin, on "Horticultural Education in Germany"; W. Hales, Esq., of Chelsea Physic Garden, on "The Education of a Gardener"; and Prof. A. Buyssens, of the School of Horticulture, Vilvorde, Belgium, on "Horticultural Education in Belgium." The second conference is arranged for Friday, the 24th inst., at 9.30 a.m., on "Legislation in Connection with Plant Diseases and Pests." The speakers include Prof. Ritzema Bos, of Holland, on "The Value of Importation Regulations as a Means of Preventing the Introduction of Plant Pests from Abroad"; A. G. L. Rogers, Esq., of the Board of Agriculture, on "The Aim of Legislation in Great Britain"; H. Maxwell Lefroy, Esq., M.A., F.Z.S., F.E.S., Imperial Entomologist for India, on "Legislation in Connection with Insect Pests" Mr. H. J. Güssow, F.R.M.S., Botanist to the Canadian Government, on "Legislation in Connection with Fungoid Diseases"; and A. W. Sutton, Esq., V.M.H., of Reading, on "Import Dues and Regulations." Reports are being prepared by the Science and Education Committee on the present condition of both horticultural education and legislation against plant pests, and will be printed with the papers and discussion.

**Chestnut Sunday at Hampton Court.**—For a very long number of years it has been the custom for the residents in and around London to visit Bushey Park, which forms so important a part of the Hampton Court domain for the purpose of enjoying the charm of the famous avenue of chestnuts when the trees are in bloom. By large numbers the visit is made on a Sunday, and by common consent the third Sunday in May is regarded as "Chestnut Sunday," for in the majority of seasons the trees are then at their best. This year, owing to the mild weather that has been experienced since early in the year, the trees are about ten days earlier in flowering than usual, and accordingly the second, instead of the third, Sunday was adopted as Chestnut Sunday. The trees are blooming with exceptional profusion this year, and, notwithstanding the drought, the flower spikes have attained to a high state of development. The people, both on the Saturday and Sunday, went to Bushey Park, in tens of thousands, by train, electric trams, motors, motor-omnibuses, taxi-cabs, and other conveyances. It is conjectured that both on Saturday and Sunday there were thousands of conveyances at Hampton Court, and as a large proportion of the visitors, after enjoying the great beauty of the avenue, strolled through the Palace gardens, the glorious display of Darwin and other May-flowering tulips were not wanting admirers. The avenue was planned by Sir Christopher Wren for William III. in the summer of 1699, and planted late in the following autumn, and consists of one row of chestnuts and four rows of limes on either side. The length of the avenue is a few yards over one mile.

**Horticultural Education.** The conference on horticultural education that was held the other day under the auspices of the North of England Horticultural Society, at the Armstrong College, Newcastle-on-Tyne, was of much interest, but the discussion on this all-important subject did not succeed in carrying it much further. The subject for discussion as set forth in the programme was "Horticulture in Secondary Schools and New Farm Institutes." Mr. C. W. Harker, as representing the Board of Agriculture, referred to the work that had been accomplished by the Board, and the great need for further education. What, in his opinion, was specially needed were central colleges and trained horticulturists to instruct gardeners in the way of combating disease. Mr. F. B. Stead suggested that it was not the business of elementary or secondary schools to turn out professional gardeners, but they should give a course illustrative of the general principles required in the practice of horticulture. The Rev. J. B. Hall expressed the opinion that there ought to be centres all over the country where people should be able to go and see things. Mr. Gillander advocated training gardeners in microscopic research. Professor Seton said he thought the point was rather missed with regard to horticulture. Gardeners did not want to be bothered with microscopes, but to be so equipped as to be able to make the gardens under their charge remarkable both for their beauty and productiveness. Professor Gilchrist, in bringing the discussion to a close, said that in his connection with agriculture he had become convinced that farmers could not be turned out by agricultural colleges, but must be trained on a commercial and not a college farm; and he believed the gardener must be trained in private nurseries and commercial establishments.

**Carnation Wodenethe.**—From Messrs. W. Wells and Co., of Merstham, we have had the pleasure of receiving a gathering of blooms of this remarkably fine pure white perpetual carnation, which the firm has so well shown at the recent meetings held by the Royal Horticultural Society. The blooms are equally remarkable for their large size, superb form, purity, and their rich clove-like perfume. As in the case of other of the perpetual-flowering carnations the petals are elegantly fringed. The blooms are borne on stiff stems, and the calyxes are wholly free from the defect of splitting.

**Carnation Lady Northcliffe.**—The Floral Committee of the Perpetual-flowering Carnation Society recently visited the nurseries of Mr. C. Engelmann at Saffron Walden, and awarded a First-class Certificate to this variety. In accordance with a new regulation, which came into force at the beginning of this year, varieties must be seen growing before F.C.C.'s are given; and Lady Northcliffe is the first variety to receive this high award under the new conditions.

**Lectures on Botany in Glasgow.**—A course of fourten popular lectures on botany, by Mr. David Ellis, D.Sc., Ph.D., has been commenced in the Royal Technical College, Glasgow. The introductory lecture was devoted to the evolution and function of flowers, and in his opening remarks Mr. Ellis contrasted the poet's and the scientist's point of view with regard to them, and said that while in both there was a good deal of imagination, the scientist had a considerable amount of drudgery and hard work to get through before he reached the imaginative stage. With the aid of lantern and slides Mr. Ellis dealt with the structure of flowers, the functions of the different parts, the arrangements for insect visitors, and the arrangements for wind fertilisation. He explained how flowers had obtained their present form by evolution, and pointed out that some were highly developed and others were of a lower type, and showed how that was brought about.

**British Gardeners' Association.**—The Committee of this Association have taken offices at 92, Pimlico Road (corner of Lower Sloane Street), near the east entrance to the Royal Hospital grounds, Chelsea. These will be open to gardeners during the show, and Mr. Cyril Harding, who has recently been elected general secretary, will be in attendance to answer enquiries relating to the work of the Association.

**Perpetual-flowering Carnation Society.**—Mr. J. S. Brunton will preside at the banquet in honour of the foreign visitors attending the Royal International Horticultural Exhibition, to be held at the Holborn Restaurant on Thursday, May 23, 1912, at 6.45 p.m. Those desirous of being present may obtain tickets from the hon. secretary, Mr. E. F. Hawes, Ulysses, Fortune Green, N.W.

## AMONG THE ALPINE PLANTS.

"     .   .   .   .   Each step
Shall wake fresh beauties; each short point present
A different picture, new, and yet the same."

These words of Mason describe the rock garden of the bright time of May, when all Nature seems joyous and when the garden is bright with the fresh greenery and the glowing blossoms of the time. As we wander among our flowers we see many "different pictures," indeed, and hardly one but what is of the greatest beauty in very truth. It is difficult to cull from among the flowers only a few to adorn our posy when so many present themselves to us for admiration and for enjoyment. Yet we must choose, and as we walk along this narrow path we catch sight of

### Androsace foliosa.

One of a series of gems of the rock garden, the leafy androsace does not meet with the general appreciation it would otherwise do had it not so many exquisite sister flowers, all of which are gems of rare worth and beauty. Has it not been written down by an authority in words which would be scathing were they not well understood as flamboyant, that this and another androsace are "a little large and coarse, . . . leafy and big, with heads of dullish lilac flowers"? But it must be remembered that this is only speaking in comparison with some of the more minute gems of the androsaces, and that nobody can well call this leafy one "large and coarse," save in accordance with a standard of refinement reserved only for the tiniest of alpines. A plant from three to five inches high, and with leaves only two to three inches long, can hardly be banned as "large and coarse" without a big reservation, and as we see this androsace open to the May sunshine on a dry rockery among the limestone it loves, we must challenge and deny any expressions of depreciation which might seem unfair to a beautiful flower. The "lilac" of the one authority is not quite so descriptive as the "pale flesh" of another and greater judge, and this leafy androsace is sufficiently beautiful to justify our admiration. I am growing it in full sun on a dry rockery well supplied with calcareous material, and there it is charming with its free and beautiful little flowers.

### Phlox stellaria.

The manifold beauties of the alpine phloxes, or moss pinks, of the setacea or subulata class should not blind us to those of their sister flowers of the rockery, and the delightful Phlox stellaria, the "starry moss pink," or, as our American cousins call it at home, the "chickweed phlox." The latter popular name has with it a sound of irreverence, for who could liken this trailing plant, with its soft green, prettily-tinged foliage, and its starry pale lilac, almost white flowers, to the chickweed, which is such a trouble to the gardener, though an object of pleasure to the domestic canary? It is only the lover of flowers who can appreciate to the full the charms of this trailing phlox, which looks so pretty as it hangs over the stones, veiling them with beauty and attracting everybody. Without the mass of flowers shown by, say, P. subulata or Setacea lilacina, or allied plants, it has yet about it a beauty we can comprehend and enjoy.

### Euphorbia capitata.

Under this name there is frequently to be seen a most effective spurge, or milkwort, in good alpine gardens, where it looks well on the rougher parts of the rockeries, although too large for the company of the choicer flowers. In speaking of it I am using the generally accepted name of capitata, which is probably correct, though the euphorbias as a whole have received so little attention from authorities that one cannot be too sure, especially as the Kew "Hand-list" refers E. capitata to E. pilulifera. It matters but little, however, as the plant in question is sold in nurseries by the name which heads this note. It is a highly effective May-flowering plant, growing some nine to twelve inches high, and giving handsome heads of yellow inflorescence, brighter in colour than that of many other spurges, and by no means to be despised in the rock garden. It apparently likes a dryish soil, and is one of the decidedly "easy" subjects for the rock garden.

### Dodecatheon Meadia.

Failing to retain for long the difficult, but beautiful Dodecatheon integrifolium, that fickle beauty among the American shooting stars, we may well remember that D. Meadia and its varieties, bigger and coarser though they may look, give us in May a class of flowers we cannot well reject. With all their failings—and these they have, we must admit—they are very pleasant garden flowers, with their largish leaves, and their stems, sturdy and enduring, carrying a cluster of pretty reflexed flowers with golden pointlets. They are the "hardy cyclamens" of May, and very attractive are they, appealing to us with their quaint flowers, of varying shades. Like so many other plants, they have been seized upon by the Messrs. Lemoine as fit subjects to hybridise, and from these and other species some charming flowers have been raised by the famous Nancy firm. But even D. Meadia in its several shades is quite a worthy flower for the base of the rock garden, where, in cool, damp, yet well-drained soil it will thrive for long, and send up its tall stems of jaunty flowers. One thing should be said, and that is that, though a lover of moisture, the place must be thoroughly drained. Another is that it is easily lost in winter, as not only does it go down to a small crown, easily overlooked, but these crowns are apt to be lifted by frost, and wasted thereby. Some stones about it helps to keep the frost from injuring it in this way.

### Other Flowers.

From mound, over stone, in nook and corner, and on terrace show many plants, such as phloxes, cytisuses, alyssums, ericas, arabises, aubrietias, glorious in colour; saxifrages, truly in glorious abundance; waldsteinias, geums, potentillas, violas and violets, anemones, fritillarias, alliums, primulas, muscaris—not yet over; androsaces, cheiranthuses, and a veritable array of other beauties of the time. In their respective places they uphold the banner of the rock garden and proclaim that in their eyes May is indeed "the fairest maid on ground," a challenge which will soon be countered by the beauties of their successors of the later time now coming into the field.

S. Arnott.

---

**Exacum affine.**—Within the last few years the large-flowered Exacum macranthum, with its rich bluish-purple coloured blossoms, has made great headway in popular favour. The species under notice, which, by the way, was discovered on the island of Socotra at the same time as Begonia socotrana (whose introduction has had such far-reaching results) is a neat compact-growing plant, little more than a foot in height, but so floriferous that the entire plant is quite a mass of its pretty little bluish-lilac flowers. —W.

## EXOCHORDA ALBERTI, VAR. MACRANTHA.

This is by far the best of the several kinds of Exochorda which may be grown in the shrubberies of the British Isles, for, in addition to being more floriferous than others, the individual blossoms are larger. Whether it is strictly a variety of E. Alberti, a species from Turkestan, is very doubtful; and it is more than likely that it is the hybrid which was raised by M. Lemoine, of Nancy, between E. Alberti and the Chinese E. grandiflora, and named E. macrantha by Francisque Morel. A reference to this plant is made in "Fruticetum Vilmorinianum," p. 76.

Of vigorous habit, its foliage more closely resembles that of E. Alberti than the Chinese species, but there are characters about the flower which are suggestive of the influence of both species. In each case the stamens are arranged in bundles of five; but, whereas in E. grandiflora three stamens only are found in each bundle, in E. Alberti each bundle consists of five stamens. In the plant under notice some bundles are made up of five, some of three, whilst occasionally four may be noted.

Of vigorous habit, it will doubtless attain a similar height to the other kinds—8 to 12ft.—while it spreads over a wide area. The white flowers appear in racemes, 4 to 5in. long, each flower being upwards of an inch across. Propagated from cuttings of semi-ripe shoots in July and August, it may be expected to form serviceable plants in two years' time. Similar treatment to that afforded shrubby spiræas is quite suitable. W. D.

## CYTISUS PURPUREUS.

When seen at its best, this is one of the most striking of the many dwarf kinds of broom, for it flowers very freely, and its flowers are distinct in colour from those of other kinds. A native of Eastern Europe, it has long been in cultivation, although it cannot be said to be common. Growing 12 to 18in. high, it forms long, slender, semi-pendant branches bearing the usual three-parted leaves peculiar to the genus. The purple or rose-purple flowers are borne from the leaf-axils along the greater part of the previous year's shoots, the flowering time being early May. It differs from most other kinds of broom insomuch that the best results are obtained by cutting away the old-flowering wood as soon as the flowers are over, and relying on annual shoots each year for blossoming. These young branches are produced freely from the bases of old shoots, from the root-stock, and also from underground stems.

A rather stronger plant than the type, also with purplish flowers, is found in C. versicolor, a hybrid between C. purpureus and C. hirsutus. Its habit is similar, and it is quite as floriferous. Both plants are sometimes grafted on stems to form weeping standards, but as a rule they prove most satisfactory when grown on their own roots. C. purpureus may be increased most expeditiously from seeds, whilst the hybrid may be rooted from cuttings. The pruning previously mentioned is applicable to both plants. L. P.

**Leptospermum scoparium.**—This member of the myrtle family cannot be regarded as showy, yet it is a very neat growing shrub, the little white flowers being borne in great profusion on the slender shoots. Being almost, if not quite, hardy in some parts of England, it is well suited for glass structures, where the heating accommodation is limited. In Australia, its native country, it is exceedingly plentiful.—K.

## NOTES FROM KEW.

### Cereus flagelliformis.

This, known as the Rat's Tail Cactus, used at one time to be a favourite window plant with cottagers in the West Country. It appears to be less grown now than formerly, though it is an exceedingly pretty member of the cactus family, and a flowering specimen suspended from the roof in the cool portion of the T range has gained many admirers. The long pendulous shoots hang down for a considerable distance, and the flowers are of a delightful shade of deep pink. It must be one of the oldest of its race, as the "Dictionary of Gardening" gives it as a native of Peru, and the date of its introduction as 1690.

### Himalayan Rhododendrons.

While the various Himalayan rhododendrons and their hybrids will flourish out of doors in the extreme west of these islands, and in other favoured spots, most of them are at Kew seen at their best under glass. In the northern portion of the Temperate House numerous species and varieties are planted out in the beds there. Among the species may be mentioned the somewhat straggling growing R. Nuttalli, whose young leaves are exceedingly pretty. The flowers, which are but few in number, disposed in a loose cluster, are large, somewhat bell-shaped, and pale yellow in colour. Rhododendron Falconeri eximeum is a form of R. Falconeri, with rounder leaves and more tomentum on their undersides. The flowers, which are borne in closely-packed roundish heads, are smaller than those of many others, their colour being a pale whitish-yellow, with a dark stain at the base of the interior. Rhododendron neilgherricum, apparently a form of R. arboreum, with rose-coloured blossoms; Rhododendron campylocarpum, with loose clusters of pleasing yellow flowers; and R. formosum, or Gibsoni, a pretty white-flowered species.

### Hybrid Rhododendrons.

A particularly striking form is R. Gill's Triumph, raised at Tremongh, near Falmouth. The parents were R. Griffithianum and R. Thomsoni, and the result a large flower much resembling R. Griffithianum, but of a rich carmine colour. Another from the same source is R. Glory of Penjerrick, with flowers paler than those of the preceding. There is also a good example of one of the earliest Griffithianum hybrids, namely R. Manglesi, raised by the Messrs. Veitch, between the just-named species and a garden variety, album elegans. When expanded, the flowers of R. Manglesi are white, with reddish dots on the upper segments. R. Beauty of Littleworth is another charming flower, white, with a few very distinct dots in the interior. Some Griffithianum crosses raised at Kew are also very attractive, particularly two in which the parents were R. Grand Arab and R. Ascot Brilliant respectively. R. Pink Pearl, of course, is also represented. A beautiful pure white flower is R. Kew Pearl, while a variety remarkable for its deep crimson colour is R. Nero, whose parentage is not recorded, but it would appear to have obtained some of its colour from R. Thomsoni. Other hybrids are the white-flowered R. Dennisoni, and R. Forsterianum, a cross between R. Edgeworthi and R. Veitchianum, one of the finest of its class, the flowers being very large, white, except a yellowish stain on the upper segment, and very sweetly scented. Another a good deal in the same way, but not quite so large, is the popular R. Lady Alice Fitzwilliam. Beside these are some small-growing azaleas, which are now classed as rhododendrons by the botanist. Some of these are Japanese varieties. K.

## NEWLY-PLANTED TREES AND SHRUBS.

Trees and shrubs planted in autumn and winter require careful attention until they become thoroughly established. During recent years we have experienced very dry weather during the late spring and early summer months; but this year we were favoured with heavy rains during the month of March. This may not be an unmixed blessing if there is any truth in the old adage, "A peck of March dust is worth a king's ransom." With the exception of a few local showers April was a dry and cold month, and never before do I remember having seen the grass assume a brown and parched appearance so early in the year.

Many trees and shrubs either perish or are rendered useless through neglect and inattention to mulching and watering, for it must be remembered that in many instances the young roots have made but little progress, and in consequence are incapable of searching very far afield for sustenance, as is the case with established specimens. It is true that work presses on every hand at this season, but it is equally true that it is idle to plant these subjects if time cannot be found to give the necessary attention subsequently, in order that they may have a fair chance to succeed. If the soil is loosened to a depth of six inches, and a thick mulch of manure is applied immediately afterwards, it will effectually prevent the ground becoming "caked"; and, further, the labour entailed in watering will be reduced to a minimum.

Large numbers of evergreens are planted during April and May, and in this case root-watering should be supplemented by overhead moisture, applied preferably with a hose. Speaking generally, professional gardeners recognise the importance of staking trees and shrubs that require it at the time of planting, but this does not apply to amateurs. One often sees specimens in small gardens quite innocent of any support, being blown hither and thither by the wind. This treatment spells disaster. It is equally important that when staked the trees should be examined from time to time, and afforded room for expansion at the point where they are attached to the stakes.

Walter H. Aggett.

**Single-flowered Camellias.**—Evidences that the taste for single flowers is on the increase may be seen in the case of the camellia, for the varieties with single or semi-double blossoms are appreciated by many. They have been extensively shown during the present year, and the old-fashioned flowers of a hard and formal outline are now, in the majority of cases, passed over in their favour. At one time these single flowers were regarded as only fit for stocks on which to graft the double kinds, but now all this is altered. Apart from the more light and elegant nature of the single blooms their central tuft of stamens forms a very noticeable feature. Several cultivators, but especially Messrs. William Paul and Sons, of Waltham Cross, have taken these single-flowered camellias in hand. Many varieties have been raised by them, and selections therefrom have been freely exhibited at the Horticultural Hall during the present season.—S. W.

## BOCCONIA CORDATA.

The genus Bocconia, although consisting at the present day of five species, is only represented in our gardens by two, namely, Bocconia cordata, a very old plant, introduced into this country in 1795, and Bocconia microcarpa, of quite recent introduction. The genus is founded on B. frutescens, of Mexican origin, known since 1739, but no longer grown.

Bocconia cordata is a striking object in the border. Individually the blossoms are small. On the other hand, however, where many of its large, terminal inflorescences are seen together the effect is excellent. The foliage alone is handsome, and when the groups are placed in a sloping, grassy bank in proximity to the rock garden, the plant will hold its own against many far more costly things by reason of its beautiful foliage. It is always seen to the best advantage when planted in a group on the grass.

Aptly named the Plume Poppy, Bocconia cordata is of exceptional value in the garden from a decorative point of view. In deep, rich soil it will exceed a height of 9ft., while even in the poorest staple it develops no mean stature. Growing at the back of herbaceous borders its effect is very picturesque and distinct when associated with such things as Spiræa ariæfolia, Spiræa Lindleyana, Arundo conspicua, and A. Donax, hollyhocks, or other tall-growing subjects, while, if favoured by a background of evergreens, its lofty spikes of bloom, often nearly 3ft. in length, are shown off to the best advantage. The great panicles of blossom shaded from reddish-brown, or what might be more aptly described as burnt almond colour, to creamy-white, are unique, both in tint and form, while the dark green of the upper surface of the lobed leaves contrasts well with the silvery white of their woolly reverse gleaming as their edges lift under the breath of the breeze.

In the wild garden the bocconia is a fine feature, as, when once well-established, it will hold its own with the native vegetation. In the herbaceous border, however, it must be kept within bounds, as it is a veritable land-grabber, and, if unrestricted, its suckers will encroach on the surrounding ground, greatly to the disadvantage of its neighbours.

No garden should be without this excellent plant, which is at once bold, handsome, and picturesque. It is especially suited for massing, when a noble picture is secured, or for planting in isolated positions on the lawn, in the front of shrubberies, or any position where abundant room can be given it for future development. Two or three spikes of bloom give but little idea of the broad effect produced by half a hundred flower-heads towering from a forest of blue-green foliage. The nut-brown stems of the withered blossoms should never be cut away, but allowed to remain, when they will provide an autumn picture as pleasing as the gradations of tones one obtains earlier in the flowers.

It may be easily raised by root-cuttings two inches in length, placed in porous soil in pans, and kept moderately moist under glass. It was at one time known as Macleaya yedoënsis.

Wyndham Fitzherbert.

BOCCONIA CORDATA.
A handsome hardy herbaceous plant with whitish inflorescens.

---

**Vitis heterophylla variegata.**—This forms an exceedingly pretty object in the greenhouse just as the leaves are expanded, for, apart from their clearly-marked variegation, all the young shoots and leaves are heavily suffused with red. It is well worth extended recognition.—W.

---

## MELON CULTURE IN POTS.

It is not customary to grow melons in pots; nevertheless, they can be so cultivated with complete success, as I have proved during the past two seasons, and the fruits obtained have been equal in size and quality to those grown in borders by the ordinary method.

The young plants are raised in small pots in the usual manner, and transferred to 6in. pots. For this potting, good turfy loam is used, with sufficient crushed charcoal to keep it sweet. The soil is made quite firm, and the plants grown near the glass in a house where a temperature of 70 deg. is maintained, and at no period of growth must the heat be allowed to fall below this figure. Careful attention is paid to damping down and syringing, always using tepid water for the purpose. When the roots reach the sides of the pots the final potting is given, and a similar compost is used, with a little bone-meal added.

I strongly object to the use of organic manure in melon soil, as this has a tendency to create over-rank growth, which probably has more to do with causing canker than other supposed causes. Strong plants, with sturdy, short-jointed growths, are rarely attacked by disease, and invariably produce good fruit. For the last shift, 12in. pots are used, and sufficient space is left at the top of the pots to allow for a top-dressing when the fruit has set. Our plants are not plunged in a hot-bed, but we stand them on boards on the stages of a house that has been filled with carnations during the winter. The subsequent treatment as regards stopping the laterals, training, and setting the fruit is identical with that followed with plants growing in borders. The laterals are pinched at the first leaf beyond the fruit, and two fruits are allowed to each plant.

At no time are the plants allowed to suffer for want of water at the roots. We do not object to wetting the stems of the plants near the soil, and no harm ever comes from this practice. When it becomes necessary to apply a top-dressing, some fertiliser can be mixed with the loam, and for subsequent feeding diluted liquid pigeon manure is excellent. Carelessness in ventilation will cause mildew. We shut the house early, to allow the temperature to rise up to 90 deg. by the sun's heat. As the fruits commence to ripen, less moisture is allowed in the atmosphere and at the roots, and a little more air is admitted.

The varieties that succeed in pots are Superlative, Blenheim Orange, and The Peer. J. Gardner.

Batsford Park Gardens.

---

**Berberis stenophylla.**—Although a great number of hybrid shrubs have been raised within recent years, this, which is of accidental origin and far removed from a novelty, still holds its own as one of the most beautiful of them all; indeed, I have heard it described as the most beautiful hardy shrub in cultivation.—K.

# AN ECHO FROM THE WEST.

## Tasting Day at the National Fruit and Cider Institute.

Mention has been made from time to time in these pages of the National Fruit and Cider Institute, at Long Ashton, near Bristol, but, except in the West of England, it is doubtful whether many people know much about it, for the simple reason that the institute is mostly engaged in the culture of apples suitable for cider making, and in investigating a hundred and one things that are of interest to the people who make and drink the popular wholesome beverage of the West Country. For nearly ten years the institute has pursued its modest way, supported by the Board of Agriculture, the Bath and West of England Agricultural Society, and the County Councils of Devon, Gloucester, Hereford, Monmouth, Somerset, and Worcester. Quietly it has proceeded in its work during this period, and amongst the records it has to show there is many a problem connected with cider making that Mr. T. B. P. Barker, M.A., the able and genial director, has solved for the benefit of the industry on behalf of which he works.

The position of the institute is unique. In the first place, it fills the office of a teacher and advisor, and any farmer or cider maker in the West Country who is in difficulty about his cider may go to the director of the institute with the assurance of receiving courteous attention and assistance. Secondly, its business is to investigate and to learn. In short, the institute is an experimental station, and the need of such a place is realised by those who are practical cider makers, and know how much is yet to be found out about the work. The present-day cider maker is a bit of a philosopher in his way. He does the best he can, according to his experience and his lights, but there is always the possibility that the cider may not come up to the the standard expected, or it may go wrong, and become undrinkable, through some unknown cause, and when this happens the farmer puts it down to a slice of bad luck, just as he would if he lost a sheep or a calf, and hopes for better things next time.

Aided by science, it is the business of the institute to investigate these troubles in cider making, with the object of ascertaining causes, and suggesting remedies, and it may lay claim to a fair measure of success. But while it teaches the institute is also learning, which, by the way, is a point that is often overlooked by persons who are unacquainted with such establishments. In the little laboratory, with its test tubes and apparatus, there is a good deal of useful research work going on, and probably Mr. Barker knows more about cider making, from a scientific standpoint, than any other man in the West Country.

Thirdly, the institute is a nursery for the propagation and distribution of cider apples, and in this department some of its most useful work is recorded. Though the history of cider making is ancient, and many of the orchards which now provide the fruit also fed the cider mills of a past generation of farmers, the planting of cider apples in recent years has been sadly neglected. The demand for table apples was largely responsible for this, and because they gave a quicker, and possibly, a more remunerative return, farmers selected them for planting new orchards and filling up old ones, in preference to vintage varieties. It must also be said that some of them were persuaded that they could sell the best of the fruit for table purposes and grind the remainder up for cider, but anybody who is acquainted with cider making knows what a fallacy this is. Drinkable and saleable cider must be made from apples suited to the purpose. What has the institute done in this direction? It has scoured the counties which contribute to its support; it has discovered local varieties, which are well known in districts where they originated, but nowhere else; it has brought them together at Long Ashton, propagated them, and sent them out as orchard trees, and it is questionable whether there is such a complete collection of cider apples to be found at any other station in England. By this branch of its work the institute has probably prevented some splendid old cider apples from dropping out of cultivation; it has been the means of distributing varieties over a wide area, and since the distribution began it is safe to say that more cider orchards pure and simple have been planted in the West of England than for many, many years past.

The first of these orchards, planted three or four years ago, are now coming to a bearing stage, and when fruiting becomes general a new era of interest will be opened in the cider-making counties. What is more, this work is acting as a stimulant to cider apple planting. There is not the anxiety to plant table fruit that there was; in fact, the scarcity of cider apples is beginning to be felt; the experience of the last few years has shown that good cider fruit will pay; people are realising what they owe to their forbears for the orchards that the latter planted, and with it comes the sense of duty as to what they owe to those who will follow them. In fact, orcharding teaches its lesson of unselfishness. If former generations had not propagated and planted there would be no need for a National Fruit and Cider Institute, and there would be no juice to fill the hogsheads. In the same way, if this generation does not propagate and plant, where is the cider to come from in the years to come?

Lastly, cider is made at the institute. It has a mill and plant of its own, apples are obtained from an area which ranges from Devonshire to Worcester, and the cider is made, not in the haphazard fashion seen on so many farms, but on proper and systematic lines, and the different results of making the beverage from single varieties, and also from blending the juices of different types of apples, are shown.

The institute has one great field day each year, but it is called "Tasting Day," for the simple reason that interested persons from the contributing counties are invited to come and taste the different ciders made at the institute, and obtain any information they may desire about them. Tasting Day took place this year on May 2, and in point of interest and attendance was the best yet arranged at the institute. Nearly two hundred persons were present, and they came from many parts. Devonshire sent some, there were farmers and cider makers from "Zummerzet," two big parties of farmers from Gloucestershire, as well as a sprinkling of commercial cider makers, another party from Hereford, a few from Worcester, and Monmouth was represented by that man of so many parts, Mr. W. J. Grant, who is honorary secretary of the institute.

Tasting was no small business. First there were fifteen lots made from sharp apples to be sampled, and of these Porter's Perfection, Yellow Styre, and Cap of Liberty were generally agreed to be the best. Next came half a dozen samples of cider made from sweet apples, and here preference seemed to be given to Sweet Alford and Slack-ma-girdle. Fourteen lots of bitter-sweets were rather too much for some of the visitors, who selected Frequin Audievre (evidently of French origin), Medaille d'Or, and Yarlington Mill, and were content. Each visitor was presented with a printed list giving particulars as to the time of making, the percentages of malic acid and tannin in each cider, as well as the specific gravity and rate of fermentation, and one could learn from the sweetness, the bitter-sweetness, or the sharpness of the different single variety ciders the necessity of judicious blending in order to obtain a palatable beverage. There were also ciders to be tried which were the result of different interesting experiments, and this tasting day proved once more that if cider is to be made out of one apple alone there is no variety equal to Kingston Black.

At the suggestion of Mr. Granville E. Lloyd Baker, a little impromptu conference was got up, Mr. Barker having something to say about the cider making, while Mr. J. Ettle, the well-known horticultural instructor in Somerset, who is superintendent of the Fruit Department at the institute, dealt with this branch, and Mr. G. H. Hollingsworth, of Gloucester, described the progress of the experimental orchards in the latter county.

In addition to the tasting, the visitors had an opportunity of inspecting the young cider orchard at the institute, in which a number of varieties are represented, and on these a host of experiments are conducted. There is also an old orchard which is typical of a hundred others like it in the West, and by contrast with the young one it looks particularly antiquated. Further on is the nursery and the plantation, for it must not be thought that the institute is confined to cider and cider apples. It also takes commercial fruit culture under its wing, and a plantation laid out on market lines is under the charge of Mr. J. Ettle. In fact, there was a lot to see, and to describe it all would take more space than is available here, but as the visitors mounted the motor charabancs that were to carry them back to Bristol town they felt that they had spent a pleasant and instructive day.

This, then, is a brief description of the work of the National Fruit and Cider Institute up to now. What it will do in the future remains to be seen, but it has possibilities stretched before it, for the Development Commissioners have cast a favourable eye upon it, the large sums of money that it was necessary to raise locally has mostly been promised, and there is a probability in the near future that the modest little group of buildings at Long Ashton will grow, and with them the facilities of the establishments, and the scope of its usefulness. In short, we hope to write of this place one day as the recognised State-supported Fruit Station in the West of England, doing more and more work in the interests of the fruit-growing and cider-making industries in the West Country.

H.

---

**Eucharis amazonica.**—In many gardens this plant has fallen out of cultivation, and where a few years since it was grown in quantity, it is now rarely seen. This may be due to change of fashion in gardening, but in some cases, perhaps, due to attacks of the "mite." It is therefore pleasant to occasionally come across this one-time favourite in good condition. I recently saw some well-flowered plants in the gardens at Ragworth Hall; there were about a dozen plants carrying strong spikes and large blooms. Their condition reflected credit on the gardener, Mr. Hall; they had no special treatment afforded them, and the prevailing conditions in the district are not of the best for the cultivation of plants, whether indoors or outside.—PAUL T. MORE.

*Supplement to THE GARDENERS' MAGAZINE, May 18, 1912.*

# *The* ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION

A·D 1912

**In the GROUNDS of the ROYAL HOSPITAL, CHELSEA, *May 22nd to May 30th, 1912.***

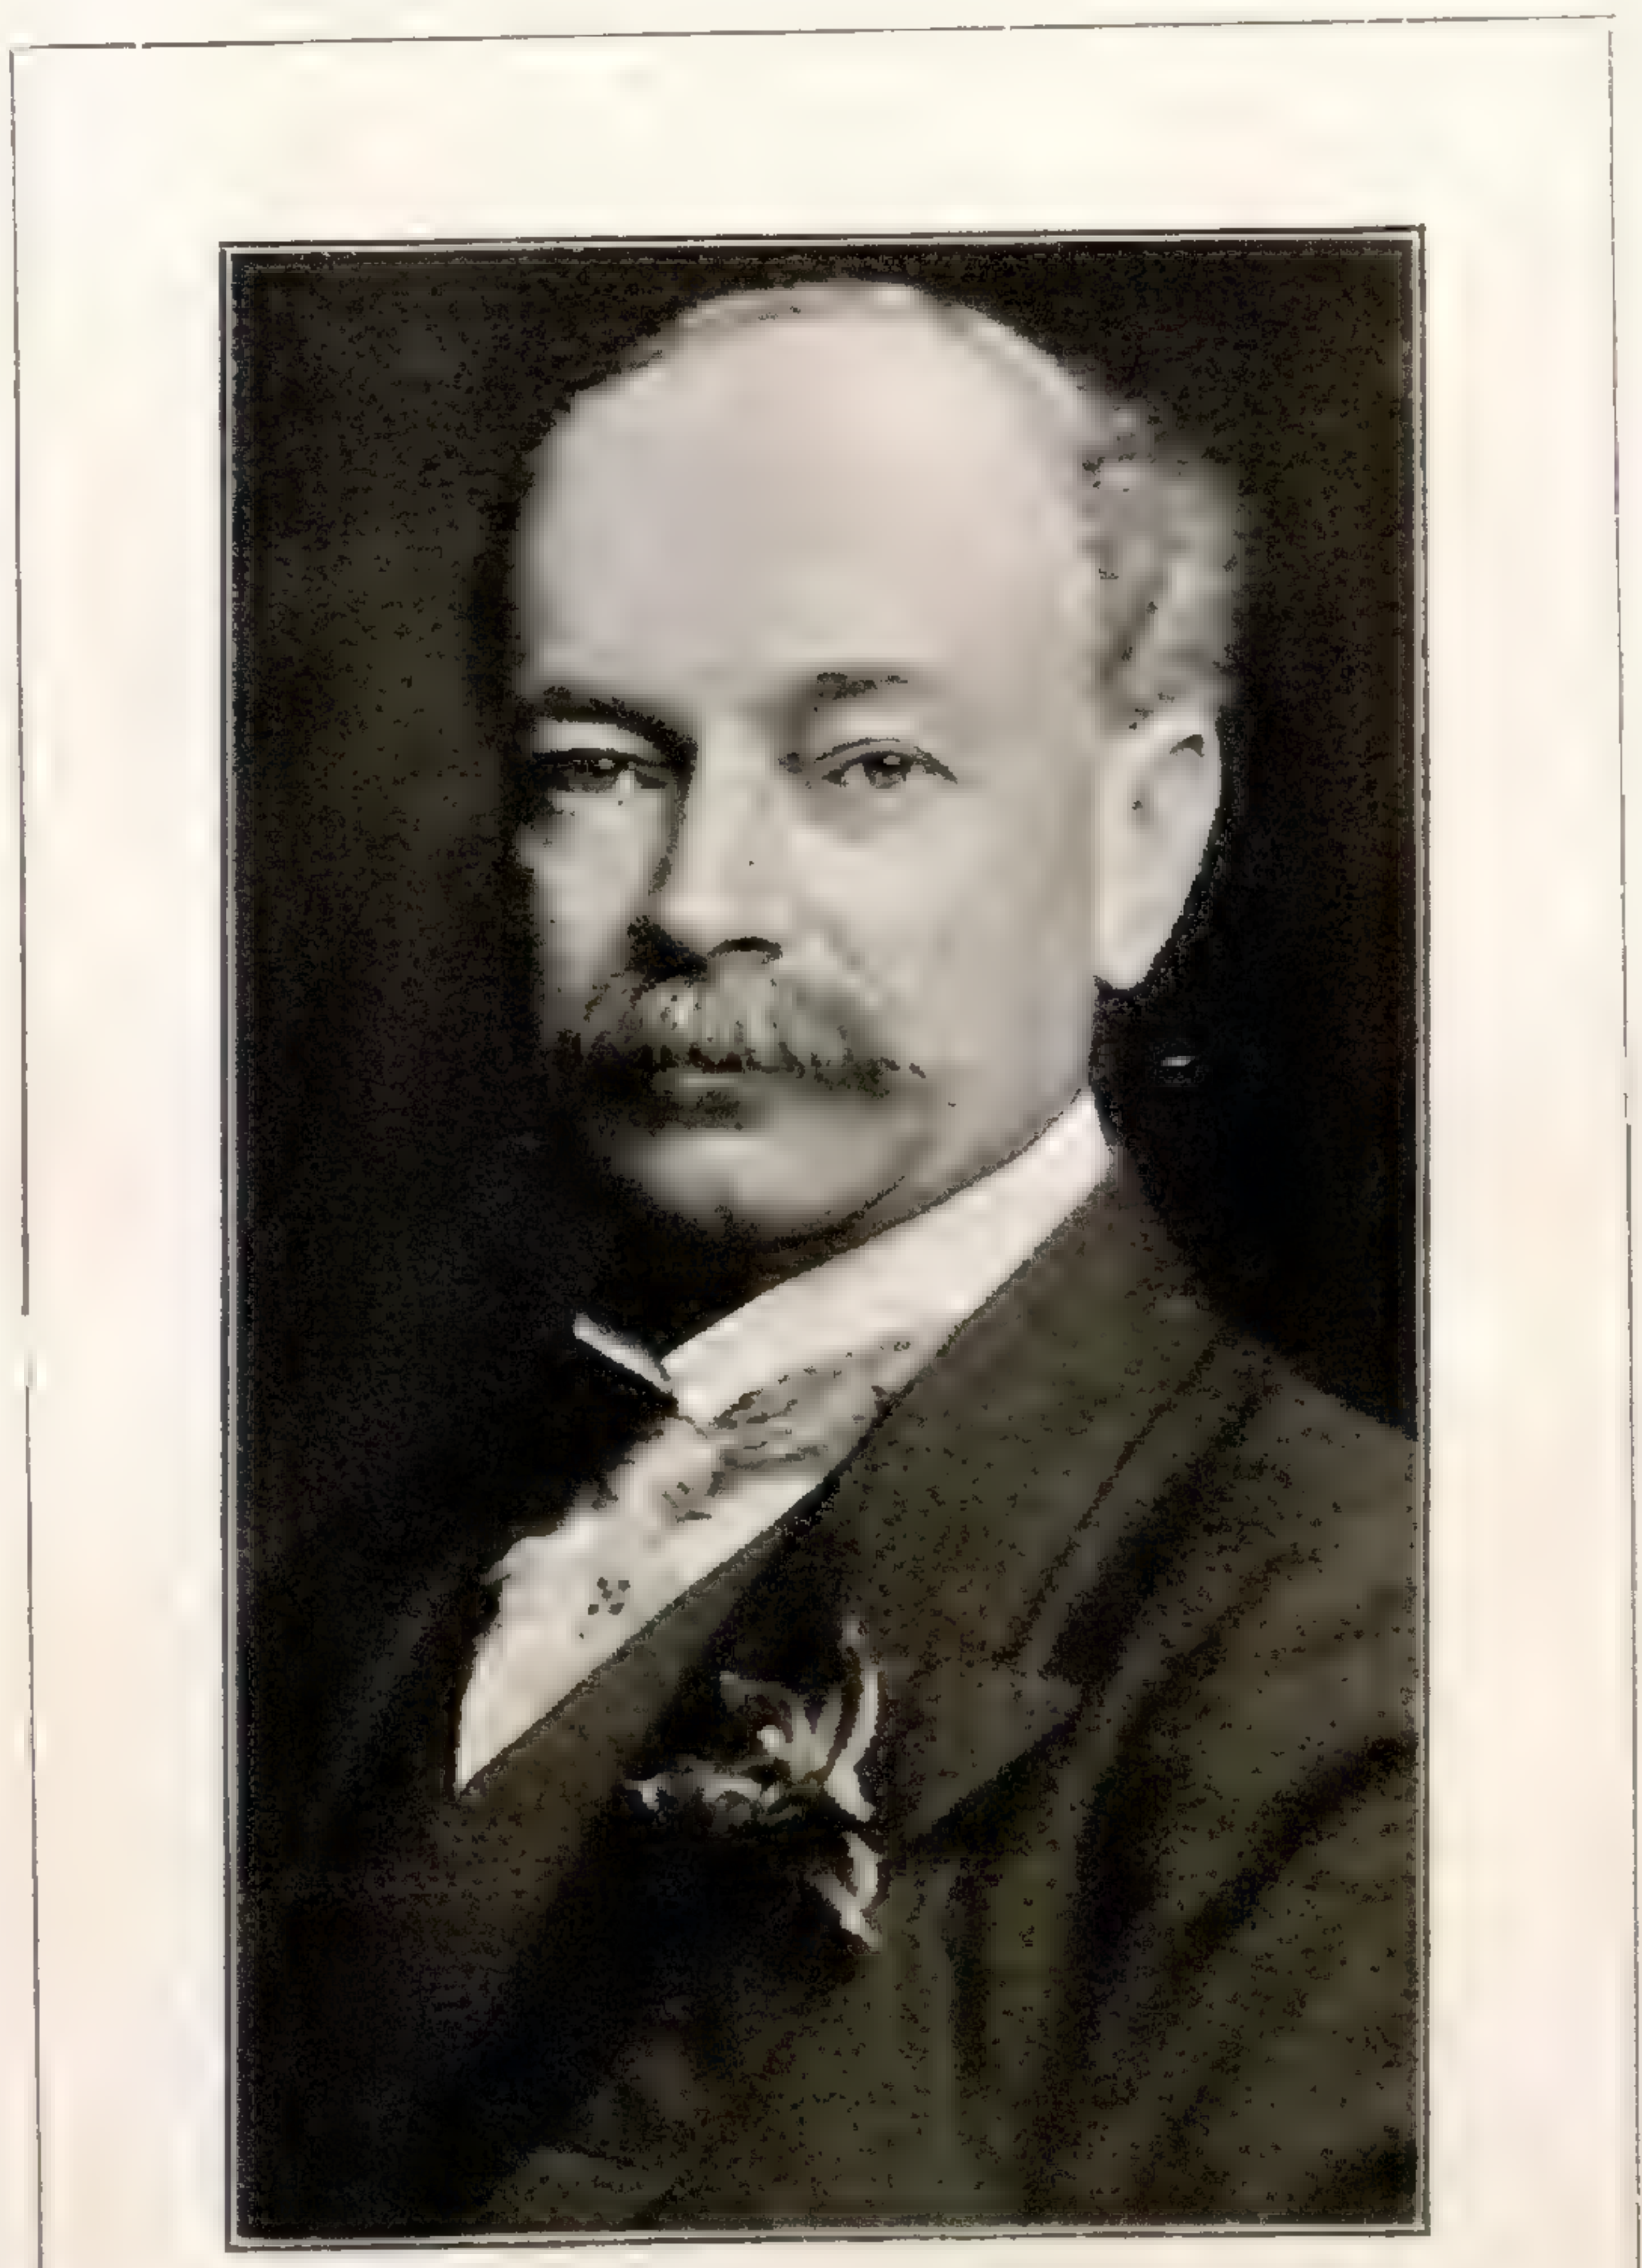
## PLAN AND SCOPE OF THE EXHIBITION.

The plan of the great exhibition to be opened at Chelsea on Wednesday, May 22, by His Majesty the King, is given in the present issue, and the scope of the exhibition is to demonstrate the high position horticulture has attained, display the finest products of the gardening art from many countries, and to indicate what enormous advances have been made since the International Horticultural Exhibition held at South Kensington in 1866.

A glance at the ground plan will show that one huge erection of wood, steel, and canvas will cover an area of 3½ acres, or, in other words, it will cover a space about twice as big as the Olympia at Addison Road. It is 660ft. long and 45ft. high, arranged in five spans and well ventilated. In 1866 the exhibition was contained in a wood and canvas erection, with seven spans, covering an area of nearly 3¾ acres; the exact measurements appear to have been 563ft. by 300ft. This year the great building is much larger on one side than the other, the shorter side being about 450ft. long and the extreme breadth a little under 300ft. So far as the main building is concerned, therefore, we show little, if any, advance on 1866, save that the structure is higher and composed of fewer spans.

But this is only part of the exhibition. Three tents, each 140ft. by 85ft., are set apart for exhibits from Belgium, Holland, and France. The cut flower tent is 600ft. long by 40ft. wide, and another marquee attached to the big tent measures 470ft. by 40ft. Orchids will occupy a specially heated tent, 250ft. by 70ft., while fruits and vegetables will be housed in a tent 140ft. by 70ft. The reception pavilion near the Chelsea Embankment entrance, the staff offices, and the two big refreshment tents take up a large amount of room, and in addition to the covered space a considerable area will be devoted to trees and shrubs. And all this is in the park-like expanse between the Hospital buildings and Old Father Thames. We give herewith two illustrations of the big tent, and one of the tents of the 1866 exhibition. The latter has been reproduced from the GARDENERS' MAGAZINE of that year.

The lime avenue is turned to account, and here will be kiosks for horticultural publications, and groups of choice hardy trees and shrubs. In the Ranelagh Gardens the exhibits for the Science and Education Section will be housed in a large tent, and one very long tent along the northern end of the gardens is devoted to horticultural sundries, while sundries of a less perishable nature will be arranged all along the length of the gardens next to the Chelsea Bridge Road. Further, in various parts of the gardens the leading exhibitors will tastefully dispose hardy trees and shrubs, herbaceous plants, etc. If the weather be fine the lower part of the Ranelagh Gardens will prove to be one of the most attractive parts of the exhibition. Here some wonderful rock, water, and Japanese gardens have been designed, some of them on a large and life-size scale, by such experts as Messrs. James Carter and Co., Messrs. Pulham and Son, and Messrs. R. Wallace and Co., among others. Large sums of money have been spent on these displays, and it is probable that the honours of the exhibition, so far as public appreciation goes, will be divided pretty equally between this section and the orchid tent, where Lieut.-Colonel Sir George Holford, Sir Jeremiah Colman, Messrs. Charlesworth, Sander, S. Low, J. Cypher, Armstrong and Brown, Hassall, and many others will provide a display of exquisitely graceful and gorgeously beautiful flowers, such as has never before been brought together. It may be noted that there are 30 classes for orchids out of a total of 428, so that orchids have not been unduly favoured. We feel sure that hybrid orchids, and what may be called the rock and water garden section will serve more than anything else to make the exhibition of 1912 quite distinct from that of 1866.



SIR JEREMIAH COLMAN, Bart., V.M.H.
Treasurer of the Royal International Horticultural Exhibition.

The schedule is divided into 13 sections, as follows: Stove and greenhouse plants, groups and specimens, 53 classes; palms and cycads, 11 classes; orchids, 30 classes; ferns and selaginellas, 24 classes; greenhouse plants—azaleas, begonias, pelargoniums, etc., 73 classes; roses, 26 classes; carnations and pinks, 15 classes; hardy plants, including rock and alpine gardens, 104 classes; new plants, 16 classes; fruits, 45 classes; vegetables, 35 classes; and a miscellaneous section for non-competitive displays.

We shall see any quantity of finely-grown pot plants next week, but there will be nothing like the number of giant specimens that were on view in 1866, when enormous specimen stove plants, huge heaths, azaleas, and roses; and big pelargoniums were present in quantity, and large specimen orchids, such as are rarely seen to-day, were then displayed by Mr. Robert Warner, Mr. Wm. Marshall, V.M.H. (whom we all hope to see recovered sufficiently from his recent illness to be present next week), Mr. John Peed, Mr. Penny, Mr. B. S. Williams, Mr. A. Turner, and Mr. Wm. Bull. The orchids shown then were all introduced species or varieties of species, a few hybrids had been raised, but probably not more than a dozen had flowered.

Cattleya Mossiæ, vandas, oncidiums, and Dendrobium nobile were represented by magnificent examples, some of Mr. Warner's cattleyas carrying 40 flowers. Forty-six years ago the new plants exhibited were chiefly tropical exotics; this year we anticipate they will be chiefly hardy exotics, florists' flowers, and hybrid orchids. Horticultural implements and sundries will show a revolution in number, variety, and design, as compared with 1866, for in syringes, spraying machinery, fumigating materials, and manures, enormous advances have been made during recent years.

BIG EXHIBITION TENT AT CHELSEA,
As seen from the leads of the Royal Hospital.

A Botanical Congress, presided over by Mons. de Candolle, was held in connection with the exhibition of 1866, and the pages of the GARDENERS' MAGAZINE of that year show that it was a very successful affair. This year there is a Science and Education Section, presided over by the Right Hon. A. H. Dyke-Acland, and with Mr. F. J. Chittenden as secretary. The programme is limited to the consideration of two very important subject: "Legislation at Home and Abroad for the Prevention and Suppression of Plant Pests" and "Horticultural Education." There will be social functions, as is only right and proper on these occasions, as they provide opportunities for showing hospitality to the stranger within our gates, but they seem scarcely numerous or extensive enough for such an important event.

How many judges there were in 1866 we do not know, but surely never before were nearly 400 eminent horticulturists brought together from almost all the ends of the earth to adjudicate upon an exhibition! We understand these will be divided up into 75 groups, and they have to be in attendance at 7.30 a.m. prompt on Wednesday next. Good fortune attend them.

A 300 h.p. engine has been installed to provide the electricity which, by means of arc-lamps, will brilliantly illuminate the tents and ground each night. A minor part of the preparatory work has been the installation of a complete drainage system for the show, while the provision of water and necessary hydrants throughout has been another item of importance. The design of the exhibition is by Mr Edward White, and Mr. S. T. Wright, of the R.H.S. Gardens, Wisley, is acting as show superintendent and doubtless his urbanity and wide knowledge of exhibitors will materially help to make matters move smoothly during the bustle and excitement of this week and the early days of next week. Messrs. Piggott Brothers and Co., Bishopsgate, London, have the erection of all the show buildings in hand, and their work has been very heavy considering the time allowed. In some of the larger rock and water garden designs electric motors have been cunningly installed for the purpose of pumping up water from the lower pools to an elevation from whence it descends again in falls and cascades.

Turning back again to the year 1866, one finds it of great interest to notice how, alas! not a few nurserymen then prominent have passed away, and in some instances the very name is now unrepresented in the trade, but it is also pleasant to find that then, as now, such firms as Messrs. Jas. Veitch and Sons, Chelsea; Wm. Paul and Son, Waltham Cross; C. Turner, Slough; William Bull, Chelsea; Backhouse and Son, York; Jackman and Son, Woking; Saltmarsh and Son, Chelmsford; Fisher, Holmes, and Co., Sheffield (now Fisher, Son, and Sibray); Jas. Carter and Co., High Holborn; Paul and Son, Cheshunt; Barr and Sugden, Covent Garden (now Barr and Sons); Wm. Cutbush and Son, Highgate; Lane and Son, Berkhampstead; H. Cannell, Woolwich (now H. Cannell and Sons, Swanley), were exhibitors. Mr. Harry J. Veitch is the only director who was also on the governing body in 1866; Mr. William Marshall is probably the only amateur living who was a foremost competitor in 1866; and Mr. Henry Cannell is the only one remaining who was the head of an exhibiting firm in that year.

So much for the plan and scope of the great exhibition, with a few comparisons added. But there is at least one other matter requiring notice, and it is that the financial success of 1866 was due to an extension of the period, during which it was originally intended the exhibition should remain open, and to the fact that the popular shilling admission was charged during the extension. The resulting profit enabled the authorities to hand over £1,000 to the Gardeners' Royal Benevolent Institution, and purchase the Lindley Library that is now housed at the Royal Horticultural Hall. If the great show of 1912 is to be a financial success there must be a very large attendance. Every garden-lover in the kingdom with a sense of his or her indebtedness to horticulture must come to Chelsea, and every gardener, whether engaged in private, public, or commercial practice should attend, even at the sacrifice of some time and money. Financial failure would be an everlasting disgrace to British horticulture.

## CHELSEA HOSPITAL GARDENS.

The minds of horticulturists the world over are turning towards Chelsea, and are full of wonderment as to the success of the great Royal International Horticultural Exhibition to be held there next week. Garden workers and garden lovers are coming from the "bounds of Empire" and from friendly neighbouring countries, as well as from lands far off, to see the most extensive and magnificent display of horticultural productions ever brought together. In 1866 the last International Horticultural Exhibition was held at South Kensington, and the site is now built over. One great difficulty that presented itself to the promoters of the present exhibition was that of site, because extent, ease of access, and a large amount of freedom for constructional purposes, were matters of great moment. How many sites were examined we do not know, but those who know London well were convinced that, failing the loan of a part of one of London's parks, there was no place so generally suitable as the gardens and grounds attached to the Royal Hospital, Chelsea, with the addition of the Ranelagh Gardens. And this was the site finally selected.

VIEW IN THE RANELAGH GARDENS, ROYAL HOSPITAL, CHELSEA.

Although the story has been told previously in these columns, a brief history of the famous hospital cannot be out of place when so much of interest to horticulturists centres in and around it. It is said that the hospital owes its institution to the pleading of Nell Gwynne, whose heart was touched with sympathy for the soldiers of her time who were "broken in our wars." Be that as it may, we know that the hospital, as well as the whole system of army pensions, came into being at the instance of Charles II., whose statue, in Roman style, stands in front of the hospital, and is annually crowned and fêted on Oak-apple Day. In those far-off days the army was a small one, and it was hoped that the hospital buildings would be large enough to accommodate all army pensioners. Sir Stephen Fox, the Paymaster-General of that time, gave £1,500 towards the funds necessary to commence proceedings, and by devious means, including the deduction of one day's pay per year from the army, he raised a goodly sum; £7,000 was added from the Secret Service Fund, and £20,000 was raised voluntarily.

The hospital lands cover about sixty acres, and as a large portion of this area is open to the public for the greater part of each day, London in general, and Chelsea in particular, have cause to bless the memory of the second Charles, and now, we, as horticulturists, may also be thankful that such a site was available for the great exhibition. The gardens and park-like grounds were not all acquired at once. The hospital building occupies the site of a Divinity College built by James I., but which was a failure, and was pulled down. The land, about twenty-seven acres, was granted to the Royal Society, but as this body could put it to no good use the property was "gladly" sold to those who were engaged in the hospital scheme, for £1,300! Just imagine, £48 an acre for land in Chelsea. Times have changed since then.

From Lord Cheyne twenty-one acres were purchased, and other parcels of land acquired brought up the total to 99½ acres. The King strained a point in favour of the Earl of Ranelagh, and granted him twenty-seven acres, but in 1742 and 1826 portions were repurchased, and these constitute the attractive and well-designed Ranelagh Gardens, where, if the weather be fine, visitors to the great exhibition will thoroughly enjoy themselves, for here, in the open, with ample space and a fine setting of trees and shrubs, the last word in design will find expression in rock gardens, water gardens, Japanese gardens, etc. No more suitable place for garden exhibits of this kind could be found in London. Noble elms and horse chestnuts, towering poplars and ailanthuses, spreading planes, and ancient thorns, as well as rhododendrons, lilacs, hollies, and other shrubs and trees, pleasingly grouped in irregular belts and masses, with wide areas of grass, an undulating surface, and winding paths, together form a garden of admirable design and no mean beauty. The summer-house or tea-house on rising ground marks the site of the old Rotunda, a building very famous in the days when the Ranelagh Gardens formed the pleasure resort of fashionable London.

The extensive buildings of the hospital were built to the designs of Sir Christopher Wren, and it is estimated that from 1681 to 1701 not less than £157,000 were expended on building, lands, and furnishing. The whole establishment forms a little township, with a population of nearly 700 people. A great deal of the work of maintenance is done by the more able-bodied pensioners, who are paid for work so done. The management is on military lines, under the governorship of Sir George White, of Ladysmith fame. The Great Hall is the centre of the

Hybridists and Growers.

**HAYWARDS HEATH, SUSSEX.**

social life of the place, and here, amid an array of old armour and weapons, fine old paintings, and flags and banners carried though many a well-fought fight, the pensioners meet for various amusements and entertainments. In this Great Hall the four hundred members of the jury will meet at 7.30 a.m. on Wednesday, May 22, to be divided into seventy-five sets, prior to their task of judging the greatest flower show ever seen. Some visitors may have an opportunity of inspecting the beautiful Chapel, famous for its windows, its gold plate, and exquisite carvings by Grinling Gibbons.

To the north of the Ranelagh Gardens is a piece of land divided into one hundred and seventy plots, each plot a little garden with which a pensioner, who has a liking for gardening, may do what he pleases. These plots are of great interest, and exceedingly ingenious are the methods followed by some of the old gardeners. In many cases the cultivator has in view a modest addition to his pocket money, and as visitors seem ever ready to purchase flowers and plants from these plots, there is no difficulty in disposing of the results of one's labours. I have told before how one old pensioner gardener raised a batch of sturdy seedlings of Impatiens Roylei in an improvised frame, and sold them speedily as "new fuchsias."

To the south of the hospital buildings, and stretching to the Embankment, is the tree-skirted park and cricket ground, and it is here that the enormous tents and other buildings have been erected for the more tender subjects that will be brought for exhibition. The tall Chilianwallah monument, with its flanking guns, is covered in, and will doubtless form a rendezvous for friends who may desire to meet each other, for it will be a quite easy matter to search in vain for a friend in this huge exhibition unless a time and place are appointed. But you cannot miss the Chilianwallah monument.

Between the park and the Ranelagh Gardens runs an avenue of lime trees, and this is remarkable from the fact that the trees were pollarded long years ago, with the result that, from a point about eight feet from the ground they produce from four to eight limbs, which bend outwards, and then ascend to a considerable height. In all the freshness of their delicate greenery these old lime trees will provide grateful shade next week, if the weather is bright, and between their stems there will be groups of ornamental trees and shrubs, and a series of kiosks for horticultural publications and in one of these kiosks the GARDENERS' MAGAZINE, and its sister paper, "Amateur Gardening," will be represented. There will be on view a volume of the GARDENERS' MAGAZINE for 1866, containing a report of the International Exhibition of that year, a full-page plan of that show, and also an illustration showing the tents and buildings occupied by the exhibition, for then, as now, the "G.M." was easily ahead of its contemporaries for illustrated reports.

The present superintendent of the gardens and grounds attached to Chelsea Hospital is Mr. T. W. Turner, formerly general foreman at the Royal Horticultural Society's gardens at Chiswick. Mr. Turner succeeded Mr. Graham. Some previous occupants of the post rest in the little cemetery that Mr. Turner has beautified with breadths of daffodils and other spring flowers, and the records tell of Henry Story, gardener twenty years (1713); Mr. James Allen, gardener (1817); and "Mr. J. Bruce, Mastr. Gardnr." (1838). Mr. Turner's house is close to the pensioners' gardens. The management of Burton Court, the Guards' sports ground, also falls to Mr. Turner, who, on the terraces in front of the hospital, annually provides a bright display of summer bedding from plants grown on the place—no mean feat for Chelsea.

C. H. CURTIS.

AVENUE OF POLLARD LIMES, ROYAL HOSPITAL GROUNDS, CHELSEA.

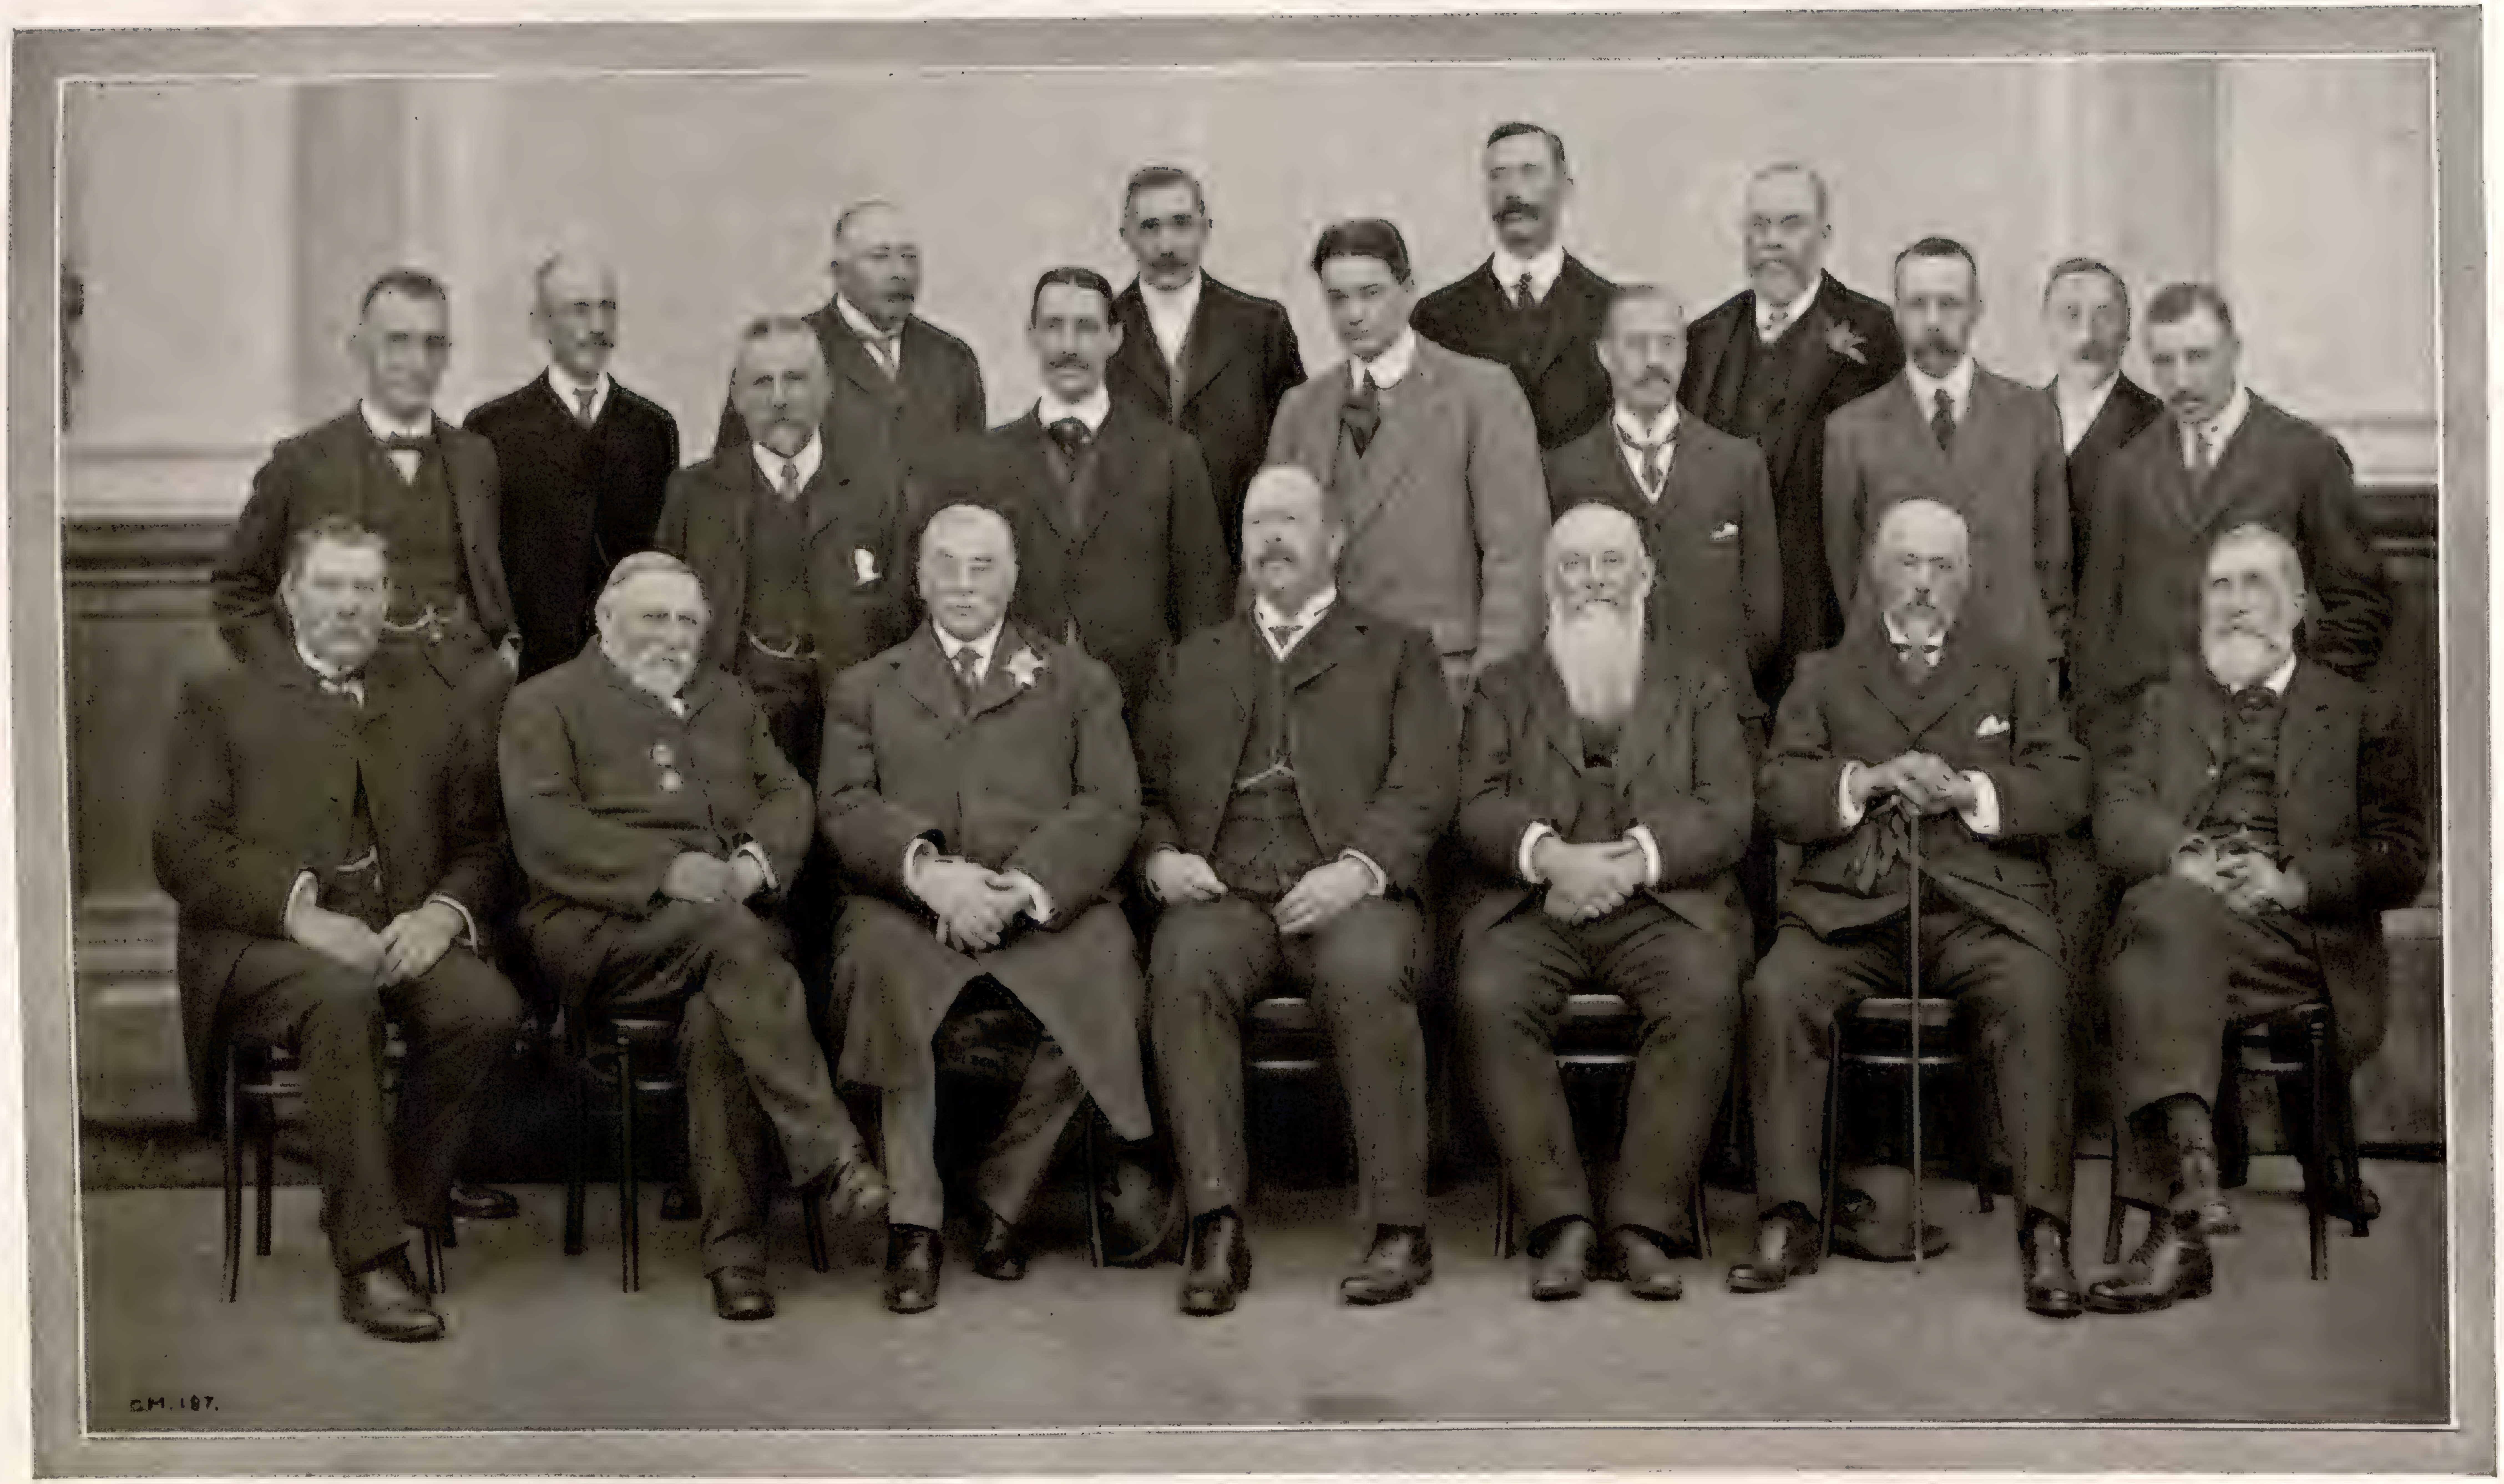
## HOW TO REACH THE EXHIBITION.

The Royal Hospital, Chelsea, with its historic associations and extensive grounds, is generally regarded as one of the most interesting features of the Metropolis; but of those who are not well acquainted with the topography of London, few are able to state offhand its exact whereabouts and the best means of reaching it. This is in a measure due to the fact that it is somewhat off the beaten track, and, so far as horticulturists are concerned, there has been no event in the neighbourhood of special interest to them, with the exception of the summer exhibition held by the Royal Horticultural Society in the grounds a few years since.

By some of our friends in the provinces whose visits to the Metropolis are of short duration, Chelsea Hospital is regarded as situate in a somewhat remote part of London, and not particularly convenient of access. This is not, however, the case, for the site is as convenient of access as any position well could be. It is less than two miles from Charing Cross, and within five minutes' walk of a station of the Metropolitan Railway, which is more or less directly connected with all the railway termini in London with the exception of London Bridge (London, Brighton, and South Coast) and Waterloo (London and South Western), and there is no difficulty in reaching the exhibition grounds from these two termini.

Chelsea Hospital occupies a prominent position on the Chelsea Embankment, and the principal entrance therefrom leads direct into the exhibition with the great tent on the right, and the marquees provided for the display of the products from foreign countries on the left. This will be the most convenient entrance for those who arrive by motor, carriage, or taxi-cab. Those who travel by railway should alight at Sloane Square Station on the Metropolitan District Railway, which is about five minutes' walk from the entrance on the north-west side of the Hospital grounds.

Visitors travelling to London by the Great Northern and the Midland Railways should, on reaching King's Cross and St. Pancras respectively, proceed to the King's Cross Station of the Metropolitan Railway, and book to Sloane Square. Those travelling by the London and North Western Railway should, on reaching Euston, proceed to Euston Square, also on the Metropolitan



DIRECTORS OF THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.

Back row: Mr. C. R. Fielder, V.M.H., Mr. A. Turner, Mr. R. H. Pearson, Mr. R. W. Wallace, Mr. F. J. Hanbury, Mr. John Green.
Middle row: Mr. C. Harman Payne, Mr. E. Beckett, V.M.H., Mr. E. White, Mr. T. G. W. Henslow, Mr. W. A. Bilney, Mr. T. A. H. Rivers, Mr. C. G. A. Nix.
Front row: Mr. A. Mackellar, V.M.H., Mr. G. Paul, V.M.H., Mr. N. N. Sherwood, V.M.H., Mr. J. Gurney Fowler, Mr. H. J. Veitch, V.M.H., Mr. A. W. Sutton, V.M.H., Mr. H. B. May, V.M.H.
(The names in each row are to be read from left to right.)

Railway, and about five minutes' walk, and book as before.

Those reaching London by the Great Central Railway should, where practicable, travel to Baker Street instead of to the main-line station at Marylebone, as the former is in direct connection with the Baker Street Station of the Metropolitan Railway, whereas Marylebone Station is six or seven minutes' walk therefrom. As before, tickets must be taken to Sloane Square.

Passengers via the Great Western Railway should, on reaching Paddington, proceed to Praed Street Station on the Metropolitan Railway, which is in direct connection, and book to Sloane Square.

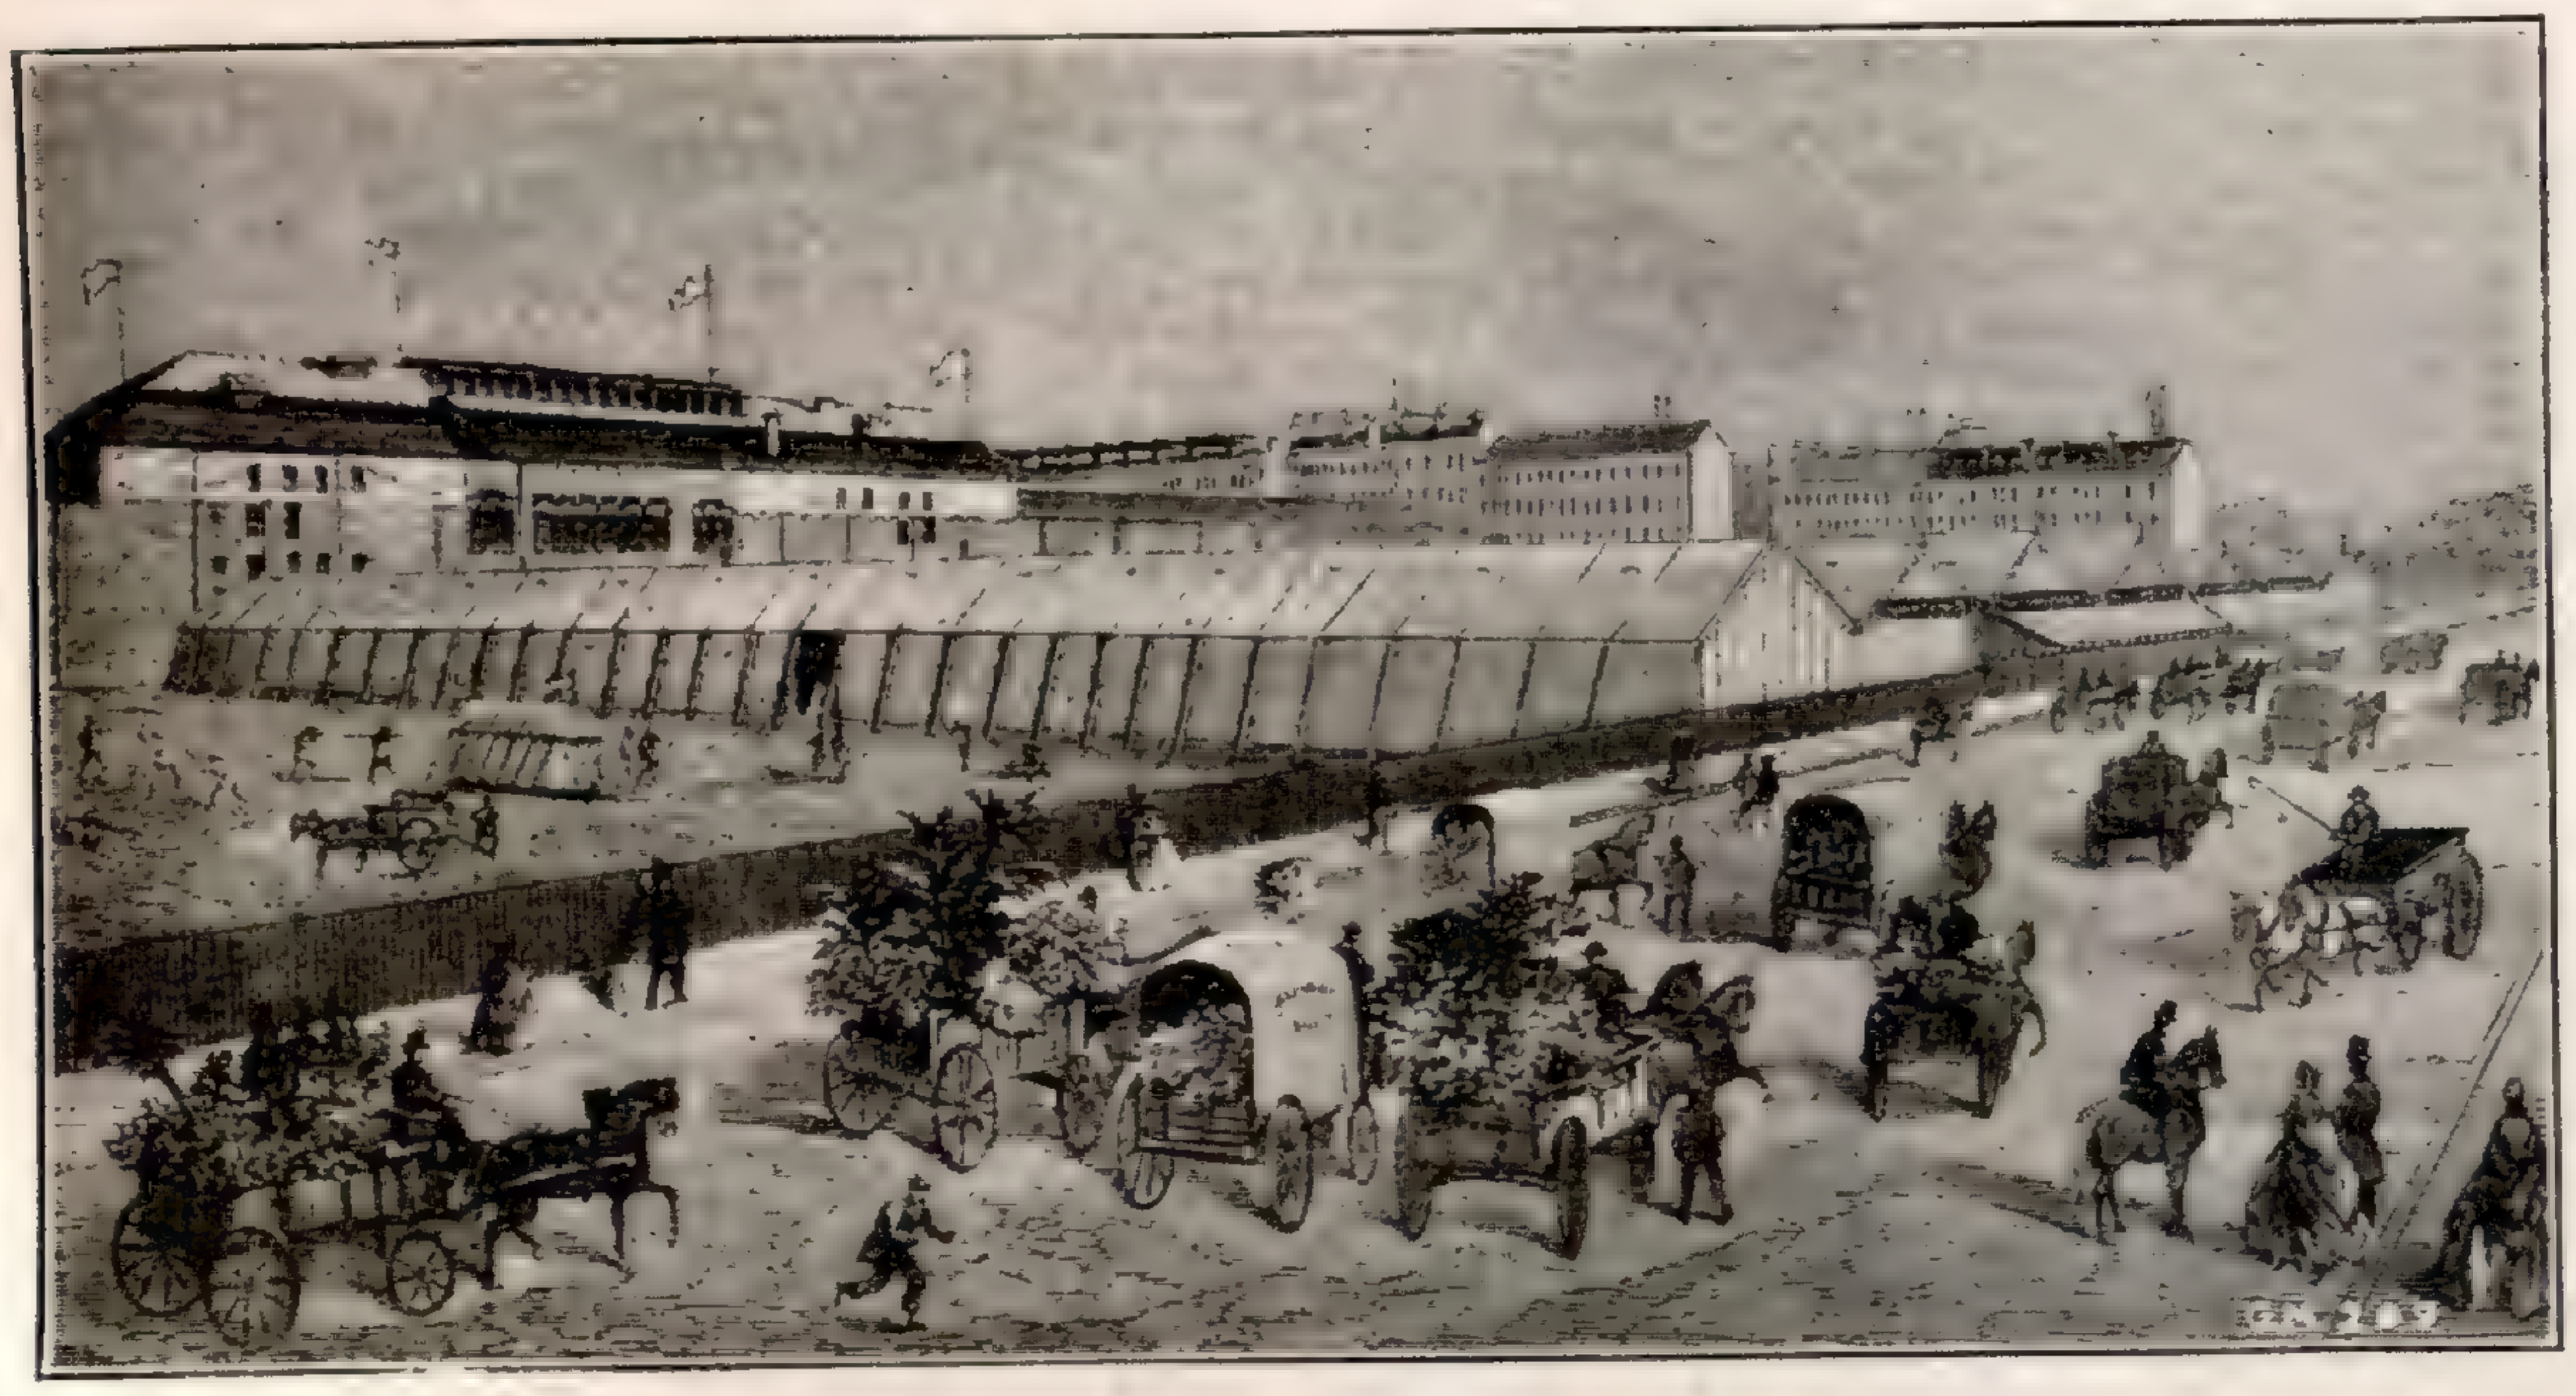
Visitors to the exhibition from the southern parts of England via the London and Brighton, South Eastern, or London, Chatham and Dover Railways, should in each case book to the Victoria terminus, which is only a short distance from the exhibition. On reaching Victoria they can travel to the exhibition by motor-bus (Service No. 11), which will be found at the western entrance to the station yard, or they can proceed through the subway to the Victoria Station of the Metropolitan District Railway and journey to Sloane Square. The motor-bus is preferable, as it puts its passengers down almost close to the entrance gates to the exhibition grounds.

On reaching Waterloo, the best course is to book from there by the Bakerloo Railway to Sloane Square, and change at Charing Cross (Embankment) Station for that station. Those visitors who travel by the South Eastern and London, Chatham, and Dover Railways to Cannon Street will proceed from the station of the same name on the Metropolitan District Railway and book for Sloane Square.

Visitors reaching London via the Tilbury and Southend Railway should, on reaching the Fenchurch Street terminus, proceed to Mark Lane Station of the Metropolitan District Railway, and, as before, book to Sloane Square.

Visitors travelling to the Liverpool Street Station of the Great Eastern Railway should, on arrival, proceed to Liverpool Street Station of the Metropolitan Railway, which is reached by a subway, and thence travel to Sloane Square.

Excepting at Mark Lane and Cannon Street, passengers must be careful to travel by an Inner Circle train, but at the two stations mentioned they may take any train.



TENTS OF THE 1866 INTERNATIONAL EXHIBITION.

As seen from Cromwell Road, South Kensington. Reproduced from the GARDENERS' MAGAZINE, 1866.

## MEMBERS OF JURY.

### SPECIAL JURY.

Balfour, Bayley, Prof., F.R.S., V.M.H., Royal Botanic Gardens, Edinburgh.
Benary, Fritz, Herr, Erfurt, Prussia.
Bowles, E. A., Esq., M.A., F.L.S., Myddleton House, Waltham Cross.
